Column customization in PdfLightTable

The following code snippet illustrates how to customize the column in [PdfLightTable](#) using the [PdfStringFormat](#) class.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Acquire page's graphics.
PdfGraphics graphics = page.Graphics;
//Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
//Set the DataSourceType as Direct.
pdfLightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns.
pdfLightTable.Columns.Add(new PdfColumn("Roll Number"));
pdfLightTable.Columns.Add(new PdfColumn("Name"));
pdfLightTable.Columns.Add(new PdfColumn("Class"));
//Add rows.
pdfLightTable.Rows.Add(new object[] { "111", "john", "III" });
// Specify column name.
pdfLightTable.Columns[1].ColumnName = "Student Name";
//create and customize the string formats
PdfStringFormat format = new PdfStringFormat();
format.Alignment = PdfTextAlignment.Center;
format.LineAlignment = PdfVerticalAlignment.Bottom;
//Apply string format
pdfLightTable.Columns[0].StringFormat = format;
//Style to display header.
pdfLightTable.Style.ShowHeader = true;
//Draw the PdfLightTable.
pdfLightTable.Draw(page, PointF.Empty);
//Save the document.
doc.Save("Output.pdf");
//close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.

Row customization in PdfGrid

You can customize row height and styles using [Rows](#) property in [PdfGrid](#) class.

The following code snippet illustrates how to customize the row in PdfGrid.

C#

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a new PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable.
DataTable dataTable = new DataTable();

```

```

//Add columns to the DataTable.
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable.
dataTable.Rows.Add(new object[] { "E01", "John" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
dataTable.Rows.Add(new object[] { "E03", "Peter" });
//Assign data source.
pdfGrid.DataSource = dataTable;
//Create an instance of PdfGridRowStyle
PdfGridRowStyle pdfGridRowStyle = new PdfGridRowStyle();
pdfGridRowStyle.BackgroundBrush = PdfBrushes.LightYellow;
pdfGridRowStyle.Font = new PdfStandardFont(PdfFontFamily.Courier, 10);
pdfGridRowStyle.TextBrush = PdfBrushes.Blue;
pdfGridRowStyle.TextPen = PdfPens.Pink;
//Set the height
pdfGrid.Rows[2].Height = 50;
//Set style for the PdfGridRow.
pdfGrid.Rows[0].Style = pdfGridRowStyle;
//Draw the PdfGrid.
PdfGridLayoutResult result = pdfGrid.Draw(pdfPage, PointF.Empty);
//Save the document.
pdfDocument.Save("Output.pdf");
//close the document
pdfDocument.Close(true);

```

VB.NET

```

'Create a new PDF document.

Support for table customization

Table customization in PdfLightTable

Essential PDF supports users to create a customizable PDF table like [CellSpacing](#), [CellPadding](#), [RepeatHeader](#), [ShowHeader](#), etc. This can be achieved by using the [PdfLightTableStyle](#) class.

The following code snippet illustrates how to customize the table using [PdfLightTable](#).

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create a PdfLightTable
PdfLightTable pdfLightTable = new PdfLightTable();
//Initialize DataTable to assign as DataSource to the light table
DataTable table = new DataTable();
//Include columns to the DataTable
table.Columns.Add("Name");
table.Columns.Add("Age");
table.Columns.Add("Sex");
//Include rows to the DataTable
table.Rows.Add(new string[] { "abc", "21", "Male" });
//Assign data source
pdfLightTable.DataSource = table;
//Declare and define light table style
PdfLightTableStyle lightTableStyle = new PdfLightTableStyle();
//Set cell padding, which specifies the space between border and content of
the cell
lightTableStyle.CellPadding = 2;
//Set cell spacing, which specifies the space between the adjacent cells
lightTableStyle.CellSpacing = 2;
//Sets to show header in table
lightTableStyle.ShowHeader = true;
//Sets to repeat header on each page
lightTableStyle.RepeatHeader = true;
//Apply style

Table customization in PdfGrid

Essential PDF supports users to create a customizable PDF table like [CellSpacing](#), [CellPadding](#), [HorizontalOverflow](#), etc. This can be achieved by using [PdfGridStyle](#) class.

The following code snippet illustrates how to customize the table using [PdfGrid](#).

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create a PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
//Assign data source
pdfGrid.DataSource = dataTable;
//Declare and define the grid style
PdfGridStyle gridStyle = new PdfGridStyle();
//Set cell padding, which specifies the space between border and content of
//the cell
gridStyle.CellPadding = new PdfPaddings(2, 2, 2, 2);
//Set cell spacing, which specifies the space between the adjacent cells
gridStyle.CellSpacing = 2;
//Enable to adjust PDF table row width based on the text length
gridStyle.AllowHorizontalOverflow = true;
//Apply style
pdfGrid.Style = gridStyle;
//Draw grid to the page of PDF document
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);
```

VB.NET

```

'Create a new PDF document
Dim document As New PdfDocument()
'Add a page
Dim page As PdfPage = document.Pages.Add()
'Create a PdfGrid
Dim pdfGrid As New PdfGrid()
'Create a DataTable
Dim dataTable As New DataTable()
'Add columns to the DataTable
dataTable.Columns.Add("ID")
dataTable.Columns.Add("Name")
'Add rows to the DataTable
dataTable.Rows.Add(New Object() {"E01", "Clay"})
dataTable.Rows.Add(New Object() {"E02", "Thomas"})
'Assign data source
pdfGrid.DataSource = dataTable
'Declare and define the grid style
Dim gridStyle As New PdfGridStyle()
'Set cell padding, which specifies the space between border and content of
the cell
gridStyle.CellPadding = New PdfPaddings(2, 2, 2, 2)
'Set cell spacing, which specifies the space between the adjacent cells
gridStyle.CellSpacing = 2
'Enable to adjust PDF table row width based on the text length
gridStyle.AllowHorizontalOverflow = True
'Apply style
pdfGrid.Style = gridStyle
'Draw grid to the page of PDF document
pdfGrid.Draw(page, New PointF(10, 10))
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)
'This will open the PDF file so, the result will be seen in default PDF
viewer
Process.Start("Output.pdf")

```

UWP

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();

```

Built-in table styles

In-built table styles can be applied to both [PdfGrid](#) and [PdfLightTable](#) models and the appearance is made similar to Microsoft Word's built-in table styles. You can also apply in-built table styles with the following additional table style options.

- Banded columns
- Banded rows
- First column
- Last column
- Header row
- Last row

The below code example illustrates how to apply built-in table style using [ApplyBuiltinStyle](#) method of the PdfGrid with styles from [PdfGridBuiltinStyle](#) Enum.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable.
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable.
dataTable.Rows.Add(new object[] { "E01", "Clay" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
dataTable.Rows.Add(new object[] { "E03", "George" });
dataTable.Rows.Add(new object[] { "E04", "Stefan" });
dataTable.Rows.Add(new object[] { "E05", "Mathew" });
//Assign data source.
pdfGrid.DataSource = dataTable;
//Apply built-in table style
pdfGrid.ApplyBuiltinStyle(PdfGridBuiltinStyle.GridTable4Accent1);
//Draw grid to the page of PDF document.
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document.
doc.Save("Output.pdf");
//close the document
doc.Close(true);
```

VB.NET

```

'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.
Dim page As PdfPage = doc.Pages.Add()
'Create a PdfGrid.
Dim pdfGrid As New PdfGrid()
'Create a DataTable.
Dim dataTable As New DataTable()
'Add columns to the DataTable
dataTable.Columns.Add("ID")
dataTable.Columns.Add("Name")
'Add rows to the DataTable.
dataTable.Rows.Add(New Object() {"E01", "Clay"})
dataTable.Rows.Add(New Object() {"E02", "Thomas"})
dataTable.Rows.Add(New Object() {"E03", "George"})
dataTable.Rows.Add(New Object() {"E04", "Stefan"})
dataTable.Rows.Add(New Object() {"E05", "Mathew"})
'Assign data source.
pdfGrid.DataSource = dataTable
'Apply built-in table style
pdfGrid.ApplyBuiltinStyle(PdfGridBuiltinStyle.GridTable4Accent1)
'Draw grid to the page of PDF document.
pdfGrid.Draw(page, New PointF(10, 10))
'Save the document.
doc.Save("Output.pdf")
'close the document
doc.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

The following image shows the PDF document with PdfGridBuiltinStyle.Gridtable4Accent2.

The below code example illustrates how to apply built-in table styles with table options to the [PdfGrid](#).

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page.
PdfPage page = doc.Pages.Add();
//Create a PdfGrid.
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable.
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable.
dataTable.Rows.Add(new object[] { "E01", "Clay" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
dataTable.Rows.Add(new object[] { "E03", "George" });
dataTable.Rows.Add(new object[] { "E04", "Stefan" });
dataTable.Rows.Add(new object[] { "E05", "Mathew" });
//Assign data source.
pdfGrid.DataSource = dataTable;
PdfGridBuiltinStyleSettings tableStyleOption = new
PdfGridBuiltinStyleSettings();
tableStyleOption.ApplyStyleForBandedRows = true;
tableStyleOption.ApplyStyleForHeaderRow = true;
//Apply built-in table style
```

```
pdfGrid.ApplyBuiltinStyle(PdfGridBuiltinStyle.GridTable4Accent4,
tableStyleOption);
//Draw grid to the page of PDF document.
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document.
doc.Save("Output.pdf");
//close the document
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page.

Pagination

Pagination in PdfLightTable

Essential PDF provides support to paginate the PdfLightTable using PdfLightTableLayoutFormat class.

The below sample illustrates how to allow the PdfLightTable to flow across pages.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
// Create a PdfLightTable.
PdfLightTable pdfLightTable = new PdfLightTable();
// Initialize DataTable to assign as Data Source to the light table.
DataTable table = new DataTable();
//Include columns to the Data Table.
table.Columns.Add("Name");
table.Columns.Add("Age");
table.Columns.Add("Sex");
//Include rows to the Data Table.//you can add multiple rows
table.Rows.Add(new string[] { "abc", "21", "Male" });
//Assign data source.
pdfLightTable.DataSource = table;
//Set properties to paginate the table.
PdfLightTableLayoutFormat layoutFormat = new PdfLightTableLayoutFormat();
layoutFormat.Break = PdfLayoutBreakType.FitPage;
layoutFormat.Layout = PdfLayoutType.Paginate;
//Draw PdfLightTable.
pdfLightTable.Draw(page, new PointF(0, 0), layoutFormat);
//Save the document.
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page.
Dim page As PdfPage = document.Pages.Add()
' Create a PdfLightTable.
Dim pdfLightTable As New PdfLightTable()
' Initialize DataTable to assign as Data Source to the light table.
Dim table As New DataTable()
'Include columns to the Data Table.
table.Columns.Add("Name")
table.Columns.Add("Age")
table.Columns.Add("Sex")
'Include rows to the Data Table.//you can add multiple rows
table.Rows.Add(New String() {"abc", "21", "Male"})
'Assign data source.
pdfLightTable.DataSource = table
'Set properties to paginate the table.
Dim layoutFormat As New PdfLightTableLayoutFormat()
layoutFormat.Break = PdfLayoutBreakType.FitPage
layoutFormat.Layout = PdfLayoutType.Paginate
'Draw PdfLightTable.
pdfLightTable.Draw(page, New PointF(0, 0), layoutFormat)
'Save the document.
document.Save("Output.pdf")
'Close the document
document.Close(True)

```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
// Create a PdfLightTable.

Pagination in PdfGrid

Essential PDF supports to paginate the [PdfGrid](#) using [PdfGridLayoutFormat](#) class.

The below sample illustrates how to allow the PdfGrid to flow across pages.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create a PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay" });
dataTable.Rows.Add(new object[] { "E02", "Thomas" });
//Assign data source.
pdfGrid.DataSource = dataTable;
//Set properties to paginate the grid.
PdfGridLayoutFormat layoutFormat = new PdfGridLayoutFormat();
layoutFormat.Break = PdfLayoutBreakType.FitPage;
layoutFormat.Layout = PdfLayoutType.Paginate;
//Draw grid to the page of PDF document.
pdfGrid.Draw(page, new PointF(10, 10), layoutFormat);
//Save the document.
document.Save("Output.pdf");
//close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create a PdfGrid.
Dim pdfGrid As New PdfGrid()
'Create a DataTable.
Dim dataTable As New DataTable()
'Add columns to the DataTable
dataTable.Columns.Add("ID")
dataTable.Columns.Add("Name")
'Add rows to the DataTable
dataTable.Rows.Add(New Object() { "E01", "Clay" })
dataTable.Rows.Add(New Object() { "E02", "Thomas" })
'Assign data source.
pdfGrid.DataSource = dataTable
```

```

'Set properties to paginate the grid
Dim layoutFormat As New PdfGridLayoutFormat()
layoutFormat.Break = PdfLayoutBreakType.FitPage
layoutFormat.Layout = PdfLayoutType.Paginate
'Draw grid to the page of PDF document.
pdfGrid.Draw(page, New PointF(10, 10), layoutFormat)
'Save the document
document.Save("Output.pdf")
'close the document
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create a PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Add values to list
List<object> data = new List<object>();
//You can add multiple rows
Object row1 = new { ID = "E01", Name = "Clay" };

//Save the PDF document to stream.

```

```

MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adjust table width automatically

You can automatically adjust the width of the table by enabling the [AllowHorizontalOverflow](#) property of [PdfGridStyle](#) instance. The following code snippet illustrates this.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add new section to the document
PdfSection section = document.Sections.Add();
//Add a page to the section
PdfPage page = section.Pages.Add();
//Initialize PdfGrid
PdfGrid grid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("Employee_ID");
dataTable.Columns.Add("Employee_Name");
dataTable.Columns.Add("Employee_Role");
dataTable.Columns.Add("Employee_DateOfBirth");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay", "Sales Representative",
"12/8/1948" });
dataTable.Rows.Add(new object[] { "E02", "Thomas", "Sales Representative",
"7/2/1963" });
dataTable.Rows.Add(new object[] { "E03", "Ash", "Sales Manager", "3/4/1955"
});
dataTable.Rows.Add(new object[] { "E04", "Andrew", "Vice President, Sales",
"2/19/1952" });
//Assign data source to grid
grid.DataSource = dataTable;
//Apply the table style
grid.ApplyBuiltinStyle(PdfGridBuiltinStyle.GridTable5DarkAccent5);
//Allow the horizontal overflow for PdfGrid
grid.Style.AllowHorizontalOverflow = true;

```

```
//Draw the PdfGrid on page
grid.Draw(page, PointF.Empty);
//Save the PDF document
document.Save("Output.pdf");
//Close the instance of PdfDocument
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Add new section to the document
Dim section As PdfSection = document.Sections.Add
'Add a page to the section
Dim page As PdfPage = section.Pages.Add
'Initialize PdfGrid
Dim grid As PdfGrid = New PdfGrid
'Create a DataTable
Dim dataTable As DataTable = New DataTable
'Add columns to the DataTable
dataTable.Columns.Add("Employee_ID")
dataTable.Columns.Add("Employee_Name")
dataTable.Columns.Add("Employee_Role")
dataTable.Columns.Add("Employee_DateOfBirth")
'Add rows to the DataTable
dataTable.Rows.Add(New Object() {"E01", "Clay", "Sales Representative",
"12/8/1948"})
dataTable.Rows.Add(New Object() {"E02", "Thomas", "Sales Representative",
"7/2/1963"})
dataTable.Rows.Add(New Object() {"E03", "Ash", "Sales Manager",
"3/4/1955"})
dataTable.Rows.Add(New Object() {"E04", "Andrew", "Vice President, Sales",
"2/19/1952"})
'Assign data source to grid
grid.DataSource = dataTable
'Apply the table style
grid.ApplyBuiltinStyle(PdfGridBuiltinStyle.GridTable5DarkAccent5)
'Allow the horizontal overflow for PdfGrid
grid.Style.AllowHorizontalOverflow = True
'Draw the PdfGrid on page
grid.Draw(page, PointF.Empty)
'Save the PDF document
document.Save("Output.pdf")
'Close the instance of PdfDocument
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add new section to the document
PdfSection section = document.Sections.Add();
//Add a page to the section
PdfPage page = section.Pages.Add();
//Initialize PdfGrid
PdfGrid grid = new PdfGrid();
```

```
//Add values to list
List<object> data = new List<object>();

Employee_Role = "Sales Manager", Employee_DateOfBirth = "3/4/1955" };
Object gridrow4 = new { Employee_ID = "E04", Employee_Name = "Andrew",
Employee_Role = "Vice President, Sales", Employee_DateOfBirth = "2/19/1952"
};
data.Add(gridrow1);
data.Add(gridrow2);
data.Add(gridrow3);
data.Add(gridrow4);
//Add list to IEnumerable
IEnumerable<object> dataTable = data;
//Assign data source to grid
grid.DataSource = dataTable;
//Apply the table style
grid.ApplyBuiltinStyle(PdfGridBuiltinStyle.GridTable5DarkAccent5);
//Allow the horizontal overflow for PdfGrid
grid.Style.AllowHorizontalOverflow = true;
//Draw the PdfGrid on page
grid.Draw(page, PointF.Empty);
//Create memory stream
MemoryStream stream = new MemoryStream();
//Open the document in browser after saving it
document.Save(stream);
//Close the instance of PdfDocument
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add new section to the document
PdfSection section = document.Sections.Add();
//Add a page to the section
PdfPage page = section.Pages.Add();
//Initialize PdfGrid
PdfGrid grid = new PdfGrid();
//Add values to list
List<object> data = new List<object>();

Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding multiple tables

The Essential PDF supports maintaining the position of a PDF grid drawn on PDF page using [PdfGridLayoutResult](#). It provides the rendered bounds of previously added grid, which can be used to place successive elements without overlapping. You can add multiple PDF grids using the bottom position of previously rendered PDF grid. The following code snippet illustrates this.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create a new PdfGrid instance
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
dataTable.Columns.Add("Salary");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay", "$10,000" });
dataTable.Rows.Add(new object[] { "E02", "Thomas", "$10,500" });
dataTable.Rows.Add(new object[] { "E03", "Simon", "$12,000" });
//Assign data source
pdfGrid.DataSource = dataTable;

```

```

//Draw grid on the page of PDF document and store the grid position in PdfGridLayoutResult
PdfGridLayoutResult pdfGridLayoutResult = pdfGrid.Draw(page, new PointF(10, 10));
//Initialize PdfGrid and DataTable
pdfGrid = new PdfGrid();
dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("Name");
dataTable.Columns.Add("Age");
dataTable.Columns.Add("Sex");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "Andrew", "21", "Male" });
dataTable.Rows.Add(new object[] { "Steven", "22", "Female" });
dataTable.Rows.Add(new object[] { "Michael", "24", "Male" });
//Assign data source
pdfGrid.DataSource = dataTable;
//Draw the grid on page using previous result
pdfGrid.Draw(page, new PointF(10, pdfGridLayoutResult.Bounds.Bottom + 20));
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

String formatting

Essential PDF supports applying string formatting for whole table, a column in table, a row in table and a cell in table using the [PdfStringFormat](#) class.

String formatting for whole table in PdfGrid

The following code snippet explains how to apply string formatting for whole table in [PdfGrid](#).

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
//Create a new PdfGrid
PdfGrid grid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
dataTable.Columns.Add("Salary");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay", "$10,000" });
dataTable.Rows.Add(new object[] { "E02", "Thomas", "$10,500" });
dataTable.Rows.Add(new object[] { "E03", "Simon", "$12,000" });
//Assign data source
grid.DataSource = dataTable;
//Create and customize the string formats
PdfStringFormat stringFormat = new PdfStringFormat();
stringFormat.Alignment = PdfTextAlignment.Center;
stringFormat.LineAlignment = PdfVerticalAlignment.Middle;
stringFormat.CharacterSpacing = 2f;
//Apply string formatting for whole table
for (int i = 0; i < grid.Columns.Count; i++)
{
grid.Columns[i].Format = stringFormat;
}
//Draw the PdfGrid on page
grid.Draw(page, new PointF(10, 10));
//Save the document and close the instance of PdfDocument
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Add page to the document
Dim page As PdfPage = document.Pages.Add
```

```

'Create a new PdfGrid
Dim grid As PdfGrid = New PdfGrid
'Create a DataTable
Dim dataTable As DataTable = New DataTable
'Add columns to the DataTable
dataTable.Columns.Add("ID")
dataTable.Columns.Add("Name")
dataTable.Columns.Add("Salary")
'Add rows to the DataTable
dataTable.Rows.Add(New Object() {"E01", "Clay", "$10,000"})
dataTable.Rows.Add(New Object() {"E02", "Thomas", "$10,500"})
dataTable.Rows.Add(New Object() {"E03", "Simon", "$12,000"})
'Assign data source
grid.DataSource = dataTable
'Create and customize the string formats
Dim stringFormat As PdfStringFormat = New PdfStringFormat
stringFormat.Alignment = PdfTextAlignment.Center
stringFormat.LineAlignment = PdfVerticalAlignment.Middle
stringFormat.CharacterSpacing = 2.0F
'Apply string formatting for whole table
Dim i As Integer = 0
For i = 0 To grid.Columns.Count - 1 Step 1
    grid.Columns(i).Format = stringFormat
Next
'Draw the PdfGrid on page
grid.Draw(page, New PointF(10, 10))
'Save the document and close the instance of PdfDocument
document.Save("Output.pdf")
document.Close(True)

```

String formatting for whole table in PdfLightTable

The following code snippet explains how to add string formatting for whole table in [PdfLightTable](#).

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
//Create a PdfLightTable
PdfLightTable lightTable = new PdfLightTable();
//Set the DataSourceType as Direct
lightTable.DataSourceType = PdfLightTableDataSourceType.TableDirect;
//Create columns
lightTable.Columns.Add(new PdfColumn("ID"));
lightTable.Columns.Add(new PdfColumn("Name"));
lightTable.Columns.Add(new PdfColumn("Salary"));
//Add rows
lightTable.Rows.Add(new object[] { "E01", "Clay", "$10,000" });
lightTable.Rows.Add(new object[] { "E02", "Thomas", "$10,500" });
lightTable.Rows.Add(new object[] { "E03", "Simon", "$12,000" });
//Enable ShowHeader
lightTable.Style.ShowHeader = true;
//Create and customize the string formats
PdfStringFormat stringFormat = new PdfStringFormat();
stringFormat.Alignment = PdfTextAlignment.Center;
stringFormat.LineAlignment = PdfVerticalAlignment.Middle;
stringFormat.CharacterSpacing = 2f;
//Apply string formatting for whole table
for (int i = 0; i < lightTable.Columns.Count; i++)
{
    lightTable.Columns[i].StringFormat = stringFormat;
}
//Draw the PdfLightTable on page
lightTable.Draw(page, new PointF(10, 10));
//Save the document and close the instance of PdfDocument
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As PdfDocument = New PdfDocument

String formatting to a column in PdfGrid

The following code snippet explains how to add string formatting to a column in [PdfGrid](#).

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add page to the document
PdfPage page = document.Pages.Add();
//Create a new PdfGrid
PdfGrid grid = new PdfGrid();

```

```

//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
dataTable.Columns.Add("Salary");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay", "$10,000" });
dataTable.Rows.Add(new object[] { "E02", "Thomas", "$10,500" });
dataTable.Rows.Add(new object[] { "E03", "Simon", "$12,000" });
//Assign data source
grid.DataSource = dataTable;
//create and customize the string formats
PdfStringFormat stringFormat = new PdfStringFormat();
stringFormat.Alignment = PdfTextAlignment.Center;
stringFormat.LineAlignment = PdfVerticalAlignment.Middle;
stringFormat.CharacterSpacing = 2f;
//Apply string formatting to a column
grid.Columns[1].Format = stringFormat;
//Draw the PdfGrid on page
grid.Draw(page, new PointF(10, 10));
//Save the document and close the instance of PdfDocument
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

Row and Column spanning

Essential PDF supports both row spanning and column spanning in a PDF table.

Row spanning in PdfGrid

You can span a row in [PdfGrid](#) by using the [RowSpan](#) property of [PdfGridCell](#). The following code snippet illustrates this.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create the page
PdfPage page = document.Pages.Add();
//Create a PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Create and customize the string formats
PdfStringFormat format = new PdfStringFormat();
format.Alignment = PdfTextAlignment.Center;
format.LineAlignment = PdfVerticalAlignment.Middle;
//Add columns to PdfGrid
pdfGrid.Columns.Add(5);
//Add rows to PdfGrid
for (int i = 0; i < pdfGrid.Columns.Count; i++)
{
PdfGridRow row = pdfGrid.Rows.Add();
row.Height = 20;
}
//Add RowSpan
PdfGridCell gridCell = pdfGrid.Rows[1].Cells[3];
gridCell.RowSpan = 3;
gridCell.StringFormat = format;
gridCell.Value = "Row Span";
gridCell.Style.BackgroundBrush = PdfBrushes.Yellow;
//Draw the PdfGrid
pdfGrid.Draw(page, new PointF(10, 10));
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);
```

VB.NET

```

'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Create the page
Dim page As PdfPage = document.Pages.Add
'Create a PdfGrid
Dim pdfGrid As PdfGrid = New PdfGrid
'Create and customize the string formats
Dim format As PdfStringFormat = New PdfStringFormat
format.Alignment = PdfTextAlignment.Center
format.LineAlignment = PdfVerticalAlignment.Middle
'Add columns to PdfGrid
pdfGrid.Columns.Add(5)
'Add rows to PdfGrid
For i = 0 To pdfGrid.Columns.Count - 1 Step 1
Dim row As PdfGridRow = pdfGrid.Rows.Add
row.Height = 20
Next
'Add RowSpan
Dim gridCell As PdfGridCell = pdfGrid.Rows(1).Cells(3)
gridCell.RowSpan = 3
gridCell.StringFormat = format
gridCell.Value = "Row Span"
gridCell.Style.BackgroundBrush = PdfBrushes.Yellow
'Draw the PdfGrid
pdfGrid.Draw(page, New PointF(10, 10))
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)

```

UWP

```

```

Table cell styles

Essential PDF allows you to add different styles like background color using [BackgroundBrush](#), background image using [BackgroundImage](#), border using [Borders](#), cell dimension by setting row [Height](#) and column [Width](#), along with spanning through [RowSpan](#) and [ColumnSpan](#).

The following code snippet explains how to add different cell styles to a cell in [PdfGrid](#).

C#

```
//Create a new PDF document
PdfDocument pdfDocument = new PdfDocument();
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a new PdfGrid instance
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
dataTable.Columns.Add("Salary");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay", "$10,000" });
dataTable.Rows.Add(new object[] { "E02", "Thomas", "$10,500" });
dataTable.Rows.Add(new object[] { "E03", "Simon", "$12,000" });
//Assign data source to PdfGrid
pdfGrid.DataSource = dataTable;
//Assign row height and column width
pdfGrid.Rows[1].Height = 50;
pdfGrid.Columns[1].Width = 100;
//Initialize PdfGridCellStyle and set background color
PdfGridCellStyle gridCellStyle = new PdfGridCellStyle();
gridCellStyle.BackgroundBrush = PdfBrushes.Yellow;
//Assign background color to a PdfGridCell
PdfGridCell gridCell = pdfGrid.Rows[0].Cells[0];
gridCell.Style = gridCellStyle;
//Initialize PdfGridCellStyle and set background image
gridCellStyle = new PdfGridCellStyle();
gridCellStyle.BackgroundImage = PdfImage.FromFile("Autumn Leaves.jpg");
//Assign background image to a PdfGridCell
```

```

gridCell = pdfGrid.Rows[1].Cells[1];
gridCell.Style = gridCellStyle;
gridCell.ImagePosition = PdfGridImagePosition.Fit;
//Initialize PdfGridCellStyle and set the border color
gridCellStyle = new PdfGridCellStyle();
gridCellStyle.Borders.All = PdfPens.Red;
//Assign the border color to a PdfGridCell
gridCell = pdfGrid.Rows[2].Cells[2];
gridCell.Style = gridCellStyle;
//Initialize PdfGridCellStyle and set text color
gridCellStyle = new PdfGridCellStyle();
gridCellStyle.TextBrush = PdfBrushes.DarkBlue;
//Assign text color to a PdfGridCell
gridCell = pdfGrid.Rows[0].Cells[2];
gridCell.Style = gridCellStyle;
//Set the column span
pdfGrid.Rows[2].Cells[0].ColumnSpan = 2;
//Initialize PdfStringFormat and set the properties
PdfStringFormat stringFormat = new PdfStringFormat();
stringFormat.Alignment = PdfTextAlignment.Center;
stringFormat.LineAlignment = PdfVerticalAlignment.Middle;
//Set the PdfStringFormat to PdfGridCell
gridCell = pdfGrid.Rows[2].Cells[0];
gridCell.StringFormat = stringFormat;
//Draw the table in the PDF page
pdfGrid.Draw(pdfPage, new PointF(10, 10));
//Save the document
pdfDocument.Save("Output.pdf");
//Close the instance of PdfDocument
pdfDocument.Close(true);

```

VB.NET

Table row style

Essential PDF supports applying different styles to a row in [PdfGrid](#) by using [PdfGridCellStyle](#) and [PdfGridRow](#) instances. The following code snippet explains this.

C#

```

//Create a new PDF document
PdfDocument pdfDocument = new PdfDocument();
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a new PdfGrid instance
PdfGrid pdfGrid = new PdfGrid();
//Create a DataTable
DataTable dataTable = new DataTable();
//Add columns to the DataTable
dataTable.Columns.Add("ID");
dataTable.Columns.Add("Name");
dataTable.Columns.Add("Salary");
//Add rows to the DataTable
dataTable.Rows.Add(new object[] { "E01", "Clay", "$10,000" });
dataTable.Rows.Add(new object[] { "E02", "Thomas", "$10,500" });

```

```

dataTable.Rows.Add(new object[] { "E03", "Simon", "$12,000" });
//Assign data source to PdfGrid
pdfGrid.DataSource = dataTable;
//Assign row height and column width
pdfGrid.Rows[1].Height = 50;
pdfGrid.Columns[1].Width = 100;
//Initialize PdfStringFormat and set the properties
PdfStringFormat stringFormat = new PdfStringFormat();
stringFormat.Alignment = PdfTextAlignment.Center;
stringFormat.LineAlignment = PdfVerticalAlignment.Middle;
stringFormat.CharacterSpacing = 2f;
//Initialize PdfGridCellStyle. Set background color and string format
PdfGridCellStyle gridCellStyle = new PdfGridCellStyle();
gridCellStyle.BackgroundBrush = PdfBrushes.Yellow;
gridCellStyle.StringFormat = stringFormat;
//Initialize PdfGridRow and apply PdfGridCellStyle to the row
PdfGridRow gridRow = pdfGrid.Rows[0];
gridRow.ApplyStyle(gridCellStyle);
//Initialize PdfGridCellStyle and set background image
gridCellStyle = new PdfGridCellStyle();
gridCellStyle.BackgroundImage = PdfImage.FromFile("Autumn Leaves.jpg");
//Initialize PdfGridRow and apply PdfGridCellStyle to the row
gridRow = pdfGrid.Rows[1];
gridRow.ApplyStyle(gridCellStyle);
//Initialize PdfGridCellStyle. Set the border color and text color
gridCellStyle = new PdfGridCellStyle();
gridCellStyle.Borders.All = PdfPens.Red;
gridCellStyle.TextBrush = PdfBrushes.DarkBlue;
//Initialize PdfGridRow and apply PdfGridCellStyle to the row
gridRow = pdfGrid.Rows[2];
gridRow.ApplyStyle(gridCellStyle);
//Draw the table in the PDF page
pdfGrid.Draw(pdfPage, new PointF(10, 10));
//Save the document
pdfDocument.Save("Output.pdf");
//Close the instance of PdfDocument
pdfDocument.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim pdfDocument As PdfDocument = New PdfDocument

Difference between PdfLightTable and PdfGrid

Both the [PdfGrid](#) and [PdfLightTable](#) models are supported across all the platforms and the below table explains the level of customizations both the models provide.

Features	PdfLightTable	PdfGrid
Formatting		
Row	No direct API, possible through events.	Yes
Column	Yes (StringFormat)	Yes (StringFormat)
Cell	No direct API for single cell formatting, possible through events.	Yes
Others		
Row span	No	Yes
Column span	No direct API, possible through events.	Yes
Nested Grid	Possible through events	Yes
Layout Events	BeginCellLayout, BeginPageLayout, BeginRowLayout, EndCellLayout, EndPageLayout, EndRowLayout	BeginPageLayout, EndPageLayout

Working with flow layout

PDF documents can be created using flow model instead of adding elements through absolute positioning. To create a PDF document in flow model, please add references to the following set of assemblies.

Assembly Name	Description
Syncfusion.Pdf.Base	This assembly contains the core feature for creating, manipulating and saving PDF documents.
Syncfusion.Compression.Base	This assembly is required for compressing the internal contents of a PDF document.

Syncfusion.DocIO.Base	This assembly contains the core features needed for creating, reading, manipulating a Word document.
Syncfusion.DocToPdfConverter.Base	This assembly is required for converting word to PDF

Include the following namespaces in your .cs or .vb file as shown below.

C#

```
using Syncfusion.Pdf;
using Syncfusion.DocIO.DLS;
using Syncfusion.DocToPDFConverter;
```

VB.NET

```
Imports Syncfusion.Pdf
Imports Syncfusion.DocIO.DLS
Imports Syncfusion.DocToPDFConverter
```

ASP.NET CORE

```
using Syncfusion.Pdf;
using Syncfusion.DocIO.DLS;
using Syncfusion.DocIORenderer;
```

XAMARIN

```
using Syncfusion.Pdf;
using Syncfusion.DocIO.DLS;
using Syncfusion.DocIORenderer;
```

Working with Text

You can create a PDF document with multiple paragraph text using flow model with the following code snippet.

C#

```
//Creates a new Word document
WordDocument wordDocument = new WordDocument();
//Adds new section with single paragraph to the document
wordDocument.EnsureMinimal();
wordDocument.LastSection.PageSetup.Margins.All = 15;
//Get Last paragraph of the document
IWParagraph paragraph = wordDocument.LastParagraph;
//Create a custom style
WParagraphStyle paragraphStyle = wordDocument.Styles.FindByName("Normal") as
WParagraphStyle;
paragraphStyle.CharacterFormat.Font = new Font("Times New Roman", 12);
paragraphStyle.ParagraphFormat.HorizontalAlignment =
HorizontalAlignment.Justify;
paragraphStyle.ParagraphFormat.AfterSpacing = 15f;
WSection section = wordDocument.LastSection;
```

```

string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Adds new text to the paragraph
paragraph.AppendText(text);
//Adds first text to the paragraph
paragraph = section.AddParagraph();
paragraph.AppendText(text);
//Second paragraph
paragraph = section.AddParagraph();
paragraph.AppendText(text);
//Creates an instance of the DocToPDFConverter
DocToPDFConverter converter = new DocToPDFConverter();
//Converts Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Save and close the PDF document
pdfDocument.Save("Output.pdf");
pdfDocument.Close(true);
//Close the document
wordDocument.Close();

```

VB.NET

```

'Creates a new Word document
Dim wordDocument As New WordDocument()
'Adds new section with single paragraph to the document
wordDocument.EnsureMinimal()
wordDocument.LastSection.PageSetup.Margins.All = 15
'Get Last paragraph of the document

The following image shows the PDF document with multiple paragraphs created using the flow model.

Working with text and images

You can create PDF document with text and image using the following code snippet.

C#

```
//A new document is created.
WordDocument document = new WordDocument();
//Adding a new section to the document.
WSection section = document.AddSection() as WSection;
//Set Margin of the section
section.PageSetup.Margins.All = 20;
//Create Paragraph styles
```

```

WParagraphStyle style = document.AddParagraphStyle("Normal") as
WParagraphStyle;
style.CharacterFormat.FontName = "Calibri";
style.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Justify;
style.CharacterFormat.FontSize = 11f;
style.ParagraphFormat.AfterSpacing = 8;
style.ParagraphFormat.FirstLineIndent = 36f;
style = document.AddParagraphStyle("Heading 1") as WParagraphStyle;
style.ApplyBaseStyle("Normal");
style.CharacterFormat.FontName = "Calibri Light";
style.CharacterFormat.FontSize = 16f;
style.CharacterFormat.TextColor = Color.FromArgb(46, 116, 181);
//Appends paragraph.
IWParagraph paragraph = section.AddParagraph();
paragraph.ApplyStyle("Heading 1");
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
paragraph.ParagraphFormat.AfterSpacing = 10;
WTextRange textRange = paragraph.AppendText("Adventure Works Cycles") as
WTextRange;
textRange.CharacterFormat.FontSize = 18f;
textRange.CharacterFormat.FontName = "Calibri";
string text =
"Adventure Works Cycles, the fictitious company on which the AdventureWorks
sample databases are based, is a large, multinational manufacturing company.
The company manufactures and sells metal and composite bicycles to North
American, European and Asian commercial markets. While its base operation is
located in Washington with 290 employees, several regional sales teams are
located throughout their market base.";
//Appends paragraph.
paragraph = section.AddParagraph();
textRange = paragraph.AppendText(text) as WTextRange;
paragraph = section.AddParagraph();
textRange = paragraph.AppendText(text) as WTextRange;
//Add image to the paragraph
paragraph = section.AddParagraph();
paragraph.ParagraphFormat.HorizontalAlignment =
Syncfusion.DocIO.DLS.HorizontalAlignment.Center;
paragraph.AppendPicture(Image.FromFile("Mountain-200.jpg"));
//Appends paragraph.
paragraph = section.AddParagraph();
textRange = paragraph.AppendText(text) as WTextRange;
//Creates an instance of the DocToPDFConverter
DocToPDFConverter converter = new DocToPDFConverter();
//Converts Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(document);
//Saves the PDF file
pdfDocument.Save("Sample.pdf");
pdfDocument.Close(true);
document.Close();

The following image shows the PDF document with multiple paragraphs and image created using the flow model.

Working with table

You can create PDF document with simple table using the following code snippet.

C#

```
//Creates a new Word document
WordDocument wordDocument = new WordDocument();
//Adding a new section to the document.
WSection section = wordDocument.AddSection() as WSection;
//Set Margin of the section
section.PageSetup.Margins.All = 20;
// Adding a new Table
WTable table = section.AddTable() as WTable;
table.TableFormat.Paddings.All = 2;
table.TableFormat.Borders.BorderType =
Syncfusion.DocIO.DLS.BorderStyle.Single;
// Inserting rows to the table.
table.ResetCells(4, 5);
//Appends paragraph with header.
IWParagraph paragraph = table[0, 0].AddParagraph();
paragraph.AppendText("SNO");
paragraph = table[0, 1].AddParagraph();
paragraph.AppendText("PRODUCT");
paragraph = table[0, 2].AddParagraph();
paragraph.AppendText("PRICE ($)");
paragraph = table[0, 3].AddParagraph();
paragraph.AppendText("QUANTITY");
paragraph = table[0, 4].AddParagraph();
paragraph.AppendText("TOTAL PRICE ($)");
//Add the first item
```

```

paragraph = table[1, 0].AddParagraph();
paragraph.AppendText("1");
paragraph = table[1, 1].AddParagraph();
paragraph.AppendText("AWC Logo Cap");
paragraph = table[1, 2].AddParagraph();
paragraph.AppendText("8.99");
paragraph = table[1, 3].AddParagraph();
paragraph.AppendText("2");
paragraph = table[1, 4].AddParagraph();
paragraph.ParagraphFormat.HorizontalAlignment = HorizontalAlignment.Right;
paragraph.AppendText("17.98");
//Add the second item
paragraph = table[2, 0].AddParagraph();
paragraph.AppendText("2");
paragraph = table[2, 1].AddParagraph();
paragraph.AppendText("Long-Sleeve Logo Jersey, M");

The following image shows the PDF document with simple table created using the flow model.

SNO	PRODUCT	PRICE (\$)	QUANTITY	TOTAL PRICE (\$)
1	AWC Logo Cap	8.99	2	17.98
2	Long-Sleeve Logo Jersey, M	49.99	3	149.97
Grand Total				167.95

Flow model using PdfLayoutResult

Syncfusion Essential PDF supports creating a PDF document with flow model by maintaining the position of previously drawn element in [PdfLayoutResult](#).

The following code snippet explains how to create a PDF document with image, paragraph text, header text, a line below the header text, and a table using flow model.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
```

```

//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load an image into PdfImage
PdfImage image = PdfImage.FromFile("AdventureCycle.jpg");
//Draw image on the page in the specified location and with required size
graphics.DrawImage(image, new RectangleF(150, 30, 200, 100));
//Initialize a standard font
PdfFont standardFont = new PdfStandardFont(PdfFontFamily.Helvetica, 12);
//Load the paragraph text into PdfTextElement with initialized standard font
PdfTextElement textElement = new PdfTextElement("Adventure Works Cycles, the
fictitious company on which the AdventureWorks sample databases are based,"
+
" is a large, multinational manufacturing company. The company manufactures
and sells metal and composite bicycles to North American, " +
"European and Asian commercial markets. While its base operation is located
in Bothell, Washington with 290 employees, several regional" +
" sales teams are located throughout their market base.", standardFont);
//Draw the paragraph text on page and maintain the position in
PdfLayoutResult
PdfLayoutResult layoutResult = textElement.Draw(page, new RectangleF(0, 150,
page.GetClientSize().Width, page.GetClientSize().Height));
//Assign header text to PdfTextElement
textElement.Text = "Top 5 sales stores";
//Assign standard font to PdfTextElement
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);

Working with Forms

An interactive form, sometimes referred to as an AcroForm is a collection of fields for gathering information. A PDF document can contain any number of fields appearing on any combination of pages, all of that make a single, globally interactive form spanning the entire document.

Creating a new PDF form

Essential PDF allows you to create and manage the form (AcroForm) in PDF document by using [PdfForm](#) class. The [PdfFormFieldCollection](#) class represents the entire field collection of the form.

Adding the text box field

[PdfTextBoxField](#) class is used to create a text box field in PDF forms.

The below code snippet illustrates how to add a textbox field to a new PDF document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document.
PdfPage page = document.Pages.Add();
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As PdfDocument = New PdfDocument()
'Add a new page to the PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create a textbox field and add the properties.
Dim textBoxField As PdfTextBoxField = New PdfTextBoxField(page, "FirstName")
textBoxField.Bounds = New RectangleF(0, 0, 100, 20)
textBoxField.ToolTip = "First Name"
'Add the form field to the document.
document.Form.Fields.Add(textBoxField)
'Save the document.
document.Save("Form.pdf")
'close the document
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document.
PdfPage page = document.Pages.Add();
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Form.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document.
PdfPage page = document.Pages.Add();
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new Syncfusion.Drawing.RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document.
PdfPage page = document.Pages.Add();
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new Syncfusion.Drawing.RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}
```

The below code snippet illustrates how to add the textbox to an existing PDF document.

C#

```
//Load the existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Create the form if the form does not exist in the loaded document
if(loadedDocument.Form==null)
loadedDocument.CreateForm();
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(loadedPage, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the existing PDF document.
loadedDocument.Form.Fields.Add(textBoxField);
//Save the document.
loadedDocument.Save("Form.pdf");
//close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Create the form if the form does not exist in the loaded document
If loadedDocument.Form Is Nothing Then
loadedDocument.CreateForm()
End If
'Load the page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Create a text box field and add the properties.
Dim textBoxField As New PdfTextBoxField(loadedPage, "FirstName")
textBoxField.Bounds = New RectangleF(0, 0, 100, 20)
textBoxField.ToolTip = "First Name"
'Add the form field to the existing PDF document.
loadedDocument.Form.Fields.Add(textBoxField)
'Save the document.
loadedDocument.Save("Form.pdf")
'close the document
loadedDocument.Close(True)
```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Create the form if the form does not exist in the loaded document
if (loadedDocument.Form == null)
loadedDocument.CreateForm();
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(loadedPage, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the existing PDF document.
loadedDocument.Form.Fields.Add(textBoxField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create the form if the form does not exist in the loaded document
if (loadedDocument.Form == null)
loadedDocument.CreateForm();
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(loadedPage, "FirstName");
textBoxField.Bounds = new Syncfusion.Drawing.RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the existing PDF document.
loadedDocument.Form.Fields.Add(textBoxField);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.

```

```
string contentType = "application/pdf";
//Define the file name.
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Create the form if the form does not exist in the loaded document
if (loadedDocument.Form == null)
loadedDocument.CreateForm();
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a textbox field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(loadedPage, "FirstName");
textBoxField.Bounds = new Syncfusion.Drawing.RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the existing PDF document.
loadedDocument.Form.Fields.Add(textBoxField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}
```

Adding the combo box field

[PdfComboBoxField](#) class is used to create a combo box field in PDF forms. You can add a list of items to the combo box by using the [PdfListFieldItem](#) class.

Please refer the below code snippet for adding the combo box in new PDF document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
```

```

//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a combo box for the first page.
PdfComboBoxField comboBoxField = new PdfComboBoxField(page, "JobTitle");
//Set the combo box properties.
comboBoxField.Bounds = new RectangleF(0, 40, 100, 20);
//Set tooltip.
comboBoxField.ToolTip = "Job Title";
//Add list items.
comboBoxField.Items.Add(new PdfListFieldItem("Development", "accounts"));
comboBoxField.Items.Add(new PdfListFieldItem("Support", "advertise"));
comboBoxField.Items.Add(new PdfListFieldItem("Documentation", "content"));
//Add combo box to the form.
document.Form.Fields.Add(comboBoxField);
//Save the document.
document.Save("Form.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create a combo box for the first page.
Dim comboBoxField As New PdfComboBoxField(page, "JobTitle")
'Set the combo box properties.
comboBoxField.Bounds = New RectangleF(0, 40, 100, 20)
'Set tooltip
comboBoxField.ToolTip = "Job Title"
'Add list items.
comboBoxField.Items.Add(New PdfListFieldItem("Development", "accounts"))

Adding the radio button field

To create the radio button in the PDF forms, you can use [PdfRadioButtonListField](#) class and you can create the radio button list items by using the [PdfRadioButtonListItem](#) class.

Please refer the below code snippet for adding the radio button in new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();

```

```

//Create a Radio button.
PdfRadioButtonListField employeesRadioList = new
PdfRadioButtonListField(page, "employeesRadioList");
//Add the radio button into form
document.Form.Fields.Add(employeesRadioList);
//Create radio button items.
PdfRadioButtonListItem radioButtonItem1 = new PdfRadioButtonListItem("1-9");
radioButtonItem1.Bounds = new RectangleF(100, 140, 20, 20);
PdfRadioButtonListItem radioButtonItem2 = new PdfRadioButtonListItem("10-
49");
radioButtonItem2.Bounds = new RectangleF(100, 170, 20, 20);
//Add the items to radio button group.
employeesRadioList.Items.Add(radioButtonItem1);
employeesRadioList.Items.Add(radioButtonItem2);
//Save the document.
document.Save("Form.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create a Radio button.
Dim employeesRadioList As New PdfRadioButtonListField(page,
"employeesRadioList")
'Add the radio button into form
document.Form.Fields.Add(employeesRadioList)
'Create radio button items.
Dim radioItem1 As New PdfRadioButtonListItem("1-9")
radioItem1.Bounds = New RectangleF(100, 140, 20, 20)
Dim radioItem2 As New PdfRadioButtonListItem("10-49")
radioItem2.Bounds = New RectangleF(100, 170, 20, 20)
'Add the items to radio button group.
employeesRadioList.Items.Add(radioItem1)
employeesRadioList.Items.Add(radioItem2)
'Save the PDF document.
document.Save("Form.pdf")
'close the document
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Radio button.
PdfRadioButtonListField employeesRadioList = new
PdfRadioButtonListField(page, "employeesRadioList");
//Add the radio button into form
document.Form.Fields.Add(employeesRadioList);
//Create radio button items.
PdfRadioButtonListItem radioButtonItem1 = new PdfRadioButtonListItem("1-9");

```

```

radioButtonItem1.Bounds = new RectangleF(100, 140, 20, 20);
PdfRadioButtonListItem radioButtonItem2 = new PdfRadioButtonListItem("10-49");
radioButtonItem2.Bounds = new RectangleF(100, 170, 20, 20);
//Add the items to radio button group.
employeesRadioList.Items.Add(radioButtonItem1);
employeesRadioList.Items.Add(radioButtonItem2);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.

Retrieving option values from acroform radio button

The Essential PDF supports retrieving option values from acroform radio button. The [OptionValue](#) property is used to get option values of [PdfLoadedRadioButtonItem](#) instance.

The following code example illustrates how to get option values from acroform radio button.

C#

```
//Load an existing document
PdfLoadedDocument doc = new PdfLoadedDocument("SourceForm.pdf");
//Gets the loaded form
PdfLoadedForm form = doc.Form;
//Set default appearance to false
form.SetDefaultAppearance(false);
//Gets the 'Gender' radio button field
PdfLoadedRadioButtonListField radioButtonField = form.Fields["Gender"] as
PdfLoadedRadioButtonListField;
//Select the item that contains option value as "Male"
foreach (PdfLoadedRadioButtonItem item in radioButtonField.Items)
{
//Gets an option value of the item
if (item.OptionValue == "Male")
{
item.Selected = true;
}
}
//Save and close the PDF document
doc.Save("Form.pdf");
doc.Close(true);
```

VB.NET

```
'Load an existing document
Dim doc As New PdfLoadedDocument("SourceForm.pdf")
'Gets the loaded form
Dim form As PdfLoadedForm = doc.Form
'Set default appearance to false
form.SetDefaultAppearance(False)
'Gets the 'Gender' radio button field
Dim radioButtonField As PdfLoadedRadioButtonListField =
TryCast(form.Fields("Gender"), PdfLoadedRadioButtonListField)
'Select the item that contains option value as "Male"
For Each item As PdfLoadedRadioButtonItem In radioButtonField.Items
'Gets an option value of the item
If item.OptionValue = "Male" Then
item.Selected = True
End If
```

Next

```
'Save and close the PDF document
doc.Save("Form.pdf")
doc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through the Open method of
PdfLoadedDocument class
await doc.OpenAsync(file);
//Gets the loaded form
PdfLoadedForm form = doc.Form;
//Set default appearance to false
form.SetDefaultAppearance(false);
//Gets the 'Gender' radio button field
PdfLoadedRadioButtonListField radioButtonField = form.Fields["Gender"] as
PdfLoadedRadioButtonListField;
//Select the item that contains option value as "Male"
foreach (PdfLoadedRadioButtonItem item in radioButtonField.Items)
{
    //Gets an option value of the item
    if (item.OptionValue == "Male")
    {
        item.Selected = true;
    }
}
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Form.pdf");
```

ASP.NET CORE

```
//Load the PDF document

Adding the list box field

You can create the list box field in PDF forms using [PdfListBoxField](#) class.

Please refer the below code snippet for adding the list box field in new PDF document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create list box.
PdfListBoxField listBoxField = new PdfListBoxField(page, "list1");
//Set the properties.
listBoxField.Bounds = new RectangleF(100, 60, 100, 50);
//Add the items to the list box.
listBoxField.Items.Add(new PdfListFieldItem("English", "English"));
listBoxField.Items.Add(new PdfListFieldItem("French", "French"));
listBoxField.Items.Add(new PdfListFieldItem("German", "German"));
//Select the item.
listBoxField.SelectedIndex = 2;
//Set the multi select option.
listBoxField.MultiSelect = true;
//Add the list box into PDF document
document.Form.Fields.Add(listBoxField);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create list box.
Dim listBoxField As New PdfListBoxField(page, "list1")
'Set the properties.
listBoxField.Bounds = New RectangleF(100, 60, 100, 50)
'Add the items to the list box.
listBoxField.Items.Add(New PdfListFieldItem("English", "English"))
listBoxField.Items.Add(New PdfListFieldItem("French", "French"))
listBoxField.Items.Add(New PdfListFieldItem("German", "German"))
'Select the item.
listBoxField.SelectedIndex = 2
```

```
'Set the multi select option.
listBoxField.MultiSelect = True
'Add the list box into PDF document
document.Form.Fields.Add(listBoxField)
'Save the document.
document.Save("Form.pdf")
'close the document
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create list box.
PdfListBoxField listBoxField = new PdfListBoxField(page, "list1");
//Set the properties.
listBoxField.Bounds = new RectangleF(100, 60, 100, 50);
//Add the items to the list box.
listBoxField.Items.Add(new PdfListFieldItem("English", "English"));
listBoxField.Items.Add(new PdfListFieldItem("French", "French"));
listBoxField.Items.Add(new PdfListFieldItem("German", "German"));
//Select the item.
listBoxField.SelectedIndex = 2;
//Set the multi select option.
listBoxField.MultiSelect = true;
//Add the list box into PDF document
document.Form.Fields.Add(listBoxField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Form.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create list box.
PdfListBoxField listBoxField = new PdfListBoxField(page, "list1");
//Set the properties.
listBoxField.Bounds = new Syncfusion.Drawing.RectangleF(100, 60, 100, 50);
//Add the items to the list box.
listBoxField.Items.Add(new PdfListFieldItem("English", "English"));

Adding the check Box field

You can create the check box field in PDF forms using [PdfCheckBoxField](#) class.

Please refer the below code snippet for adding the check box field in new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create Check Box field.
PdfCheckBoxField checkBoxField = new PdfCheckBoxField(page, "CheckBox");
//Set check box properties.
checkBoxField.ToolTip = "Check Box";
checkBoxField.Bounds = new RectangleF(0, 20, 10, 10);
//Add the form field to the document.
document.Form.Fields.Add(checkBoxField);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create Check Box field.
Dim checkBoxField As New PdfCheckBoxField(page, "CheckBox")
'Set check box properties.

```

```

checkBoxField.ToolTip = "Check Box"
checkBoxField.Bounds = new RectangleF(0, 20, 10, 10)
'Add the form field to the document.'
document.Form.Fields.Add(checkBoxField)
'Save the document.'
document.Save("Form.pdf")
'close the document'
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create Check Box field.
PdfCheckBoxField checkBoxField = new PdfCheckBoxField(page, "CheckBox");
//Set check box properties.
checkBoxField.ToolTip = "Check Box";
checkBoxField.Bounds = new RectangleF(0, 20, 10, 10);
//Add the form field to the document.
document.Form.Fields.Add(checkBoxField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.

Adding the signature field

You can add the signature field in PDF forms using [PdfSignatureField](#) class.

Please refer the below code snippet for adding the signature field in new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create PDF Signature field.
PdfSignatureField signatureField = new PdfSignatureField(page, "Signature");
//Set properties to the signature field.
signatureField.Bounds = new RectangleF(0, 400, 90, 20);
signatureField.ToolTip = "Signature";
//Add the form field to the document.
document.Form.Fields.Add(signatureField);
//Save the document.
document.Save("Form.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.

```

```

Dim page As PdfPage = document.Pages.Add()
'Create PDF Signature field.
Dim signatureField As New PdfSignatureField(page, "Signature")
'Set properties to the signature field.
signatureField.Bounds = New RectangleF(0, 400, 90, 20)
signatureField.ToolTip = "Signature"
'Add the form field to the document.
document.Form.Fields.Add(signatureField)
'Save the document.
document.Save("Form.pdf")
'Close the document
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create PDF Signature field.
PdfSignatureField signatureField = new PdfSignatureField(page, "Signature");
//Set properties to the signature field.
signatureField.Bounds = new RectangleF(0, 400, 90, 20);
signatureField.ToolTip = "Signature";
//Add the form field to the document.

Adding the button field

To create button fields in PDF forms, you can use [PdfButtonField](#) class.

The below code illustrates how to add the button field in new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Button.
PdfButtonField buttonField = new PdfButtonField(page, "Click");
//Set properties to the Button field.
buttonField.Bounds = new RectangleF(0, 150, 90, 20);
buttonField.Text = "Click";
//Add the form field to the document.
document.Form.Fields.Add(buttonField);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create a Button.
Dim buttonField As New PdfButtonField(page, "Click")
'Set properties to the Button field.
buttonField.Bounds = New RectangleF(0, 150, 90, 20)
buttonField.Text = "Click"
'Add the form field to the document.
document.Form.Fields.Add(buttonField)
'Save the document.
document.Save("Form.pdf")
'close the document
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Button.
PdfButtonField buttonField = new PdfButtonField(page, "Click");
//Set properties to the Button field.
buttonField.Bounds = new RectangleF(0, 150, 90, 20);
buttonField.Text = "Click";
//Add the form field to the document.
document.Form.Fields.Add(buttonField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Button.
PdfButtonField buttonField = new PdfButtonField(page, "Click");
//Set properties to the Button field.
buttonField.Bounds = new Syncfusion.Drawing.RectangleF(0, 150, 90, 20);
buttonField.Text = "Click";
//Add the form field to the document.
document.Form.Fields.Add(buttonField);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the PDF document to stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.

```

```

stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Button.
PdfButtonField buttonField = new PdfButtonField(page, "Click");
//Set properties to the Button field.
buttonField.Bounds = new Syncfusion.Drawing.RectangleF(0, 150, 90, 20);
buttonField.Text = "Click";
//Add the form field to the document.
document.Form.Fields.Add(buttonField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android

TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}

```

Please refer the below code snippet for adding the button field in existing PDF document.

C#

```

//Load the existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Create the form if the form does not exist in the loaded document
if (loadedDocument.Form == null)
loadedDocument.CreateForm();
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;

```

```
//Create a Button and set properties to the Button field.
PdfButtonField buttonField = new PdfButtonField(loadedPage, "Click");
buttonField.Bounds = new RectangleF(0, 150, 90, 20);
buttonField.Text = "Click";
//Add the form field to the existing document.
loadedDocument.Form.Fields.Add(buttonField);
//Save the document.
loadedDocument.Save("Form.pdf");
//close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Create the form if the form does not exist in the loaded document
If loadedDocument.Form Is Nothing Then
loadedDocument.CreateForm()
End If
'Load the page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Create a Button and set properties to the Button field.
Dim buttonField As New PdfButtonField(loadedPage, "Click")
buttonField.Bounds = New RectangleF(0, 150, 90, 20)
buttonField.Text = "Click"
'Add the form field to the existing document.
loadedDocument.Form.Fields.Add(buttonField)
'Save the document.
loadedDocument.Save("Form.pdf")
'close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);

loadedDocument.Form.Fields.Add(buttonField);
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}

```

Set appearance to the PDF form fields

After filling the form fields in the PDF document, it may appear empty due to the absence of the appearance dictionary. By setting false to the [SetDefaultAppearance] (<https://help.syncfusion.com/cr/aspnetmvc/Syncfusion.Pdf.Base~Syncfusion.Pdf.Interactive.PdfForm~SetDefaultAppearance.html>) method in PdfForm class, you can create the appearance dictionary. By this, the text will be visible in all PDF Viewers.

The following code snippet explains how to set appearance to the PDF form fields.

C#

```

//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the default appearance
loadedForm.SetDefaultAppearance(false);
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
//Save the document
loadedDocument.Save("Form.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument(fileName)

```

```

'Get the loaded form
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Set the default appearance
loadedForm.SetDefaultAppearance(False)
'Get the loaded form field
Dim loadedTextBoxField As PdfLoadedTextBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedTextBoxField)
loadedTextBoxField.Text = "Text"
'Save the document
loadedDocument.Save("Form.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the default appearance
loadedForm.SetDefaultAppearance(false);
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text"
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the PDF/UWP section for respective code samples
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open, FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the default appearance
loadedForm.SetDefaultAppearance(false);
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as PdfLoadedTextBoxField;
loadedTextBoxField.Text = "text";

```

```
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the content type for PDF file
string contentType = "application/pdf";
//Define the file name

//Close the document
loadedDocument.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}
```

Modifying the existing form field in PDF document

You can modify an existing form field by getting the field from the [PdfFormFieldCollection](#). You can retrieve a field from the field collection by index or by field name.

The following code snippet explains how to modify an existing form field in a PDF document.

C#

```

//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field and modify the properties.
PdfLoadedTextBoxField loadedTextBoxField= loadedForm.Fields[0] as
PdfLoadedTextBoxField;
RectangleF newBounds = new RectangleF(100, 100, 150, 50);
loadedTextBoxField.Bounds = newBounds;
loadedTextBoxField.SpellCheck = true;
loadedTextBoxField.Text = "New text of the field.";
loadedTextBoxField.Password = false;
//Save the document.
loadedDocument.Save("sample.pdf");
//close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Get the loaded form field and Modify the properties.
Dim loadedTextBoxField As PdfLoadedTextBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedTextBoxField)
Dim newBounds As New RectangleF(100, 100, 150, 50)
loadedTextBoxField.Bounds = newBounds
loadedTextBoxField.SpellCheck = True
loadedTextBoxField.Text = "New text of the field."
loadedTextBoxField.Password = False
'Save the document.
loadedDocument.Save("sample.pdf")
'close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field and modify the properties.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
RectangleF newBounds = new RectangleF(100, 100, 150, 50);

```

```
loadedTextBoxField.Bounds = newBounds;
loadedTextBoxField.SpellCheck = true;
loadedTextBoxField.Text = "New text of the field.";
loadedTextBoxField.Password = false;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "sample.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field and modify the properties.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
RectangleF newBounds = new RectangleF(100, 100, 150, 50);
loadedTextBoxField.Bounds = newBounds;
loadedTextBoxField.SpellCheck = true;
loadedTextBoxField.Text = "New text of the field.";
loadedTextBoxField.Password = false;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```

Retrieving/Modifying the fore and back color of an existing form fields

You can retrieve/modify the fore and background color of existing form fields in a PDF document by using **ForeColor** and **BackColor** properties of the respective form fields. The following code snippet illustrate this.

C#

```

//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
//Get fore color of the field
PdfColor foreColor = loadedTextBoxField.ForeColor;
//Set the fore color
loadedTextBoxField.ForeColor = new PdfColor(Color.Red);
//Get background color of the field
PdfColor backColor = loadedTextBoxField.BackColor;
//Set the background color
loadedTextBoxField.BackColor = new PdfColor(Color.Green);
//Save the document
loadedDocument.Save("Form.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Get the loaded form field
Dim loadedTextBoxField As PdfLoadedTextBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedTextBoxField)
'Get fore color of the field
Dim foreColor As PdfColor = loadedTextBoxField.ForeColor
'Set the fore color
loadedTextBoxField.ForeColor = New PdfColor(Color.Red)
'Get background color of the field
Dim backColor As PdfColor = loadedTextBoxField.BackColor
'Set the background color
loadedTextBoxField.BackColor = New PdfColor(Color.Green)
'Save the document
loadedDocument.Save("Form.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
//Get fore color of the field
PdfColor foreColor = loadedTextBoxField.ForeColor;
//Set the fore color
loadedTextBoxField.ForeColor = new PdfColor(255,0,0);
//Get background color of the field
PdfColor backColor = loadedTextBoxField.BackColor;
//Set the background color
loadedTextBoxField.BackColor = new PdfColor(0,255,0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Form.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
//Get fore color of the field
PdfColor foreColor = loadedTextBoxField.ForeColor;
//Set the fore color
loadedTextBoxField.ForeColor = new PdfColor(Color.Red);
//Get background color of the field
PdfColor backColor = loadedTextBoxField.BackColor;
//Set the background color
loadedTextBoxField.BackColor = new PdfColor(Color.Green);
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the content type for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded form field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
//Get fore color of the field
PdfColor foreColor = loadedTextBoxField.ForeColor;
//Set the fore color
loadedTextBoxField.ForeColor = new PdfColor(Syncfusion.Drawing.Color.Red);
//Get background color of the field
PdfColor backColor = loadedTextBoxField.BackColor;
//Set the background color
loadedTextBoxField.BackColor = new PdfColor(Syncfusion.Drawing.Color.Green);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
```

```
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}
```

Filling form fields in an existing PDF Document

Essential PDF allows you to fill the form fields using [PdfLoadedField](#) class.

Filling the text box field

You can fill a text box field using [Text](#) property of [PdfLoadedTextBoxField](#) class. The below code snippet illustrates this.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Save the modified document.
loadedDocument.Save("sample.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Get the loaded text box field and fill it.
Dim loadedTextBoxField As PdfLoadedTextBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedTextBoxField)
loadedTextBoxField.Text = "First Name"
'Save the modified document.
loadedDocument.Save("sample.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
```

```

var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "sample.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");

```

```

PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Filling the combo box field

You can fill a combo box field using [SelectedValue](#) or [SelectedIndex](#) properties of [PdfLoadedComboBoxField](#) class. Please refer the below code snippet to fill the combo box field in an existing PDF document.

C#

```

//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded combo box field and modify the properties
PdfLoadedComboBoxField loadedComboboxField = loadedForm.Fields[1] as
PdfLoadedComboBoxField;
loadedComboboxField.SelectedIndex = 1;
//Save the modified document.
loadedDocument.Save("sample.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Get the loaded combo box field and modify the properties

```

```

Dim loadedComboboxField As PdfLoadedComboBoxField =
TryCast(loadedForm.Fields(1), PdfLoadedComboBoxField)
loadedComboboxField.SelectedIndex = 1
'Save the modified document.
loadedDocument.Save("sample.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded combo box field and modify the properties
PdfLoadedComboBoxField loadedComboboxField = loadedForm.Fields[1] as
PdfLoadedComboBoxField;
loadedComboboxField.SelectedIndex = 1;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "sample.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded combo box field and modify the properties
PdfLoadedComboBoxField loadedComboboxField = loadedForm.Fields[1] as
PdfLoadedComboBoxField;
loadedComboboxField.SelectedIndex = 1;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.

```

```
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded combo box field and modify the properties
PdfLoadedComboBoxField loadedComboboxField = loadedForm.Fields[1] as
PdfLoadedComboBoxField;
loadedComboboxField.SelectedIndex = 1;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Filling the radio button field

You can fill a radio button field using [SelectedValue](#) or [SelectedIndex](#) properties of [PdfLoadedRadioButtonListField](#) class. Please refer the below code snippet to fill the radio button field in an existing PDF document.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded radio button field.
PdfLoadedRadioButtonListField loadedRadioButtonField = loadedForm.Fields[3]
as PdfLoadedRadioButtonListField;
loadedRadioButtonField.SelectedIndex = 1;
//Save the modified document.
```

```
loadedDocument.Save("sample.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Get the loaded radio button field.
Dim loadedRadioButtonField As PdfLoadedRadioButtonListField =
TryCast(loadedForm.Fields(3), PdfLoadedRadioButtonListField)
loadedRadioButtonField.SelectedIndex = 1
'Save the modified document.
loadedDocument.Save("sample.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded radio button field.
PdfLoadedRadioButtonListField loadedRadioButtonField = loadedForm.Fields[3]
as PdfLoadedRadioButtonListField;
loadedRadioButtonField.SelectedIndex = 1;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "sample.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded radio button field.
```

```

PdfLoadedRadioButtonListField loadedRadioButtonField = loadedForm.Fields[3]
as PdfLoadedRadioButtonListField;
loadedRadioButtonField.SelectedIndex = 1;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded radio button field.
PdfLoadedRadioButtonListField loadedRadioButtonField = loadedForm.Fields[0]
as PdfLoadedRadioButtonListField;
loadedRadioButtonField.SelectedIndex = 1;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Filling the list box field

The below code snippet illustrates how to fill the list box field in an existing PDF document, using [SelectedIndex](#) property of [PdfLoadedListBoxField](#) class.

C#

```

//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Fill list box.
PdfLoadedListBoxField loadedListBox = loadedForm.Fields[2] as
PdfLoadedListBoxField;
// Fill list box and Modify the list box select index
loadedListBox.SelectedIndex = new int[2] { 1, 2 };
//Save the modified document.
loadedDocument.Save("sample.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Fill list box and Modify the list box select index
Dim loadedListBox As PdfLoadedListBoxField = TryCast(loadedForm.Fields(0),
PdfLoadedListBoxField)
loadedListBox.SelectedIndex = New Integer(1) {1, 2}
'Save the modified document.
loadedDocument.Save("sample.pdf")
'close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Fill list box.
PdfLoadedListBoxField loadedListBox = loadedForm.Fields[2] as
PdfLoadedListBoxField;
// Fill list box and Modify the list box select index
loadedListBox.SelectedIndex = new int[2] { 1, 2 };
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);

```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "sample.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Fill list box.
PdfLoadedListBoxField loadedListBox = loadedForm.Fields[2] as
PdfLoadedListBoxField;
// Fill list box and Modify the list box select index
loadedListBox.SelectedIndex = new int[2] { 1, 2 };
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Fill list box.

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Filling the check Box field

You can fill a check box field by enabling [Checked](#) property of [PdfLoadedCheckBoxField](#) class. Please refer the below code snippet to fill the check box field.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//load the check box from field collection
PdfLoadedCheckBoxField loadedCheckBoxField = loadedForm.Fields[0] as
PdfLoadedCheckBoxField;
// fill the checkbox .
loadedCheckBoxField.Items[0].Checked = true;
//Check the checkbox if it is not grouped.
loadedCheckBoxField.Checked = true;
//Save the modified document.
loadedDocument.Save("sample.pdf");
//close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'load the check box from field collection
Dim loadedCheckBoxField As PdfLoadedCheckBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedCheckBoxField)
'Fill the checkbox.
loadedCheckBoxField.Items(0).Checked = True
'Check the checkbox if it is not grouped.
loadedCheckBoxField.Checked = True
'Save the modified document.
loadedDocument.Save("sample.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
```

```

//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//load the check box from field collection
PdfLoadedCheckBoxField loadedCheckBoxField = loadedForm.Fields[0] as PdfLoadedCheckBoxField;
// fill the checkbox .
loadedCheckBoxField.Items[0].Checked = true;
//Check the checkbox if it is not grouped.
loadedCheckBoxField.Checked = true;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(stream, "sample.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open, FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//load the check box from field collection
PdfLoadedCheckBoxField loadedCheckBoxField = loadedForm.Fields[0] as PdfLoadedCheckBoxField;
// fill the checkbox .
loadedCheckBoxField.Items[0].Checked = true;
//Check the checkbox if it is not grouped.
loadedCheckBoxField.Checked = true;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//load the check box from field collection
PdfLoadedCheckBoxField loadedCheckBoxField = loadedForm.Fields[0] as
PdfLoadedCheckBoxField;
// fill the checkbox .
loadedCheckBoxField.Items[0].Checked = true;
//Check the checkbox if it is not grouped.
loadedCheckBoxField.Checked = true;
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Filling the signature field

The below code snippet illustrates how to fill the signature field with certificate using [Certificate](#) property.

C#

```

//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Create PDF Certificate.
PdfCertificate certificate = new PdfCertificate("Pdf.pfx", "password");
//Load the signature field from field collection and fill this with
certificate
PdfLoadedSignatureField loadedSignatureField = loadedForm.Fields[0] as
PdfLoadedSignatureField;
loadedSignatureField.Signature = new PdfSignature(loadedPage);
loadedSignatureField.Signature.Certificate = certificate;
loadedSignatureField.Signature.Reason = "Reason";
//Save the modified document.

```

```
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Create PDF Certificate.
Dim certificate As New PdfCertificate("Pdf.pfx", "password")
'Load the signature field from field collection and fill with certificate
Dim loadedSignatureField As PdfLoadedSignatureField =
TryCast(loadedForm.Fields(0), PdfLoadedSignatureField)
loadedSignatureField.Signature = New PdfSignature(loadedPage)
loadedSignatureField.Signature.Certificate = certificate
loadedSignatureField.Signature.Reason = "Reason"
'Save the modified document.
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker

"application/pdf", stream);
}

```

Enumerate the form fields

All the form fields are maintained in [PdfLoadedFormFieldCollection](#) class. You can enumerate the fields from this form field collection and fill them.

The following code example illustrates this.

C#

```

//Load the PDF document.
PdfLoadedDocument document = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm form = document.Form;
PdfLoadedFormFieldCollection fields = form.Fields;
//Enumerates the form fields.
for (int i = 0; i < fields.Count; i++)
{
if (fields[i] is PdfLoadedTextBoxField)
{
PdfLoadedTextBoxField loadedTextBoxField = fields[i] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
}
}
//Save and close the modified document.
document.Save(OutputFileName);
document.Close(true);

```

VB.NET

```

'Load the PDF document.
Dim document As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim form As PdfLoadedForm = document.Form
Dim fields As PdfLoadedFormFieldCollection = form.Fields
'Enumerate the form fields.
For i As Integer = 0 To fields.Count - 1
If TypeOf fields(i) Is PdfLoadedTextBoxField Then
Dim loadedTextBoxField As PdfLoadedTextBoxField = TryCast(fields(i),
PdfLoadedTextBoxField)
loadedTextBoxField.Text = "Text"
End If
Next i
'Save and close the modified document.
document.Save(OutputFileName)
document.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await document.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm form = document.Form;
PdfLoadedFormFieldCollection fields = form.Fields;
//Enumerates the form fields.
for (int i = 0; i < fields.Count; i++)
{
if (fields[i] is PdfLoadedTextBoxField)
{
PdfLoadedTextBoxField loadedTextBoxField = fields[i] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
}
}
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "output.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm form = document.Form;
PdfLoadedFormFieldCollection fields = form.Fields;
//Enumerates the form fields.
for (int i = 0; i < fields.Count; i++)
{
    if (fields[i] is PdfLoadedTextBoxField)
    {
        PdfLoadedTextBoxField loadedTextBoxField = fields[i] as
        PdfLoadedTextBoxField;
        loadedTextBoxField.Text = "Text";
    }
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}
```

TryGetField

To get a form field from an existing document using the field name, you can use the [TryGetField](#) method in the [PdfFormFieldCollection](#) class. It specifies whether the particular field is available in the form or not by returning a boolean value.

The below code snippet explains how to get the field from collection using [TryGetField](#) method.

C#

```
// Load the document.
PdfLoadedDocument doc = new PdfLoadedDocument(fileName);
// Load the form from the loaded document.
PdfLoadedForm form = doc.Form;
// Load the form field collections from the form.
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
PdfLoadedField loadedField = null;
// Get the field using TryGetField Method.
if (fieldCollection.TryGetField("f1-1", out loadedField))
{
(loadedField as PdfLoadedTextBoxField).Text = "1";
}
//Save and close the modified document.
doc.Save("output.pdf");
doc.Close(true);
```

VB.NET

```
' Load the document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
' Load the form from the loaded document.
Dim form As PdfLoadedForm = loadedDocument.Form
' Load the form field collections from the form.
Dim fieldCollection As PdfLoadedFormFieldCollection = TryCast(form.Fields,
PdfLoadedFormFieldCollection)
Dim loadedField As PdfLoadedField = Nothing
' Get the field using TryGetField Method.
If fieldCollection.TryGetField("f1-1", loadedField) Then
TryCast(loadedField, PdfLoadedTextBoxField).Text = "1"
```

End If

```
'Save and close the modified document.
loadedDocument.Save("output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument doc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await doc.OpenAsync(file);
// Load the form from the loaded document.
PdfLoadedForm form = doc.Form;
// Load the form field collections from the form.
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
PdfLoadedField loadedField = null;
// Get the field using TryGetField Method.
if (fieldCollection.TryGetField("f1-1", out loadedField))
{
    (loadedField as PdfLoadedTextBoxField).Text = "1";
}
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document.
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
// Load the form from the loaded document.
PdfLoadedForm form = doc.Form;
// Load the form field collections from the form.
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
PdfLoadedField loadedField = null;
// Get the field using TryGetField Method.
if (fieldCollection.TryGetField("f1-1", out loadedField))
{
    (loadedField as PdfLoadedTextBoxField).Text = "1";
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
```

```

doc.Save(stream);
stream.Position = 0;
//Close the document.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument doc = new PdfLoadedDocument(docStream);
// Load the form from the loaded document.
PdfLoadedForm form = doc.Form;
// Load the form field collections from the form.
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
PdfLoadedField loadedField = null;
// Get the field using TryGetField Method.
if (fieldCollection.TryGetField("f1-1", out loadedField))
{
    (loadedField as PdfLoadedTextBoxField).Text = "1";
}
//Save the PDF document to stream.
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document.
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}

```

TryGetValue

To get the field value from the given field name, you can use [TryGetValue](#) method in [PdfFormFieldCollection](#) class. It specifies whether the particular field is available in the form or not by returning a boolean value.

Please refer the below code snippet to get the field value from collection using `TryGetValue` method.

C#

```
// Load the document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(filename);
// Load the form from the loaded document.
PdfLoadedForm form = loadedDocument.Form;
// Load the form field collections from the form.
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
string fieldValue = string.Empty;
// Get the field value using TryGetValue Method
fieldCollection.TryGetValue("f1-2", out fieldValue);
//Save and close the modified document.
loadedDocument.Save("output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
' Load the document.
Dim loadedDocument As New PdfLoadedDocument(filename)
' Load the form from the loaded document.
Dim form As PdfLoadedForm = loadedDocument.Form
' Load the form field collections from the form.
Dim fieldCollection As PdfLoadedFormFieldCollection = TryCast(form.Fields,
PdfLoadedFormFieldCollection)
Dim fieldValue As String = String.Empty
' Get the field value using TryGetValue Method
fieldCollection.TryGetValue("f1-2", fieldValue)
'Save and close the modified document.
loadedDocument.Save("output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
// Load the form from the loaded document
PdfLoadedForm form = loadedDocument.Form;
// Load the form field collections from the form
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
string fieldValue = string.Empty;
// Get the field value using TryGetValue Method
fieldCollection.TryGetValue("f1-2", out fieldValue);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
```

```
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
// Load the form from the loaded document.
PdfLoadedForm form = loadedDocument.Form;
// Load the form field collections from the form.
PdfLoadedFormFieldCollection fieldCollection = form.Fields as
PdfLoadedFormFieldCollection;
string fieldValue = string.Empty;
// Get the field value using TryGetValue Method
fieldCollection.TryGetValue("FirstName", out fieldValue);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
//and iOS platforms. Please refer PDF/Xamarin section for respective code
//samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}
```

Fill the XFA form fields along with Acroform in a same API

The static XFA document contains both the XFA and Acroform.

The Essential PDF supports filling both the XFA and Acroform in a same instance (Fills the XFA form via Acroform instance) by enabling the [EnableXfaFormFill](#) property available in the [PdfLoadedForm](#) class.

The following code snippet illustrates how to fill XFA forms via Acroform API

C#

```
//Load the existing XFA PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Form.pdf");
//Get the existing Acroform
PdfLoadedForm acroform = loadedDocument.Form;
//Enable XFA form filling
acroform.EnableXfaFormFill = true;
//Get the existing text box field
PdfLoadedTextBoxField firstName = acroform.Fields["FirstName"] as
PdfLoadedTextBoxField;
//Set text
firstName.Text = "Simon";
PdfLoadedTextBoxField lastName = acroform.Fields["LastName"] as
PdfLoadedTextBoxField;
//Set text
lastName.Text = "Bistro";
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing XFA PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Form.pdf")
'Get the existing Acroform
Dim acroform As PdfLoadedForm = loadedDocument.Form
'Enable XFA form filling
acroform.EnableXfaFormFill = True
'Get the existing text box field
Dim firstName As PdfLoadedTextBoxField =
TryCast(acroform.Fields("FirstName"), PdfLoadedTextBoxField)
```

```
'Set text
firstName.Text = "Simon"
Dim lastName As PdfLoadedTextBoxField = TryCast(acroform.Fields("LastName"),
PdfLoadedTextBoxField)
'Set text
lastName.Text = "Bistro"
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Get the existing Acroform
PdfLoadedForm acroform = loadedDocument.Form;
//Enable XFA form filling
acroform.EnableXfaFormFill = true;
//Get the existing text box field
PdfLoadedTextBoxField firstName = acroform.Fields["FirstName"] as
PdfLoadedTextBoxField;
//Set text
firstName.Text = "Simon";
PdfLoadedTextBoxField lastName = acroform.Fields["LastName"] as
PdfLoadedTextBoxField;
//Set text
lastName.Text = "Bistro";
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Form.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the existing Acroform
PdfLoadedForm acroform = loadedDocument.Form;
//Enable XFA form filling
acroform.EnableXfaFormFill = true;
//Get the existing text box field
PdfLoadedTextBoxField firstName = acroform.Fields["FirstName"] as
PdfLoadedTextBoxField;
//Set text
```

```

firstName.Text = "Simon";
PdfLoadedTextBoxField lastName = acroform.Fields["LastName"] as
PdfLoadedTextBoxField;
//Set text
lastName.Text = "Bistro";
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
loadedDocument.Save(stream);
//If the position is not set to '0', then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

Removing editing capability of form fields

The form field editing or filling capabilities can be removed by either flattening the PDF document or by marking the form or field as read only.

Essential PDF provides support to [Flatten](#) a form field by removing the existing form field and replacing it with graphical objects that would resemble the form field and cannot be edited.

Please refer the sample for flattening the form fields in new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Flatten the whole form field
document.Form.Flatten = true;
//Flattens the first field //form.Fields[0].Flatten = true;
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()

```

```

'Create a Text box field and add the properties.
Dim textBoxField As New PdfTextBoxField(page, "FirstName")
textBoxField.Bounds = New RectangleF(0, 0, 100, 20)
textBoxField.ToolTip = "First Name"
'Flatten the whole form field
document.Form.Flatten = True
'Add the form field to the document.
document.Form.Fields.Add(textBoxField)
'Save the PDF document.
document.Save("Form.pdf")
'close the document
document.Close(True)

```

UWP

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to PDF document
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Flatten the whole form field
document.Form.Flatten = true;
//Flattens the first field //form.Fields[0].Flatten = true;
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to PDF document
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Flatten the whole form field
document.Form.Flatten = true;
//Flattens the first field //form.Fields[0].Flatten = true;
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;

```

```
//Close the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name.
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}
```

Please refer the sample for flattening the form fields in existing PDF document.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
PdfLoadedFormFieldCollection fields = loadedForm.Fields;
//Get the loaded text box field
```

```

PdfLoadedTextBoxField loadedTextBoxField = fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
//Flatten the whole form.
loadedForm.Flatten = true;
//Save and close the modified document.
loadedDocument.Save("output.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
Dim fields As PdfLoadedFormFieldCollection = loadedForm.Fields
'Get the loaded text box field
Dim loadedTextBoxField As PdfLoadedTextBoxField = TryCast(fields(0),
PdfLoadedTextBoxField)
loadedTextBoxField.Text = "Text"
'Flatten the whole form.
loadedForm.Flatten = True
'Save and close the modified document.
loadedDocument.Save("output.pdf")
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
PdfLoadedFormFieldCollection fields = loadedForm.Fields;
//Get the loaded text box field
PdfLoadedTextBoxField loadedTextBoxField = fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
//Flatten the whole form
loadedForm.Flatten = true;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
PdfLoadedFormFieldCollection fields = loadedForm.Fields;
//Get the loaded text box field
PdfLoadedTextBoxField loadedTextBoxField = fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
//Flatten the whole form.
loadedForm.Flatten = true;
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
PdfLoadedFormFieldCollection fields = loadedForm.Fields;
//Get the loaded text box field
PdfLoadedTextBoxField loadedTextBoxField = fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "Text";
//Flatten the whole form.
loadedForm.Flatten = true;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}

```

To prevent the user from changing the form field content, you can also use [ReadOnly](#) property.

The below code snippet illustrates how to set the ReadOnly property to a new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create the form
PdfForm form = document.Form;
//Set the form as read only
form.ReadOnly = true;
//Create a text box field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
textBoxField.Text = "john";
//set read only property for a particular field
//textBoxField.ReadOnly = true;
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create the form
Dim form As PdfForm = document.Form
'Set the form as read only
form.ReadOnly = True
'Create a Text box field and add the properties.
Dim textBoxField As New PdfTextBoxField(page, "FirstName")
textBoxField.Bounds = New RectangleF(0, 0, 100, 20)
textBoxField.ToolTip = "First Name"
textBoxField.Text = "john"
'set read only property for a particular field

```

```
'textBoxField.ReadOnly = True;
'Add the form field to the document.
document.Form.Fields.Add(textBoxField)
'Save the document.
document.Save("Form.pdf")
'close the document
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create the form
PdfForm form = document.Form;
//Set the form as read only
form.ReadOnly = true;
//Create a text box field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
textBoxField.Text = "john";
//set read only property for a particular field
//textBoxField.ReadOnly = true;
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Save the PDF document to stream

//Close the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}

```

The below code snippet illustrates how to set the ReadOnly property to an existing PDF document.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the form as read only
loadedForm.ReadOnly = true;
//Save the document.
loadedDocument.Save("sample.pdf");
//close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Set the form as read only
loadedForm.ReadOnly = True
'Save the document.
loadedDocument.Save("Form1.pdf")
'close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the form as read only
loadedForm.ReadOnly = true;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "sample.pdf");
```

ASP.NET CORE

```
//Load the PDF document
```

```

FileStream docStream = new FileStream(fileName, FileMode.Open,
    FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the form as read only
loadedForm.ReadOnly = true;
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Set the form as read only
loadedForm.ReadOnly = true;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
        "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
        "application/pdf", stream);
}

```

Note: Flattening and adding Read-only properties can be done to the entire form or an individual form field.

Removing the form fields from existing PDF document

You can remove the form fields from an existing PDF document using [Remove](#) or [RemoveAt](#) methods of [PdfFieldCollection](#) class.

The below code illustrates how to remove the form fields from the existing PDF document.

C#

```
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Load the textbox field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedTextBoxField);
//Remove the field at index 0
loadedForm.Fields.RemoveAt(0);
//Save the modified document.
loadedDocument.Save("form.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Load the page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Load the textbox field
Dim loadedTextBoxField As PdfLoadedTextBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedTextBoxField)
'Remove the field
loadedForm.Fields.Remove(loadedTextBoxField)
'Remove the field at index 0
loadedForm.Fields.RemoveAt(0);
'Save the modified document.
loadedDocument.Save("form.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
```

```

//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Load the textbox field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as PdfLoadedTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedTextBoxField);
//Remove the field at index 0
loadedForm.Fields.RemoveAt(0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code sample
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Load the textbox field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as PdfLoadedTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedTextBoxField);
//Remove the field at index 0
loadedForm.Fields.RemoveAt(0);
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Load the textbox field
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedTextBoxField);
//Remove the field at index 0
loadedForm.Fields.RemoveAt(0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}

```

Importing FDF file to PDF

FDF stands for Forms Data Format. FDF is a file format for representing form data and annotations that are contained in a PDF form. You can import the FDF file to PDF using [ImportDataFDF](#) method in [PdfLoadedForm](#) class.

The below code illustrates how to import FDF file to PDF.

C#

```

//Load an existing document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
// Load the existing form
PdfLoadedForm loadedForm = loadedDocument.Form;
// Load the FDF file
FileStream stream = new FileStream("ImportFDF.fdf", FileMode.Open);
// Import the FDF stream
loadedForm.ImportDataFDF(stream, true);
//Close the document.
loadedDocument.Close(true);

```

VB.NET

```
'Load an existing document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
' Load the existing form
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
' Load the FDF file
Dim stream As New FileStream("ImportFDF.fdf", FileMode.Open)
' Import the FDF stream
loadedForm.ImportDataFDF(stream, True)
' Close the document
loadedDocument.Close(True)
```

Export PDF file to FDF

To export the FDF file from PDF document, you can use [ExportData](#) method in [PdfLoadedForm](#) class.

The below code illustrates how to export FDF file from PDF document.

C#

```
// Load an existing document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
// Load an existing form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Export the existing PDF document to FDF file
loadedForm.ExportData("Export.fdf", DataFormat.Fdf, "SourceForm.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
' Load an existing document
Dim loadedDocument As New PdfLoadedDocument(fileName)
' Load an existing form
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Export the existing PDF document to FDF file
loadedForm.ExportData("Export.fdf", DataFormat.Fdf, "SourceForm.pdf")
'Close the document
loadedDocument.Close(True)
```

Complex script support for form fields

You can add a complex script language text in PDF AcroForm fields by using the [ComplexScript](#) property of the form field instance. The following code snippet illustrates this.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
```

```
//Set text
textField.Text = "สวัสดีชาวโลก";
//Create new PdfTrueTypeFont instance
PdfTrueTypeFont font = new PdfTrueTypeFont(new Font("Tahoma", 10), true);
//Set font
textField.Font = font;
//Enable complex script layout
textField.ComplexScript = true;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance as false
document.Form.SetDefaultAppearance(false);
//Save the PDF document
document.Save("Form.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
'Add a new PDF page
Dim page As PdfPage = document.Pages.Add()
'Create new PDF text box field
Dim textField As New PdfTextBoxField(page, "textBox")
'Set bounds
textField.Bounds = New RectangleF(10, 10, 200, 30)
'Set text
textField.Text = "สวัสดีชาวโลก"
'Create new PdfTrueTypeFont instance
Dim font As New PdfTrueTypeFont(New Font("Tahoma", 10), True)
'Set font
textField.Font = font
'Enable complex script layout
textField.ComplexScript = True
'Add the text box field to the form collection
document.Form.Fields.Add(textField)
'Set default appearance as false
document.Form.SetDefaultAppearance(False)
'Save the PDF document
document.Save("Form.pdf")
'Close the document
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
```

```

textField.Text = "สวัสดิ์ชาวโลก";
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("ComplexSc
riptSample.Assets.tahoma.ttf");
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set font
textField.Font = font;
//Enable complex script layout
textField.ComplexScript = true;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance to false
document.Form.SetDefaultAppearance(false);
//Save the PDF document
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the PDF document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create the new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
textField.Text = "สวัสดิ์ชาวโลก";
FileStream fontStream = new FileStream("tahoma.ttf", FileMode.Open,
FileAccess.Read);
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set font
textField.Font = font;
//Enable complex script layout
textField.ComplexScript = true;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance as false
document.Form.SetDefaultAppearance(false);
//Save the PDF document
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the PDF document
document.Close(true);
//Defining the content type for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";

```

```
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create the new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
textField.Text = "สวัสดิ์ชาวโลก";
//Load the font as stream
Stream fontStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
tahoma.ttf");
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set font
textField.Font = font;
//Enable complex script layout
textField.ComplexScript = true;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance as false
document.Form.SetDefaultAppearance(false);
//Save the PDF document
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the PDF document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

You can add the complex script for all the supported form fields by enabling the [ComplexScript](#) property of [PdfForm](#) or [PdfLoadedForm](#) instance.

Supported form fields:

- Text box field
- Combo box field
- List box field
- Button field

The following code example illustrates how to add complex script support for all the supported fields in PDF document.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create the new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
textField.Text = "สวัสดีชาวโลก";
//Create new PdfTrueTypeFont instance
PdfTrueTypeFont font = new PdfTrueTypeFont(new Font("Tahoma", 10), true);
//Set font
textField.Font = font;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance to false
document.Form.SetDefaultAppearance(false);
//Enable complex script layout for form
document.Form.ComplexScript = true;
//Save the PDF document
document.Save("Form.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
'Add a new PDF page
Dim page As PdfPage = document.Pages.Add()
'Create the new PDF text box field
Dim textField As New PdfTextBoxField(page, "textBox")
'Set bounds
textField.Bounds = New RectangleF(10, 10, 200, 30)
'Set text
textField.Text = "สวัสดีชาวโลก"
'Create new PdfTrueTypeFont instance
Dim font As New PdfTrueTypeFont(New Font("Tahoma", 10), True)
'Set font
textField.Font = font
'Add the text box field to the form collection
document.Form.Fields.Add(textField)
'Set default appearance to false
document.Form.SetDefaultAppearance(False)
```

```
'Enable complex script layout for form
document.Form.ComplexScript = True
'Save the PDF document
document.Save("Form.pdf")
'Close the document
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create the new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
textField.Text = "สวัสดิ์ชาวโลก";
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("ComplexSc
riptSample.Assets.tahoma.ttf");
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set font
textField.Font = font;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance to false
document.Form.SetDefaultAppearance(false);
//Enable complex script layout for form
document.Form.ComplexScript = true;
//Save the PDF document
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples.
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create the new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
textField.Text = "สวัสดิ์ชาวโลก";
FileStream fontStream = new FileStream("tahoma.ttf", FileMode.Open,
FileAccess.Read);
```

```
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set font
textField.Font = font;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance as false
document.Form.SetDefaultAppearance(false);
//Enable complex script layout for form
document.Form.ComplexScript = true;
//Save the PDF document
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the PDF document
document.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new PDF page
PdfPage page = document.Pages.Add();
//Create the new PDF text box field
PdfTextBoxField textField = new PdfTextBoxField(page, "textBox");
//Set bounds
textField.Bounds = new RectangleF(10, 10, 200, 30);
//Set text
textField.Text = "สวัสดิ์ชาวโลก";
//Load the font as stream
Stream fontStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
tahoma.ttf");
//Create a new PDF font instance
PdfFont font = new PdfTrueTypeFont(fontStream, 10);
//Set font
textField.Font = font;
//Add the text box field to the form collection
document.Form.Fields.Add(textField);
//Set default appearance as false
document.Form.SetDefaultAppearance(false);
//Enable complex script layout for form
document.Form.ComplexScript = true;
//Save the PDF document
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the PDF document
document.Close(true);
//Save the stream into PDF file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

You can also flatten the existing form fields with complex script layout by using the following code snippet.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Form.pdf");
//Get the existing PDF form
PdfLoadedForm lForm = loadedDocument.Form as PdfLoadedForm;
//Set the complex script layout
lForm.ComplexScript = true;
//Set flatten
lForm.Flatten = true;
//Save the document
loadedDocument.Save("flatten.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedDocument("Form.pdf")
'Get the existing PDF form
Dim lForm As PdfLoadedForm = TryCast(loadedDocument.Form, PdfLoadedForm)
'Set the complex script layout
lForm.ComplexScript = True
'Set flatten
lForm.Flatten = True
'Save the document
loadedDocument.Save("flatten.pdf")
'Close the document
loadedDocument.Close(True)
```

UWP

```
Stream inputFileStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Form.pdf"
);
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(inputFileStream);
```

```
//Get the existing PDF form
PdfLoadedForm lForm = loadedDocument.Form as PdfLoadedForm;
//Set the complex script layout
lForm.ComplexScript = true;
//Set flatten
lForm.Flatten = true;
MemoryStream stream = new MemoryStream();
//Save the document
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
FileStream inputFileStream = new FileStream("Form.pdf", FileMode.Open,
FileAccess.Read);
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(inputFileStream);
//Get the existing PDF form
PdfLoadedForm lForm = loadedDocument.Form as PdfLoadedForm;
//Set the complex script layout
lForm.ComplexScript = true;
//Set flatten
lForm.Flatten = true;
MemoryStream stream = new MemoryStream();
//Save the document
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Defining the content type for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
Stream inputFileStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Form.pdf");
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(inputFileStream);
//Get the existing PDF form
PdfLoadedForm lForm = loadedDocument.Form as PdfLoadedForm;
//Set the complex script layout
lForm.ComplexScript = true;
//Set flatten
lForm.Flatten = true;
//Save the PDF document
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
```

```
//Close the PDF document
loadedDocument.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Auto naming of form fields

The Essential PDF supports auto naming of form fields in a PDF document while creating form fields with same name. The [FieldAutoNaming](#) property of [PdfForm](#) is used to enable or disable auto naming of form field.

While enabling this property, the field names are auto naming. If the fields are created using same/common name, the created fields will act as individual.

While disabling this property, the field names are not auto naming and the created fields are saved in a single group. The same value will be referred in all the same name fields.

By default, the value is set to true. This is illustrated in the following code sample.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document
PdfPage page = document.Pages.Add();
//Create the form
PdfForm form = document.Form;
//Enable the field auto naming
form.FieldAutoNaming = true;
//Create a textbox field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "Name");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "FirstName";
textBoxField.Text = "John";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Create a text box field with the same name and add the properties
PdfTextBoxField textBoxField1 = new PdfTextBoxField(page, "Name");
textBoxField1.Bounds = new RectangleF(0, 50, 100, 20);
textBoxField1.ToolTip = "LastName";
textBoxField1.Text = "Doe";
//Add form field to the document
document.Form.Fields.Add(textBoxField1);
//Save the document
```

```
document.Save("Output.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
'Add a new page to the PDF document
Dim page As PdfPage = document.Pages.Add()
'Create the form
Dim form As PdfForm = document.Form
'Enable the field auto naming
form.FieldAutoNaming = True
'Create a text box field and add the properties
Dim textBoxField As New PdfTextBoxField(page, "Name")
textBoxField.Bounds = New RectangleF(0, 0, 100, 20)
textBoxField.ToolTip = "FirstName"
textBoxField.Text = "John"
'Add the form field to the document
document.Form.Fields.Add(textBoxField)
'Create a text box field with the same name and add the properties
Dim textBoxField1 As New PdfTextBoxField(page, "Name")
textBoxField1.Bounds = New RectangleF(0, 50, 100, 20)
textBoxField1.ToolTip = "LastName"
textBoxField1.Text = "Doe"
'Add form field to the document
document.Form.Fields.Add(textBoxField1)
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document
PdfPage page = document.Pages.Add();
//Create the form
PdfForm form = document.Form;
//Enable the field auto naming
form.FieldAutoNaming = true;
//Create a text box field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "Name");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "FirstName";
textBoxField.Text = "John";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Create a text box field with the same name and add the properties
PdfTextBoxField textBoxField1 = new PdfTextBoxField(page, "Name");
textBoxField1.Bounds = new RectangleF(0, 50, 100, 20);
textBoxField1.ToolTip = "LastName";
textBoxField1.Text = "Doe";
//Add form field to the document
```

```
document.Form.Fields.Add(textBoxField1);
//Save the document as stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document
PdfPage page = document.Pages.Add();
//Create the form
PdfForm form = document.Form;
//Enable the field auto naming
form.FieldAutoNaming = true;
//Create a text box field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "Name");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "FirstName";
textBoxField.Text = "John";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Create a text box field with the same name and add the properties
PdfTextBoxField textBoxField1 = new PdfTextBoxField(page, "Name");
textBoxField1.Bounds = new RectangleF(0, 50, 100, 20);
textBoxField1.ToolTip = "LastName";
textBoxField1.Text = "Doe";
//Add form field to the document
document.Form.Fields.Add(textBoxField1);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0', then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for PDF file.
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

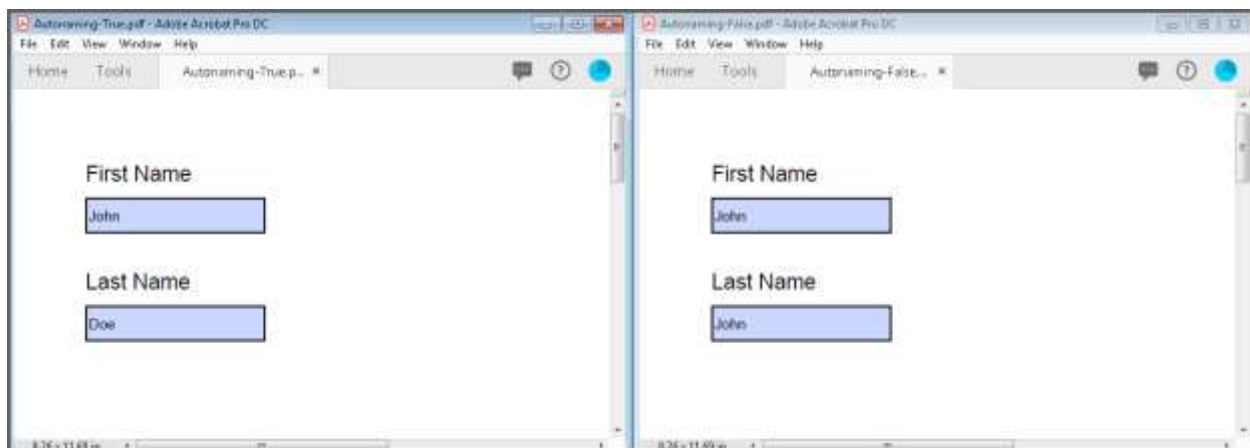

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to the PDF document
PdfPage page = document.Pages.Add();
```

```

//Create the form
PdfForm form = document.Form;
//Enable the field auto naming
form.FieldAutoNaming = true;
//Create a textbox field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "Name");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "FirstName";
textBoxField.Text = "John";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Create a text box field with the same name and add the properties
PdfTextBoxField textBoxField1 = new PdfTextBoxField(page, "Name");
textBoxField1.Bounds = new RectangleF(0, 50, 100, 20);
textBoxField1.ToolTip = "LastName";
textBoxField1.Text = "Doe";
//Add form field to the document
document.Form.Fields.Add(textBoxField1);
//Save the document as stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

The following screenshot shows the enabling and disabling of form fields auto naming in PDF documents.

Adding actions to form fields

Please refer to the [actions](#) section for more details

Note: Essential PDF allows users to preserve the extended rights for form filling alone.

Auto resizing text box field text

The Essential PDF provides support to automatically resize the text of text box field based on the field width and height. You can auto resize the text box text by using the [AutoResizeText](#) property available in [PdfLoadedTextBox](#) instance.

The following code illustrates how to set `AutoResizeText` in an existing PDF text box field.

C#

```
//Load an existing document
PdfLoadedDocument doc = new PdfLoadedDocument("SourceForm.pdf");
//Read the text box field
PdfLoadedForm form = doc.Form;
PdfLoadedTextBoxField loadedField = doc.Form.Fields[0] as
PdfLoadedTextBoxField;
//Enable auto resize
loadedField.AutoResizeText = true;
//Flatten the form
form.Flatten = true;
//Save the document
doc.Save("Form.pdf");
//Close the document
doc.Close(true);
```

VB.NET

```
'Load an existing document
Dim doc As PdfLoadedDocument = New PdfLoadedDocument("SourceForm.pdf")
Dim form As PdfLoadedForm = doc.Form
'Read the text box field
Dim loadedField As PdfLoadedTextBoxField = TryCast(doc.Form.Fields(0),
PdfLoadedTextBoxField)
'Enable auto resize.
loadedField.AutoResizeText = True
'Flatten the form
form.Flatten = True
'Save the document
doc.Save("Form.pdf")
'Close the document
doc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
```

```

//Loads or opens an existing PDF document through Open method of the PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Read the text box field
PdfLoadedTextBoxField loadedField = loadedDocument.Form.Fields[0] as PdfLoadedTextBoxField;
//Enable auto resize
loadedField.AutoResizeText = true;
//Flatten the form
loadedForm.Flatten = true;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the PDF/UWP section for respective code samples
Save(stream, "sample.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open, FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Read the text box field
PdfLoadedTextBoxField loadedField = loadedDocument.Form.Fields[0] as PdfLoadedTextBoxField;
//Enable auto resize
loadedField.AutoResizeText = true;
//Flatten the form
loadedForm.Flatten = true;
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.Sample.pdf");

```

```

PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form
PdfLoadedForm loadedForm = loadedDocument.Form;
//Read the text box field
PdfLoadedTextBoxField loadedField = loadedDocument.Form.Fields[0] as
PdfLoadedTextBoxField;
//Enable auto resize
loadedField.AutoResizeText = true;
//Flatten the form
form.Flatten = true;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}

```

Troubleshooting

Form fields may appear empty in adobe reader some time due to the absence of the appearance dictionary. To resolve this, you have to enable the Adobe Reader default appearance by using the [SetDefaultAppearance](#) method in [PdfForm](#) class.

The below code illustrates how to enable the default appearance in new PDF document.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Enable the default Appearance
document.Form.SetDefaultAppearance(true);
//Save the document.
document.Save("Form.pdf");
//close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a new page to PDF document.
Dim page As PdfPage = document.Pages.Add()
'Create a Text box field and add the properties.
Dim textBoxField As New PdfTextBoxField(page, "FirstName")
textBoxField.Bounds = New RectangleF(0, 0, 100, 20)
textBoxField.ToolTip = "First Name"
'Add the form field to the document.
document.Form.Fields.Add(textBoxField)
'Enable the default Appearance
document.Form.SetDefaultAppearance(True)
'Save the document.
document.Save("Form.pdf")
'close the document
document.Close(True)

```

UWP

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page to PDF document
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
//Enable the default Appearance
document.Form.SetDefaultAppearance(true);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Form.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);

```

```
//Enable the default Appearance
document.Form.SetDefaultAppearance(true);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Form.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a new page to PDF document.
PdfPage page = document.Pages.Add();
//Create a Text box field and add the properties.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
textBoxField.Bounds = new Syncfusion.Drawing.RectangleF(0, 0, 100, 20);
textBoxField.ToolTip = "First Name";
//Add the form field to the document.
document.Form.Fields.Add(textBoxField);
//Enable the default Appearance
document.Form.SetDefaultAppearance(true);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Form.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Form.pdf",
"application/pdf", stream);
}
```

The below code illustrates how to enable the default appearance in existing PDF document.

C#

```
//Load the PDF document.
```

```

PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Enable the default Appearance
loadedDocument.Form.SetDefaultAppearance(true);
//Save the modified document.
loadedDocument.Save("sample.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Get the loaded form.
Dim loadedForm As PdfLoadedForm = loadedDocument.Form
'Get the loaded text box field and fill it.
Dim loadedTextBoxField As PdfLoadedTextBoxField =
TryCast(loadedForm.Fields(0), PdfLoadedTextBoxField)
loadedTextBoxField.Text = "First Name"
'Enable the default Appearance
loadedDocument.Form.SetDefaultAppearance(True)
'Save the modified document.
loadedDocument.Save("sample.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Enable the default Appearance
loadedDocument.Form.SetDefaultAppearance(true);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);

```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples
Save(stream, "sample.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the loaded form.
PdfLoadedForm loadedForm = loadedDocument.Form;
//Get the loaded text box field and fill it.
PdfLoadedTextBoxField loadedTextBoxField = loadedForm.Fields[0] as
PdfLoadedTextBoxField;
loadedTextBoxField.Text = "First Name";
//Enable the default Appearance
loadedDocument.Form.SetDefaultAppearance(true);
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file

loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Working with XFA

XFA stands for XML Forms Architecture, dynamic forms are based on a XML specification. Essential PDF supports both the dynamic and static XFA forms.

- In a static form the form's appearance and layout is fixed, regardless of the field content.
- Dynamic forms can change in appearance in several ways in response to changes in the data.

Creating a new XFA form

Essential PDF allows you to create and manipulate the XFA form in PDF document by using [PdfXfaDocument](#) and [PdfXfaForm](#) classes. The [PdfXfaFieldCollection](#) class represents the entire field collection of the XFA form.

Adding a new page to the XFA document

The following code sample explains you on how to add a new page in a PDF XFA document.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!");
//Add the field to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//Close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form

```

```

Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a text element and add the properties
Dim textElement As New PdfXfaTextElement("Hello World!")
'Add the field to the XFA form
mainForm.Fields.Add(textElement)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'Close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form

MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

Note: XFA documents are created based on the flow layout, so the pages are sequentially added if the doesn't have space to fit the field it will automatically move on the next page, so we can't specify the page and page numbers.

PDF supports XFA forms only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, UWP platforms, Xamarin (.NETStandard 2.0 and above), and ASP.NET Core (.NETStandard 2.0 and above).

Adding the XFA document settings

Essential PDF supports various XFA page setting options through [PdfXfaPageSettings](#) class, to control the page display.

The below sample illustrates how to create a new PDF document with XFA page size.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Set the page size
document.PageSettings.PageSize = PdfPageSize.A4
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a text element and add the properties
Dim textElement As New PdfXfaTextElement("Hello World!!!")
'Set font
textElement.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold)
'Add the text element to the XFA form
mainForm.Fields.Add(textElement)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");
```

ASP.NET CORE

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document.
document.XfaForm = mainForm;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
```

```
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "XfaForm.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document.
document.XfaForm = mainForm;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

You can create a custom page size to the PDF document by using following code snippet.

C#

```
//Create a new PDF XFA document
```

```

PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = new SizeF(500,700);
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1",xfaPage,xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf",PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Set the page size
document.PageSettings.PageSize = New SizeF(500,700)
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New
PdfXfaForm("subform1",xfaPage,xfaPage.GetClientSize().Width)
'Create a text element and add the properties
Dim textElement As New PdfXfaTextElement("Hello World!!!")
'Set font
textElement.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold)
'Add the text element to the XFA form
mainForm.Fields.Add(textElement)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf",PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = new SizeF(500, 700);
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form

```

```

PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");

```

ASP.NET CORE

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = new SizeF(500, 700);
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

You can change page orientation from portrait to landscape by using the following code snippet.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = new SizeF(500, 700);
//Change the page orientation to landscape
document.PageSettings.PageOrientation = PdfXfaPageOrientation.Landscape;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form

```

```

PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize ().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Set the page size
document.PageSettings.PageSize = New SizeF(500,700)
'Change the page orientation to landscape
document.PageSettings.PageOrientation = PdfXfaPageOrientation.Landscape
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form

```

Creating dynamic XFA forms

The below sample illustrates how to create a dynamic XFA forms.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();

```

```

//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize ().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document dynamic form
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Set the page size
document.PageSettings.PageSize = PdfPageSize.A4
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New PdfXfaForm("subform1",
xfaPage, xfaPage.GetClientSize().Width)
'Create a text element and add the properties
Dim textElement As New PdfXfaTextElement("Hello World!!!")
'Set font
textElement.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold)
'Add the text element to the XFA form
mainForm.Fields.Add(textElement)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document dynamic form
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font

```

```

textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");

```

ASP.NET CORE

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size

Creating static XFA forms

The below sample illustrates how to create a static XFA forms.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");
//Set font
textElement.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold);

```

```
//Add the text element to the XFA form
mainForm.Fields.Add(textElement);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document with static form
document.Save("XfaForm.pdf", PdfXfaType.Static);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Set the page size
document.PageSettings.PageSize = PdfPageSize.A4
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a text element and add the properties
Dim textElement As New PdfXfaTextElement("Hello World!!!")
'Set font
textElement.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 14,
PdfFontStyle.Bold)
'Add the text element to the XFA form
mainForm.Fields.Add(textElement)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document with static form
document.Save("XfaForm.pdf", PdfXfaType.Static)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Set the page size
document.PageSettings.PageSize = PdfPageSize.A4;
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a text element and add the properties
PdfXfaTextElement textElement = new PdfXfaTextElement("Hello World!!!");

```

Creating XFA form fields

[Adding the XFA text box field.](#)

The below code snippet illustrates how to add a textbox field to a new PDF document using [PdfXfaTextBoxField](#) class.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a textbox field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("FirstName", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the tool tip
textBoxField.ToolTip = "First Name";
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);

```

```
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a textbox field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("FirstName", New SizeF(200, 20))
'Set the caption text
textBoxField.Caption.Text = "First Name"
'Set the tool tip
textBoxField.ToolTip = "First Name"
'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form

Adding the XFA combo box field

The below code snippet illustrates how to add a combo box field to a new PDF document using [PdfXfaComboBoxField](#) class.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a combo box field and add the properties
PdfXfaComboBoxField comboBoxField = new PdfXfaComboBoxField("comboBoxField",
new SizeF(200, 20));
//Set the caption text
comboBoxField.Caption.Text = "Job Title";
//Add the combo box items
comboBoxField.Items.Add("Development.");
comboBoxField.Items.Add("Support.");
comboBoxField.Items.Add("Documentation.");
//Add the field to the XFA form
mainForm.Fields.Add(comboBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a combo box field and add the properties
PdfXfaComboBoxField comboBoxField = new PdfXfaComboBoxField("comboBoxField",
new SizeF(200, 20));
//Set the caption text
comboBoxField.Caption.Text = "Job Title";
//Add the combo box items
comboBoxField.Items.Add("Development.");
comboBoxField.Items.Add("Support.");
comboBoxField.Items.Add("Documentation.");
//Add the field to the XFA form
mainForm.Fields.Add(comboBoxField);
```

```
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a combo box field and add the properties
PdfXfaComboBoxField comboBoxField = new PdfXfaComboBoxField("comboBoxField",

Adding XFA check box field

The below code snippet illustrates how to add a check box field to a new PDF document using [PdfXfaCheckBoxField](#) class.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a check box field and add the properties
PdfXfaCheckBoxField checkBoxField = new PdfXfaCheckBoxField("checkBoxField",
new SizeF(100, 20));
//Set the caption text
checkBoxField.Caption.Text = "Check box Field";
checkBoxField.CheckedStyle = PdfXfaCheckedStyle.Cross;
//Add the field to the XFA form
mainForm.Fields.Add(checkBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a check box field and add the properties
Dim checkBoxField As New PdfXfaCheckBoxField("checkBoxField", New SizeF(100,
20))
'Set the caption text
checkBoxField.Caption.Text = "Check box Field"
checkBoxField.CheckedStyle = PdfXfaCheckedStyle.Cross
'Add the field to the XFA form
mainForm.Fields.Add(checkBoxField)
'Add the XFA form to the document

Adding the XFA radio button field

The below code snippet illustrates how to add a radio button field to a new PDF document using [PdfXfaRadioButtonField](#) class and add it into [PdfXfaRadioButtonGroup](#).

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a radio button group
PdfXfaRadioButtonGroup group = new PdfXfaRadioButtonGroup("radioGroup");
group.FlowDirection = PdfXfaFlowDirection.Vertical;
//Create a radio button field and add the properties
PdfXfaRadioButtonField radioButtonField1 = new PdfXfaRadioButtonField("r1",
new.SizeF(80, 20));
//Set the caption text
radioButtonField1.Caption.Text = "Male";
PdfXfaRadioButtonField radioButtonField2 = new PdfXfaRadioButtonField("r2",
new.SizeF(80, 20));
radioButtonField2.Caption.Text = "Female";
//Add the radio button fields to the radio button group
group.Items.Add(radioButtonField1);
group.Items.Add(radioButtonField2);
//Add the field to the XFA form
mainForm.Fields.Add(group);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add a new XFA page

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a circle field and add the properties
PdfXfaCircleField circle = new PdfXfaCircleField("circle", new SizeF(100,
100));
//Set the fill color
circle.Border.FillColor = new PdfXfaSolidBrush(Color.Red);
//Add the text element to the XFA form
mainForm.Fields.Add(circle);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form

```

```

Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a circle field and add the properties
Dim circle As New PdfXfaCircleField("circle", New SizeF(100, 100))
'Set the fill color
circle.Border.FillColor = New PdfXfaSolidBrush(Color.Red)
'Add the text element to the XFA form
mainForm.Fields.Add(circle)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Create a circle field and add the properties
PdfXfaCircleField circle = new PdfXfaCircleField("circle", new SizeF(100,

```

Adding the XFA image

The below code snippet illustrates how to add an image to a new PDF document using [PdfXfaImage](#) class.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width);
//Create a image and add the properties
PdfXfaImage image = new PdfXfaImage("image1", "image.jpg");
//Add the image to the XFA form
mainForm.Fields.Add(image);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add a new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form
Dim mainForm As New
PdfXfaForm("subform1", xfaPage, xfaPage.GetClientSize().Width)
'Create a image and add the properties
Dim image As New PdfXfaImage("image1", "image.jpg")
'Add the image to the XFA form
mainForm.Fields.Add(image)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
```

```
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add a new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form
PdfXfaForm mainForm = new PdfXfaForm("subform1", xfaPage,
xfaPage.GetClientSize().Width);
//Load the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.image.jpg");
//Create a image and add the properties
PdfXfaImage image = new PdfXfaImage("image1", imageStream);
//Add the image to the XFA form
mainForm.Fields.Add(image);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");
```

ASP.NET CORE

```
//Create a new PDF XFA document

```

Working with XFA form flow directions

There are two types of flow directions available in XFA forms.

1. Horizontal
2. Vertical

Horizontal flow direction

You can set the flow direction to an XFA form while creating, using [PdfXfaFlowDirection](#) Enum. The below sample illustrate how to set the horizontal flow direction in XFA forms.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a textbox field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("FirstName", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the tool tip
textBoxField.ToolTip = "First Name";
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
PdfXfaTextBoxField textBoxField1 = new PdfXfaTextBoxField("LastName", new
SizeF(200, 20));
//Set the caption text
textBoxField1.Caption.Text = "Last Name";
mainForm.Fields.Add(textBoxField1);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a textbox field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("FirstName", New SizeF(200, 20))
'Set the caption text
textBoxField.Caption.Text = "First Name"
'Set the tool tip
textBoxField.ToolTip = "First Name"
'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
Dim textBoxField1 As New PdfXfaTextBoxField("LastName", New SizeF(200, 20))
'Set the caption text
textBoxField1.Caption.Text = "Last Name"
mainForm.Fields.Add(textBoxField1)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a textbox field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("FirstName", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the tool tip
textBoxField.ToolTip = "First Name";
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
PdfXfaTextBoxField textBoxField1 = new PdfXfaTextBoxField("LastName", new
SizeF(200, 20));
//Set the caption text
textBoxField1.Caption.Text = "Last Name";
mainForm.Fields.Add(textBoxField1);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();

```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");
```

ASP.NET CORE

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a textbox field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("FirstName", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the tool tip
textBoxField.ToolTip = "First Name";
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
PdfXfaTextBoxField textBoxField1 = new PdfXfaTextBoxField("LastName", new
SizeF(200, 20));
//Set the caption text
textBoxField1.Caption.Text = "Last Name";
mainForm.Fields.Add(textBoxField1);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "XfaForm.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF XFA document

"application/pdf", fdfStream);
}

```

Vertical flow direction

You can set the flow direction to an XFA form while creating, using [PdfXfaFlowDirection](#) Enum. The below sample illustrate how to set the vertical flow direction in XFA forms.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with vertical flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Vertical,
xfaPage.GetClientSize().Width);
//Create a textbox field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("FirstName", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the tool tip
textBoxField.ToolTip = "First Name";
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);

```

```

PdfXfaTextBoxField textBoxField1 = new PdfXfaTextBoxField("LastName", new
SizeF(200, 20));
//Set the caption text
textBoxField1.Caption.Text = "Last Name";
mainForm.Fields.Add(textBoxField1);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with vertical flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Vertical,
xfaPage.ClientSize().Width)
'Create a textbox field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("FirstName", New SizeF(200, 20))
'Set the caption text
textBoxField.Caption.Text = "First Name"
'Set the tool tip
textBoxField.ToolTip = "First Name"
'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
Dim textBoxField1 As New PdfXfaTextBoxField("LastName", New SizeF(200, 20))
'Set the caption text
textBoxField1.Caption.Text = "Last Name"
mainForm.Fields.Add(textBoxField1)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with vertical flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Vertical,

```

Validating the date time field

You can validate the date time fields of the input text by enabling the [RequireValidation](#) property of [PdfXfaDateTimeField](#). The following code snippet illustrates this.

C#

```
//Create a new PDF XFA document
```

```

PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a date time field and add the properties
PdfXfaDateTimeField dateTimeField = new PdfXfaDateTimeField("dateTimeField",
new SizeF(200, 20));
//Set the caption text
dateTimeField.Caption.Text = "Date of Birth";
//Set the date pattern
dateTimeField.DatePattern = PdfXfaDatePattern.DDMMYY;
//Enable the validation
dateTimeField.RequireValidation = true;
//Add the field to the XFA form
mainForm.Fields.Add(dateTimeField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a date time field and add the properties
Dim dateTimeField As New PdfXfaDateTimeField("dateTimeField", New SizeF(200,
20))
'Set the caption text
dateTimeField.Caption.Text = "Date of Birth"
'Set the date pattern
dateTimeField.DatePattern = PdfXfaDatePattern.DDMMYY
'Enable the validation
dateTimeField.RequireValidation = True
'Add the field to the XFA form
mainForm.Fields.Add(dateTimeField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page

```

```

PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a date time field and add the properties
PdfXfaDateTimeField dateTimeField = new PdfXfaDateTimeField("dateTimeField",
new SizeF(200, 20));
//Set the caption text

"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Customizing the numeric field value

You can customize the numeric field input value to the specific pattern through [PatternString](#) property of [PdfXfaNumericField](#) class. The following code snippet explains this.

Please refer the below link for numeric pattern format in detail,

http://help.adobe.com/en_US/lifecycle/10.0/DesignerHelp/WS92d06802c76abadb-56c02439129b8b00ebc-7ecf.html

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a numeric field and add the properties
PdfXfaNumericField numericField = new PdfXfaNumericField("numericField", new
SizeF(200, 20));
//Set the caption text
numericField.Caption.Text = "Numeric Field";
//Set the pattern string
numericField.PatternString = "zzzzzzzzz9";
//Add the field to the XFA form
mainForm.Fields.Add(numericField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a numeric field and add the properties
Dim numericField As New PdfXfaNumericField("numericField", New SizeF(200,
20))
'Set the caption text
numericField.Caption.Text = "Numeric Field"
'Set the pattern string
numericField.PatternString = "zzzzzzzzz9"
'Add the field to the XFA form
mainForm.Fields.Add(numericField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
```

```

PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a numeric field and add the properties
PdfXfaNumericField numericField = new PdfXfaNumericField("numericField", new
SizeF(200, 20));
//Set the caption text
numericField.Caption.Text = "Numeric Field";
//Set the pattern string
numericField.PatternString = "zzzzzzzz9";
//Add the field to the XFA form
mainForm.Fields.Add(numericField);
//Add the XFA form to the document
document.XfaForm = mainForm;

{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Adding nested sub forms

You can add the nested sub forms by using the following code snippet.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a font
```

```

PdfFont font = new PdfStandardFont(xfaPage, PdfFontFamily.Helvetica, 12,
PdfFontStyle.Bold);
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text element
PdfXfaTextElement element = new PdfXfaTextElement("Main Form", font, 400,
20);
//Add the field to the XFA form
mainForm.Fields.Add(element);
//Create a form
PdfXfaForm form1 = new PdfXfaForm(PdfXfaFlowDirection.Vertical, 400);
PdfXfaTextElement element1 = new PdfXfaTextElement("First Form", font, 400,
20);
form1.Fields.Add(element1);
PdfXfaForm form2 = new PdfXfaForm(PdfXfaFlowDirection.Horizontal, 400);
PdfXfaTextElement element2 = new PdfXfaTextElement("Second Form",
font, 400, 20);
form2.Fields.Add(element2);
form1.Fields.Add(form2);
mainForm.Fields.Add(form1);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Static);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a font
Dim font As PdfFont = New PdfStandardFont(xfaPage, PdfFontFamily.Helvetica,
12, PdfFontStyle.Bold)
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a text element
Dim element As New PdfXfaTextElement("Main Form", font, 400, 20)
'Add the field to the XFA form
mainForm.Fields.Add(element)
'Create a form
Dim form1 As New PdfXfaForm(PdfXfaFlowDirection.Vertical, 400)
Dim element1 As New PdfXfaTextElement("First Form", font, 400, 20)
form1.Fields.Add(element1)
Dim form2 As New PdfXfaForm(PdfXfaFlowDirection.Horizontal, 400)
Dim element2 As New PdfXfaTextElement("Second Form", font, 400, 20)
form2.Fields.Add(element2)
form1.Fields.Add(form2)
mainForm.Fields.Add(form1)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document

```

```
document.Save("XfaForm.pdf", PdfXfaType.Static)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();

}

```

Formatting XFA form fields

Working with alignments

XFA support both the horizontal and vertical alignments.

Horizontal alignment

You can add the horizontal alignments in XFA form fields through [HorizontalAlignment](#) property by using [PdfXfaHorizontalAlignment](#) Enum. The below code snippet illustrates this.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the horizontal alignment
textBoxField.HorizontalAlignment = PdfXfaHorizontalAlignment.Right;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document

```

Vertical alignment

You can add the vertical alignments in XFA form fields through [VerticalAlignment](#) property by using [PdfXfaVerticalAlignment](#) Enum. The below code snippet explains this.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(XfaPagePdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the vertical alignment
textBoxField.VerticalAlignment = PdfXfaVerticalAlignment.Bottom;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page

```

```

Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(XfaPagePdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a text box field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("textBoxField", New SizeF(200,
20))
'Set the caption text
textBoxField.Caption.Text = "Fist Name"
'Set the vertical alignment
textBoxField.VerticalAlignment = PdfXfaVerticalAlignment.Bottom
'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the vertical alignment
textBoxField.VerticalAlignment = PdfXfaVerticalAlignment.Bottom;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");

```

ASP.NET CORE

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction

```

```

PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new

//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the vertical alignment
textBoxField.VerticalAlignment = PdfXfaVerticalAlignment.Bottom;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Save the stream into XFDF file

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Adding margins to the XFA fields

You can add margin to the XFA form fields by using [Margins](#) property. The below code snippet explains this.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the margins
textBoxField.Margins.Left = 10;
textBoxField.Margins.Right = 5;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a text box field and add the properties
```

```

Dim textBoxField As New PdfXfaTextBoxField("textBoxField", New SizeF(200,
20))
'Set the caption text
textBoxField.Caption.Text = "Fist Name"
'Set the margins
textBoxField.Margins.Left = 10
textBoxField.Margins.Right = 5
'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the margins
textBoxField.Margins.Left = 10;
textBoxField.Margins.Right = 5;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");

```

ASP.NET CORE

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties

```

```

PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the margins
textBoxField.Margins.Left = 10;
textBoxField.Margins.Right = 5;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "XfaForm.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.ClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the margins
textBoxField.Margins.Left = 10;
textBoxField.Margins.Right = 5;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

Adding padding to the XFA fields

You can add padding to the XFA form fields by using the below code snippet.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the paddings
textBoxField.Padding.All = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a text box field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("textBoxField", New SizeF(200,
20))
'Set the caption text
textBoxField.Caption.Text = "Fist Name"
'Set the paddings
textBoxField.Padding.All = 2

```

```

'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.ClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the paddings
textBoxField.Padding.All = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");

```

ASP.NET CORE

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.ClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the paddings
textBoxField.Padding.All = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document

```

```

document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "XfaForm.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "First Name";
//Set the paddings
textBoxField.Padding.All = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,

samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

Adding border to the XFA fields

You can add the fields border by using the below code snippet.

C#

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the border color and width
textBoxField.Border.Color = new PdfColor (200,123,0);
textBoxField.Border.Width = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(xfaPage, PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a text box field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("textBoxField", New SizeF(200,
20))
'Set the caption text
textBoxField.Caption.Text = "Fist Name"
'Set the border color and width
textBoxField.Border.Color = New PdfColor(200,123,0)
textBoxField.Border.Width = 2
'Add the field to the XFA form
mainForm.Fields.Add(textBoxField)
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()
```

UWP

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the border color and width
textBoxField.Border.Color = new PdfColor(200, 123, 0);
textBoxField.Border.Width = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "XfaForm.pdf");
```

ASP.NET CORE

```
//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(xfaPage,
PdfXfaFlowDirection.Horizontal, xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Set the border color and width
textBoxField.Border.Color = new PdfColor(200, 123, 0);
textBoxField.Border.Width = 2;
//Add the field to the XFA form
mainForm.Fields.Add(textBoxField);
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close();
```

```
//Defining the ContentType for pdf file

}
```

Filling form fields in an existing XFA document

Essential PDF allows you to fill the XFA form fields using [PdfLoadedXfaform](#) class.

Filling the XFA text box field

Please refer the below sample for filling the XFA text box field using [PdfLoadedXfaTextBoxField](#) class.

C#

```
//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded text box field
PdfLoadedXfaTextBoxField loadedTextBox = (loadedForm.Fields["subform1[0]"]
as PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//fill the text box
loadedTextBox.Text = "First Name";
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded text box field
Dim loadedTextBox As PdfLoadedXfaTextBoxField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm).Fields("text[0]"), PdfLoadedXfaTextBoxField)
'fill the text box
loadedTextBox.Text = "First Name"
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()
```

UWP

```
//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded text box field
PdfLoadedXfaTextBoxField loadedTextBox = (loadedForm.Fields["subform1[0]"]
as PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//fill the text box
loadedTextBox.Text = "First Name";
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded text box field
PdfLoadedXfaTextBoxField loadedTextBox = (loadedForm.Fields["subform1[0]"]
as PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//fill the text box
loadedTextBox.Text = "First Name";
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the PDF document
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded text box field
PdfLoadedXfaTextBoxField loadedTextBox = (loadedForm.Fields["subform1[0]"]
as PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//fill the text box
loadedTextBox.Text = "First Name";
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Filling the XFA numeric field

You can fill the XFA numeric field by using [PdfLoadedXfaNumericField](#) class. The below code snippet illustrates this.

C#

```
//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded numeric field
PdfLoadedXfaNumericField loadedNumericField =
(loaderForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["numericField[0]"] as PdfLoadedXfaNumericField;
//fill the numeric field
loadedNumericField.NumericValue = 945322;
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded numeric field
Dim loadedNumericField As PdfLoadedXfaNumericField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm).Fields("numericField[0]"), PdfLoadedXfaNumericField)
'fill the numeric field
loadedNumericField.NumericValue = 945322
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()
```

UWP

```

//Load the PDF document as stream
Stream docStream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded numeric field
PdfLoadedXfaNumericField loadedNumericField =
    (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["numericField[0]"] as PdfLoadedXfaNumericField;
//fill the numeric field
loadedNumericField.NumericValue = 945322;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded numeric field
PdfLoadedXfaNumericField loadedNumericField =
    (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["numericField[0]"] as PdfLoadedXfaNumericField;
//fill the numeric field
loadedNumericField.NumericValue = 945322;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document.
loadedDocument.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the PDF document

```

```

Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded numeric field
PdfLoadedXfaNumericField loadedNumericField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["numericField[0]"] as PdfLoadedXfaNumericField;
//fill the numeric field
loadedNumericField.NumericValue = 945322;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document.
loadedDocument.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

Filling the XFA combo box field

You can fill the XFA combo box field by using [PdfLoadedXfaComboBoxField](#) class. The below code snippet explains this.

C#

```

//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded combo box field
PdfLoadedXfaComboBoxField loadedComboBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["comboBoxField[0]"] as PdfLoadedXfaComboBoxField;
//Set the combo box selected index
loadedComboBoxField.SelectedIndex = 1;
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded combo box field
Dim loadedComboBoxField As PdfLoadedXfaComboBoxField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm)).Fields("comboBoxField[0]"), PdfLoadedXfaComboBoxField)
'Set the combo box selected index
loadedComboBoxField.SelectedIndex = 1
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()

```

UWP

```

//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded combo box field
PdfLoadedXfaComboBoxField loadedComboBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["comboBoxField[0]"] as PdfLoadedXfaComboBoxField;
//Set the combo box selected index
loadedComboBoxField.SelectedIndex = 1;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded combo box field.
PdfLoadedXfaComboBoxField loadedComboBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["comboBoxField[0]"] as PdfLoadedXfaComboBoxField;
//Set the combo box selected index
loadedComboBoxField.SelectedIndex = 1;

```

```

MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the PDF document
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded combo box field.
PdfLoadedXfaComboBoxField loadedComboBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["comboBoxField[0]"] as PdfLoadedXfaComboBoxField;
//Set the combo box selected index
loadedComboBoxField.SelectedIndex = 1;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

You can fill and save hidden items in XFA combo box field by using the following code snippet.

C#

```

//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("Input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded combo box field
PdfLoadedXfaComboBoxField loadedComboBoxField =
    (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["comboBoxField[0]"] as PdfLoadedXfaComboBoxField;
//Set the combo box selected index using hidden items
loadedComboBoxField.SelectedValue = loadedComboBoxField.HiddenItems[0];
//Save the combo box field hidden values
List<string> hiddenValues = new List<string>();
hiddenValues = loadedComboBoxField.HiddenItems;
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("Input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded combo box field
Dim loadedComboBoxField As PdfLoadedXfaComboBoxField =
TryCast(TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm).Fields("comboBoxField[0]"), PdfLoadedXfaComboBoxField)
'Set the combo box selected index using hidden items
loadedComboBoxField.SelectedValue = loadedComboBoxField.HiddenItems(0)
'Save the combo box field hidden values
Dim hiddenValues As New List(Of String)()
hiddenValues = loadedComboBoxField.HiddenItems
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()

```

UWP

```

//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded combo box field
PdfLoadedXfaComboBoxField loadedComboBoxField =
    (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["comboBoxField[0]"] as PdfLoadedXfaComboBoxField;
//Set the combo box selected index using hidden items
loadedComboBoxField.SelectedValue = loadedComboBoxField.HiddenItems[0];
//Save the combo box field hidden values
List<string> hiddenValues = new List<string>();

```

```

hiddenValues = loadedComboBoxField.HiddenItems;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document

samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Filling the XFA list box field

You can fill the XFA list box field by using [PdfLoadedXfaListBoxField](#) class. The below code snippet illustrates this.

C#

```
//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded list box field
PdfLoadedXfaListBoxField loadedListBoxField =
(loaderForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["listBoxField[0]"] as PdfLoadedXfaListBoxField;
//Set the list box selected index
loadedListBoxField.SelectedIndex = 1;
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded list box field
```

```

Dim loadedListBoxField As PdfLoadedXfaListBoxField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm)).Fields("listBoxField[0]"), PdfLoadedXfaListBoxField)
'Set the list box selected index
loadedListBoxField.SelectedIndex = 1
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()

```

UWP

```

//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded list box field
PdfLoadedXfaListBoxField loadedListBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["listBoxField[0]"] as PdfLoadedXfaListBoxField;
//Set the list box selected index
loadedListBoxField.SelectedIndex = 1;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded list box field.
PdfLoadedXfaListBoxField loadedListBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["listBoxField[0]"] as PdfLoadedXfaListBoxField;
//Set the list box selected index
loadedListBoxField.SelectedIndex = 1;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Defining the ContentType for pdf file

```

```

string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the PDF document
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded list box field.
PdfLoadedXfaListBoxField loadedListBoxField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["listBoxField[0]"] as PdfLoadedXfaListBoxField;
//Set the list box selected index
loadedListBoxField.SelectedIndex = 1;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

You can also select the multiple values by using the below code snippet.

C#

```

//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded list box field

```

```

PdfLoadedXfaListBoxField loadedListBoxField =
    (loadedForm.Fields["subform1[0]"] as
    PdfLoadedXfaForm).Fields["listBoxField[0]"] as PdfLoadedXfaListBoxField;
//Set the list box selected items
loadedListBoxField.SelectedItems = new string[] { "English", "Spanish" };
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded list box field
Dim loadedListBoxField As PdfLoadedXfaListBoxField =
    TryCast((TryCast(loadedForm.Fields("subform1[0]"),
    PdfLoadedXfaForm).Fields("listBoxField[0]"), PdfLoadedXfaListBoxField)
'Set the list box selected items
loadedListBoxField.SelectedItems = New String() { "English", "Spanish" }
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()

```

UWP

```

//Load the PDF document as stream
Stream docStream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
    sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded list box field
PdfLoadedXfaListBoxField loadedListBoxField =
    (loadedForm.Fields["subform1[0]"] as

Filling the XFA date time field

You can fill the XFA date time field by using [PdfLoadedXfaDateTimeField](#) class. The below code snippet explains this.

C#

```
//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded date time field
PdfLoadedXfaDateTimeField loadedDateTimeField =
(loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["dateTimeField[0]"] as PdfLoadedXfaDateTimeField;
//Set the value
loadedDateTimeField.Value = DateTime.Now;
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the loaded date time field
Dim loadedDateTimeField As PdfLoadedXfaDateTimeField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm).Fields("dateTimeField[0]"), PdfLoadedXfaDateTimeField)
'Set the value
loadedDateTimeField.Value = Date.Now
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()
```

UWP

```
//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
```

```

//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the loaded date time field
PdfLoadedXfaDateTimeField loadedDateTimeField =
    (loadedForm.Fields["subform1[0]"] as
    PdfLoadedXfaForm).Fields["dateTimeField[0]"] as PdfLoadedXfaDateTimeField;
//Set the value
loadedDateTimeField.Value = DateTime.Now;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

Removing editing capability of form fields

The form field editing or filling capabilities can be removed by marking the form or field as read only. To prevent the user from changing the form field content, you can enable the [ReadOnly](#) property of [PdfXfaForm](#).

The below code snippet illustrates how to set the read only property to a new PDF document.

C#

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Add the text box to the XFA form
mainForm.Fields.Add(textBoxField);
//Set the form as read only
mainForm.ReadOnly = true;
//Add the XFA form to the document
document.XfaForm = mainForm;
//Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic);
//close the document
document.Close();

```

VB.NET

```

'Create a new PDF XFA document
Dim document As New PdfXfaDocument()
'Add new XFA page
Dim xfaPage As PdfXfaPage = document.Pages.Add()
'Create a new PDF XFA form with horizontal flow direction
Dim mainForm As New PdfXfaForm(PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width)
'Create a text box field and add the properties
Dim textBoxField As New PdfXfaTextBoxField("textBoxField", New SizeF(200,
20))
'Set the caption text
textBoxField.Caption.Text = "Fist Name"
'Add the text box to the XFA form
mainForm.Fields.Add(textBoxField)
'Set the form as read only
mainForm.ReadOnly = True
'Add the XFA form to the document
document.XfaForm = mainForm
'Save the document
document.Save("XfaForm.pdf", PdfXfaType.Dynamic)
'close the document
document.Close()

```

UWP

```

//Create a new PDF XFA document
PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new
SizeF(200, 20));
//Set the caption text
textBoxField.Caption.Text = "Fist Name";
//Add the text box to the XFA form
mainForm.Fields.Add(textBoxField);
//Set the form as read only
mainForm.ReadOnly = true;
//Add the XFA form to the document
document.XfaForm = mainForm;
MemoryStream stream = new MemoryStream();
document.Save(stream, PdfXfaType.Dynamic);
//Close the document
document.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Create a new PDF XFA document

```

```

PdfXfaDocument document = new PdfXfaDocument();
//Add new XFA page
PdfXfaPage xfaPage = document.Pages.Add();
//Create a new PDF XFA form with horizontal flow direction
PdfXfaForm mainForm = new PdfXfaForm(PdfXfaFlowDirection.Horizontal,
xfaPage.GetClientSize().Width);
//Create a text box field and add the properties
PdfXfaTextBoxField textBoxField = new PdfXfaTextBoxField("textBoxField", new

```
document.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

The below code snippet illustrates how to set the **ReadOnly** property to an existing PDF document.

C#

```
//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Set the form as read only
loadedForm.ReadOnly = true;
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Set the form as read only
loadedForm.ReadOnly = True
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()
```

UWP

```
//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document

input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Set the form as read only
loadedForm.ReadOnly = true;
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Flattening XFA Form fields

The form field editing or filling capabilities can be removed by flattening the PDF document.

The Essential PDF flattens a form field by removing the existing form field and replacing it with graphical objects that will resemble the form field and cannot be edited. This can be achieved by enabling the [Flatten](#) property of [PdfLoadedXfaDocument](#).

The following code snippet illustrates how to flatten the XFA form field.

C#

```
//Load the existing document
PdfLoadedXfaDocument ldoc = new PdfLoadedXfaDocument("input.pdf");
//Set flatten
ldoc.Flatten = true;
//Save the document
ldoc.Save("output.pdf");
//Close the document
ldoc.Close();
```

VB.NET

```
'Load the existing document
Dim ldoc As New PdfLoadedXfaDocument("input.pdf")
'Set flatten
ldoc.Flatten = True
'Save the document
ldoc.Save("output.pdf")
'Close the document
ldoc.Close()
```

UWP

```
//PDF supports flattening XFA form fields only in Windows Forms, WPF,
//ASP.NET and ASP.NET MVC.
```

Removing the dynamic form fields from an existing XFA document

You can remove the dynamic XFA form fields by using [Remove](#) method of [PdfLoadedXfaFieldCollection](#) class. The below code snippet explained this.

C#

```

//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedText);
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the existing field
Dim loadedText As PdfLoadedXfaTextBoxField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm).Fields("text[0]"), PdfLoadedXfaTextBoxField)
'Remove the field
loadedForm.Fields.Remove(loadedText)
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()

```

UWP

```

//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedText);
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedText);
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the PDF document
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Remove the field
loadedForm.Fields.Remove(loadedText);
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Modifying the existing fields in XFA document

You can modify the existing dynamic XFA fields by using the below code snippet.

C#

```
//Load the existing PDF document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument("input.pdf");
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Set the width and height of the field
loadedText.Width = 200;
loadedText.Height = 30;
//Set the caption text
loadedText.Caption.Text = "Second Name";
//Save the document
loadedDocument.Save("output.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedXfaDocument("input.pdf")
'Load the existing XFA form
Dim loadedForm As PdfLoadedXfaForm = loadedDocument.XfaForm
'Get the existing field
Dim loadedText As PdfLoadedXfaTextBoxField =
TryCast((TryCast(loadedForm.Fields("subform1[0]"),
PdfLoadedXfaForm).Fields("text[0]"), PdfLoadedXfaTextBoxField)
'Set the width and height of the field
loadedText.Width = 200
loadedText.Height = 30
'Set the caption text
loadedText.Caption.Text = "Second Name"
'Save the document
loadedDocument.Save("output.pdf")
'Close the document
loadedDocument.Close()
```

UWP

```
//Load the PDF document as stream
```

```

Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Set the width and height of the field
loadedText.Width = 200;
loadedText.Height = 30;
//Set the caption text
loadedText.Caption.Text = "Second Name";
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Set the width and height of the field
loadedText.Width = 200;
loadedText.Height = 30;
//Set the caption text
loadedText.Caption.Text = "Second Name";
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the PDF document
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Load the existing XFA form
PdfLoadedXfaForm loadedForm = loadedDocument.XfaForm;
//Get the existing field
PdfLoadedXfaTextBoxField loadedText = (loadedForm.Fields["subform1[0]"] as
PdfLoadedXfaForm).Fields["text[0]"] as PdfLoadedXfaTextBoxField;
//Set the width and height of the field
loadedText.Width = 200;
loadedText.Height = 30;
//Set the caption text
loadedText.Caption.Text = "Second Name";
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}

```

Clear XFA date time field value

The Essential PDF supports clearing XFA form date time fields values, you can clear the date time values by using the [ClearValue](#) method available in the [PdfLoadedXfaDateTimeField](#).

The following sample illustrates how to clear the date time field in an existing XFA document.

C#

```

//Load the existing XFA PDF document
PdfLoadedXfaDocument loadedXfaDocument = new
PdfLoadedXfaDocument("input.pdf");
//Get the date time field
PdfLoadedXfaDateTimeField dateTimeField =
loadedXfaDocument.XfaForm.TryGetFieldByCompleteName("form[0].subform[0].date
Time[0]") as PdfLoadedXfaDateTimeField;
//Clear the date time field value
dateTimeField.ClearValue();
//Save and close the document

```

```
loadedXfaDocument.Save("output.pdf");
```

VB.NET

```
'Load the existing XFA PDF document
Dim loadedXfaDocument As PdfLoadedXfaDocument = New
PdfLoadedXfaDocument("input.pdf")
'Get the date time field
Dim dateTimeField As PdfLoadedXfaDateTimeField =
TryCast(loadedXfaDocument.XfaForm.TryGetFieldByCompleteName("form[0].subform
[0].dateTime[0]"), PdfLoadedXfaDateTimeField)
'Clear the date time field value
dateTimeField.ClearValue()
'Save and close the document
loadedXfaDocument.Save("output.pdf")
```

UWP

```
//Load the PDF document as stream
Stream docStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Get the date time field
PdfLoadedXfaDateTimeField dateTimeField =
loadedDocument.XfaForm.TryGetFieldByCompleteName("form[0].subform[0].dateTim
e[0]") as PdfLoadedXfaDateTimeField;
//Clear the date time field value
dateTimeField.ClearValue();
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close();
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Get the date time field
PdfLoadedXfaDateTimeField dateTimeField =
loadedDocument.XfaForm.TryGetFieldByCompleteName("form[0].subform[0].dateTim
e[0]") as PdfLoadedXfaDateTimeField;
//Clear the date time field value
dateTimeField.ClearValue();
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0', then the PDF will be empty
stream.Position = 0;
```

```
//Close the document
loadedDocument.Close();
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the PDF document
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
//Load the existing XFA document
PdfLoadedXfaDocument loadedDocument = new PdfLoadedXfaDocument(docStream);
//Get the date time field
PdfLoadedXfaDateTimeField dateTimeField =
loadedDocument.XfaForm.TryGetFieldByCompleteName("form[0].subform[0].dateTim
e[0]") as PdfLoadedXfaDateTimeField;
//Clear the date time field value
dateTimeField.ClearValue();
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//If the position is not set to '0', then the PDF will be empty
stream.Position = 0;
//Close the document
loadedDocument.Close();
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("XfaForm.pdf",
"application/pdf", fdfStream);
}
```

Supported fields for XFA form

The following XFA fields are supported in creating, filling, and flattening the PDF document.

- Text box field
- Numeric field
- DateTime field
- Combo box field
- Radio button field

- List box field
- Check box field
- Text Element
- Button
- Line
- Rectangle
- Circle
- Image

Note: Removing and modifying the form fields is not supported in **static** XFA forms.

Merge Documents

Essential PDF supports merging multiple PDF documents from disk and stream.

Merging multiple documents from disk and stream

You can merge the multiple PDF document using [Merge](#) method of [PdfDocumentBase](#) class, by specifying the path of the documents in a string array.

Refer to the following code example to merge multiple documents from disk.

C#

```
//Creates a new PDF document
PdfDocument finalDoc = new PdfDocument();
// Creates a string array of source files to be merged.
string[] source = { "file1.pdf", "file2.pdf" };
// Merges PDFDocument.
PdfDocument.Merge(finalDoc, source);
//Saves the final document
finalDoc.Save("Sample.pdf");
//Closes the document
finalDoc.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim finalDoc As New PdfDocument()
' Creates a string array of source files to be merged.
Dim source As String() = {"file1.pdf", "file2.pdf"}
' Merges PDFDocument.
PdfDocument.Merge(finalDoc, source)
'Saves the final document
finalDoc.Save("Sample.pdf")
'Closes the document
finalDoc.Close(True)
```

UWP

```
//Due to platform limitations, the PDF file cannot be loaded from disk.
However, you can merge specified document using the following code snippet.
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
```

```
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Merge the document
PdfDocumentBase.Merge(document, loadedDocument);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the documents
document.Close(true);
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respective code samples
Save(stream, "Sample.pdf");
```

ASP.NET CORE

```
//Due to platform limitations, the PDF file cannot be loaded from disk.
However, you can merge multiple documents from stream using the following
code snippet.
//Creates a PDF document
PdfDocument finalDoc = new PdfDocument();
FileStream stream1 = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
FileStream stream2 = new FileStream("file2.pdf", FileMode.Open,
FileAccess.Read);
// Creates a PDF stream for merging
Stream[] streams = { stream1, stream2 };
// Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams);
//Save the document into stream
MemoryStream stream = new MemoryStream();
finalDoc.Save(stream);
stream.Position = 0;
//Close the document
finalDoc.Close(true);
//Disposes the streams.
stream1.Dispose();
stream2.Dispose();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```

//Due to platform limitations, the PDF file cannot be loaded from disk.
However, you can merge multiple documents from stream using the following
code snippet.
//Loads the file as stream
Stream stream1 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file1.pdf");
Stream stream2 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file2.pdf");
//Creates a PDF stream for merging
Stream[] source = { stream1, stream2 };
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Merge the documents
PdfDocumentBase.Merge(document, source);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the documents
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pdf",
"application/pdf", stream);
}

```

You can merge the PDF document streams by using the following code example.

C#

```

//Creates a PDF document
PdfDocument finalDoc = new PdfDocument();
Stream stream1 = File.OpenRead("file1.pdf");
Stream stream2 = File.OpenRead("file2.pdf");
// Creates a PDF stream for merging.
Stream[] streams = { stream1, stream2 };
// Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams);
//Saves the document
finalDoc.Save("sample.pdf");
//Closes the document
finalDoc.Close(true);
//Disposes the streams
stream1.Dispose();
stream2.Dispose();

```

VB.NET

```

'Creates a PDF document
Dim finalDoc As New PdfDocument()
Dim stream1 As Stream = File.OpenRead("file1.pdf")
Dim stream2 As Stream = File.OpenRead("file2.pdf")
' Creates a PDF stream for merging.
Dim streams As Stream() = {stream1, stream2}
' Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams)
'Saves the document
finalDoc.Save("sample.pdf")
'Closes the document
finalDoc.Close(True)
'Disposes the streams
stream1.Dispose()
stream2.Dispose()

```

UWP

```

//PDF supports merging multiple documents from stream only in Windows Forms,
WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms. However, you
can merge specified document using the following code snippet.
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.file1.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(pdfStream);
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Merge the document
PdfDocumentBase.Merge(document, loadedDocument);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the documents
document.Close(true);
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Sample.pdf");

```

ASP.NET CORE

```

//Creates a PDF document
PdfDocument finalDoc = new PdfDocument();
FileStream stream1 = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
FileStream stream2 = new FileStream("file2.pdf", FileMode.Open,
FileAccess.Read);
// Creates a PDF stream for merging
Stream[] streams = { stream1, stream2 };

```

```
// Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams);
//Save the document into stream
MemoryStream stream = new MemoryStream();
finalDoc.Save(stream);
stream.Position = 0;
//Close the document
finalDoc.Close(true);
//Disposes the streams.
stream1.Dispose();
stream2.Dispose();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Loads the file as stream
Stream stream1 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file1.pdf");
Stream stream2 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file2.pdf");
//Creates a PDF stream for merging
Stream[] source = { stream1, stream2 };
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Merge the documents
PdfDocumentBase.Merge(document, source);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the documents
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pdf",
"application/pdf", stream);
}
```

Importing pages from multiple documents

Essential PDF provides support for importing the pages from one document to another document using [ImportPage](#) method. The following code illustrates this. The imported page is added to the end of the original document.

C#

```
//Loads document
PdfLoadedDocument lDoc = new PdfLoadedDocument("file1.pdf");
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPage(lDoc, 1);
//Saves the document
document.Save("sample.pdf");
//Closes the document
document.Close(true);
lDoc.Close(true)
```

VB.NET

```
'Loads document
Dim lDoc As New PdfLoadedDocument("file1.pdf")
'Creates a new document
Dim document As New PdfDocument()
'Imports the page at 1 from the lDoc
document.ImportPage(lDoc, 1)
'Saves the document
document.Save("sample.pdf")
'Closes the document
document.Close(True)
lDoc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPage(lDoc, 1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Closes the document
document.Close(true);
lDoc.Close(true);
```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples
Save(stream, "sample.pdf");
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPage(lDoc, 1);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
lDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPage(lDoc, 1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
lDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
```

```

}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
    "application/pdf", stream);
}

```

You can import multiple pages from an existing document by using [ImportPageRange](#) method. The following code example illustrates this.

C#

```

//Loads PDF document
PdfLoadedDocument lDoc = new PdfLoadedDocument("file1.pdf");
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the pages from the lDoc
document.ImportPageRange(lDoc, 0, lDoc.Pages.Count - 1);
//Saves the document
document.Save("sample.pdf");
//Closes the documents
document.Close(true);
lDoc.Close(true);

```

VB.NET

```

'Loads PDF document
Dim lDoc As New PdfLoadedDocument("file1.pdf")
'Creates a new document
Dim document As New PdfDocument()
'Imports the pages from the lDoc
document.ImportPageRange(lDoc, 0, lDoc.Pages.Count - 1)
'Saves the document
document.Save("sample.pdf")
'Closes the documents
document.Close(True)
lDoc.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPageRange(lDoc, 0, lDoc.Pages.Count - 1);
//Save the PDF document to stream

```

```

MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Closes the document
document.Close(true);
lDoc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "sample.pdf");

```

ASP.NET CORE

```

//Load the PDF document.
FileStream docStream = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPageRange(lDoc, 0, lDoc.Pages.Count - 1);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
lDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file1.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Creates a new document
PdfDocument document = new PdfDocument();
//Imports the page at 1 from the lDoc
document.ImportPageRange(lDoc, 0, lDoc.Pages.Count - 1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
lDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

You can also import pages from multiple documents and arrange the pages as required. The following code example explains the same.

C#

```

//Loads document
PdfLoadedDocument lDoc = new PdfLoadedDocument("file1.pdf");
//Loads document
PdfLoadedDocument lDoc2 = new PdfLoadedDocument("file1.pdf");
//Creates the new document
PdfDocument document = new PdfDocument();
//Imports and arranges the pages
document.ImportPage(lDoc, 2);
document.ImportPage(lDoc2, 1);
//Saves the document
document.Save("sample.pdf");
//Closes the documents
document.Close(true);
lDoc.Close(true);
lDoc2.Close(true);

```

VB.NET

```

'Loads a document
Dim lDoc As New PdfLoadedDocument("file1.pdf")
Dim lDoc2 As New PdfLoadedDocument("file2.pdf")
'create a new document
Dim document As New PdfDocument()
'imports and arranges the pages
document.ImportPage(lDoc, 2)
document.ImportPage(lDoc2, 1)
'Saves the document
document.Save("sample.pdf")
'Closes the documents
document.Close(True)
lDoc.Close(True)
lDoc2.Close(True)

```

UWP

```

//Load the PDF document as stream

```

```

Stream pdfStream1 =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.file1.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument(pdfStream1);
//Load the PDF document as stream
Stream pdfStream2 =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.file2.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc2 = new PdfLoadedDocument(pdfStream2);
//Creates the new document
PdfDocument document = new PdfDocument();
//Imports and arranges the pages
document.ImportPage(lDoc, 2);
document.ImportPage(lDoc2, 1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Closes the documents
document.Close(true);
lDoc.Close(true);
lDoc2.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "sample.pdf");

```

ASP.NET CORE

```

//Load the PDF document.
FileStream docStream1 = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream1);
//Load the PDF document.
FileStream docStream2 = new FileStream("file2.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument lDoc2 = new PdfLoadedDocument(docStream2);
//Creates the new document
PdfDocument document = new PdfDocument();
//Imports and arranges the pages
document.ImportPage(lDoc, 1);
document.ImportPage(lDoc2, 0);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the documents
document.Close(true);
lDoc.Close(true);
lDoc2.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";

```

```
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream1 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file1.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream1);
//Load the file as stream
Stream docStream2 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file2.pdf");
PdfLoadedDocument lDoc2 = new PdfLoadedDocument(docStream2);
//Creates the new document
PdfDocument document = new PdfDocument();
//Imports and arranges the pages
document.ImportPage(lDoc, 1);
document.ImportPage(lDoc2, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the documents
document.Close(true);
lDoc.Close(true);
lDoc2.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
sample
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Best practices

Merging multiple large PDF documents can lead to high runtime memory. So, you can split the documents into multiple documents and later you can merge. This method avoids the extensive memory usage and increases the performance.

Note: Note: The parent PDF document has all the contents in run time memory. It releases the memory once the final PDF document instance is disposed.

You can split a large PDF document into multiple documents using [Split](#) method of [PdfLoadedDocument](#) class. The following code snippet explains this.

C#

```
//Loads the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("large.pdf");
//Splits the document
loadedDocument.Split("split.pdf");
//Closes the document
loadedDocument.Close(true);
```

VB.NET

```
'Loads the PDF document
Dim loadedDocument As New PdfLoadedDocument("large.pdf")
'Splits the document
loadedDocument.Split("split.pdf")
'Closes the document
loadedDocument.Close(True)
```

UWP

//Due to platform limitations, multiple PDF files cannot be saved to disk. So, Essential PDF supports splitting the document into multiple documents only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms.

ASP.NET CORE

//Due to platform limitations, multiple PDF files cannot be saved to disk. So, Essential PDF supports splitting the document into multiple documents only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms.

XAMARIN

//Due to platform limitations, multiple PDF files cannot be saved to disk. So, Essential PDF supports splitting the document into multiple documents only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms.

The following code shows how to merge multiple PDF documents.

C#

```
//Input documents
string[] inputDocuments = Directory.GetFiles("../Data/Split");
//Creates a PDF document
PdfDocument document = new PdfDocument();
//Merges the document
PdfDocumentBase.Merge(document, inputDocuments);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Input documents
Dim inputDocuments As String() = Directory.GetFiles("../Data/Split")
```

```

'Creates a PDF document
Dim document As New PdfDocument()
'Merges the document
PdfDocumentBase.Merge(document, inputDocuments)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Due to platform limitations, the PDF file cannot be loaded from disk.
However, you can merge specified document using the following code snippet.
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Merge the document
PdfDocumentBase.Merge(document, loadedDocument);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the documents
document.Close(true);
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respective code samples
Save(stream, "Sample.pdf");

```

ASP.NET CORE

```

//Due to platform limitations, the PDF file cannot be loaded from disk.
However, you can merge multiple documents from stream using the following code snippet.
//Creates a PDF document
PdfDocument finalDoc = new PdfDocument();
FileStream stream1 = new FileStream("file1.pdf", FileMode.Open, FileAccess.Read);
FileStream stream2 = new FileStream("file2.pdf", FileMode.Open, FileAccess.Read);
// Creates a PDF stream for merging
Stream[] streams = { stream1, stream2 };
// Merges PDFDocument.
PdfDocumentBase.Merge(finalDoc, streams);
//Save the document into stream
MemoryStream stream = new MemoryStream();
finalDoc.Save(stream);
stream.Position = 0;
//Close the document

```

```
finalDoc.Close(true);
//Disposes the streams.
stream1.Dispose();
stream2.Dispose();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Due to platform limitations, the PDF file cannot be loaded from disk.
//However, you can merge multiple documents from stream using the following
//code snippet.
//Loads the file as stream
Stream stream1 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file1.pdf");
Stream stream2 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file2.pdf");
//Creates a PDF stream for merging
Stream[] source = { stream1, stream2 };
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Merge the documents
PdfDocumentBase.Merge(document, source);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the documents
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pdf",
"application/pdf", stream);
}
```

Optimizing PDF resources when merging PDF documents

Essential PDF provides support to optimize the PDF resources when merging PDF documents. You can optimize the resources by enabling the `OptimizeResources` property available in the `PdfMergeOptions` instance.

Refer to the following code example to optimize the PDF resources when merging PDF documents.

C#

```
//Creates a new PDF document
PdfDocument finalDoc = new PdfDocument();
//Creates a string array of source files to be merged
string[] source = { "file1.pdf", "file2.pdf" };
PdfMergeOptions mergeOptions = new PdfMergeOptions();
//Enable Optimize Resources
mergeOptions.OptimizeResources = true;
//Merges PDFDocument
PdfDocument.Merge(finalDoc, mergeOptions, source);
//Saves the final document
finalDoc.Save("Sample.pdf");
//Closes the document
finalDoc.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim finalDoc As New PdfDocument()
'Creates a string array of source files to be merged
Dim source As String() = {"file1.pdf", "file2.pdf"}
Dim mergeOptions As New PdfMergeOptions()
'Enable Optimize Resources
mergeOptions.OptimizeResources = True
'Merges PDFDocument
PdfDocument.Merge(finalDoc, mergeOptions, source)
'Saves the final document
finalDoc.Save("Sample.pdf")
'Closes the document
finalDoc.Close(True)
```

ASP.NET CORE

```
//Due to platform limitations, the PDF file cannot be loaded from disk.
However, you can optimize PDF resources when merging multiple documents from
stream using the following code snippet
//Creates a PDF document
PdfDocument finalDoc = new PdfDocument();
FileStream stream1 = new FileStream("file1.pdf", FileMode.Open,
FileAccess.Read);
FileStream stream2 = new FileStream("file2.pdf", FileMode.Open,
FileAccess.Read);
//Creates a PDF stream for merging
Stream[] streams = { stream1, stream2 };
PdfMergeOptions mergeOptions = new PdfMergeOptions();
//Enable Optimize Resources
mergeOptions.OptimizeResources = true;
//Merges PDFDocument
PdfDocumentBase.Merge(finalDoc, mergeOptions, streams);
//Save the document into stream
MemoryStream stream = new MemoryStream();
finalDoc.Save(stream);
stream.Position = 0;
```

```
//Close the document
finalDoc.Close(true);
//Disposes the streams
stream1.Dispose();
stream2.Dispose();
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Due to platform limitations, the PDF file cannot be loaded from disk.
//However, you can optimize PDF resources when merging multiple documents from
//stream using the following code snippet
//Loads the file as stream
Stream stream1 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file1.pdf");
Stream stream2 =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
file2.pdf");
//Creates a PDF stream for merging
Stream[] source = { stream1, stream2 };
//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfMergeOptions mergeOptions = new PdfMergeOptions();
//Enable Optimize Resources
mergeOptions.OptimizeResources = true;
//Merge the documents
PdfDocumentBase.Merge(document, mergeOptions, source);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the documents
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pdf",
"application/pdf", stream);
}
```

Working with Text Extraction

Essential PDF allows you to extract the text from a particular page or the entire PDF document.

Working with basic text extraction

You can extract the text from a page using [ExtractText](#) method in [PdfPageBase](#) class.

The following code snippet explains how to extract the texts from a page.

C#

```
//Load an existing PDF.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load the first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedText = page.ExtractText();
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load an existing PDF.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Load the first page.
Dim page As PdfPageBase = loadedDocument.Pages(0)
'Extract the text from first page.
Dim extractedText As String = page.ExtractText()
'close the document.
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Load the first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedText = page.ExtractText();
//Close the document.
loadedDocument.Close(true);
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("Sample.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
```

```
//Load the first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedText = page.ExtractText();
//Close the document.
loadedDocument.Close(true);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
TextLineCollection lineCollection = new TextLineCollection();
string extractedText = page.ExtractText(out lineCollection);
//Close the document
loadedDocument.Close(true);
```

Note: In this method, the text is extracted in the order in which it is written in the document stream and it may not be in the order in which it is viewed in the PDF reader application.

Note: Extracting text from the PDF document pages will not load the entire document content into memory.

The below code illustrates how to extract the text from entire PDF document:

C#

```
// Load an existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
// Loading page collections
PdfLoadedPageCollection loadedPages = loadedDocument.Pages;
string extractedText = string.Empty;
// Extract text from existing PDF document pages
foreach (PdfLoadedPage loadedPage in loadedPages)
{
    extractedText += loadedPage.ExtractText();
}
// Close the document.
loadedDocument.Close(true);
```

VB.NET

```
' Load an existing PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
' Loading page collections
Dim loadedPages As PdfLoadedPageCollection = loadedDocument.Pages
Dim extractedText As String = String.Empty
' Extract text from existing PDF document pages
For Each loadedPage As PdfLoadedPage In loadedPages
    extractedText &= loadedPage.ExtractText()
```

```

Next loadedPage
' Close the document.
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
// Loading page collections
PdfLoadedPageCollection loadedPages = loadedDocument.Pages;
string extractedText = string.Empty;
// Extract text from existing PDF document pages
foreach (PdfLoadedPage loadedPage in loadedPages)
{
    extractedText += loadedPage.ExtractText();
}
//Close the document.
loadedDocument.Close(true);

```

ASP.NET CORE

```

//Load the PDF document.
FileStream docStream = new FileStream("Sample.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
// Loading page collections
PdfLoadedPageCollection loadedPages = loadedDocument.Pages;
string extractedText = string.Empty;
// Extract text from existing PDF document pages
foreach (PdfLoadedPage loadedPage in loadedPages)
{
    extractedText += loadedPage.ExtractText();
}
//Close the document.
loadedDocument.Close(true);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
// Loading page collections
PdfLoadedPageCollection loadedPages = loadedDocument.Pages;
TextLineCollection lineCollection = new TextLineCollection();

```

```
string extractedText = string.Empty;
// Extract text from existing PDF document pages
foreach (PdfLoadedPage loadedPage in loadedPages)
{
    extractedText += loadedPage.ExtractText(out lineCollection);
}
//Close the document
loadedDocument.Close(true);
```

Working with layout based text extraction

You can extract text from the given PDF page based on its layout using [ExtractText\(bool\)](#) overload. In this method, the text is extracted in the layout as it is viewed in the reader application.

Please refer the following code snippet to extract the text with layout.

C#

```
//Load an existing PDF.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedTexts = page.ExtractText(true);
//close the document
loadedDocument.Close(true);
```

VB.NET

```
//Load an existing PDF.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedTexts = page.ExtractText(true);
//close the document
loadedDocument.Close(true);
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Load first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedTexts = page.ExtractText(true);
//Close the document.
loadedDocument.Close(true);
```

ASP.NET CORE

```
//Load the PDF document.
FileStream docStream = new FileStream("Sample.pdf", FileMode.Open,
FileAccess.Read);
//Load the PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load first page.
PdfPageBase page = loadedDocument.Pages[0];
//Extract text from first page.
string extractedTexts = page.ExtractText(true);
//Close the document.
loadedDocument.Close(true);
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
```

XAMARIN

```
//PDF supports extract text from the given PDF page based on its layout
using ExtractText(bool) overload only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and UWP platforms.
```

Note: Layout based text extraction may take additional processing time when compared to the normal extraction mode.

Text Extraction with Bounds

Working with Lines

You can get the line and its properties that contains texts by using **TextLine**. Refer to the following code sample.

C#

```
// Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
// Get the first page of the loaded PDF document
PdfPageBase page = loadedDocument.Pages[0];
TextLines lineCollection = new TextLines();
// Extract text from the first page
string extractedText = page.ExtractText(out lineCollection);
// Gets specific line from the collection
TextLine line = lineCollection[0];
// Gets bounds of the line
RectangleF lineBounds = line.Bounds;
// Gets text in the line
string text = line.Text;
```

VB.NET

```
' Load the existing PDF document
```

```

Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument(fileName)
' Get the first page of the loaded PDF document
Dim page As PdfPageBase = loadedDocument.Pages(0)
Dim lineCollection As TextLines = New TextLines()
' Extract text from the first page
Dim extractedText As String = page.ExtractText(lineCollection)
' Gets specific line from the collection
Dim line As TextLine = lineCollection(0)
' Gets bounds of the line
Dim lineBounds As RectangleF = line.Bounds
' Gets text in the line
Dim text As String = line.Text

```

UWP

```

//PDF supports getting the lines and its properties using TextLine only in
WinForms, WPF and Xamarin platforms.

```

ASP.NET CORE

```

//PDF supports getting the lines and its properties using TextLine only in
WinForms, WPF and Xamarin platforms.

```

XAMARIN

```

//Load the existing PDF document
PdfLoadedDocument m_loadedDocument = new PdfLoadedDocument(stream);
//Get the first page of the loaded PDF document
PdfPageBase page = m_loadedDocument.Pages[0];
TextLineCollection lineCollection = new TextLineCollection();
//Extract text from the first page
string m_extractedText = page.ExtractText(out lineCollection);
//Gets specific line from the collection
TextLine line = lineCollection.TextLine[0];
//Gets bounds of the line
RectangleF lineBounds = line.Bounds;
//Gets the font of the text
string fontName = line.FontName;
//Gets the size of the text
float fontSize = line.FontSize;
//Gets font style of the text
FontStyle fontStyle = line.FontStyle;
//Gets text in the line
string text = line.Text;
//Gets collection of the words in the line
List<TextWord> textWordCollection = line.WordCollection;

```

Working with words

You can get the single word and its properties by using **TextWord**. Refer to the following code sample.

C#

```

// Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
// Get the first page of the loaded PDF document

```

```

PdfPageBase page = loadedDocument.Pages[0];
TextLines lineCollection = new TextLines();
// Extract text from the first page
string extractedText = page.ExtractText(out lineCollection);
// Gets specific line from the collection
TextLine line = lineCollection[0];
// Gets bounds of the line
RectangleF lineBounds = line.Bounds;
// Gets text in the line
string text = line.Text;
// Gets collection of the words in the line
List<TextWord> textWordCollection = line.WordCollection;

```

VB.NET

```

' Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument(fileName)
' Get the first page of the loaded PDF document
Dim page As PdfPageBase = loadedDocument.Pages(0)
Dim lineCollection As TextLines = New TextLines()
' Extract text from the first page
Dim extractedText As String = page.ExtractText(lineCollection)
' Gets specific line from the collection
Dim line As TextLine = lineCollection(0)
' Gets bounds of the line
Dim lineBounds As RectangleF = line.Bounds
' Gets text in the line
Dim text As String = line.Text
' Gets collection of the words in the line
Dim textWordCollection As List(Of TextWord) = line.WordCollection

```

UWP

```

//PDF supports getting the word and its properties using TextWord only in
WinForms, WPF and Xamarin platforms.

```

ASP.NET CORE

```

//PDF supports getting the word and its properties using TextWord only in
WinForms, WPF and Xamarin platforms.

```

XAMARIN

```

//Load the existing PDF document
PdfLoadedDocument m_loadedDocument = new PdfLoadedDocument(stream);
//Get the first page of the loaded PDF document
PdfPageBase page = m_loadedDocument.Pages[0];
TextLineCollection lineCollection = new TextLineCollection();
//Extract text from the first page
string m_extractedText = page.ExtractText(out lineCollection);
//Gets specific line from the collection
TextLine line = lineCollection.TextLine[0];
//Gets collection of the words in the line
List<TextWord> textWordCollection = line.WordCollection;
//Gets word from the collection using index

```

```

TextWord textWord = textWordCollection[0];
//Gets bounds of the word
RectangleF WordBounds = textWord.Bounds;
//Gets font name of the word
string wordFontName = textWord.FontName;
//Gets size of the word
float wordFontSize = textWord.FontSize;
//Gets font style of the word
FontStyle wordFontStyle = textWord.FontStyle;
// Gets the word
string wordText = textWord.Text;
// Gets Glyph details of the word
List<TextGlyph> textGlyphCollection = textWord.Glyphs;

```

Working with characters

You can get single character and its properties by using [TextGlyph](#). Refer to the following code sample.

C#

```

//PDF supports getting the single character and its properties using
TextGlyph only in Xamarin platform.

```

VB.NET

```

//PDF supports getting the single character and its properties using
TextGlyph only in Xamarin platform.

```

UWP

```

//PDF supports getting the single character and its properties using
TextGlyph only in Xamarin platform.

```

ASP.NET CORE

```

//PDF supports getting the single character and its properties using
TextGlyph only in Xamarin platform.

```

XAMARIN

```

//Load the existing PDF document
PdfLoadedDocument m_loadedDocument = new PdfLoadedDocument(stream);
//Get the first page of the loaded PDF document
PdfPageBase page = m_loadedDocument.Pages[0];
TextLineCollection lineCollection = new TextLineCollection();
//Extract text from the first page
string m_extractedText = page.ExtractText(out lineCollection);
//Gets specific line from the collection
TextLine line = lineCollection.TextLine[0];
//Gets collection of the words in the line
List<TextWord> textWordCollection = line.WordCollection;
//Gets word from the collection using index
TextWord textWord = textWordCollection[0];
// Gets Glyph details of the word
List<TextGlyph> textGlyphCollection = textWord.Glyphs;

```

```
//Gets character of the word
TextGlyph textGlyph = textGlyphCollection[0];
//Gets bounds of the character
RectangleF glyphBounds = textGlyph.Bounds;
//Gets font name of the character
string GlyphFontName = textGlyph.FontName;
//Gets font size of the character
float GlyphFontSize = textGlyph.FontSize;
//Gets font style of the character
FontStyle GlyphFontStyle = textGlyph.FontStyle;
//Gets character in the word
char GlyphText = textGlyph.Text;
```

Working with Image Extraction

The Essential PDF provides support to extract images from a particular page or an entire PDF document. You can extract the images from a page using the [ExtractImages](#) method in the [PdfPageBase](#) class.

Refer to the following code snippet to extract the images from a PDF page.

C#

```
//Load an existing PDF
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load the first page
PdfPageBase pageBase = loadedDocument.Pages[0];
//Extract images from first page
Image[] extractedImages = pageBase.ExtractImages();
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load an existing PDF
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Load the first page
Dim pageBase As PdfPageBase = loadedDocument.Pages(0)
'Extract images from first page
Dim extractedImages As Image() = pageBase.ExtractImages()
'Close the document
loadedDocument.Close(True)
```

UWP

```
//PDF supports extracting the images from PDF document only in Windows
Forms, WPF, ASP.NET, and ASP.NET MVC platforms
```

ASP.NET CORE

```
//Load an existing PDF
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the first page
PdfPageBase pageBase = loadedDocument.Pages[0];
//Extract images from first page
```

```
Image[] extractedImages = pageBase.ExtractImages();
//Close the document
loadedDocument.Close(true);
```

XAMARIN

```
//PDF supports extracting the images from PDF document only in Windows
Forms, WPF, ASP.NET, and ASP.NET MVC platforms
```

Note: To extract the images from PDF page in .NET Core, you need to include [Syncfusion.Pdf.Imaging.Portable](#) assembly reference in .NET Core project.

Image informations

To extract the image properties such as bounds, image index, and more from a page, you can use the [ImagesInfo](#) property in the [PdfPageBase](#) class.

Refer to the following code snippet to extract the image info from a PDF page.

C#

```
//Load an existing PDF
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load the first page
PdfPageBase pageBase = loadedDocument.Pages[0];
//Extracts all the images info from first page
PdfImageInfo[] imagesInfo= pageBase.ImagesInfo;
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load an existing PDF
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Load the first page
Dim pageBase As PdfPageBase = loadedDocument.Pages(0)
'Extracts all the images info from first page
Dim imagesInfo As PdfImageInfo[] = pageBase.ImagesInfo
'Close the document
loadedDocument.Close(True)
```

UWP

```
//PDF supports extracting the images from PDF document only in Windows
Forms, WPF, ASP.NET, and ASP.NET MVC platforms
```

ASP.NET CORE

```
//Load an existing PDF
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the first page
PdfPageBase pageBase = loadedDocument.Pages[0];
//Extracts all the images info from first page
```

```
PdfImageInfo[] imagesInfo= pageBase.GetImagesInfo();  
//Close the document  
loadedDocument.Close(true);
```

XAMARIN

```
//PDF supports extracting the image information from PDF document only in  
Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms
```

Note: To extract the image information from PDF page in .NET Core, you need to include [Syncfusion.Pdf.Imaging.Portable](#) assembly reference in .NET Core project.

Converting HTML to PDF

Essential PDF supports converting HTML pages to PDF document. The converter offers full support for HTML tags, HTML5, CSS3, JavaScript, SVG and page breaks. The following are the three rendering engines:

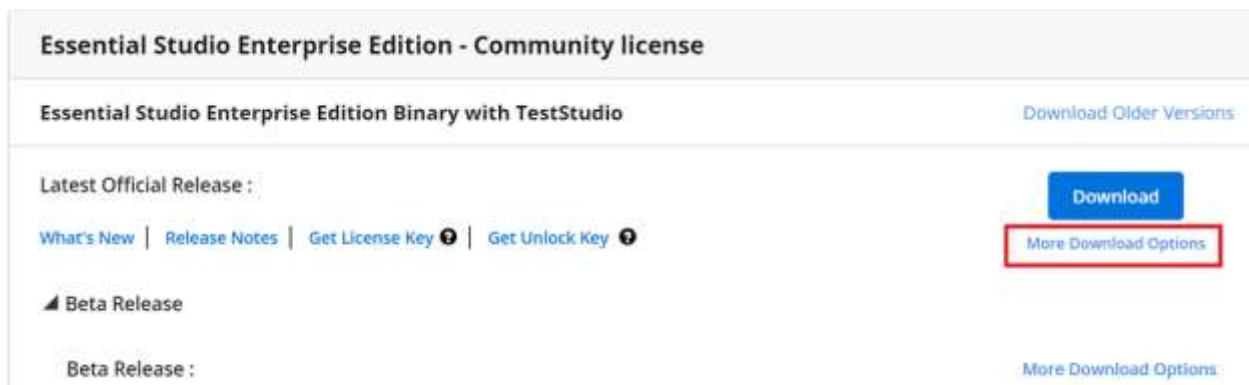

- WebKit rendering
- Blink rendering
- IE rendering

Steps to download the HTML converter installer

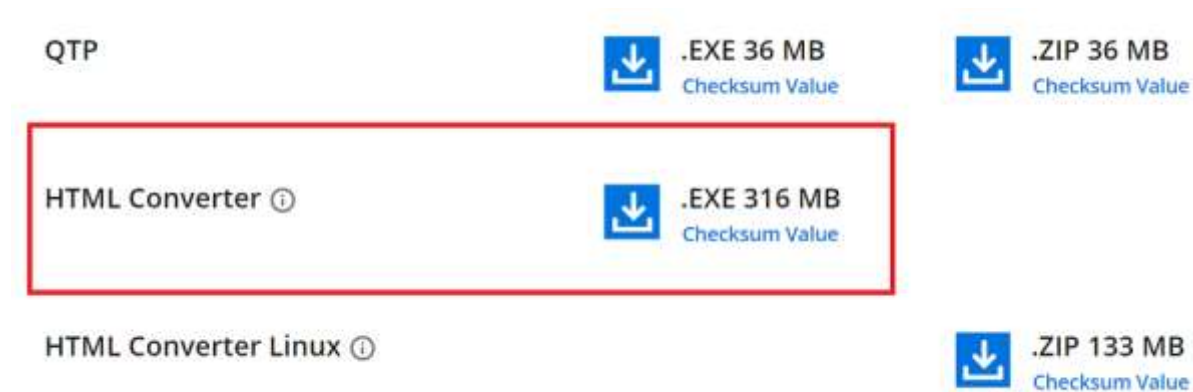

- The latest version of Essential HTML converter can be downloaded from

<https://www.syncfusion.com/downloads/latest-version>

- Click more downloads option from the required product version. Refer to the following screenshot.

- The HTML converter is available under the Add-On section. Refer to the following screenshot.

Getting Started

Essential PDF supports converting HTML contents to PDF. To add the HTML to PDF conversion functionality, add the following assemblies as reference to the project.

Assembly Name	Description
Syncfusion.HtmlConverter.Base	This is required for converting HTML to PDF.
Syncfusion.Pdf.Base	Contains the core feature for creating, manipulating, and saving PDF documents.
Syncfusion.Compression.Base	This is required for compressing the internal contents of a PDF document.

Include the following namespaces in your .cs or .vb file as follows.

C#

```
using Syncfusion.Pdf;
using Syncfusion.HtmlConverter;
```

VB.NET

```
Imports Syncfusion.Pdf
Imports Syncfusion.HtmlConverter
```

ASP.NET CORE

```
using Syncfusion.Pdf;
using Syncfusion.HtmlConverter;
```

Converting HTML to PDF using WebKit rendering engine

To convert website URL or local HTML file to PDF using WebKit rendering engine, refer to the following code snippet. Click the following link for more details to convert the HTML to PDF using WebKit rendering engine.

[Conversion using WebKit Rendering](#)

C#

```
//Initialize the HTML to PDF converter
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
WebKitConverterSettings settings = new WebKitConverterSettings();
//Set WebKit path
settings.WebKitPath = @"QtBinaries/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = settings;
//Convert URL to PDF
PdfDocument document = htmlConverter.Convert("https://www.google.com");
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Initialize the HTML to PDF converter
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
Dim settings As New WebKitConverterSettings()
'Set WebKit path
settings.WebKitPath = "/QtBinaries/"
'Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = settings
'Convert URL to PDF
Dim document As PdfDocument =
htmlConverter.Convert("https://www.google.com")
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

ASP.NET CORE

```
//Initialize the HTML to PDF converter
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
WebKitConverterSettings settings = new WebKitConverterSettings();
//Set WebKit path
settings.WebKitPath = @"QtBinariesDotNetCore\";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = settings;
//Convert URL to PDF
PdfDocument document = htmlConverter.Convert("https://www.google.com");
FileStream fileStream = new FileStream("Sample.pdf", FileMode.CreateNew,
FileAccess.ReadWrite);
//Save and close the PDF document
document.Save(fileStream);
document.Close(true);
```

Converting HTML to PDF using Blink rendering engine

To convert website URL or local HTML file to PDF using Blink rendering engine, refer to the following code snippet. Click the following link for more details to convert the HTML to PDF using Blink rendering engine.

[Conversion using Blink Rendering](#)

C#

```
//Initialize the HTML to PDF converter with Blink rendering engine
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.Blink);
BlinkConverterSettings blinkConverterSettings = new
BlinkConverterSettings();
//Set the BlinkBinaries folder path
blinkConverterSettings.BlinkPath = @"BlinkBinaries/";
//Assign Blink converter settings to HTML converter
htmlConverter.ConverterSettings = blinkConverterSettings;
//Convert URL to PDF
PdfDocument document = htmlConverter.Convert("https://www.google.com");
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Initialize the HTML to PDF converter with Blink rendering engine
Dim htmlConverter As HtmlToPdfConverter = New
HtmlToPdfConverter(HtmlRenderingEngine.Blink)
Dim blinkConverterSettings As BlinkConverterSettings = New
BlinkConverterSettings()
'Set the BlinkBinaries folder path
blinkConverterSettings.BlinkPath = "BlinkBinaries/"
'Assign Blink converter settings to HTML converter
htmlConverter.ConverterSettings = blinkConverterSettings
'Convert URL to PDF
Dim document As PdfDocument =
htmlConverter.Convert("https://www.google.com")
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

ASP.NET CORE

```
//Currently, Blink rendering engine does not support conversion in .NET Core
platform
```

Converting HTML to PDF using IE rendering engine

To convert website URL or local HTML file to PDF using IE rendering engine, refer to the following code snippet. Click the following link for more details to convert the HTML to PDF using IE rendering engine.

[Conversion using IE Rendering](#)

C#

```
//Initialize the HTML to PDF converter
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.IE);
IEConverterSettings settings = new IEConverterSettings();
//Assign IE settings to HTML converter
htmlConverter.ConverterSettings = settings;
//Convert URL to PDF
PdfDocument document = htmlConverter.Convert("https://www.google.com");
//Save and close the PDF document
```

```
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Initialize the HTML to PDF converter
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.IE)
Dim settings As New IEConverterSettings()
'Assign IE settings to HTML converter
htmlConverter.ConverterSettings = settings
'Convert URL to PDF
Dim document As PdfDocument =
htmlConverter.Convert("https://www.google.com")
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

ASP.NET CORE

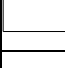

```
//Currently, IE rendering engine does not support conversion in .NET Core
platform
```

Supported and Unsupported Features by Rendering Engines

The following table shows the WebKit, Blink and IE rendering engines supported features:

Feature	WebKit Renderer	Blink Renderer	IE Renderer
Convert URLs to PDF			
Convert HTML string to PDF			
Images			
Hyperlinks			
CSS			
JavaScript			
ActiveX plugin			
HTML 5			
Page breaks			

Vector Graphics (Selectable/searchable text)			HTML 5 pages are rendered as bitmap.
Handling image and text split across pages			
PDF A1-B			
Tagged PDF			
Page settings			
Header and Footer			
Windows Authentication			
Form Authentication			
HTML to Image			
HTML to SVG			
HTML to MHTML			
SVG to PDF			
HTML Form to PDF Form			
HTTP GET and POST			
Partial HTML to PDF			
Bookmarks			
Repeat HTML Table Header and Footer			
Auto Create Table of Contents			

Windows status			
Print Media Type			
Offline mode conversion			
System proxy			
Manual proxy			
Azure App Service	 (Except free and shared plan)		
Azure Cloud Service			
Azure Function	 (Except consumption plan)		

Working with Document Conversions

Converting Word documents to PDF

Essential PDF allows you to convert a Word document into PDF. For converting a Word document to PDF, the following assemblies need to be referenced in your application

Assembly Name	Description
Syncfusion.DocIO.Base	This assembly has the core features for creating and manipulating Word documents.
Syncfusion.Compression.Base	This assembly is used to package the Word documents
Syncfusion.DocToPdfConverter.Base	This assembly is needed for converting the Word document to PDF.
Syncfusion.Pdf.Base	This assembly has the core features for creating PDF file.
Syncfusion.OfficeChart.Base	This assembly has features to work with chart in Word document.

The following assemblies are need to be referred in addition to the above mentioned assemblies for converting the chart present in the Word document into PDF.

Assembly Name	Description
Syncfusion.OfficeChartToImageConverter.WPF	This assembly is used to convert the chart to image.
Syncfusion.SfChart.WPF	This is supporting assembly for Syncfusion.OfficeChartToImageConverter.WPF
Syncfusion.Shared.WPF	This is supporting assembly for Syncfusion.OfficeChartToImageConverter.WPF

The following namespaces are required to compile the code in this topic.

For Windows Forms, WPF, ASP.NET and ASP.NET MVC applications

- using Syncfusion.OfficeChart
- using Syncfusion.DocIO
- using Syncfusion.DocIO.DLS
- using Syncfusion.DocToPDFConverter
- using Syncfusion.Pdf
- using Syncfusion.OfficeChartToImageConverter

For ASP.NET Core and Xamarin applications

- using Syncfusion.DocIO
- using Syncfusion.DocIO.DLS
- using Syncfusion.DocIORenderer
- using Syncfusion.Pdf

[DocToPDFConverter](#) class is responsible for converting a Word document into PDF. The following code snippet illustrates how to convert a Word document into PDF document.

C#

```
//Load an existing Word document
WordDocument wordDocument = new WordDocument("Template.docx",
FormatType.Docx);
//Initialize chart to image converter for converting charts during Word to
pdf conversion
wordDocument.ChartToImageConverter = new ChartToImageConverter();
//Create an instance of DocToPDFConverter
DocToPDFConverter converter = new DocToPDFConverter();
//Convert Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Save the PDF file
pdfDocument.Save("WordtoPDF.pdf");
//Close the instance of document objects
pdfDocument.Close(true);
wordDocument.Close();
```

VB.NET

```

'Load an existing Word document
Dim wordDocument As New WordDocument("Template.docx", FormatType.Docx)
'Initialize chart to image converter for converting charts during Word to
pdf conversion
wordDocument.ChartToImageConverter = New ChartToImageConverter()
'Create an instance of DocToPDFConverter
Dim converter As New DocToPDFConverter()
'Convert Word document into PDF document
Dim pdfDocument As PdfDocument = converter.ConvertToPDF(wordDocument)
'Save the PDF file
pdfDocument.Save("WordtoPDF.pdf")
'Close the instance of document objects
pdfDocument.Close(True)
wordDocument.Close()

```

ASP.NET CORE

```

// Open the file as Stream
FileStream docStream = new FileStream(@"Template.docx", FileMode.Open,
FileAccess.Read);
//Loads file stream into Word document
WordDocument wordDocument = new WordDocument(docStream,
Syncfusion.DocIO.FormatTypeAutomatic);
//Instantiation of DocIORenderer for Word to PDF conversion
DocIORenderer render = new DocIORenderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(wordDocument);
//Releases all resources used by the Word document and DocIO Renderer
objects
render.Dispose();
wordDocument.Dispose();
//Save the document into stream
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
stream.Position = 0;
//Close the documents
pdfDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = " WordtoPDF.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the Word document as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Template.docx");
//Load the stream into word document
WordDocument wordDocument = new WordDocument(docStream,
Syncfusion.DocIO.FormatTypeAutomatic);

```

```

//Instantiation of DocIORenderer for Word to PDF conversion
DocIORenderer render = new DocIORenderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(wordDocument);
//Releases all resources used by the Word document and DocIO Renderer objects
render.Dispose();
wordDocument.Dispose();
//Save the document into memory stream
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
stream.Position = 0;
//Close the document
pdfDocument.Close();
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer PDF/Xamarin section for respective code samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("WordtoPDF.pdf", "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("WordtoPDF.pdf", "application/pdf", stream);
}

```

Note:

- Initializing the [ChartToImageConverter](#) is mandatory to convert the charts present in the Word document to PDF. Otherwise the charts will not be exported to the converted PDF.
- [ChartToImageConverter](#) is supported from .NET Framework 4.0 onwards.
- Total number of pages may vary based on unsupported elements in the converted PDF document when compare to Word document.

Customizing the Word document to PDF conversion

Essential DocIO allows you to customize the Word to PDF conversion with the below options:

- Allows to determine the quality of the charts in the converted PDF
- Allows to determine the quality of the JPEG images in the converted PDF
- Allows to reduce the Main Memory usage in Word to PDF conversion by reusing the identical images.

C#

```

//Loads an existing Word document
WordDocument wordDocument = new WordDocument("Sample_Image.docx", FormatType.Docx);
//Initialize chart to image converter for converting charts during Word to pdf conversion

```

```

wordDocument.ChartToImageConverter = new ChartToImageConverter();
//Set the scaling mode for charts
wordDocument.ChartToImageConverter.ScalingMode = ScalingMode.Normal;
//create an instance of DocToPDFConverter - responsible for Word to PDF
conversion
DocToPDFConverter converter = new DocToPDFConverter();
//Set the image quality
converter.Settings.ImageQuality = 100;
//Set the image resolution
converter.Settings.ImageResolution = 640;
//Set true to optimize the memory usage for identical images
converter.Settings.OptimizeIdenticalImages = true;
//Convert Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Save the PDF file to file system
pdfDocument.Save("WordtoPDF.pdf");
//close the instance of document objects
pdfDocument.Close(true);
wordDocument.Close();

```

VB.NET

```

'Loads an existing Word document
Dim wordDocument As New WordDocument("Sample_Image.docx", FormatType.Docx)
'Initialize chart to image converter for converting charts during Word to
pdf conversion
wordDocument.ChartToImageConverter = New ChartToImageConverter()
'Set the scaling mode for charts
wordDocument.ChartToImageConverter.ScalingMode = ScalingMode.Normal
'create an instance of DocToPDFConverter - responsible for Word to PDF
conversion
Dim converter As New DocToPDFConverter()
'Set the image quality
converter.Settings.ImageQuality = 100
'Set the image resolution
converter.Settings.ImageResolution = 640
'Set true to optimize the memory usage for identical images
converter.Settings.OptimizeIdenticalImages = True
'Convert Word document into PDF document
Dim pdfDocument As PdfDocument = converter.ConvertToPDF(wordDocument)
'Save the PDF file to file system
pdfDocument.Save("WordtoPDF.pdf")
'close the instance of document objects
pdfDocument.Close(True)
wordDocument.Close()

```

ASP.NET CORE

```

//Essential PDF supports customizing the Word document to PDF conversion
only in Windows Forms, WPF, ASP.NET and ASP.NET MVC Platforms.

```

XAMARIN

```

//Essential PDF supports customizing the Word document to PDF conversion
only in Windows Forms, WPF, ASP.NET and ASP.NET MVC Platforms.

```

Converting Excel documents to PDF

[ExcelToPdfConverter](#) is responsible for converting an Excel document into PDF. Essential PDF allows you to convert an entire workbook or a single worksheet into PDF document. For converting an Excel document to PDF, the following assemblies need to be referenced in your application.

- Syncfusion.XlsIO.Base.dll
- Syncfusion.Compression.Base.dll
- Syncfusion.ExcelToPDFConverter.Base.dll
- Syncfusion.ExcelChartToImageConverter.Wpf.dll
- Syncfusion.SfChart.Wpf.dll
- Syncfusion.Shared.Wpf.dll
- Syncfusion.Pdf.Base.dll

Converting a Workbook to PDF

The following code illustrates how to convert a workbook to PDF Document using [ExcelToPdfConverter](#).

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
//Open the Excel Document to Convert
ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
//Initialize PDF Document
PdfDocument pdfDocument = new PdfDocument();
//Convert Excel Document into PDF document
pdfDocument = converter.Convert();
//Save the pdf file
pdfDocument.Save("ExcelToPDF.pdf");
//Dispose the objects
pdfDocument.Close();
converter.Dispose();
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As ExcelEngine = New ExcelEngine
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
'Open the Excel Document to Convert
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Initialize the PDF Document
Dim pdfDocument As PdfDocument = New PdfDocument()
'Convert Excel Document into PDF document
pdfDocument = converter.Convert()
'Save the pdf file
pdfDocument.Save("ExcelToPDF.pdf")
```

```
'Dispose the objects
pdfDocument.Close()
converter.Dispose()
workbook.Close()
excelEngine.Dispose()
```

UWP

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

Converting a Worksheet to PDF

The following code shows how to convert a particular sheet to PDF Document using [ExcelToPdfConverter](#).

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
//convert the sheet to pdf
ExcelToPdfConverter converter = new ExcelToPdfConverter(sheet);
PdfDocument pdfDocument= new PdfDocument();
pdfDocument = converter.Convert();
pdfDocument.Save("ExcelToPDF.pdf");
pdfDocument.Close();
converter.Dispose();
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As ExcelEngine = New ExcelEngine
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Converts the particular sheet
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(sheet)
Dim pdfDocument As PdfDocument = New PdfDocument()
```

```
pdfDocument = converter.Convert()
'Save the pdf file
pdfDocument.Save("ExcelToPDF.pdf")
'Dispose the objects
pdfDocument.Close()
converter.Dispose()
workbook.Close()
excelEngine.Dispose()
```

UWP

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

Creating individual PDF document for each worksheet

The following code snippet shows how to create an individual PDF document for each worksheet in a workbook.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
PdfDocument pdfDocument = new PdfDocument();
foreach (IWorksheet sheet in workbook.Worksheets)
{
    ExcelToPdfConverter converter = new ExcelToPdfConverter(sheet);
    pdfDocument = converter.Convert();
    //Save the pdf file
    pdfDocument.Save(sheet.Name+".pdf");
    converter.Dispose();
}
//Dispose the objects
pdfDocument.Close();
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
```

```

Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim pdfDocument As New PdfDocument()
For Each sheet As IWorksheet In workbook.Worksheets
Dim converter As New ExcelToPdfConverter(sheet)
PdfDocument = converter.Convert()
'Save the pdf file
PdfDocument.Save(sheet.Name + ".pdf")
converter.Dispose()
Next
pdfDocument.Close()
workbook.Close()
excelEngine.Dispose()

```

UWP

```

//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.

```

ASP.NET CORE

```

//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.

```

XAMARIN

```

//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.

```

Excel with Chart to PDF

To preserve the charts during Excel to PDF conversion, you should initialize the [ChartToImageConverter](#) of [IApplication](#) interface, otherwise the charts present in worksheet will get skipped. The following code illustrate how to convert an Excel with chart to PDF document.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiating the ChartToImageConverter and
//Assigning the ChartToImageConverter instance of XlsIO application
application.ChartToImageConverter = new ChartToImageConverter();
//Tuning Chart Image Quality
application.ChartToImageConverter.ScalingMode = ScalingMode.Best;
IWorkbook workbook = application.Workbooks.Open("chart.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
PdfDocument pdfDocument = new PdfDocument();
pdfDocument = converter.Convert();
pdfDocument.Save("ExcelToPDF.pdf");
converter.Dispose();
pdfDocument.Close();
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```
Dim excelEngine As New ExcelEngine()  
Dim application As IApplication = excelEngine.Excel  
application.DefaultVersion = ExcelVersion.Excel2013  
'Instantiating the ChartToImageConverter and  
'Assigning the ChartToImageConverter instance of XlsIO application  
application.ChartToImageConverter = New ChartToImageConverter()  
'Tuning Chart Image Quality  
application.ChartToImageConverter.ScalingMode = ScalingMode.Best  
Dim workbook As IWorkbook = application.Workbooks.Open("chart.xlsx")  
Dim worksheet As IWorksheet = workbook.Worksheets(0)  
Dim converter As New ExcelToPdfConverter(workbook)  
Dim pdfDocument As New PdfDocument()  
pdfDocument = converter.Convert()  
pdfDocument.Save("ExcelToPDF.pdf")  
converter.Dispose()  
pdfDocument.Close()  
workbook.Close()  
excelEngine.Dispose()
```

UWP

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,  
ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,  
ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//Essential PDF supports Excel to PDF conversion only in Windows Forms, WPF,  
ASP.NET and ASP.NET MVC platforms.
```

Note: This section is applicable only to the Windows Forms, ASP.NET, MVC and WPF platforms.

Supported Elements

This feature provides support for the following elements:

- Styles
- Character formatting
- Headers and footers
- Images
- Text box
- Hyperlinks
- Document properties
- Comments
- Encryption
- Table Style Support
- Text Rotations

- Excel Page Setup Options
- Unicode Support
- Background Images
- Printing Titles when Converting the Excel to PDF
- Page Break Support
- Print Area Support
- Print Order Support
- Unicode in Headers and Footers

Unsupported Elements

The following list contains unsupported elements that presently will not be preserved in the generated PDF document.

- Grouping columns
- OLE Objects
- Text rotations
- Background images

Converting RTF documents to PDF

Essential PDF allows you to convert a RTF to PDF document. For converting a RTF to PDF, the following assemblies need to be referenced in your application

Assembly Name	Description
Syncfusion.DocIO.Base	This assembly has the core features for creating and manipulating RTF documents.
Syncfusion.Compression.Base	This assembly is used to package the RTF documents
Syncfusion.DocToPdfConverter.Base	This assembly is needed for converting the RTF to PDF.
Syncfusion.Pdf.Base	This assembly has the core features for creating PDF file.

The following namespaces are required to compile the code in this topic.

For Windows Forms, WPF, ASP.NET and ASP.NET MVC applications

- using Syncfusion.DocIO
- using Syncfusion.DocIO.DLS
- using Syncfusion.DocToPDFConverter
- using Syncfusion.Pdf

For ASP.NET Core and Xamarin applications

- using Syncfusion.DocIO

- using Syncfusion.DocIO.DLS
- using Syncfusion.DocIO.Renderer
- using Syncfusion.Pdf

[DocToPDFConverter](#) class is responsible for converting a RTF to PDF. The following code snippet illustrates how to convert a RTF to PDF document.

C#

```
//Load an existing RTF document
WordDocument rtfDocument = new WordDocument(inputFileName);
//Create an instance of DocToPDFConverter
DocToPDFConverter converter = new DocToPDFConverter();
//Convert Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(rtfDocument);
//Save the PDF file
pdfDocument.Save("RTFToPDF.pdf");
//Close the instance of document objects
pdfDocument.Close(true);
rtfDocument.Close();
```

VB.NET

```
'Load an existing Word document
Dim rtfDocument As New WordDocument(inputFileName)
'Create an instance of DocToPDFConverter
Dim converter As New DocToPDFConverter()
'Convert Word document into PDF document
Dim pdfDocument As PdfDocument = converter.ConvertToPDF(rtfDocument)
'Save the PDF file
pdfDocument.Save("RTFToPDF.pdf")
'Close the instance of document objects
pdfDocument.Close(True)
rtfDocument.Close()
```

ASP.NET CORE

```
//Open the file as Stream
FileStream docStream = new FileStream(@"Input.rtf", FileMode.Open,
FileAccess.Read);
//Loads file stream into Word document
WordDocument wordDocument = new WordDocument(docStream,
Syncfusion.DocIO.FormatType.Automatic);
//Instantiation of DocIO.Renderer for Word to PDF conversion
DocIO.Renderer render = new DocIO.Renderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(wordDocument);
//Releases all resources used by the Word document and DocIO Renderer
objects
render.Dispose();
wordDocument.Dispose();
//Save the document into stream
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
stream.Position = 0;
```

```
//Close the documents
pdfDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = " RTFTToPDF.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the Word document as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.rtf");
//Load an existing Word document
WordDocument rtfDocument = new WordDocument(docStream,
Syncfusion.DocIO.FormatType.Automatic);
//Instantiation of DocIORenderer for Word to PDF conversion
DocIORenderer render = new DocIORenderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(rtfDocument);
//Releases all resources used by the Word document and DocIO Renderer
objects
render.Dispose();
rtfDocument.Dispose();
//Save the document into memory stream
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
stream.Position = 0;
//Close the document
pdfDocument.Close();
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("RTFTToPDF.pdf"
, "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("RTFTToPDF.pdf",
"application/pdf", stream);
}
```

Note: Total number of pages may vary based on unsupported elements in the converted PDF document when compare to RTF document.

[Customizing the RTF to PDF conversion](#)

Essential DocIO allows you to customize the RTF to PDF conversion with the below options:

- Allows to determine the quality of the JPEG images in the converted PDF
- Allows to reduce the Main Memory usage in RTF to PDF conversion by reusing the identical images.

C#

```
//Loads an existing Word document
WordDocument rtfDocument = new WordDocument(inputFileName);
//create an instance of DocToPDFConverter - responsible for Word to PDF
conversion
DocToPDFConverter converter = new DocToPDFConverter();
//Set the image quality
converter.Settings.ImageQuality = 100;
//Set the image resolution
converter.Settings.ImageResolution = 640;
//Set true to optimize the memory usage for identical images
converter.Settings.OptimizeIdenticalImages = true;
//Convert Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(rtfDocument);
//Save the PDF file to file system
pdfDocument.Save("RTFToPDF.pdf");
//close the instance of document objects
pdfDocument.Close(true);
rtfDocument.Close();
```

VB.NET

```
'Loads an existing Word document
Dim rtfDocument As New WordDocument(inputFileName)
'create an instance of DocToPDFConverter - responsible for Word to PDF
conversion
Dim converter As New DocToPDFConverter()
'Set the image quality
converter.Settings.ImageQuality = 100
'Set the image resolution
converter.Settings.ImageResolution = 640
'Set true to optimize the memory usage for identical images
converter.Settings.OptimizeIdenticalImages = True
'Convert Word document into PDF document
Dim pdfDocument As PdfDocument = converter.ConvertToPDF(rtfDocument)
'Save the PDF file to file system
pdfDocument.Save("RTFToPDF.pdf")
'close the instance of document objects
pdfDocument.Close(True)
rtfDocument.Close()
```

ASP.NET CORE

```
//Essential PDF supports customizing the RTF to PDF conversion only Windows
Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//Essential PDF supports customizing the RTF to PDF conversion only Windows
Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

Converting TIFF to PDF

Converting multi page TIFF to PDF

Multi frame TIFF image can be converted to PDF document. This can be done by accessing each frame of the multi frame TIFF image and rendering it in each page of the PDF document.

The code snippet to illustrate the same is given below.

C#

```
//Create a PDF document
PdfDocument pdfDocument = new PdfDocument();
//Load multi frame TIFF image
PdfBitmap tiffImage = new PdfBitmap("image.tiff");
//Get the frame count
int frameCount = tiffImage.FrameCount;
//Access each frame and draw into the page
for (int i = 0; i < frameCount; i++)
{
    tiffImage.ActiveFrame = i;
    //Add a section to the PDF document
    PdfSection section = pdfDocument.Sections.Add();
    //Set page margins
    section.PageSettings.Margins.All = 0;
    //Create a PDF unit converter instance
    PdfUnitConvertor converter = new PdfUnitConvertor();
    //Convert to point
   .SizeF size = converter.ConvertFromPixels(tiffImage.PhysicalDimension,
    PdfGraphicsUnit.Point);
    //Set page orientation
    section.PageSettings.Orientation = (size.Width > size.Height) ?
    PdfPageOrientation.Landscape : PdfPageOrientation.Portrait;
    //Set page size
    section.PageSettings.Size = size;
    //Add a page to the section
    PdfPage page = section.Pages.Add();
    //Draw TIFF image into the PDF page
    page.Graphics.DrawImage(tiffImage, PointF.Empty, size);
}
//Save and close the document
pdfDocument.Save("Sample.pdf");
pdfDocument.Close(true);
```

VB.NET

```
'Create a PDF document
Dim pdfDocument As New PdfDocument()
'Load multi frame TIFF image
Dim tiffImage As New PdfBitmap("image.tiff")
'Get the frame count
Dim frameCount As Integer = tiffImage.FrameCount
'Access each frame and draw into the page
For i As Integer = 0 To frameCount - 1
    tiffImage.ActiveFrame = i
'Add a section to the PDF document
```

```

Dim section As PdfSection = pdfDocument.Sections.Add()
'Set page margins
section.PageSettings.Margins.All = 0
'Create a PDF unit converter instance
Dim converter As New PdfUnitConvertor()
'Convert to point
Dim size As.SizeF = converter.ConvertFromPixels(tiffImage.PhysicalDimension,
PdfGraphicsUnit.Point)
'Set page orientation
If size.Width > size.Height Then section.PageSettings.Orientation =
PdfPageOrientation.Landscape
'Set page size
section.PageSettings.Size = size
'Add a page to the section
Dim page As PdfPage = section.Pages.Add()
'Draw TIFF image into the PDF page
page.Graphics.DrawImage(tiffImage, PointF.Empty, size)
Next
'Save and close the document
pdfDocument.Save("Sample.pdf")
pdfDocument.Close(True)

```

UWP

```

//Create a PDF document
PdfDocument pdfDocument = new PdfDocument();
//Load multi frame TIFF image
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.image.tiff");
PdfBitmap tiffImage = new PdfBitmap(imageStream);
//Get the frame count
int frameCount = tiffImage.FrameCount;
//Access each frame and draw into the page
for (int i = 0; i < frameCount; i++)
{
tiffImage.ActiveFrame = i;
//Add a section to the PDF document
PdfSection section = pdfDocument.Sections.Add();
//Set page margins
section.PageSettings.Margins.All = 0;
//Create a PDF unit converter instance
PdfUnitConvertor converter = new PdfUnitConvertor();
//Convert to point
SizeF size = converter.ConvertFromPixels(tiffImage.PhysicalDimension,
PdfGraphicsUnit.Point);
//Set page orientation
section.PageSettings.Orientation = (size.Width > size.Height) ?
PdfPageOrientation.Landscape : PdfPageOrientation.Portrait;
//Set page size
section.PageSettings.Size = size;
//Add a page to the section
PdfPage page = section.Pages.Add();
//Draw TIFF image into the PDF page
page.Graphics.DrawImage(tiffImage, PointF.Empty, size);
}

```

```

MemoryStream memoryStream = new MemoryStream();
//Save the document
await pdfDocument.SaveAsync(memoryStream);
//Close the documents
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(memoryStream, "Sample.pdf");

```

ASP.NET CORE

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Load the multi frame TIFF image from the disk
FileStream imageStream = new FileStream("image.tiff", FileMode.Open,
FileAccess.Read);
PdfTiffImage tiffImage = new PdfTiffImage(imageStream);
//Get the frame count
int frameCount = tiffImage.FrameCount;
//Access each frame and draw into the page
for (int i = 0; i < frameCount; i++)
{
//Add a section to the PDF document
PdfSection section = document.Sections.Add();
//Set page margins
section.PageSettings.Margins.All = 0;
tiffImage.ActiveFrame = i;
//Create a PDF unit converter instance
PdfUnitConvertor converter = new PdfUnitConvertor();
//Convert to point
Syncfusion.Drawing.SizeF size =
converter.ConvertFromPixels(tiffImage.PhysicalDimension,
PdfGraphicsUnit.Point);
//Set page orientation
section.PageSettings.Orientation = (size.Width > size.Height) ?
PdfPageOrientation.Landscape : PdfPageOrientation.Portrait;
//Set page size
section.PageSettings.Size = size;
//Add a page to the section
PdfPage page = section.Pages.Add();
//Draw TIFF image into the PDF page
page.Graphics.DrawImage(tiffImage, Syncfusion.Drawing.PointF.Empty, size);
}
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";

```

```
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Essential PDF supports converting multi page TIFF to PDF only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

Note: 1. Essential PDF supports converting TIFF to PDF with [Syncfusion.Pdf.Imaging.Portable](#) assembly reference in ASP.NET Core.

Compression in monochrome images

Essential PDF supports JBIG2 compression for best compression of monochrome images.

Refer the below code snippet to draw a single frame monochrome TIFF image with JBIG2 compression

C#

```
//Create a PDF document
PdfDocument pdfDocument = new PdfDocument();
//Add a page
PdfPage page = pdfDocument.Pages.Add();
//Load single frame TIFF image
PdfBitmap tiffImage = PdfImage.FromFile("image.tiff") as PdfBitmap;
//Set encode type
tiffImage.Encoding = EncodingType.JBIG2;
//Draw an image
page.Graphics.DrawImage(tiffImage, 0, 0, page.GetClientSize().Width,
page.GetClientSize().Height);
//Save and close the document
pdfDocument.Save("Sample.pdf");
pdfDocument.Close(true);
```

VB.NET

```
'Create a PDF document
Dim pdfDocument As New PdfDocument()
'Add a page
Dim page As PdfPage = pdfDocument.Pages.Add()
'Load single frame TIFF image
Dim tiffImage As PdfBitmap = TryCast(PdfImage.FromFile("image.tiff"),
PdfBitmap)
'Set encode type
tiffImage.Encoding = EncodingType.JBIG2
'Draw an image
page.Graphics.DrawImage(tiffImage, 0, 0, page.GetClientSize().Width,
page.GetClientSize().Height)
'Save and close the document
pdfDocument.Save("Sample.pdf")
pdfDocument.Close(True)
```

UWP

```
//Essential PDF supports compressing monochrome images only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

ASP.NET CORE

```
//Essential PDF supports compressing monochrome images only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

XAMARIN

```
//Essential PDF supports compressing monochrome images only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.
```

Note: 1. Currently the JBIG2Decode compression is supported only in lossy mode and also only single frame TIFF images are supported.

2. By default, all monochrome images will be compressed in CITT4 compression.

Converting XPS document to PDF

The XPS (XML Paper Specification) document format is a fixed document format which consists of structured XML markup that defines the layout of a document and the visual appearance of each page, along with rendering rules for distributing, archiving, rendering, processing and printing the documents.

Essential PDF provides support for converting XPS to PDF using [XPSToPdfConverter](#) class.

The below code illustrates how to convert XPS to PDF.

C#

```
//Create converter class
XPSToPdfConverter converter = new XPSToPdfConverter();
//Convert the XPS to PDF
PdfDocument document = converter.Convert(xpsFileName);
//Save and close the document
document.Save("Sample.pdf");
document.Close(true);
```

VB.NET

```
'Create converter class
Dim converter As New XPSToPdfConverter()
'Convert the XPS to PDF
Dim document As PdfDocument = converter.Convert(xpsFileName)
'Save and close the document
document.Save("Sample.pdf")
document.Close(True)
```

UWP

```
//Create converter class
XPSToPdfConverter converter = new XPSToPdfConverter();
//Load the XPS file
Stream fileStream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.input.xps");
```

```
//Convert the XPS to PDF
PdfDocument document = converter.Convert(fileStream);
MemoryStream memoryStream = new MemoryStream();
//Save the document
await document.SaveAsync(memoryStream);
//Close the documents
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Sample.pdf");
```

ASP.NET CORE

```
//Initialize XPS to PDF converter.
XPSToPdfConverter converter = new XPSToPdfConverter();
//Open the XPS file as stream.
FileStream fileStream = new FileStream("Input.xps", FileMode.Open,
FileAccess.ReadWrite);
//Convert the XPS to PDF
PdfDocument document = converter.Convert(fileStream);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document into stream.
document.Save(stream);
//If the position is not set to '0' then the PDF will be empty.
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

//Essential PDF supports converting XPS document to PDF only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and UWP platforms.

Note: Essential PDF supports converting XPS to PDF with [Syncfusion.XpsToPdfConverter.Net.Core](#) package reference in .NET Core application.

Supported Elements

The below table shows the list of elements supported in XPS during the conversion.

Element	Convert to PDF
ArcSegment	Yes
Canvas	Yes

Element	Convert to PDF
DocumentOutline	No
DocumentReference	No
FigureStructure	No
FixedPageResources	Yes
Glyphs	Yes
Gradient	Yes
ImageBrush (JPG, BMP, GIF, TIFF)	Yes
Intent	Yes
LinkTarget	Yes
ListItemStructure	Yes
ListStructure	Yes
MatrixTransform	Yes
NamedElement	No
OutlineEntry	No
PageContent	Yes
PageContentLinkTargets	No
ParagraphStructure	No
Path	Yes
PolyBezierSegment	Yes
PolyLineSegment	Yes
PolyQuadraticBezierSegment	Yes
ResourceDictionary	Yes

Element	Convert to PDF
SectionStructure	No
SignBy	No
SignatureDefinition	No
SignatureDefinitions	No
SigningLocation	No
SolidColorBrush	Yes
SpotLocation	No
Story	No
TableStructure	No
VisualBrush	No

Converting PDF to Image

PDF pages can be converted into images. To add PDF to image functionality in an application, add the following assemblies as reference to the project:

1. Syncfusion.Compression.Base.dll
2. Syncfusion.Pdf.Base.dll

The following code snippet illustrates how to convert PDF page into image.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("HTTP
Succinctly.pdf");
//Get the PDF page count
int count = loadedDocument.Pages.Count;
//Convert each page to image file
for (int i = 0; i < count; i++)
{
    //Export PDF page to image
    Image image = loadedDocument.ExportAsImage(i);
    //Save the exported image
    image.Save("Image" + i + ".png", System.Drawing.Imaging.ImageFormat.Png);
}
//Close the document
ldoc.Close(true);
```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("HTTP
Succinctly.pdf")
'Get the PDF page count
Dim count As Integer = loadedDocument.Pages.Count
'Convert each page to image file
Dim i As Integer = 0
Do While (i < count)
'Export PDF page to image
Dim image As Image = loadedDocument.ExportAsImage(i)
'Save the exported image
image.Save(("Image" _+ (i + ".png")),
System.Drawing.Imaging.ImageFormat.Png)
i = (i + 1)
Loop
'Close the document
ldoc.Close(true)

```

MHTML to PDF

The MHTML file can be converted to PDF using [WebKit rendering engine](https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows). Please refer the below code snippet,

Prerequisites - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows>

Troubleshooting - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#troubleshooting>

C#

```

//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert MHTML to PDF
PdfDocument document = htmlConverter.Convert("input.mhtml");
//Save the document
document.Save("Sample.pdf");
document.Close();

```

VB.NET

```

'Initialize HTML converter with WebKit rendering engine
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "QtBinaries/"
'Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings
'Convert MHTML to PDF

```

```
Dim document As PdfDocument = htmlConverter.Convert("input.mhtml")
'Save the document
document.Save("Sample.pdf")
document.Close()
```

UWP

```
//Essential PDF supports converting MHTML to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

ASP.NET CORE

```
//Initialize HTML to PDF converter
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinariesDotNetCore/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert MHTML to PDF
PdfDocument document = htmlConverter.Convert(@"input.mhtml");
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = " Sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Essential PDF supports converting MHTML to PDF only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC and ASP.NET Core platforms.
```

HTML to MHTML

The [WebKit HTML Converter](#) provides support for converting the webpage to MHTML. Please refer the below code snippet,

Prerequisites - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows>

Troubleshooting - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#troubleshooting>

C#

```
//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
```

```

WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert URL to MHTML
htmlConverter.ConvertToMhtml("http://www.syncfusion.com", "sample.mhtml");

```

VB.NET

```

'Initialize HTML converter with WebKit rendering engine
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "/QtBinaries/"
'Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings
'Convert URL to MHTML
htmlConverter.ConvertToMhtml("http://www.syncfusion.com", "sample.mhtml")

```

UWP

```

//Essential PDF supports converting HTML to MHTML only in Windows Forms,

```

ASP.NET CORE

```

//Essential PDF supports converting HTML to MHTML only in Windows Forms,
WPF, ASP.NET, ASP.NET MVC platforms.

```

XAMARIN

```

//Essential PDF supports converting HTML to MHTML only in Windows Forms,
WPF, ASP.NET, ASP.NET MVC platforms.

```

HTML to Raster Image

The [WebKit HTML Converter](#) provides support for converting webpage to Image. Please refer the below code snippet,

Prerequisites - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows>

Troubleshooting - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#troubleshooting>

C#

```

//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign WebKit settings to HTML converter

```

```
htmlConverter.ConverterSettings = webKitSettings;
//Convert URL to Image
Image[] image = htmlConverter.ConvertToImage("http://www.syncfusion.com");
//Save the image
image[0].Save("Sample.jpg");
```

VB.NET

```
'Initialize HTML converter with WebKit rendering engine
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "/QtBinaries/"
'Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings
'Convert URL to Image
Dim image As Image() =
htmlConverter.ConvertToImage("http://www.syncfusion.com ")
'Save the image
image(0).Save("Sample.jpg")
```

UWP

```
//Essential PDF supports converting HTML to raster image only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinariesDotNetCore/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert URL to Image
Image image = htmlConverter.ConvertToImage("http://www.google.com");
byte[] imageByte = image.ImageData;
//Save the image
File.WriteAllBytes("Output.jpg", imageByte);
```

XAMARIN

```
//Essential PDF supports converting HTML to raster image only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC platforms.
```

HTML string to Raster Image

The [WebKit HTML Converter](#) provides support for converting HTML string to Image. Please refer the below code snippet,

Prerequisites - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows>

Troubleshooting - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#troubleshooting>

C#

```
string htmlString = "<html><body>Hello World!!!</body></html>";
string baseUrl = "";
//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert HTML string to Image
Image[] image = htmlConverter.ConvertToImage(htmlString, baseUrl);
//Save the image
image[0].Save("Sample.jpg");
```

VB.NET

```
Dim htmlString As String = "<html><body>Hello World!!!</body></html>"
Dim baseUrl As String = ""
'Initialize HTML converter with WebKit rendering engine
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "QtBinaries/"
'Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings
'Convert HTML string to Image
Dim image As Image() = htmlConverter.ConvertToImage(htmlString, baseUrl)
'Save the image
image(0).Save("Sample.jpg")
```

UWP

```
//Essential PDF supports converting HTML string to raster image only in
Windows Forms, WPF, ASP.NET, ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinariesDotNetCore/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//HTML string and Base URL
string htmlString = "<html><body>Hello World!!!</body></html>";
string baseUrl = "";
//Convert HTML string to Image
Image image = htmlConverter.ConvertToImage(htmlString, baseUrl);
```

```
byte[] imageByte = image.ImageData;
//Save the image
File.WriteAllBytes("Output.jpg", imageByte);
```

XAMARIN

```
//Essential PDF supports converting HTML string to raster image only in
Windows Forms, WPF, ASP.NET, ASP.NET MVC platforms.
```

Partial webpage to Raster Image

The [WebKit HTML Converter](#) provides support for converting partial webpage to Image. Please refer the below code snippet,

Prerequisites - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows>

Troubleshooting - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#troubleshooting>

C#

```
//Initialize HTML converter
HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
// WebKit converter settings
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Assign the WebKit binaries path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign the WebKit settings
htmlConverter.ConverterSettings = webKitSettings;
//Convert Partial HTML to Image
Image[] image = htmlConverter.ConvertPartialHtmlToImage("input.html",
"pic");
//Save Image
image[0].Save("Output.jpg");
```

VB.NET

```
'Initialize HTML converter
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
' WebKit converter settings
Dim webKitSettings As New WebKitConverterSettings()
'Assign the WebKit binaries path
webKitSettings.WebKitPath = "QtBinaries/"
'Assign the WebKit settings
htmlConverter.ConverterSettings = webKitSettings
'Convert Partial HTML to Image
Dim image As Image() = htmlConverter.ConvertPartialHtmlToImage("input.html",
"pic")
'Save Image
image(0).Save("Output.jpg")
```

HTML

```
<html>
```

```

<head>
</head>
<body>
Hello world
<div id="pic">
<br>
This is a Syncfusion Logo
</div>
<div>
Hello world
</div>
</body>
</html>

```

UWP

//Essential PDF supports converting partial webpage to raster image only in Windows Forms, WPF, ASP.NET, ASP.NET MVC platforms.

ASP.NET CORE

```

//Initialize HTML converter with WebKit rendering engine
HtmlToPdfConverter htmlConverter = new HtmlToPdfConverter();
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinariesDotNetCore/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert Partial HTML to Image
Image image =
htmlConverter.ConvertPartialHtmlToImage("http://www.google.com", "lga");
byte[] imageByte = image.ImageData;
//Save the image
File.WriteAllBytes("Output.jpg", imageByte);

```

XAMARIN

//Essential PDF supports converting partial webpage to raster image only in Windows Forms, WPF, ASP.NET, ASP.NET MVC platforms.

HTML to SVG

The [WebKit HTML Converter](#) provides support for converting HTML to SVG. Please refer the below code snippet,

Prerequisites - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#prerequisites-for-windows>

Troubleshooting - <https://help.syncfusion.com/file-formats/pdf/convert-html-to-pdf/webkit#troubleshooting>

C#

```

//Initialize HTML converter with WebKit rendering engine

```

```

HtmlToPdfConverter htmlConverter = new
HtmlToPdfConverter(HtmlRenderingEngine.WebKit);
WebKitConverterSettings webKitSettings = new WebKitConverterSettings();
//Set WebKit path
webKitSettings.WebKitPath = @"QtBinaries/";
//Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings;
//Convert URL to SVG
htmlConverter.ConvertToSvg("http://www.syncfusion.com", "sample.svg");

```

VB.NET

```

'Initialize HTML converter with WebKit rendering engine
Dim htmlConverter As New HtmlToPdfConverter(HtmlRenderingEngine.WebKit)
Dim webKitSettings As New WebKitConverterSettings()
'Set WebKit path
webKitSettings.WebKitPath = "/QtBinaries/"
'Assign WebKit settings to HTML converter
htmlConverter.ConverterSettings = webKitSettings
'Convert URL to SVG
htmlConverter.ConvertToSvg("http://www.syncfusion.com", "sample.svg")

```

UWP

```

//Essential PDF supports converting HTML to SVG only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC platforms.

```

ASP.NET CORE

```

//Essential PDF supports converting HTML to SVG only in Windows Forms, WPF,
ASP.NET, ASP.NET MVC platforms.

```

XAMARIN

```

//Essential PDF supports converting HTML to SVG only in Windows Forms, WPF,

```

XAMARIN

```
//Essential PDF supports converting partial webpage to SVG only in Windows
Forms, WPF, ASP.NET, ASP.NET MVC platforms.
```

Working with Optical Character Recognition (OCR)

Essential PDF provides support for Optical Character Recognition with the help of Google's Tesseract Optical Character Recognition engine.

Prerequisites and setting up the Tesseract Engine

- To use the OCR feature in your application, you need to add reference to the following set of assemblies.
 1. Syncfusion.Compression.Base.dll
 2. Syncfusion.Pdf.Base.dll
 3. Syncfusion.OCRProcessor.Base.dll
- Place the SyncfusionTesseract.dll and liblpt168.dll Tesseract assemblies in the local system and provide the assembly path to the OCR processor.

C#

```
OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\")
```

VB.NET

```
Dim processor As New OCRProcessor("TesseractBinaries\")
```

- Place the Tesseract language data {E.g eng.traineddata} in the local system and provide a path to the OCR processor

C#

```
OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\");  
processor.PerformOCR(lDoc, @"TessData\");
```

VB.NET

```
Dim processor As New OCRProcessor("TesseractBinaries\  
processor.PerformOCR(lDoc, "TessData\")
```

You can also download the language packages from below link

<https://github.com/tesseract-ocr/tessdata>

Note: From 16.1.0.24 OCR is not a part of Essential Studio and is available as separate package (OCR Processor) under the Add-On section in the below link <https://www.syncfusion.com/downloads/latest-version>.

Note: PDF supports OCR only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

Performing OCR for an entire document

You can perform OCR on PDF document with the help of [OCRProcessor](#) Class. Refer the below code snippet for the same.

C#

```
//Initialize the OCR processor by providing the path of tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
    //Load a PDF document
    PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
    //Set OCR language to process
    processor.Settings.Language = Languages.English;
    //Process OCR by providing the PDF document and Tesseract data
    processor.PerformOCR(lDoc, @"TessData\");
    //Save the OCR processed PDF document in the disk
    lDoc.Save("Sample.pdf");
    lDoc.Close(true);
}
```

VB.NET

```
'Initialize the OCR processor by providing the path of tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
'Load a PDF document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Process OCR by providing the PDF document and Tesseract data
processor.PerformOCR(lDoc, "TessData\")
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
lDoc.Close(True)
End Using
```

Note: The PerformOCR method returns only the text OCR'd by OCRProcessor. Other existing text in the PDF page won't be returned in this method. Please check [text extraction](#) feature for this.

Performing OCR with tesseract version 3.05

You can perform OCR using the tesseract version 3.05. The [TesseractVersion](#) property is used to switch the tesseract version between 3.02 and 3.05. By default, OCR works with tesseract version 3.02.

You must use the pre built Syncfusion tesseract version 3.05 in the sample to run the OCR properly. The tesseract binaries are shipping with Syncfusion NuGet package, use the following link to download the NuGet package.

<https://www.nuget.org/packages/Syncfusion.OCRProcessor.Base>

The following sample code snippet demonstrates the OCR processor with Tesseract3.05 for PDF documents.

C#

```
using (OCRProcessor processor = new OCRProcessor(@"Tesseract3.05Binaries \"))
{
    //Load a PDF document
    PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
    //Set OCR language to process
    processor.Settings.Language = Languages.English;
    //Set tesseract OCR Engine
```

```

processor.Settings.TesseractVersion = TesseractVersion.Version3_05;
//Process OCR by providing the PDF document and tesseract data, and enabling
the isMemoryOptimized property
processor.PerformOCR(lDoc, @"TessData\", true);
//Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf");
lDoc.Close(true);
}

```

VB.NET

```

Using processor As New OCRProcessor("Tesseract3.05Binaries\")
'Load a PDF document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Set tesseract OCR engine
processor.Settings.TesseractVersion = TesseractVersion.Version3_05
'Process OCR by providing the PDF document and tesseract data, and enabling
the isMemoryOptimized property
processor.PerformOCR(lDoc, "TessData\", True)
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
lDoc.Close(True)
End Using

```

Performing OCR for a region of the document

You can perform OCR on particular region or several regions of a PDF page with the help of [PageRegion](#) class. Refer the below code snippet for the same.

C#

```

//Initialize the OCR processor by providing the path of the tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
//Load a PDF document
PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
//Set OCR language to process
processor.Settings.Language = Languages.English;
RectangleF rect = new RectangleF(0, 100, 950, 150);
//Assign rectangles to the page
List<PageRegion> pageRegions = new List<PageRegion>();
PageRegion region = new PageRegion();
region.PageIndex = 1;
region.PageRegions = new RectangleF[] { rect };
pageRegions.Add(region);
processor.Settings.Regions = pageRegions;
//Process OCR by providing the PDF document and Tesseract data
processor.PerformOCR(lDoc, @"TessData\"");
//Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf");
lDoc.Close(true);
}

```

VB.NET

```

'Initialize the OCR processor by providing the path of the tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
'Load a PDF document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
Dim rect As New RectangleF(0, 100, 950, 150)
'Assign rectangles to the page
Dim pageRegions As New List(Of PageRegion)()
Dim region As New PageRegion()
region.PageIndex = 1
region.PageRegions = New RectangleF() {rect}
pageRegions.Add(region)
processor.Settings.Regions = pageRegions
'Process OCR by providing the PDF document and Tesseract data
processor.PerformOCR(lDoc, "TessData\")
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
lDoc.Close(True)

```

Performing OCR on image

You can perform OCR on an image also. Refer the below code snippets for the same.

C#

```

//Initialize the OCR processor by providing the path of the tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
    //loading the input image
    Bitmap image = new Bitmap("input.jpeg");
    //Set OCR language to process
    processor.Settings.Language = Languages.English;
    //Process OCR by providing the bitmap image, data dictionary and language
    string ocrText= processor.PerformOCR(image, @"TessData\");
}

```

VB.NET

```

'Initialize the OCR processor by providing the path of the tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
'loading the input image
Dim image As New Bitmap("input.jpeg")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Process OCR by providing the bitmap image, data dictionary and language
Dim ocrText As String = processor.PerformOCR(image, "TessData\")
End Using

```

Performing OCR for large PDF documents

You can optimize the memory to perform OCR for large PDF documents by enabling the `isMemoryOptimized` property in `PerformOCR` method of `OCRProcessor` class. Optimization will be effective only with Multithreading environment or PDF document with more images. This is demonstrated in the following code sample.

C#

```
//Initialize the OCR processor by providing the path of tesseract
//binaries(SyncfusionTesseract.dll and liblpt168.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
    //Load a PDF document.
    PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
    //Set OCR language to process.
    processor.Settings.Language = Languages.English;
    //Process OCR by providing the PDF document, Tesseract data and enable
    //isMemoryOptimized property
    processor.PerformOCR(lDoc, @"TessData\", true);
    //Save the OCR processed PDF document in the disk.
    lDoc.Save("Sample.pdf");
    lDoc.Close(true);
}
```

VB.NET

```
'Initialize the OCR processor by providing the path of tesseract
//binaries(SyncfusionTesseract.dll and liblpt168.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
    'Load a PDF document.
    Dim lDoc As New PdfLoadedDocument("Input.pdf")
    'Set OCR language to process.
    processor.Settings.Language = Languages.English
    'Process OCR by providing the PDF document and Tesseract data enable
    //isMemoryOptimized property.
    processor.PerformOCR(lDoc, "TessData\", True)
    'Save the OCR processed PDF document in the disk.
    lDoc.Save("Sample.pdf")
    lDoc.Close(True)
End Using
```

Performing OCR on rotated page of PDF document

You can perform OCR on the rotated page of a PDF document. Refer to the following code snippet for the same.

C#

```
//Initialize the OCR processor by providing the path of tesseract
//binaries(SyncfusionTesseract.dll and liblpt168.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
    //Load a PDF document
    PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
    //Set OCR language to process
    processor.Settings.Language = Languages.English;
```

```
//Set OCR page auto detection rotation
processor.Settings.AutoDetectRotation = true;
//Process OCR by providing the PDF document
processor.PerformOCR(lDoc, @"TessData\");
//Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf");
lDoc.Close(true);
}
```

VB.NET

```
'Initialize the OCR processor by providing the path of tesseract
binaries(SyncfusionTesseract.dll and liblpt168.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
'Load a PDF document.
Dim lDoc As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Set OCR page auto detection rotation
processor.Settings.AutoDetectRotation = true
'Process OCR by providing the PDF document
processor.PerformOCR(lDoc, "TessData\")
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
lDoc.Close(true)
End Using
```

Layout result from OCR

You can get the OCR'd text and its bounds from a scanned PDF document by using the [OCRLayoutResult](#) Class. Refer to the following code snippet.

C#

```
//Initialize the OCR processor by providing the path of tesseract binaries
(SyncfusionTesseract.dll and liblpt168.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
    //Load a PDF document
    PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
    //Set OCR language to process
    processor.Settings.Language = Languages.English;
    //Initializes OCR layout result
    OCRLayoutResult result;
    //Process OCR by providing the PDF document, Tesseract data, and layout
    result
    processor.PerformOCR(lDoc, @"TessData\", out result);
    //Get OCR'd line collection from first page
    OCRLineCollection lines = result.Pages[0].Lines;
    //Get each OCR'd line and its bounds
    foreach (Line line in lines)
    {
        string text = line.Text;
        RectangleF bounds = line.Rectangle;
    }
    //Save the OCR processed PDF document in the disk
}
```

```

lDoc.Save("Sample.pdf");
//Close the document
lDoc.Close(true);
}

```

VB.NET

```

'Initialize the OCR processor by providing the path of tesseract binaries
(SyncfusionTesseract.dll and libleft168.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
'Load a PDF document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Initializes OCR layout result
Dim result As OCRLayoutResult
'Process OCR by providing the PDF document, Tesseract data, and layout
result
processor.PerformOCR(lDoc, "TessData\ ", result)
'Get OCR'd line collection from first page
Dim lines As OCRLineCollection = result.Pages(0).Lines
'Get each OCR'd line and its bounds
For Each line As Line In lines
Dim text As String = line.Text
Dim bounds As RectangleF = line.Rectangle
Next
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
'Close the document
lDoc.Close(True)
End Using

```

Native call

Enable native call will not launch any temporary process for OCR processing, instead it will invoke the native calls.

Tesseract 3.02

Tesseract 3.02 supports only 32-bit version. By default, this property will be disabled.

Note: Enable native call will not work in 64-bit in Tesseract 3.02 version. Instead a temporary process will be launched for OCR processing.

The following sample code snippet demonstrates the OCR processor with native call support of tesseract 3.02.

C#

```

using (OCRProcessor processor = new OCRProcessor(@"Tesseract3.02Binaries\"))
{
//Load a PDF document
PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
//Set OCR language to process
processor.Settings.Language = Languages.English;
//Set tesseract OCR Engine
processor.Settings.TesseractVersion = TesseractVersion.Version3_02;
}

```

```
//Process OCR by providing the PDF document and tesseract data, and enabling
the isMemoryOptimized property
processor.PerformOCR(lDoc, @"TessData\", true);
//Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf");
lDoc.Close(true);
}
```

VB.NET

```
Using processor As New OCRProcessor("Tesseract3.02Binaries\")
'Load a PDF document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Set tesseract OCR engine
processor.Settings.TesseractVersion = TesseractVersion.Version3_02
'Process OCR by providing the PDF document and tesseract data, and enabling
the isMemoryOptimized property
processor.PerformOCR(lDoc, "TessData\", True)
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
lDoc.Close(True)
End Using
```

Tesseract 3.05

Tesseract 3.05 supports the native call for both x86 and x64 architectures. By default, the x86 tesseract binaries are available with NuGet package or the tesseract installer.

You can download the x64 supporting tesseract binaries from the following link.

[Tesseract 64-bit binaries](#)

Note: This 64-bit binaries are required only when the native call property is enabled.

Make sure to provide the 64-bit binaries path while using in the 64-bit environment.

The following sample code snippet demonstrates the OCR processor with native call support of tesseract 3.05.

C#

```
using (OCRProcessor processor = new OCRProcessor(@" Tesseract3.05Binaries
\"))
{
//Load a PDF document
PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
//Set OCR language to process
processor.Settings.Language = Languages.English;
//Set tesseract OCR engine
processor.Settings.TesseractVersion = TesseractVersion.Version3_05;
//Set enable native call
processor.Settings.EnableNativeCall = true;
//Process OCR by providing the PDF document and tesseract data, and enabling
the isMemoryOptimized property
processor.PerformOCR(lDoc, @"TessData\", true);
//Save the OCR processed PDF document in the disk
```

```
lDoc.Save("Sample.pdf");
lDoc.Close(true);
}
```

VB.NET

```
Using processor As New OCRProcessor("Tesseract3.05Binaries\")
    'Load a PDF document
    Dim lDoc As New PdfLoadedDocument("input.pdf")
    'Set OCR language to process
    processor.Settings.Language = Languages.English
    'Set tesseract OCR engine
    processor.Settings.TesseractVersion = TesseractVersion.Version3_05
    'Set enable native call
    processor.Settings.EnableNativeCall = True
    'Process OCR by providing the PDF document and tesseract data, and enabling
    the isMemoryOptimized property
    processor.PerformOCR(lDoc, "TessData\", True)
    'Save the OCR processed PDF document in the disk
    lDoc.Save("Sample.pdf")
    lDoc.Close(True)
End Using
```

Customizing temp folder

While performing OCR on an existing scanned PDF document, the OCR Processor will create temporary files (.temp, .tiff, .txt) and the files are deleted after the process is completed. You can change this temporary files folder location using the [TempFolder](#) property available in the [OCRSettings](#) Instance. Refer to the following code snippet.

C#

```
//Initialize the OCR processor by providing the path of tesseract binaries
(SyncfusionTesseract.dll and libtesseract.dll)
using (OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\"))
{
    //Load a PDF document
    PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
    //Set OCR language to process
    processor.Settings.Language = Languages.English;
    //Set custom temp file path location
    processor.Settings.TempFolder = "D:/Temp/";
    //Process OCR by providing the PDF document and Tesseract data
    processor.PerformOCR(lDoc, @"TessData\");
    //Save the OCR processed PDF document in the disk
    lDoc.Save("Sample.pdf");
    //Close the document
    lDoc.Close(true);
}
```

VB.NET

```
'Initialize the OCR processor by providing the path of tesseract binaries
(SyncfusionTesseract.dll and libtesseract.dll)
Using processor As New OCRProcessor("TesseractBinaries\")
```

```
'Load a PDF document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Set OCR language to process
processor.Settings.Language = Languages.English
'Set custom temp file path location
processor.Settings.TempFolder = "D:/Temp/"
'Process OCR by providing the PDF document and Tesseract data
processor.PerformOCR(lDoc, "TessData\")
'Save the OCR processed PDF document in the disk
lDoc.Save("Sample.pdf")
'Close the document
lDoc.Close(True)
End Using
```

Best Practices

You can improve the accuracy of the OCR process by choosing the correct compression method when converting the scanned paper to a TIFF image and then to a PDF document.

- Use (zip) lossless compression for color or gray-scale images.
- Use CCITT Group 4 or JBIG2 (lossless) compression for monochrome images. This ensures that optical character recognition works on the highest-quality image, thereby improving the OCR accuracy. This is especially useful in low-resolution scans.
- In addition, rotated images and skewed images can also affect the accuracy and readability of the OCR process.

Tesseract works best with text when at least 300 dots per inch (DPI) are used, so it is beneficial to resize images.

For more details regarding quality improvement, refer to the following link:

<https://github.com/tesseract-ocr/tesseract/wiki/ImproveQuality>

You can set the different performance level to the OCRProcessor using [Performance](#) enumeration.

- Rapid – high speed OCR performance and provide normal OCR accuracy
- Fast – provides moderate OCR processing speed and accuracy
- Slow – Slow OCR performance and provide best OCR accuracy.

Refer below code snippet to set the performance of the OCR.

C#

```
OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\")
//set the OCR performance
processor.Settings.Performance = Performance.Fast;
```

VB.NET

```
Dim processor As New OCRProcessor("TesseractBinaries\")
'Set the OCR performance
processor.Settings.Performance = Performance.Fast
```

Troubleshooting

Issue: You can get the exception “Tesseract has not been initialized” while performing OCR process.

Solution 1: To resolve this, make sure the path of the Tesseract binaries and Tesseract data are properly provided as shown below.

C#

```
//TesseractBinaries - path of the folder containing SyncfusionTesseract.dll
and liblpt168.dll
OCRProcessor processor = new OCRProcessor(@"TesseractBinaries\");
//TessData - path of the folder containing the language pack
processor.PerformOCR(lDoc, @"TessData\");
```

VB.NET

```
'TesseractBinaries - path of the folder containing SyncfusionTesseract.dll
and liblpt168.dll
Dim processor As New OCRProcessor("TesseractBinaries\")
'TessData - path of the folder containing the language pack
processor.PerformOCR(lDoc, "TessData\")
```

Solution 2: Make sure that your data file version is 3.02, since the OCR processor is built with Tesseract version 3.02.

Issue: OCR processor doesn’t process languages other than English.

Solution: Essential PDF supports all the languages supported by Tesseract engine.

The dictionary packs for the languages can be downloaded from the following online location:

<https://github.com/tesseract-ocr/tesseract/wiki/Data-Files#data-files-for-version-302>

It is also mandatory to change the corresponding language code in the OCRProcessor.Settings.Language property. For example, to perform optical character recognition in German, the property should be set as processor.Settings.Language = "deu";

The following link contains the complete set of languages supported by Tesseract and their language codes.

<https://github.com/tesseract-ocr/tesseract/blob/master/doc/tesseract.1.asc#languages>

Working with Hyperlinks

In PDF, hyperlinks can be added to allow the users to navigate to another part of PDF file, web page or any other external content. Essential PDF provides support for all these types of hyperlink.

Working with Web navigation

You can navigate to specified URL from a PDF document by using the [PdfTextWebLink](#) class.

Please refer the below code snippet for navigating to the web page.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
```

```

//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in PDF page
textLink.DrawTextWebLink(page, new PointF(10, 40));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 12.0F)
'Create the Text Web Link.
Dim textLink As New PdfTextWebLink()
'Add the hyperlink
textLink.Url = "http://www.syncfusion.com"
'Set the link text
textLink.Text = "Syncfusion .NET components and controls"
'Set the font
textLink.Font = font
'Draw the hyperlink in PDF page
textLink.DrawTextWebLink(loadedPage.Graphics, New PointF(10, 40))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;

```

```
//Draw the hyperlink in PDF page
textLink.DrawTextWebLink(page, new PointF(10, 40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in PDF page
textLink.DrawTextWebLink(page, new PointF(10, 40));
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
```

```

textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in PDF page
textLink.DrawTextWebLink(page, new PointF(10, 40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

To add a web hyperlink to an existing document, please refer the below code snippet.

C#

```

//Load the existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(@"Filename.pdf");
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in loaded page graphics
textLink.DrawTextWebLink(loadedPage.Graphics, new PointF(10, 40));
//Save the document.
loadedDocument.Save("Output.pdf");
//Close the document.
loadedDocument.Close(true);

```

VB.NET

```

'Load the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument("fileName.pdf")
'Load the page

```

```

Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Create the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 12.0F)
'Create the Text Web Link.
Dim textLink As New PdfTextWebLink()
'Add the hyperlink
textLink.Url = "http://www.syncfusion.com"
'Set the link text
textLink.Text = "Syncfusion .NET components and controls"
'Set the font
textLink.Font = font
'Draw the hyperlink in loaded page graphics
textLink.DrawTextWebLink(loadedPage.Graphics, New PointF(10, 40))
'Save the document.
loadedDocument.Save("Output1.pdf")
'Close the document.
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in loaded page graphics
textLink.DrawTextWebLink(loadedPage.Graphics, new PointF(10, 40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in loaded page graphics
textLink.DrawTextWebLink(loadedPage.Graphics, new PointF(10, 40));
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the Text Web Link.
PdfTextWebLink textLink = new PdfTextWebLink();
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
//Draw the hyperlink in loaded page graphics
textLink.DrawTextWebLink(loadedPage.Graphics, new PointF(10, 40));
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
```

```
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

Working with internal document navigation

To allow the users to navigate to any other part of the same document, [PdfDocumentLinkAnnotation](#) class can be used. The below code explains how to add the hyperlink for internal document navigation.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create a new rectangle
RectangleF docLinkAnnotationBounds = new RectangleF(10, 40, 30, 30);
//Create a new document link annotation.
PdfDocumentLinkAnnotation documentLinkAnnotation = new
PdfDocumentLinkAnnotation(docLinkAnnotationBounds);
//Set the annotation flags.
documentLinkAnnotation.AnnotationFlags = PdfAnnotationFlags.NoRotate;
//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the annotation's color.
documentLinkAnnotation.Color = new PdfColor(Color.Navy);
//Creates another page
PdfPage navigationPage = document.Pages.Add();
//Set the destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new Point(10, 0);
//Set the document annotation zoom level
documentLinkAnnotation.Destination.Zoom = 5;
//Add this annotation to a new page.
page.Annotations.Add(documentLinkAnnotation);
//Save the document to disk.
document.Save("DocumentLinkAnnotation.pdf");
//Close the document
document.Close();
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Create a new page
Dim page As PdfPage = document.Pages.Add()
'Create a new rectangle
Dim docLinkAnnotationBounds As New RectangleF(10, 40, 30, 30)
'Create a new document link annotation.
```

```

Dim documentLinkAnnotation As New
PdfDocumentLinkAnnotation(docLinkAnnotationBounds)
'Set the annotation flags.
documentLinkAnnotation.AnnotationFlags = PdfAnnotationFlags.NoRotate
'Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation"
'Set the annotation's color.
documentLinkAnnotation.Color = New PdfColor(Color.Navy)
'Create another page
Dim navigationPage As PdfPage = document.Pages.Add()
'Set the destination.
documentLinkAnnotation.Destination = New PdfDestination(navigationPage)
'Set the document link annotation location.
documentLinkAnnotation.Destination.Location = New Point(10, 0)
'Set the document annotation zoom level
documentLinkAnnotation.Destination.Zoom = 5
'Add this annotation to a new page.
page.Annotations.Add(documentLinkAnnotation)
'Save the document to disk.
document.Save("DocumentLinkAnnotation.pdf")
'Close the document
document.Close()

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create a new rectangle
RectangleF docLinkAnnotationBounds = new RectangleF(10, 40, 30, 30);
//Create a new document link annotation.
PdfDocumentLinkAnnotation documentLinkAnnotation = new
PdfDocumentLinkAnnotation(docLinkAnnotationBounds);
//Set the annotation flags.
documentLinkAnnotation.AnnotationFlags = PdfAnnotationFlags.NoRotate;
//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the annotation's color.
documentLinkAnnotation.Color = new PdfColor(System.Drawing.Color.FromArgb(0,
0, 0, 128));
//Creates another page
PdfPage navigationPage = document.Pages.Add();
//Set the destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new PointF(10, 0);
//Set the document annotation zoom level
documentLinkAnnotation.Destination.Zoom = 5;
//Add this annotation to a new page.
page.Annotations.Add(documentLinkAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);

```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "DocumentLinkAnnotation.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create a new rectangle
RectangleF docLinkAnnotationBounds = new RectangleF(10, 40, 30, 30);
//Create a new document link annotation.
PdfDocumentLinkAnnotation documentLinkAnnotation = new
PdfDocumentLinkAnnotation(docLinkAnnotationBounds);
//Set the annotation flags.
documentLinkAnnotation.AnnotationFlags = PdfAnnotationFlags.NoRotate;
//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the annotation's color.
documentLinkAnnotation.Color = new PdfColor(Color.Navy);
//Creates another page
PdfPage navigationPage = document.Pages.Add();
//Set the destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new PointF(10, 0);
//Set the document annotation zoom level
documentLinkAnnotation.Destination.Zoom = 5;
//Add this annotation to a new page.
page.Annotations.Add(documentLinkAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentLinkAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create a new rectangle
RectangleF docLinkAnnotationBounds = new RectangleF(10, 40, 30, 30);
//Create a new document link annotation.
PdfDocumentLinkAnnotation documentLinkAnnotation = new
PdfDocumentLinkAnnotation(docLinkAnnotationBounds);
```

```

//Set the annotation flags.
documentLinkAnnotation.AnnotationFlags = PdfAnnotationFlags.NoRotate;
//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the annotation's color.
documentLinkAnnotation.Color = new PdfColor(Syncfusion.Drawing.Color.Navy);
//Creates another page
PdfPage navigationPage = document.Pages.Add();
//Set the destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new PointF(10, 0);
//Set the document annotation zoom level
documentLinkAnnotation.Destination.Zoom = 5;
//Add this annotation to a new page.
page.Annotations.Add(documentLinkAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DocumentLinkA
nnotation.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentLinkAnnotation.pd
f", "application/pdf", stream);
}

```

To add a [PdfDocumentLinkAnnotation](#) to an existing document, please use the below code snippet.

C#

```

//Load the existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(@"fileName.pdf");
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a new rectangle
RectangleF docLinkAnnotationBounds = new RectangleF(10, 40, 30, 30);
//Create a new document link annotation.
PdfDocumentLinkAnnotation documentLinkAnnotation = new
PdfDocumentLinkAnnotation(docLinkAnnotationBounds);
//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the existing page for navigation
PdfLoadedPage navigationPage = loadedDocument.Pages[1] as PdfLoadedPage;
//Set the pdf destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);

```

```
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new Point(10, 0);
//Add this annotation to respective page.
loadedPage.Annotations.Add(documentLinkAnnotation);
//Save the document to disk.
loadedDocument.Save("DocumentLinkAnnotation.pdf");
//Close the document
loadedDocument.Close();
```

VB.NET

```
'Load the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument("fileName.pdf")
'Load the page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Create a new rectangle
Dim docLinkAnnotationBounds As New RectangleF(10, 40, 30, 30)
'Create a new document link annotation.
Dim documentLinkAnnotation As New
PdfDocumentLinkAnnotation(docLinkAnnotationBounds)
'Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation"
'Set the existing page for navigation
Dim navigationPage As PdfLoadedPage = TryCast(loadedDocument.Pages(1),
PdfLoadedPage)
'Set the pdf destination.
documentLinkAnnotation.Destination = New PdfDestination(navigationPage)
'Set the document link annotation location.
documentLinkAnnotation.Destination.Location = New Point(10, 0)
'Add this annotation to respective page.
loadedPage.Annotations.Add(documentLinkAnnotation)
'Save the document to disk.
loadedDocument.Save("DocumentLinkAnnotation.pdf")
'Close the document
loadedDocument.Close()
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance

//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the existing page for navigation
PdfLoadedPage navigationPage = loadedDocument.Pages[1] as PdfLoadedPage;
//Set the pdf destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new PointF(10, 0);
//Add this annotation to respective page.
loadedPage.Annotations.Add(documentLinkAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentLinkAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a new rectangle
RectangleF docLinkAnnotationBounds = new RectangleF(10, 40, 30, 30);
//Create a new document link annotation.
PdfDocumentLinkAnnotation documentLinkAnnotation = new
PdfDocumentLinkAnnotation(docLinkAnnotationBounds);
//Set the annotation text.
documentLinkAnnotation.Text = "Document link annotation";
//Set the existing page for navigation
PdfLoadedPage navigationPage = loadedDocument.Pages[1] as PdfLoadedPage;
//Set the pdf destination.
documentLinkAnnotation.Destination = new PdfDestination(navigationPage);
//Set the document link annotation location.
documentLinkAnnotation.Destination.Location = new
Syncfusion.Drawing.PointF(10, 0);
//Add this annotation to respective page.
loadedPage.Annotations.Add(documentLinkAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Closes the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DocumentLinkA
nnotation.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentLinkAnnotation.pd
f", "application/pdf", stream);
}

```

Working with external document navigation

You can open external documents like images, text files, PDF, etc. using [PdfFileLinkAnnotation](#) class.

Please refer the below code snippet for navigating to external documents:

C#

```

//Create the PDF document
PdfDocument document = new PdfDocument();

```

```
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new rectangle
RectangleF bounds = new RectangleF(10, 40, 30, 30);
//Create a link for image file
PdfFileLinkAnnotation fileLinkAnnotation = new PdfFileLinkAnnotation(bounds,
@"..\..\Data\logo.png");
//Add this annotation to a page.
page.Annotations.Add(fileLinkAnnotation);
//Save the document to disk.
document.Save("FileLinkAnnotation.pdf");
//close the document
document.Close();
```

VB.NET

```
'Create the PDF document
Dim document As New PdfDocument()
'Creates a new page and adds it as the last page of the document
Dim page As PdfPage = document.Pages.Add()
'Create a new rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Create a link for image file
Dim fileLinkAnnotation As New PdfFileLinkAnnotation(rectangle,
"..\..\Data\logo.png")
'Add this annotation to a page.
page.Annotations.Add(fileLinkAnnotation)
'Save the document to disk.
document.Save("FileLinkAnnotation.pdf")
'close the document
document.Close()
```

UWP

```
//PDF supports external document navigation only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports external document navigation only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports external document navigation only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

Note: The above link makes use of the absolute path of the file for navigation. So, moving the files to another machine or location may lead to file not found error in PDF reader applications.

To open a file in relative path, the [PdfLaunchAction](#) can be used. While using the relative path in launch action, the files can be moved to any machine, provided the relative path is being maintained. The below code snippet explains the same.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create the button field
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(100, 160, 100, 20);
submitButton.Text = "Launch";
//Create a the PdfLaunchAction
PdfLaunchAction launchAction = new PdfLaunchAction(@"..\..\Data\
Document.txt", PdfFilePathType.Relative);
//Set the launchAction to the submitButton
submitButton.Actions.GotFocus = launchAction;
//Add the form field
document.Form.Fields.Add(submitButton);
//Save the document to disk.
document.Save("output.pdf");
//close the document
document.Close();
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Create a new page
Dim page As PdfPage = document.Pages.Add()
'Create a new PdfButtonField
Dim submitButton As New PdfButtonField(page, "submitButton")
submitButton.Bounds = New RectangleF(25, 160, 100, 20)
submitButton.Text = "Launch"
'Create a the PdfLaunchAction
Dim launchAction As New PdfLaunchAction(@"..\..\Data\Document.txt",
PdfFilePathType.Relative)
'Set the launch Action to the submitButton
submitButton.Actions.GotFocus = launchAction
'Add the form field
document.Form.Fields.Add(submitButton)
'Save the document to disk.
document.Save("output.pdf")
'close the document
document.Close()
```

UWP

```
//PDF supports external document navigation only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports external document navigation only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports external document navigation only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

Working with PDF Templates

A PDF template is a drawing surface, where contents can be added. All the elements that can be added to a [PdfPage](#) is supported in [PdfTemplate](#) as well. The template in turn can be drawn over the page or can be positioned at any part of the page.

Creating a new PDF template

The [PdfTemplate](#) class can be used to create a new PDF template. You can add contents to the template using [Graphics](#) property of the PdfTemplate object.

The below code snippet illustrates how to add contents to the PdfTemplate and render into the new PDF page.

C#

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a PDF Template.
PdfTemplate template = new PdfTemplate(100, 50);
//Draw a rectangle on the template graphics
template.Graphics.DrawRectangle(PdfBrushes.BurlyWood, new
System.Drawing.RectangleF(0, 0, 100, 50));
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Draw a string using the graphics of the template.
template.Graphics.DrawString("Hello World", font, brush, 5, 5);
//Draw the template on the page graphics of the document.
pdfPage.Graphics.DrawPdfTemplate(template, PointF.Empty);
//Save the document.
pdfDocument.Save("Output.pdf");
//close the document
pdfDocument.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
'Add a page to the PDF document.
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
'Create a PDF Template.
Dim template As New PdfTemplate(100, 50)
'Draw a rectangle on the template graphics.
template.Graphics.DrawRectangle(PdfBrushes.BurlyWood, New
System.Drawing.RectangleF(0, 0, 100, 50))
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 14)
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
'Draw a string using the graphics of the template.
template.Graphics.DrawString("Hello World", font, brush, 5, 5)
'Draw the template on the page graphics of the document.
```

```
pdfPage.Graphics.DrawPdfTemplate(template, PointF.Empty)
'Save the document.
pdfDocument.Save("Output.pdf")
'close the document
pdfDocument.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a PDF Template.
PdfTemplate template = new PdfTemplate(100, 50);
//Draw a rectangle on the template graphics
template.Graphics.DrawRectangle(PdfBrushes.BurlyWood, new
System.Drawing.RectangleF(0, 0, 100, 50));
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
PdfBrush brush = new PdfSolidBrush(Color.FromArgb(255, 0, 0, 0));
//Draw a string using the graphics of the template.
template.Graphics.DrawString("Hello World", font, brush, 5, 5);
//Draw the template on the page graphics of the document.
pdfPage.Graphics.DrawPdfTemplate(template, PointF.Empty);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await pdfDocument.SaveAsync(stream);
//Close the document
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();

Creating templates from existing PDF document

Essential PDF supports to create the templates from an existing PDF document page and draw it in on a new PDF document.

The below code illustrates how to create the template from an existing page and draw it in new PDF document.

C#

```

//Load the existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the template from the page.
PdfTemplate template = loadedPage.CreateTemplate();
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Set the document margin
document.PageSettings.SetMargins(2);
//Add the page
PdfPage page = document.Pages.Add();
//Create the graphics
PdfGraphics graphics = page.Graphics;

```

```
//Draw the template
graphics.DrawPdfTemplate(template, PointF.Empty, new
SizeF(page.Size.Width/2, page.Size.Height));
//Save the new document.
document.Save("output.pdf");
//Close the documents
loadedDocument.Close(true);
document.Close(true);
```

VB.NET

```
'Load the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Load the page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Create the template from the page.
Dim template As PdfTemplate = loadedPage.CreateTemplate()
'Create a new PDF document
Dim document As New PdfDocument()
'Set the document margin
document.PageSettings.SetMargins(2)
'Add the page
Dim page As PdfPage = document.Pages.Add()
'Create the graphics
Dim graphics As PdfGraphics = page.Graphics
'Draw the template
graphics.DrawPdfTemplate(template, PointF.Empty, New SizeF(page.Size.Width \
2, page.Size.Height))
'Save the new document.
document.Save("output.pdf")
'Close the documents
loadedDocument.Close(True)
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the template from the page.
PdfTemplate template = loadedPage.CreateTemplate();
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Set the document margin
document.PageSettings.SetMargins(2);
//Add the page
```

```

PdfPage page = document.Pages.Add();
//Create the graphics
PdfGraphics graphics = page.Graphics;
//Draw the template
graphics.DrawPdfTemplate(template, PointF.Empty, new SizeF(page.Size.Width /
2, page.Size.Height));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream(fileName, FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the template from the page.
PdfTemplate template = loadedPage.CreateTemplate();
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Set the document margin
document.PageSettings.SetMargins(2);
//Add the page
PdfPage page = document.Pages.Add();
//Create the graphics
PdfGraphics graphics = page.Graphics;
//Draw the template
graphics.DrawPdfTemplate(template, Syncfusion.Drawing.PointF.Empty, new
Syncfusion.Drawing.SizeF(page.Size.Width / 2, page.Size.Height));
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");

```

```

PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create the template from the page.
PdfTemplate template = loadedPage.CreateTemplate();
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Set the document margin
document.PageSettings.SetMargins(2);
//Add the page
PdfPage page = document.Pages.Add();
//Create the graphics
PdfGraphics graphics = page.Graphics;
//Draw the template
graphics.DrawPdfTemplate(template, PointF.Empty, new SizeF(page.Size.Width /
2, page.Size.Height));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Closes the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android

samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}

```

Working with PdfPageTemplateElement

[PdfPageTemplateElement](#) is template element that can be added to any part of the PDF page such as header, footer etc.

The below code illustrates how to add the page template elements in a PDF document.

C#

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a header and draw the image.
RectangleF bounds = new RectangleF(0, 0,
pdfDocument.Pages[0].GetClientSize().Width, 50);
PdfPageTemplateElement header = new PdfPageTemplateElement(bounds);
PdfImage image = new PdfBitmap(@"Logo.png");
//Draw the image in the header.
header.Graphics.DrawImage(image, new PointF(0, 0), new SizeF(100, 50));

```

```

//Add the header at the top.
pdfDocument.Template.Top = header;
//Create a Page template that can be used as footer.
PdfPageTemplateElement footer = new PdfPageTemplateElement(bounds );
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 7);
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Create page number field.
PdfPageNumberField pageNumber = new PdfPageNumberField(font, brush);
//Create page count field.
PdfPageCountField count = new PdfPageCountField(font, brush);
//Add the fields in composite fields.
PdfCompositeField compositeField = new PdfCompositeField(font, brush, "Page
{0} of {1}", pageNumber, count);
compositeField.Bounds = footer.Bounds;
//Draw the composite field in footer.
compositeField.Draw(footer.Graphics, new PointF(470, 40));
//Add the footer template at the bottom.
pdfDocument.Template.Bottom = footer;
//Save and close the document.
pdfDocument.Save("Output.pdf");
pdfDocument.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
'Add a page to the PDF document.
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
'Create a header and draw the image.
Dim bounds As New RectangleF(0, 0,
pdfDocument.Pages(0).GetClientSize().Width, 50)
Dim header As New PdfPageTemplateElement(bounds )
Dim image As PdfImage = New PdfBitmap("Logo.jpg")
'Draw the image in the Header.
header.Graphics.DrawImage(image, New PointF(0, 0), New SizeF(100, 50))
'Add the header at the top.
pdfDocument.Template.Top = header
'Create a page template that can be used as footer.
Dim footer As New PdfPageTemplateElement(bounds )
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 7)
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
'Create page number field.
Dim pageNumber As New PdfPageNumberField(font, brush)
'Create page count field.
Dim count As New PdfPageCountField(font, brush)
'Add the fields in composite fields.
Dim compositeField As New PdfCompositeField(font, brush, "Page {0} of {1}",
pageNumber, count)
compositeField.Bounds = footer.Bounds
'Draw the composite field in footer.
compositeField.Draw(footer.Graphics, New PointF(470, 40))
'Add the footer template at the bottom.
pdfDocument.Template.Bottom = footer
'Save and close the document.
pdfDocument.Save("Output.pdf")
pdfDocument.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a header and draw the image.

Creating Document Overlays

Multiple templates can be drawn over a PDF page, to create a document-overlay. The below code illustrates how to overlay the documents.

C#

```

//Load the existing documents
PdfLoadedDocument loadedDocument1 = new PdfLoadedDocument(fileName1);
PdfLoadedDocument loadedDocument2 = new PdfLoadedDocument(fileName2);
//Create the new document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
//Create a template from the first document
PdfPageBase loadedPage = loadedDocument1.Pages[0];
PdfTemplate template = loadedPage.CreateTemplate();
//Draw the loaded template into new document.

```

```

page.Graphics.DrawPdfTemplate(template, new PointF(0, 0), new SizeF(500,
700));
// Create a template from the second document
loadedPage = loadedDocument2.Pages[0];
template = loadedPage.CreateTemplate();
//Draw the loaded template into new document.
page.Graphics.DrawPdfTemplate(template, new PointF(10, 10), new SizeF(400,
500));
//Save the new document.
document.Save("output.pdf");
//Close the documents
loadedDocument1.Close(true);
loadedDocument2.Close(true);
document.Close(true);

```

VB.NET

```

'Load the existing documents
Dim loadedDocument1 As New PdfLoadedDocument(fileName1)
Dim loadedDocument2 As New PdfLoadedDocument(fileName2)
'Create the new document
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
'Create a template from the first document
Dim loadedPage As PdfPageBase = loadedDocument1.Pages(0)
Dim template As PdfTemplate = loadedPage.CreateTemplate()
'Draw the loaded template into new document.
page.Graphics.DrawPdfTemplate(template, New PointF(0, 0), New SizeF(500,
700))
'Create a template from the first document
loadedPage = loadedDocument2.Pages(0)
template = loadedPage.CreateTemplate()
'Draw the loaded template into new document.
page.Graphics.DrawPdfTemplate(template, New PointF(10, 10), New SizeF(400,
500))
'Save the new document.
document.Save("output.pdf")
'Close the documents
loadedDocument1.Close(True)
loadedDocument2.Close(True)
document.Close(True)

```

UWP

```

//Load the existing documents.
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Sample1.pdf");
PdfLoadedDocument loadedDocument1 = new PdfLoadedDocument();
await loadedDocument1.OpenAsync(pdfStream);
Stream pdfStream1 =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Sample2.pdf");
PdfLoadedDocument loadedDocument2 = new PdfLoadedDocument();
await loadedDocument2.OpenAsync(pdfStream1);
//Create the new document

```

```

PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
//Create a template from the first document
PdfPageBase loadedPage = loadedDocument1.Pages[0];
PdfTemplate template = loadedPage.CreateTemplate();
//Draw the loaded template into new document.
page.Graphics.DrawPdfTemplate(template, new PointF(0, 0), new SizeF(500,
700));
// Create a template from the second document
loadedPage = loadedDocument2.Pages[0];
template = loadedPage.CreateTemplate();
//Draw the loaded template into new document.
page.Graphics.DrawPdfTemplate(template, new PointF(10, 10), new SizeF(400,
500));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the documents
document.Close(true);
loadedDocument1.Close(true);
loadedDocument2.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP

"application/pdf", stream);
}
else
{
```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}
```

Working with Headers and Footers

Essential PDF supports to draw the header and footer in PDF document using [PdfPageTemplateElement](#) class. The header and footer can contain any types of element including dynamic fields.

Adding an automatic field in header and footer

Essential PDF supports to add page count, page numbers, date and time using dynamic fields such as PdfPageCountField, PdfPageNumberField, etc.

The below code snippet explains how to draw the page numbers in footer using automatic fields.

C#

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a header and draw the image.
RectangleF bounds = new RectangleF(0, 0,
pdfDocument.Pages[0].GetClientSize().Width, 50);
PdfPageTemplateElement header = new PdfPageTemplateElement(bounds);
PdfImage image = new PdfBitmap(@"Logo.png");
//Draw the image in the header.
header.Graphics.DrawImage(image, new PointF(0, 0), new SizeF(100, 50));
//Add the header at the top.
pdfDocument.Template.Top = header;
//Create a Page template that can be used as footer.
PdfPageTemplateElement footer = new PdfPageTemplateElement(bounds);
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 7);
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Create page number field.
PdfPageNumberField pageNumber = new PdfPageNumberField(font, brush);
//Create page count field.
PdfPageCountField count = new PdfPageCountField(font, brush);
//Add the fields in composite fields.
PdfCompositeField compositeField = new PdfCompositeField(font, brush, "Page
{0} of {1}", pageNumber, count);
compositeField.Bounds = footer.Bounds;
//Draw the composite field in footer.
compositeField.Draw(footer.Graphics, new PointF(470, 40));
//Add the footer template at the bottom.
pdfDocument.Template.Bottom = footer;
//Save and close the document.
pdfDocument.Save("Output.pdf");
pdfDocument.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
'Add a page to the PDF document.
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
```

```

'Create a header and draw the image.
Dim bounds As New RectangleF(0, 0,
pdfDocument.Pages(0).GetClientSize().Width, 50)
Dim header As New PdfPageTemplateElement(bounds)
Dim image As PdfImage = New PdfBitmap("Logo.jpg")
'Draw the image in the Header.
header.Graphics.DrawImage(image, New PointF(0, 0), New SizeF(100, 50))
'Add the header at the top.
pdfDocument.Template.Top = header
'Create a page template that can be used as footer.
Dim footer As New PdfPageTemplateElement(bounds)
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 7)
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
'Create page number field.
Dim pageNumber As New PdfPageNumberField(font, brush)
'Create page count field.
Dim count As New PdfPageCountField(font, brush)
'Add the fields in composite fields.
Dim compositeField As New PdfCompositeField(font, brush, "Page {0} of {1}",
pageNumber, count)
compositeField.Bounds = footer.Bounds
'Draw the composite field in footer.
compositeField.Draw(footer.Graphics, New PointF(470, 40))
'Add the footer template at the bottom.
pdfDocument.Template.Bottom = footer
'Save and close the document.
pdfDocument.Save("Output.pdf")
pdfDocument.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Create a header and draw the image.
RectangleF bounds = new RectangleF(0, 0,
pdfDocument.Pages[0].GetClientSize().Width, 50);
PdfPageTemplateElement header = new PdfPageTemplateElement(bounds);
//Load the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As

}
```

Working with Shapes

Essential PDF has support for adding the below shapes.

- Line
- Curve
- Path
- Text
- Rectangle
- Pie
- Arc
- Bezier
- Ellipse

Adding Shapes to a PDF document

Essential PDF supports adding shapes with different types of brushes like solid brush, gradient brush, tiling brush, and image brush along with various [color spaces](#) and transparency levels.

Polygon

You can draw a polygon in PDF document by using the [DrawPolygon](#) method of [PdfGraphics](#). The following code snippet explains how to draw a polygon in new PDF document.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Initialize PdfPen to draw the polygon
PdfPen pen = new PdfPen(PdfBrushes.Brown, 10f);
//Initialize PdfLinearGradientBrush for drawing the polygon
PdfLinearGradientBrush brush = new PdfLinearGradientBrush(new PointF(10,
100), new PointF(100, 200), new PdfColor(Color.Red), new
PdfColor(Color.Green));
//Create the polygon points
PointF p1 = new PointF(10, 100);
PointF p2 = new PointF(10, 200);
PointF p3 = new PointF(100, 100);
PointF p4 = new PointF(100, 200);
PointF p5 = new PointF(55, 150);
PointF[] points = { p1, p2, p3, p4, p5 };
//Draw the polygon on PDF document
page.Graphics.DrawPolygon(pen, brush, points);
//Save the PDF document
document.Save("Output.pdf");
```

```
//Close the instance of PdfDocument
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = document.Pages.Add
'Initialize PdfPen to draw the polygon
Dim pen As PdfPen = New PdfPen(PdfBrushes.Brown, 10.0F)
'Initialize PdfLinearGradientBrush for drawing the polygon
Dim brush As PdfLinearGradientBrush = New PdfLinearGradientBrush(New
PointF(10, 100), New PointF(100, 200), New PdfColor(Color.Red), New
PdfColor(Color.Green))
'Create the polygon points
Dim p1 As PointF = New PointF(10, 100)
Dim p2 As PointF = New PointF(10, 200)
Dim p3 As PointF = New PointF(100, 100)
Dim p4 As PointF = New PointF(100, 200)
Dim p5 As PointF = New PointF(55, 150)
Dim points As PointF() = {p1, p2, p3, p4, p5}
'Draw the polygon on PDF document
page.Graphics.DrawPolygon(pen, brush, points)
'Save the PDF document
document.Save("Output.pdf")
'Close the instance of PdfDocument
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Initialize PdfPen to draw the polygon
PdfPen pen = new PdfPen(PdfBrushes.Brown, 10f);
//Initialize PdfLinearGradientBrush for drawing the polygon
PdfLinearGradientBrush brush = new PdfLinearGradientBrush(new PointF(10,
100), new PointF(100, 200), new PdfColor(Color.FromArgb(255, 255, 0, 0)),
new PdfColor(Color.FromArgb(255, 0, 128, 0)));
//Create the polygon points
PointF p1 = new PointF(10, 100);
PointF p2 = new PointF(10, 200);
PointF p3 = new PointF(100, 100);
PointF p4 = new PointF(100, 200);
PointF p5 = new PointF(55, 150);
PointF[] points = { p1, p2, p3, p4, p5 };
//Draw the polygon on PDF document
page.Graphics.DrawPolygon(pen, brush, points);
//Create memory stream
MemoryStream stream = new MemoryStream();
//Open the document in browser after saving it
document.Save(stream);
//Close the instance of PdfDocument
document.Close(true);
```

```
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

"application/pdf", stream);
}

```

Text

You can draw text in a PDF document by using the [DrawString](#) method of [PdfGraphics](#). To draw different PDF elements based on the position of previously drawn element, draw the text by using [Draw](#) method of [PdfTextElement](#) and store its bounds in [PdfLayoutResult](#). Refer to the [Working with Text](#) section for more information.

Rectangle

You can draw a rectangle in PDF document by using the [DrawRectangle](#) method of [PdfGraphics](#). The following code snippet explains how to draw a rectangle in new PDF document.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Initialize PdfSolidBrush for drawing the rectangle
PdfSolidBrush brush = new PdfSolidBrush(Color.Green);
//Set the bounds for rectangle
RectangleF bounds = new RectangleF(10, 10, 100, 50);
//Draw the rectangle on PDF document
page.Graphics.DrawRectangle(brush, bounds);
//Save the PDF document
document.Save("Output.pdf");
//Close the instance of PdfDocument
document.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = document.Pages.Add
'Initialize PdfSolidBrush for drawing the rectangle
Dim brush As PdfSolidBrush = New PdfSolidBrush(Color.Green)
'Set the bounds for rectangle
Dim bounds As RectangleF = New RectangleF(10, 10, 100, 50)
'Draw the rectangle on PDF document
page.Graphics.DrawRectangle(brush, bounds)
'Save the PDF document
document.Save("Output.pdf")
'Close the instance of PdfDocument
document.Close(True)

```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Initialize PdfSolidBrush for drawing the rectangle
PdfSolidBrush brush = new PdfSolidBrush(Color.FromArgb(255, 0, 128, 0));
//Set the bounds for rectangle
RectangleF bounds = new RectangleF(10, 10, 100, 50);
//Draw the rectangle on PDF document
page.Graphics.DrawRectangle(brush, bounds);
//Create memory stream
MemoryStream stream = new MemoryStream();
//Open the document in browser after saving it
document.Save(stream);
//Close the instance of PdfDocument
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document

Arc

You can draw an arc in PDF document by using the [DrawArc](#) method of [PdfGraphics](#). The following code snippet explains how to draw an arc in new PDF document.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Initialize the pen for drawing an arc
PdfPen pen = new PdfPen(Color.Brown, 10f);
//Set the line join style of the pen
pen.LineCap = PdfLineCap.Square;
//Set the bounds for arc
RectangleF bounds = new RectangleF(20, 40, 200, 200);
//Draw the arc on PDF document
page.Graphics.DrawArc(pen, bounds, 270, 90);
//Save the PDF document
document.Save("Output.pdf");
//Close the instance of PdfDocument
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Add a page to the document
Dim page As PdfPage = document.Pages.Add
'Initialize the pen for drawing an arc
Dim pen As PdfPen = New PdfPen(Color.Brown, 10.0F)
'Set the line join style of the pen
pen.LineCap = PdfLineCap.Square
'Set the bounds for arc
Dim bounds As RectangleF = New RectangleF(20, 40, 200, 200)
'Draw the arc on PDF document
page.Graphics.DrawArc(pen, bounds, 270, 90)
'Save the PDF document
document.Save("Output.pdf")
'Close the instance of PdfDocument
```

```
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Add a page to the document
PdfPage page = document.Pages.Add();
//Initialize the pen for drawing an arc
PdfPen pen = new PdfPen(Color.FromArgb(255, 165, 42, 42), 10f);
//Set the line join style of the pen
pen.LineCap = PdfLineCap.Square;
//Set the bounds for arc
RectangleF bounds = new RectangleF(20, 40, 200, 200);
//Draw the arc on PDF document
page.Graphics.DrawArc(pen, bounds, 270, 90);
//Create memory stream
MemoryStream stream = new MemoryStream();
//Open the document in browser after saving it
document.Save(stream);
//Close the instance of PdfDocument
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document

Working with shape pagination

You can also allow large shapes to paginate across pages by assigning `Paginate` of `PdfLayoutType` Enum to `Layout` property of `PdfLayoutFormat` class.

C#

```
//Create Document
PdfDocument doc = new PdfDocument();
//Add new page
PdfPage page = doc.Pages.Add();
//Set bounds for ellipse
RectangleF rect = new RectangleF(0, 0, 100, 1000);
//Create ellipse
PdfEllipse ellipse = new PdfEllipse(rect);
//Set layout property to make the ellipse break across the pages.
PdfLayoutFormat format = new PdfLayoutFormat();
format.Break = PdfLayoutBreakType.FitPage;
format.Layout = PdfLayoutType.Paginate;
ellipse.Brush = PdfBrushes.Brown;
//Draw ellipse.
ellipse.Draw(page, 20, 20, format);
//Save and close the PDF
doc.Save("Shapes.pdf");
doc.Close(true);
```

VB.NET

```
'Create Document
Dim doc As New PdfDocument()
'Add new page

"application/pdf", stream);
}

```

Working with Bookmarks

Essential PDF provides support to insert, remove and modify the bookmarks in the PDF Document.

Adding Bookmarks in a PDF

The [PdfBookmarkBase](#) collection represents the bookmarks in a PDF document. You can add a bookmark in a new PDF document using [PdfBookmark](#) class. Please refer the following code example.

C#

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.Red;
//Saves and closes the PDF document.
document.Save("Output.pdf");
document.Close(True);

```

VB.NET

```

'Creates a new document.
Dim document As New PdfDocument()
'Adds a page.
Dim page As PdfPage = document.Pages.Add()
'Creates document bookmarks.
Dim bookmark As PdfBookmark = document.Bookmarks.Add("Page 1")
'Sets the destination page.
bookmark.Destination = New PdfDestination(page)
'Sets the destination location.
bookmark.Destination.Location = New PointF(20, 20)
'Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold
bookmark.Color = Color.Red
'Saves and closes the PDF document.
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.FromArgb(0, 255, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Sets the text style and color.

```

```

bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Syncfusion.Drawing.Color.Red;
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Syncfusion.Drawing.Color.Red;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding Bookmarks in an existing PDF document

To add bookmarks to an existing PDF document, use the following code example.

C#

```
//Loads the document.
PdfLoadedDocument document = new PdfLoadedDocument("input.pdf");
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(document.Pages[0]);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.Red;
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Saves and closes the PDF document.
document.Save("Output.pdf");
document.Close(True);
```

VB.NET

```
'Loads the document.
Dim document As New PdfLoadedDocument("input.pdf")
'Creates document bookmarks.
Dim bookmark As PdfBookmark = document.Bookmarks.Add("Page 1")
'Sets the destination page.
bookmark.Destination = New PdfDestination(document.Pages(0))
'Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold
bookmark.Color = Color.Red
'Sets the destination location.
bookmark.Destination.Location = New PointF(20, 20)
'Saves and closes the PDF document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await document.OpenAsync(file);
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(document.Pages[0]);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.FromArgb(0, 255, 0, 0);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Save the PDF document to stream
```

```

MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(document.Pages[0]);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.Red;
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Creates document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(document.Pages[0]);
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Syncfusion.Drawing.Color.Red;
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);

```

```

//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding a Child to the Bookmarks

You can add a child bookmark by using [Insert](#) method. Please refer to the following code example.

C#

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates bookmark.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Adds the child bookmark
PdfBookmark childBookmark = bookmark.Insert(0, "heading 1");
childBookmark.Destination = new PdfDestination(page);
childBookmark.Destination.Location = new PointF(400, 300);
childBookmark.Destination.Zoom = 2F;
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.Red;
//Saves and closes the PDF document.
document.Save("Output.pdf");
document.Close(True);

```

VB.NET

```

'Creates a new document.
Dim document As New PdfDocument()
'Adds a page.
Dim page As PdfPage = document.Pages.Add()
'Creates bookmark.
Dim bookmark As PdfBookmark = document.Bookmarks.Add("Page 1")
'Sets the destination page.
bookmark.Destination = New PdfDestination(page)
'Sets the destination location.

```

```

bookmark.Destination.Location = New PointF(20, 20)
'Adds the child bookmark
Dim childBookmark As PdfBookmark = bookmark.Insert(0, "heading 1")
childBookmark.Destination = New PdfDestination(page)
childBookmark.Destination.Location = New PointF(400, 300)
childBookmark.Destination.Zoom = 2.0F
'Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold
bookmark.Color = Color.Red
'Saves and closes the PDF document.
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates bookmark.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Adds the child bookmark
PdfBookmark childBookmark = bookmark.Insert(0, "heading 1");
childBookmark.Destination = new PdfDestination(page);
childBookmark.Destination.Location = new PointF(400, 300);
childBookmark.Destination.Zoom = 2F;
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.FromArgb(0, 255, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates bookmark.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Adds the child bookmark
PdfBookmark childBookmark = bookmark.Insert(0, "heading 1");

```

```

childBookmark.Destination = new PdfDestination(page);
childBookmark.Destination.Location = new PointF(400, 300);
childBookmark.Destination.Zoom = 2F;
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Syncfusion.Drawing.Color.Red;
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates a new document.
PdfDocument document = new PdfDocument();
//Adds a page.
PdfPage page = document.Pages.Add();
//Creates bookmark.

//Sets the destination page.
bookmark.Destination = new PdfDestination(page);
//Sets the destination location.
bookmark.Destination.Location = new PointF(20, 20);
//Adds the child bookmark
PdfBookmark childBookmark = bookmark.Insert(0, "heading 1");
childBookmark.Destination = new PdfDestination(page);
childBookmark.Destination.Location = new PointF(400, 300);
childBookmark.Destination.Zoom = 2F;
//Sets the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Syncfusion.Drawing.Color.Red;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else

```

```
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Inserting Bookmarks in an existing PDF

When loading an existing document, the Essential PDF loads all bookmarks of the document.

Each loaded bookmark is represented by the [PdfLoadedBookmark](#) object. The following code example illustrates how to insert new bookmarks in the existing PDF document.

C#

```
//Creates a new document.
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Inserts a new bookmark in the existing bookmark collection.
PdfBookmark bookmark = document.Bookmarks.Insert(1, "New Page 2");
//Sets the destination page and location.
bookmark.Destination = new PdfDestination(document.Pages[1]);
bookmark.Destination.Location = new PointF(0, 300);
//Saves and closes the PDF document.
document.Save("Output.pdf");
document.Close(True);
```

VB.NET

```
'Creates a new document.
Dim document As New PdfLoadedDocument("Input.pdf")
'Inserts a new bookmark in the existing bookmark collection.
Dim bookmark As PdfBookmark = document.Bookmarks.Insert(1, "New Page 2")
'Sets the destination page and location.
bookmark.Destination = New PdfDestination(document.Pages(1))
bookmark.Destination.Location = New PointF(0, 300)
'Saves and closes the PDF document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await document.OpenAsync(file);
//Inserts a new bookmark in the existing bookmark collection.
PdfBookmark bookmark = document.Bookmarks.Insert(1, "New Page 2");
//Sets the destination page and location.
bookmark.Destination = new PdfDestination(document.Pages[1]);
bookmark.Destination.Location = new PointF(0, 300);
//Save the PDF document to stream
```

```

MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Inserts a new bookmark in the existing bookmark collection.
PdfBookmark bookmark = document.Bookmarks.Insert(1, "New Page 2");
//Sets the destination page and location.
bookmark.Destination = new PdfDestination(document.Pages[1]);
bookmark.Destination.Location = new PointF(0, 300);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Inserts a new bookmark in the existing bookmark collection.
PdfBookmark bookmark = document.Bookmarks.Insert(1, "New Page 2");
//Sets the destination page and location.
bookmark.Destination = new PdfDestination(document.Pages[1]);
bookmark.Destination.Location = new PointF(0, 300);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

```

```
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Removing Bookmarks from an existing PDF

You can also remove bookmarks from the existing PDF document by using [Remove](#) method. Please refer the following code example.

C#

```
//Loads the PDF document.
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Gets all the bookmarks.
PdfBookmarkBase bookmarks = document.Bookmarks;
//Removes bookmark by bookmark name.
bookmarks.Remove("Page 1");
//Removes bookmark by index.
bookmarks.RemoveAt(1);
//Saves and closes the document.
document.Save("Output.pdf");
document.Close(True);
```

VB.NET

```
'Loads the PDF document.
Dim document As New PdfLoadedDocument("Input.pdf")
'Gets all the bookmarks.
Dim bookmarks As PdfBookmarkBase = document.Bookmarks
'Removes bookmark by bookmark name.
bookmarks.Remove("Page 1")
'Removes bookmark by index.
bookmarks.RemoveAt(1)
'Saves and closes the document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await document.OpenAsync(file);
//Gets all the bookmarks.
```

```

PdfBookmarkBase bookmarks = document.Bookmarks;
//Removes bookmark by bookmark name.
bookmarks.Remove("Page 1");
//Removes bookmark by index.
bookmarks.RemoveAt(1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Gets all the bookmarks.
PdfBookmarkBase bookmarks = document.Bookmarks;
//Removes bookmark by bookmark name.
bookmarks.Remove("Page 1");
//Removes bookmark by index.
bookmarks.RemoveAt(1);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Gets all the bookmarks.
PdfBookmarkBase bookmarks = document.Bookmarks;
//Removes bookmark by bookmark name.
bookmarks.Remove("Page 1");
//Removes bookmark by index.
bookmarks.RemoveAt(1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);

```

```
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Modifying the Bookmarks

Essential PDF allows you to modify the bookmarks in the existing PDF document. The following modifications can be done to bookmarks in an existing document.

- Modify the bookmark style, color, title, and destination.
- Add or insert new bookmarks into the root collection.
- Add or insert new bookmarks as a child of another bookmark.
- Assign the destination of the added bookmarks to a loaded page or a new page of the document.

The following code example shows how to modify the [Destination](#), [Color](#), [TextStyle](#) and [Title](#) of an existing bookmark collection.

C#

```
//Loads the PDF document.
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Gets all the bookmarks.
PdfBookmarkBase bookmarks = document.Bookmarks;
//Gets the first bookmark and changes the properties of the bookmark.
PdfLoadedBookmark bookmark = bookmarks[0] as PdfLoadedBookmark;
bookmark.Destination = new PdfDestination(document.Pages[1]);
bookmark.Color = Color.Green;
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Title = "Changed title";
//Saves the document
document.Save("Output.pdf");
document.Close(True);
```

VB.NET

```
'Loads the PDF document.
Dim document As New PdfLoadedDocument("Input.pdf")
'Gets all the bookmarks.
Dim bookmarks As PdfBookmarkBase = document.Bookmarks
'Gets the first bookmark and changes the properties of the bookmark.
```

```

Dim bookmark As PdfLoadedBookmark = TryCast(bookmarks(0), PdfLoadedBookmark)
bookmark.Destination = New PdfDestination(document.Pages(1))
bookmark.Color = Color.Green
bookmark.TextStyle = PdfTextStyle.Bold
bookmark.Title = "Changed title"

}
```

Working with Named Destination

Essential PDF provides support to add, remove and modify the named destination in the PDF document. When you open a PDF file in a web browser, the first page of the PDF file will be shown by default. By adding a named destination, you can open the PDF with the desired location and magnification. The following link example shows how to open a PDF document with named destination in a web page.

Another example that uses "nameddest" parameter in URL:

e.g. <http://www.syncfusion.com/downloads/support/directtrac/general/pd/mydocument-1524150305.pdf#nameddest=Chapter3>

Points to remembers:

- Individual parameters, together with their values (separated by & or #), can be no greater than 32 characters in length.
- You cannot use the reserved characters =, #, and &. There is no way to escape these special characters.

Adding Named Destination to a PDF document

You can add, remove and modify the named destination using [PdfNamedDestination](#) class.

The following code example shows how to add named destination in a new PDF document.

C#

```
//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
doc.NamedDestinationCollection.Add(destination);
//Draw the text.
page.Graphics.DrawString("Hello World!!", new
PdfStandardFont(PdfFontFamily.Helvetica, 10), PdfBrushes.Black, new
PointF(0, 500));
//Save the document.
doc.Save("Output.pdf");
//Close the document.
doc.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = doc.Pages.Add()
'Create an instance for named destination.
Dim destination As New PdfNamedDestination("TOC")
destination.Destination = New PdfDestination(page)
'Set the location
destination.Destination.Location = New PointF(0, 500)
'Set zoom factor to 400 percentage
destination.Destination.Zoom = 4
doc.NamedDestinationCollection.Add(destination)
'Draw the text.
```

```

page.Graphics.DrawString("Hello World!!", New
PdfStandardFont(PdfFontFamily.Helvetica, 10), PdfBrushes.Black, New
PointF(0, 500))
'Save the document.
doc.Save("Output.pdf")
'Close the document.
doc.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
doc.NamedDestinationCollection.Add(destination);
//Draw the text.
page.Graphics.DrawString("Hello World!!", new
PdfStandardFont(PdfFontFamily.Helvetica, 10), PdfBrushes.Black, new
PointF(0, 500));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
doc.NamedDestinationCollection.Add(destination);
//Draw the text.
page.Graphics.DrawString("Hello World!!", new
PdfStandardFont(PdfFontFamily.Helvetica, 10), PdfBrushes.Black, new
PointF(0, 500));
//Save the document into stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);

```

```

stream.Position = 0;
//Closes the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document.

{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding Named Destination to an existing PDF document

The following code example shows how to add named destination in an existing PDF document using the [PdfNamedDestination](#) class.

C#

```

//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Get the first page of the document
PdfPageBase page = loadedDocument.Pages[0];
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
loadedDocument.NamedDestinationCollection.Add(destination);
//Save the document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Get the first page of the document
Dim page As PdfPageBase = loadedDocument.Pages(0)
'Create an instance for named destination.
Dim destination As New PdfNamedDestination("TOC")
destination.Destination = New PdfDestination(page)
'Set the location
destination.Destination.Location = New PointF(0, 500)
'Set zoom factor to 400 percentage
destination.Destination.Zoom = 4
loadedDocument.NamedDestinationCollection.Add(destination)
'Save the document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the first page of the document
PdfPageBase page = loadedDocument.Pages[0];
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage

```

```

destination.Destination.Zoom = 4;
loadedDocument.NamedDestinationCollection.Add(destination);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the first page of the document
PdfPageBase page = loadedDocument.Pages[0];
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
loadedDocument.NamedDestinationCollection.Add(destination);
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the first page of the document
PdfPageBase page = loadedDocument.Pages[0];
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 500);
//Set zoom factor to 400 percentage

```

```

destination.Destination.Zoom = 4;
loadedDocument.NamedDestinationCollection.Add(destination);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Closes the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Removing/Modifying the named destination

You can remove the named destination using [Remove](#) method of [PdfNamedDestinationCollection](#). The following code snippet illustrates the same.

C#

```

//Load the PDF document
PdfLoadedDocument lDoc = new PdfLoadedDocument("Sample.pdf");
//Get the named destination collection
PdfNamedDestinationCollection destinationCollection =
lDoc.NamedDestinationCollection;
//Remove the named destination by title
destinationCollection.Remove("TOC");
//Modify the exiting named destination
PdfNamedDestination destination = destinationCollection[0];
destination.Title = "POC";
//Save the document
lDoc.Save("Output.pdf");
//Close the document
lDoc.Close(true);

```

VB.NET

```

'Load the PDF document
Dim lDoc As New PdfLoadedDocument("Sample.pdf")
'Get the named destination collection
Dim destinationCollection As PdfNamedDestinationCollection =
lDoc.NamedDestinationCollection
'Remove the named destination by title
destinationCollection.Remove("TOC")
'Modify the exiting named destination
Dim destination As PdfNamedDestination = destinationCollection(0)

```

```
destination.Title = "POC"
'Save the document
lDoc.Save("Output.pdf")
'Close the document
lDoc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Get the named destination collection
PdfNamedDestinationCollection destinationCollection =
lDoc.NamedDestinationCollection;
//Remove the named destination by title
destinationCollection.Remove("TOC");
//Modify the exiting named destination
PdfNamedDestination destination = destinationCollection[0];
destination.Title = "POC";
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await lDoc.SaveAsync(stream);
//Close the document
lDoc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Barcode.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Get the named destination collection
PdfNamedDestinationCollection destinationCollection =
lDoc.NamedDestinationCollection;
//Remove the named destination by title
destinationCollection.Remove("TOC");
//Modify the exiting named destination
PdfNamedDestination destination = destinationCollection[0];
destination.Title = "POC";
//Save the document into stream.
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
stream.Position = 0;
//Close the documents.
lDoc.Close(true);
//Defining the ContentType for pdf file.
```

```

string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Get the named destination collection
PdfNamedDestinationCollection destinationCollection =
lDoc.NamedDestinationCollection;
//Remove the named destination by title
destinationCollection.Remove("TOC");
//Modify the exiting named destination
PdfNamedDestination destination = destinationCollection[0];
destination.Title = "POC";
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
//Closes the document
lDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding named destination to the bookmarks

The following code example shows how to add named destination to the [Bookmarks](#) in the PDF document.

C#

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");

```

```

destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 800);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
//Add the named destination to the collection
doc.NamedDestinationCollection.Add(destination);
//Create a bookmark
PdfBookmark bookmark = doc.Bookmarks.Add("TOC");
//Assign the named destination to the bookmark
bookmark.NamedDestination = destination;
//Save the document
doc.Save("Sample.pdf");
//Close the document
doc.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim doc As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = doc.Pages.Add()
'Create an instance for named destination.
Dim destination As New PdfNamedDestination("TOC")
destination.Destination = New PdfDestination(page)
'Set the location
destination.Destination.Location = New PointF(0, 800)
'Set zoom factor to 400 percentage
destination.Destination.Zoom = 4
'Add the named destination to the collection
doc.NamedDestinationCollection.Add(destination)
'Create a bookmark
Dim bookmark As PdfBookmark = doc.Bookmarks.Add("TOC")
'Assign the named destination to the bookmark
bookmark.NamedDestination = destination
'Save the document
doc.Save("Sample.pdf")
'Close the document
doc.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 800);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
//Add the named destination to the collection
doc.NamedDestinationCollection.Add(destination);
//Create a bookmark

```

```

PdfBookmark bookmark = doc.Bookmarks.Add("TOC");
//Assign the named destination to the bookmark
bookmark.NamedDestination = destination;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument doc = new PdfDocument();
//Add a page to the document.
PdfPage page = doc.Pages.Add();
//Create an instance for named destination.
PdfNamedDestination destination = new PdfNamedDestination("TOC");
destination.Destination = new PdfDestination(page);
//Set the location
destination.Destination.Location = new PointF(0, 800);
//Set zoom factor to 400 percentage
destination.Destination.Zoom = 4;
//Add the named destination to the collection

Working with Annotations

Essential PDF provides support for interactive annotations.

You can add, delete and modify the annotation from the PDF documents.

Adding annotations to a PDF document

You can add a popup annotation to the page using [PdfPopupAnnotation](#) class. The following code example explains this.

C#

```

//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to the created page.
page.Annotations.Add(popupAnnotation);

```

```
//Saves the document to disk.
document.Save("PopupAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document.
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Creates a new popup annotation.
Dim popupAnnotation As New PdfPopupAnnotation(rectangle, "Test popup
annotation")
popupAnnotation.Border.Width = 4
popupAnnotation.Border.HorizontalRadius = 20
popupAnnotation.Border.VerticalRadius = 30
'Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph
'Adds this annotation to the created page.
page.Annotations.Add(popupAnnotation)
'Saves the document to disk.
document.Save("PopupAnnotation.pdf")
document.Close(True)
```

UWP

```
//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to the created page.
page.Annotations.Add(popupAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "PopupAnnotation.pdf");
```

ASP.NET CORE

```
//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a rectangle

//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation();
popupAnnotation.Bounds = rectangle;
popupAnnotation.Text = "Test popup annotation";
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to the created page.
page.Annotations.Add(popupAnnotation);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("PopupAnnotation.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("PopupAnnotation.pdf",
"application/pdf", stream);
}
```

To add annotations to an existing PDF document, use the following code example.

C#

```
//Creates a new PDF document.
PdfLoadedDocument document = new PdfLoadedDocument("input.pdf");
//Creates a rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds the annotation to loaded page
document.Pages[0].Annotations.Add(popupAnnotation);
//Saves the document to disk.
document.Save("PopupAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document.
Dim document As New PdfLoadedDocument("input.pdf")
'Creates a rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Creates a new popup annotation.
Dim popupAnnotation As New PdfPopupAnnotation(rectangle, "Test popup
annotation")
popupAnnotation.Border.Width = 4
popupAnnotation.Border.HorizontalRadius = 20
popupAnnotation.Border.VerticalRadius = 30
'Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph
'Adds the annotation to loaded page
document.Pages(0).Annotations.Add(popupAnnotation)
'Saves the document to disk.
document.Save("PopupAnnotation.pdf")
document.Close(True)
```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await document.OpenAsync(file);
//Creates a rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds the annotation to loaded page
document.Pages[0].Annotations.Add(popupAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples
Save(stream, "PopupAnnotation.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Creates a rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds the annotation to loaded page
document.Pages[0].Annotations.Add(popupAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;

```

```
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "PopupAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Creates a rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the pdf popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds the annotation to loaded page
document.Pages[0].Annotations.Add(popupAnnotation);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("PopupAnnotati
on.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("PopupAnnotation.pdf",
"application/pdf", stream);
}
```

Flatten annotation

Annotations can be flattened by removing the existing annotation and replacing it with graphics objects that would resemble the annotation and cannot be edited.

This can be achieved by enabling the [Flatten](#) property. Please refer the sample for flattening all the annotations in the PDF document.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    //Flatten all the annotations in the page
    loadedPage.Annotations.Flatten = true;
}
//Save and close the PDF document instance
loadedDocument.Save("output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedDocument("input.pdf")
'Get all the pages
For Each loadedPage As PdfLoadedPage In loadedDocument.Pages
    'Flatten all the annotations in the page
    loadedPage.Annotations.Flatten = True
Next
'Save and close the PDF document instance
loadedDocument.Save("output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    //Flatten all the annotations in the page
    loadedPage.Annotations.Flatten = true;
}
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
//Flatten all the annotations in the page
loadedPage.Annotations.Flatten = true;
}
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
//Flatten all the annotations in the page
loadedPage.Annotations.Flatten = true;
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
```

```
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}
```

To flatten the specific annotation in the PDF document, use the below code example.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
//Flatten all the annotations in the page
foreach (PdfLoadedAnnotation annotation in loadedPage.Annotations)
{
//Check for the circle annotation
if (annotation is PdfLoadedCircleAnnotation)
{
//Flatten the circle annotation
annotation.Flatten = true;
}
}
}
//Save and close the PDF document instance
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As New PdfLoadedDocument("input.pdf")
'Get all the pages
For Each loadedPage As PdfLoadedPage In loadedDocument.Pages
'Flatten all the annotations in the page
For Each annotation As PdfLoadedAnnotation In loadedPage.Annotations
'Check for the circle annotation
If TypeOf annotation Is PdfLoadedCircleAnnotation Then
'Flatten the circle annotation
annotation.Flatten = True
End If
Next
Next
'Save and close the PDF document instance
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
```

```

//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    //Flatten all the annotations in the page
    foreach (PdfLoadedAnnotation annotation in loadedPage.Annotations)
    {
        //Check for the circle annotation
        if (annotation is PdfLoadedCircleAnnotation)
        {
            //Flatten the circle annotation
            annotation.Flatten = true;
        }
    }
}
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    //Flatten all the annotations in the page
    foreach (PdfLoadedAnnotation annotation in loadedPage.Annotations)
    {
        //Check for the circle annotation
        if (annotation is PdfLoadedCircleAnnotation)
        {
            //Flatten the circle annotation
            annotation.Flatten = true;
        }
    }
}
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";

```

```
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    //Flatten all the annotations in the page
    foreach (PdfLoadedAnnotation annotation in loadedPage.Annotations)
    {
        //Check for the circle annotation
        if (annotation is PdfLoadedCircleAnnotation)
        {
            //Flatten the circle annotation
            annotation.Flatten = true;
        }
    }
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}
```

To flatten pop-up annotation in the PDF document, use the following code example.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument("PopupAnnotation.pdf");
//Get all the pages
```

```

foreach(PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    foreach(PdfLoadedAnnotation annotation in loadedPage.Annotations)
    {
        if(annotation is PdfLoadedPopupAnnotation)
        {
            //Enable the flatten annotation
            annotation.Flatten = true;
            //Enable flatten for the pop-up window annotation
            annotation.FlattenPopUps = true;
        }
    }
}
//Save the document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As New PdfLoadedDocument("PopupAnnotation.pdf")
'Get all the pages
For Each loadedPage As PdfLoadedPage In loadedDocument.Pages
For Each annotation As PdfLoadedAnnotation In loadedPage.Annotations
If TypeOf annotation Is PdfLoadedPopupAnnotation Then
'Enable the flatten annotation
annotation.Flatten = True
'Enable flatten for the pop-up window annotation
annotation.FlattenPopUps = True
End If
Next
Next
'Save the document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document using Open method of the
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get all the page
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    foreach (PdfLoadedAnnotation annotation in loadedPage.Annotations)
    {
        if (annotation is PdfLoadedPopupAnnotation)

```

```

{
    //Enable the flatten annotation
    annotation.Flatten = true;
    //Enable flatten for the pop-up window annotation
    annotation.FlattenPopUps = true;
}
}
}
//Save the document as stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document instances
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("PopupAnnotation.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get all the pages
foreach (PdfLoadedPage loadedPage in loadedDocument.Pages)
{
    foreach (PdfLoadedAnnotation annotation in loadedPage.Annotations)
    {
        if (annotation is PdfLoadedPopupAnnotation)

samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Supported annotation types

3D Annotation

3D Annotations are used to represent 3D artworks in a PDF document. Essential PDF provides support to embed 3D files (u3d) in PDF.

You can add a 3D annotation in PDF document using [Pdf3DAnnotation](#) class. The following example illustrates this.

C#

```

//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new pdf 3d annotation.
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), @"3DAnnotation.U3D");

```

```
//Handles the activation of the 3d annotation
Pdf3DActivation activation = new Pdf3DActivation();
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation;
activation.ShowToolbar = true;
pdf3dAnnotation.Activation = activation;
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Saves the document to disk.
document.Save("3DAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document.
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new pdf 3d annotation.
Dim pdf3dAnnotation As New Pdf3DAnnotation(New RectangleF(10, 50, 300, 150),
"3DAnnotation.U3D")
'Handles the activation of the 3d annotation
Dim activation As New Pdf3DActivation()
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation
activation.ShowToolbar = True
pdf3dAnnotation.Activation = activation
'Adds annotation to page
page.Annotations.Add(pdf3dAnnotation)
'Saves the document to disk.
document.Save("3DAnnotation.pdf")
document.Close(True)
```

UWP

```
//PDF supports 3D annotation only in Windows Forms, WPF, ASP.NET, ASP.NET
MVC and ASP.NET Core.
```

ASP.NET CORE

```
//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
FileStream inputStream = new FileStream("3DAnnotation.U3D", FileMode.Open,
FileAccess.Read);
//Creates a new pdf 3d annotation.
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), inputStream);
//Handles the activation of the 3d annotation
Pdf3DActivation activation = new Pdf3DActivation();
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation;
activation.ShowToolbar = true;
pdf3dAnnotation.Activation = activation;
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the document into stream
```

```

MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "3DAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
Stream inputStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.3DAnnotation.u3d");
//Creates a new PDF 3d annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), inputStream);
//Handles the activation of the 3d annotation
Pdf3DActivation activation = new Pdf3DActivation();
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation;
activation.ShowToolbar = true;
pdf3dAnnotation.Activation = activation;
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("3DAnnotation.
pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("3DAnnotation.pdf",
"application/pdf", stream);
}

```

You can add the JavaScript script to the 3D annotation using the [OnInstantiate](#) property, which is executed whenever a 3D stream is read to create an instance of the 3D artwork. The following code snippet illustrate this.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PDF 3D annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), @"Input.u3d");
//Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")";
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the document to disk
document.Save("3DAnnotation.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Create a new PDF 3D annotation
Dim pdf3dAnnotation As New Pdf3DAnnotation(New RectangleF(10, 50, 300, 150),
"Input.u3d")
'Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")"
'Adds annotation to page
page.Annotations.Add(pdf3dAnnotation)
'Save the document to disk
document.Save("3DAnnotation.pdf")
'Close the document
document.Close(True)
```

UWP

```
//PDF supports 3D annotation only in Windows Forms, WPF, ASP.NET, ASP.NET
MVC, and ASP.NET Core platforms
```

ASP.NET CORE

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
FileStream inputStream = new FileStream("3DAnnotation.U3D", FileMode.Open,
FileAccess.Read);
//Creates a new PDF 3D annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), inputStream);
//Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")";
//Adds annotation to page
```

```

page.Annotations.Add(pdf3dAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "3DAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
Stream inputStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.3DAnnotation.u3d");
//Creates a new PDF 3d annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), inputStream);
//Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")";
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("3DAnnotation.
pdf", "application/pdf", stream);
}
else
{

```

File Link Annotation

Links for external files can be added in a PDF document by using the [PdfFileLinkAnnotation](#) class.

The following code example explains how to add a file link annotation in PDF.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new pdf file link annotation.
PdfFileLinkAnnotation fileLinkAnnotation = new
PdfFileLinkAnnotation(rectangle, @"logo.png");
//Adds this annotation to a new page.
page.Annotations.Add(fileLinkAnnotation);
//Saves the document to disk.
document.Save("FileLinkAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Creates a new pdf file link annotation.
Dim fileLinkAnnotation As New PdfFileLinkAnnotation(rectangle, "logo.png")
'Adds this annotation to a new page.
page.Annotations.Add(fileLinkAnnotation)
'Saves the document to disk.
document.Save("FileLinkAnnotation.pdf")
document.Close(True)
```

UWP

```
//PDF supports File Link Annotation only in Windows Forms, WPF, ASP.NET and
ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports File Link Annotation only in Windows Forms, WPF, ASP.NET and
ASP.NET MVC.
```

XAMARIN

```
//PDF supports File Link Annotation only in Windows Forms, WPF, ASP.NET and
ASP.NET MVC.
```

Free Text Annotation

Free text annotation enables you to display the text directly on the page. When you want to add a comment directly without placing it on a pop-up window, [PdfFreeTextAnnotation](#) can be used.

The following code example explains how to add a free text annotation in the PDF document.

C#

```

//Creates a new pdf document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates PDF free text annotation
PdfFreeTextAnnotation freeText = new PdfFreeTextAnnotation(new
RectangleF(50, 100, 100, 50));
//Sets properties to the annotation
freeText.MarkupText = "Free Text with Callout";
freeText.TextMarkupColor = new PdfColor(Color.Black);
freeText.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 7f);
freeText.Color = new PdfColor(Color.Yellow);
freeText.BorderColor = new PdfColor(Color.Red);
freeText.Border = new PdfAnnotationBorder(.5f);
freeText.LineEndingStyle = PdfLineEndingStyle.OpenArrow;
freeText.AnnotationFlags = PdfAnnotationFlags.Default;
freeText.Text = "Free Text";
freeText.Opacity = 0.5f;
PointF[] points = { new PointF(100, 450), new PointF(100, 200), new
PointF(100, 150) };
freeText.CalloutLines = points;
//Adds the annotation to page
page.Annotations.Add(freeText);
//Saves the document to disk.
document.Save("FreeTextAnnotation.pdf");
document.Close(true);

```

VB.NET

```

'Creates a new pdf document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates PDF free text annotation
Dim freeText As New PdfFreeTextAnnotation(New RectangleF(50, 100, 100, 50))
'Sets properties to the annotation
freeText.MarkupText = "Free Text with Callout"
freeText.TextMarkupColor = New PdfColor(Color.Black)
freeText.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 7.0F)
freeText.Color = New PdfColor(Color.Yellow)
freeText.BorderColor = New PdfColor(Color.Red)
freeText.Border = New PdfAnnotationBorder(0.5F)
freeText.LineEndingStyle = PdfLineEndingStyle.OpenArrow
freeText.AnnotationFlags = PdfAnnotationFlags.[Default]
freeText.Text = "Free Text"
freeText.Opacity = 0.5F
Dim points As PointF() = { New PointF(100, 450), New PointF(100, 200), New
PointF(100, 150) }
freeText.CalloutLines = points
'Adds the annotation to page
page.Annotations.Add(freeText)
'Saves the document to disk.
document.Save("FreeTextAnnotation.pdf")
document.Close(True)

```

UWP

```

//Creates a new pdf document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates PDF free text annotation
PdfFreeTextAnnotation freeText = new PdfFreeTextAnnotation(new
RectangleF(50, 100, 100, 50));
//Sets properties to the annotation

Line Annotation

Line annotation displays a single straight line on the page. When you open it, it displays a pop-up window containing text of the associated note.

[PdfLineAnnotation](#) is used to create and set the properties of the Line annotation.

C#

```
//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Specifies the line end points
int[] points = new int[] { 80, 420, 150, 420 };
//Creates a new line annotation.
PdfLineAnnotation lineAnnotation = new PdfLineAnnotation(points, "Line Annotation");
//Creates pdf line border
LineBorder lineBorder = new LineBorder();
lineBorder.BorderStyle = PdfBorderStyle.Solid;
lineBorder.BorderWidth = 1;
lineAnnotation.LineBorder = lineBorder;
lineAnnotation.LineIntent = PdfLineIntent.LineDimension;
//Assigns the line ending style
lineAnnotation.BeginLineStyle = PdfLineEndingStyle.Butt;
lineAnnotation.EndLineStyle = PdfLineEndingStyle.Diamond;
lineAnnotation.AnnotationFlags = PdfAnnotationFlags.Default;
//Assigns the line color
lineAnnotation.InnerLineColor = new PdfColor(Color.Green);
lineAnnotation.BackColor = new PdfColor(Color.Green);
//Assigns the leader line
lineAnnotation.LeaderLineExt = 0;
lineAnnotation.LeaderLine = 0;
//Assigns the Line caption type
lineAnnotation.LineCaption = true;
lineAnnotation.CaptionType = PdfLineCaptionType.Inline;
//Adds this annotation to a new page.
page.Annotations.Add(lineAnnotation);
//Saves the document to disk.
document.Save("LineAnnotation.pdf");
document.Close(true);
```

```

Ink Annotation

Ink annotation represents freehand “scribble” comprising one or more disjoint paths.

When you open it, it displays a pop-up window containing text of the associated note.

[PdfInkAnnotation](#) is used to create ink annotation in a PDF document.

C#

```

//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
List<float> linePoints=new List<float>{40,300,60,100,40,50,40,300};
//Creates a new ink annotation
RectangleF rectangle = new RectangleF(0, 0, 300, 400);
PdfInkAnnotation inkAnnotation = new PdfInkAnnotation(rectangle,linePoints);
inkAnnotation.Color = new PdfColor(Color.Red);
//Adds annotation to the page
page.Annotations.Add(inkAnnotation);
//Saves the document to disk.
document.Save("InkAnnotation.pdf");
document.Close(true);

```

VB.NET

```

'Creates a new PDF document.
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
Dim linePoints As New List(Of Single)() From {40, 300, 60, 100, 40, 50, 40,
300}
'Creates a new ink annotation
Dim rectangle As New RectangleF(0, 0, 300, 400)

```

```

Dim inkAnnotation As New PdfInkAnnotation(rectangle, linePoints)
inkAnnotation.Color = New PdfColor(Color.Red)
'Adds annotation to the page
page.Annotations.Add(inkAnnotation)
'Saves the document to disk.
document.Save("InkAnnotation.pdf")
document.Close(True)

```

UWP

```

//Creates a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
List<float> linePoints = new List<float> { 40, 300, 60, 100, 40, 50, 40, 300
};
//Creates a new ink annotation
RectangleF rectangle = new RectangleF(0, 0, 300, 400);
PdfInkAnnotation inkAnnotation = new PdfInkAnnotation(rectangle,
linePoints);
inkAnnotation.Color = new PdfColor(Color.FromArgb(0,255,0,0));
//Adds annotation to the page
page.Annotations.Add(inkAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "InkAnnotation.pdf");

```

ASP.NET CORE

```

//Creates a new PDF document.

"application/pdf", stream);
}
```

You can get ink list points from the [PdfLoadedInkAnnotation](#), represented by [InkPointsCollection](#). The following code illustrate this.

C#

```
//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("Input.pdf");
//Gets the first page from the document
PdfLoadedPage page = lDoc.Pages[0] as PdfLoadedPage;
//Gets the annotation collection
PdfLoadedAnnotationCollection annotations = page.Annotations;
//Gets the first ink annotation
PdfLoadedInkAnnotation inkAnnotation = annotations[0] as
PdfLoadedInkAnnotation;
//Gets the ink points collection
```

```
List<List<float>> points = inkAnnotation.InkPointsCollection;
//Save the document
lDoc.Save("Output.pdf");
//Close the document
lDoc.Close(true);
```

VB.NET

```
'Loads the document
Dim lDoc As New PdfLoadedDocument("Input.pdf")
'Gets the first page from the document
Dim page As PdfLoadedPage = TryCast(lDoc.Pages(0), PdfLoadedPage)
'Gets the annotation collection
Dim annotations As PdfLoadedAnnotationCollection = page.Annotations
'Gets the first ink annotation

Pop-up Annotation

Pop-up annotation displays text in a pop-up window for entry and editing.

It typically does not appear alone, but is associated with markup annotation, its parent annotation.

[PdfPopupAnnotation](#) is used to add pop-up annotation in a PDF document.

C#

```
//Creates a new rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the PDF popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to a new page.
page.Annotations.Add(popupAnnotation);
//Saves the document to disk.
document.Save("PopupAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document.
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Creates a new popup annotation.
Dim popupAnnotation As New PdfPopupAnnotation(rectangle, "Test popup
annotation")
popupAnnotation.Border.Width = 4
popupAnnotation.Border.HorizontalRadius = 20
popupAnnotation.Border.VerticalRadius = 30
'Sets the PDF popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph
'Adds this annotation to a new page.
page.Annotations.Add(popupAnnotation)
'Saves the document to disk.
document.Save("PopupAnnotation.pdf")
document.Close(True)
```

UWP

```

//Create new PDF document
PdfDocument document = new PdfDocument();
//Create a new PDF page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the PDF popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to a new page.
page.Annotations.Add(popupAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected c
Save(stream, "PopupAnnotation.pdf");

```

ASP.NET CORE

```

//Create new PDF document
PdfDocument document = new PdfDocument();
//Create a new PDF page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new popup annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the PDF popup icon.
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to a new page.
page.Annotations.Add(popupAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name

"application/pdf", stream);
}
```

File Attachment Annotation

File attachment annotation contains reference to a file that typically is embedded in the PDF file.

[PdfAttachmentAnnotation](#) is used to add a file attachment annotation in a PDF document.

C#

```
//Creates a new PDF Document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF attachmentRectangle = new RectangleF(10, 40, 30, 30);
```

```
//Creates a new attachment annotation.
PdfAttachmentAnnotation attachmentAnnotation = new
PdfAttachmentAnnotation(attachmentRectangle, @"logo.png");
//Sets the attachment icon to attachment annotation.
attachmentAnnotation.Icon = PdfAttachmentIcon.PushPin;
//Adds this annotation to a new page.
page.Annotations.Add(attachmentAnnotation);
//Saves the document to disk.
document.Save("AttachmentAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF Document.
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new rectangle
Dim attachmentRectangle As New RectangleF(10, 40, 30, 30)
'Creates a new attachment annotation.
Dim attachmentAnnotation As New PdfAttachmentAnnotation(attachmentRectangle,
"logo.png")
'Sets the attachment icon to attachment annotation.
attachmentAnnotation.Icon = PdfAttachmentIcon.PushPin
'Adds this annotation to a new page.
page.Annotations.Add(attachmentAnnotation)
'Saves the document to disk.
document.Save("AttachmentAnnotation.pdf")
document.Close(True)
```

UWP

```
//Creates a new PDF Document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF attachmentRectangle = new RectangleF(10, 40, 30, 30);
//Load the file as stream
Stream inputStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Logo.png");
//Creates a new attachment annotation.
PdfAttachmentAnnotation attachmentAnnotation = new
PdfAttachmentAnnotation(attachmentRectangle, @"logo.png", inputStream);
//Sets the attachment icon to attachment annotation.
attachmentAnnotation.Icon = PdfAttachmentIcon.PushPin;
//Adds this annotation to a new page.
page.Annotations.Add(attachmentAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
```

```
Save(stream, "AttachmentAnnotation.pdf");
```

ASP.NET CORE

```
//Creates a new PDF Document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF attachmentRectangle = new RectangleF(10, 40, 30, 30);
//Load the PDF document
FileStream inputStream = new FileStream("logo.png", FileMode.Open,
FileStream.Read);
//Creates a new attachment annotation.
PdfAttachmentAnnotation attachmentAnnotation = new
PdfAttachmentAnnotation(attachmentRectangle, @"logo.png", inputStream);
//Sets the attachment icon to attachment annotation.
attachmentAnnotation.Icon = PdfAttachmentIcon.PushPin;
//Adds this annotation to a new page.
page.Annotations.Add(attachmentAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "PopupAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creates a new PDF Document.

otation.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("AttachmentAnnotation.pdf"
, "application/pdf", stream);
}
```

Sound Annotation

Sound annotation is used to play the sound clip in the PDF Document.

The following code example explains how to add a sound annotation in a PDF document using [PdfSoundAnnotation](#).

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
//Creates a new sound annotation.
PdfSoundAnnotation soundAnnotation = new PdfSoundAnnotation(rectangle,
@"startup.wav");
soundAnnotation.Sound.Encoding = PdfSoundEncoding.Signed;
soundAnnotation.Sound.Channels = PdfSoundChannels.Stereo;
soundAnnotation.Sound.Bits = 16;
soundAnnotation.Color = new PdfColor(Color.Red);
//Sets the pdf sound icon.
soundAnnotation.Icon = PdfSoundIcon.Speaker;
//Adds this annotation to a new page.
page.Annotations.Add(soundAnnotation);
//Saves the document to disk.
document.Save("SoundIcon.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Creates a new sound annotation.
```

```

Dim soundAnnotation As New PdfSoundAnnotation(rectangle, "startup.wav")
soundAnnotation.Sound.Encoding = PdfSoundEncoding.Signed
soundAnnotation.Sound.Channels = PdfSoundChannels.Stereo
soundAnnotation.Sound.Bits = 16
soundAnnotation.Color = New PdfColor(Color.Red)
'Sets the pdf sound icon.
soundAnnotation.Icon = PdfSoundIcon.Speaker
'Adds this annotation to a new page.
page.Annotations.Add(soundAnnotation)
'Saves the document to disk.
document.Save("SoundIcon.pdf")
document.Close(True)

```

UWP

```

//PDF supports Sound Annotation only in Windows Forms, WPF, ASP.NET, ASP.NET
MVC and ASP.NET Web.

```

ASP.NET CORE

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle

URI Annotation

URI annotation is used to navigate to a particular web URI

The following code example explains how to add URI annotation in a PDF document using [PdfUriAnnotation](#).

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new rectangle
RectangleF rectangle = new RectangleF(10, 40, 30, 30);

```

```

//Creates a new Uri Annotation
PdfUriAnnotation uriAnnotation = new PdfUriAnnotation(rectangle,
"http://www.google.com");
//Sets Text to uriAnnotation
uriAnnotation.Text = "Uri Annotation";
//Adds this annotation to a new page
page.Annotations.Add(uriAnnotation);
//Saves the document to disk
document.Save("UriAnnotation.pdf");
document.Close(true);

```

VB.NET

```

'Creates a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new rectangle
Dim rectangle As New RectangleF(10, 40, 30, 30)
'Creates a new Uri Annotation
Dim uriAnnotation As New PdfUriAnnotation(rectangle,
"http://www.google.com")
'Sets Text to uriAnnotation.
uriAnnotation.Text = "Uri Annotation"
'Adds this annotation to a new page
page.Annotations.Add(uriAnnotation)
'Saves the document to disk.
document.Save("UriAnnotation.pdf")
document.Close(True)

```

UWP

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page

Measurement Annotations

Essential PDF supports interactive measurement annotations, which measures the distance, area, and angle of the line segments.

The following measurement annotation types are supported in Essential PDF:

Line measurement annotation

The line measurement annotation is displayed as the straight line in the page. The distance of the line is measured automatically when you change the position of the line and is displayed in the pop-up window.

[PdfLineMeasurementAnnotation](#) to add a line measurement annotation to the page.

C#

```

//Creates a new PDF document.
PdfDocument document= new PdfDocument();
//Creates a new page.
PdfPage page = document.Pages.Add();
PdfFont font= new PdfStandardFont(PdfFontFamily.Helvetica, 10f, PdfFontStyle.Regular);
//Specifies the line end points.
int[] points = new int[] { 100, 750, 500, 750 };
//Creates the line measurement annotation
PdfLineMeasurementAnnotation lineMeasureAnnotation = new PdfLineMeasurementAnnotation(points);
//Assign author to the line measurement annotation.
lineMeasureAnnotation.Author = "Syncfusion";
//Assign subject to the line measurement annotation
lineMeasureAnnotation.Subject = "LineAnnotation";
//Assign unit to the line measurement annotation
lineMeasureAnnotation.Unit = PdfMeasurementUnit.Inch;
//Assign borderWidth to the line measurement annotation.
lineMeasureAnnotation.LineBorder.BorderWidth = 2;
//Assign font to the line measurement annotation.
lineMeasureAnnotation.Font = font;
//Assign color to the line measurement annotation.
lineMeasureAnnotation.Color = new PdfColor(Color.Red);
//Adds the line measurement annotation to a new page.
page.Annotations.Add(lineMeasureAnnotation);
//Saves the document to disk.
document.Save("LineMeasurementAnnotation.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

//Creates a new PDF document
Dim document As PdfDocument = New PdfDocument

```

```
//Creates a new page
Dim page As PdfPage = document.Pages.Add
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 10.0!,
PdfFontStyle.Regular)
//Specifies the line end points.
Dim points() As Integer = New Integer() {100, 750, 500, 750}
//Creates the line measurement annotation
Dim lineMeasureAnnotation As PdfLineMeasurementAnnotation = New
PdfLineMeasurementAnnotation(points)
'Assign author to the line measurement annotation
lineMeasureAnnotation.Author = "Syncfusion"
'Assign subject to the line measurement annotation
lineMeasureAnnotation.Subject = "LineAnnotation"
'Assign unit to the line measurement annotation

}

```

Angle measurement annotation

The angle measurement annotation calculates the angle between three points and draws arc between three points. The angle of the annotation is displayed in the pop-up window.

[PdfAngleMeasurementAnnotation](#) helps you to add angle measurement annotation to the page.

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
PointF[] points = new PointF[] { new PointF(100, 700), new PointF(150, 650),
new PointF(100, 600) };
//Creates the angel measurement annotation
PdfAngleMeasurementAnnotation angleMeasureAnnotation = new
PdfAngleMeasurementAnnotation(points);
//Set font to the angle measurement annotation
angleMeasureAnnotation.Font = new PdfStandardFont(PdfFontFamily.Helvetica,
12f, PdfFontStyle.Regular);
//Assign color to the angle measurement annotation
angleMeasureAnnotation.Color = Color.Red;
//Adds angle measurement annotation
page.Annotations.Add(angleMeasureAnnotation);
//Saves the document to disk

```

```
document.Save("AngleMeasurementAnnotation.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
Dim points As PointF() = New PointF() {New PointF(100, 700), New PointF(150, 650), New PointF(100, 600)}
'Creates the angel measurement annotation
Dim angleMeasureAnnotation As New PdfAngleMeasurementAnnotation(points)
'Set font to the angle measurement annotation
angleMeasureAnnotation.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 12.0F, PdfFontStyle.Regular)
'Assign color to the angle measurement annotation
angleMeasureAnnotation.Color = Color.Red
'Adds angle measurement annotation
page.Annotations.Add(angleMeasureAnnotation)
'Saves the document to disk
document.Save("AngleMeasurementAnnotation.pdf")
document.Close(True)
```

UWP

```
//PDF supports angle measurement annotation only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Web.
```

ASP.NET CORE

```
//PDF supports angle measurement annotation only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Web.
```

XAMARIN

```
//PDF supports angle measurement annotation only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Web.
```

Modifying the annotations

Essential PDF allows you to modify the annotation of existing document. The following code illustrates this.

C#

```
//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("inputAnnotation.pdf");
//Gets the first page from the document
PdfLoadedPage page = lDoc.Pages[0] as PdfLoadedPage;
//Gets the annotation collection
PdfLoadedAnnotationCollection annotations = page.Annotations;
//Gets the first annotation and modify the properties
PdfLoadedPopupAnnotation popUp = annotations[0] as PdfLoadedPopupAnnotation;
popUp.Border = new PdfAnnotationBorder(4, 0, 0);
```

```

popUp.Color = new PdfColor(Color.Red);
popUp.Text = "Modified annotation";
//Saves the document
lDoc.Save("sample.pdf");
lDoc.Close(true);

```

VB.NET

```

'Loads the document
Dim lDoc As New PdfLoadedDocument("inputAnnotation.pdf")
'Gets the first page from the document
Dim page As PdfLoadedPage = TryCast(lDoc.Pages(0), PdfLoadedPage)
'Gets the annotation collections
Dim annotations As PdfLoadedAnnotationCollection = page.Annotations
'Gets the annotation at index 0 and modifying the properties
Dim popUp As PdfLoadedPopupAnnotation = TryCast(annotations(0),
PdfLoadedPopupAnnotation)
popUp.Border = New PdfAnnotationBorder(4, 0, 0)
popUp.Color = New PdfColor(Color.Red)
popUp.Text = "Modified annotation"
'Saves the document
lDoc.Save("sample.pdf")
lDoc.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Gets the first page from the document
PdfLoadedPage page = lDoc.Pages[0] as PdfLoadedPage;
//Gets the annotation collection
PdfLoadedAnnotationCollection annotations = page.Annotations;
//Gets the first annotation and modify the properties
PdfLoadedPopupAnnotation popUp = annotations[0] as PdfLoadedPopupAnnotation;
popUp.Border = new PdfAnnotationBorder(4, 0, 0);
popUp.Color = new PdfColor(Color.FromArgb(0,255,0,0));
popUp.Text = "Modified annotation";
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await lDoc.SaveAsync(stream);
//Close the document
lDoc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "sample.pdf");

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("inputAnnotation.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Gets the first page from the document
PdfLoadedPage page = lDoc.Pages[0] as PdfLoadedPage;
//Gets the annotation collection
PdfLoadedAnnotationCollection annotations = page.Annotations;
//Gets the first annotation and modify the properties
PdfLoadedPopupAnnotation popUp = annotations[0] as PdfLoadedPopupAnnotation;
popUp.Border = new PdfAnnotationBorder(4, 0, 0);
popUp.Color = new PdfColor(Color.Red);
popUp.Text = "Modified annotation";
//Save the document into stream
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
stream.Position = 0;
//Closes the document
lDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
inputAnnotation.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Gets the first page from the document
PdfLoadedPage page = lDoc.Pages[0] as PdfLoadedPage;
//Gets the annotation collection
PdfLoadedAnnotationCollection annotations = page.Annotations;
//Gets the first annotation and modify the properties
PdfLoadedPopupAnnotation popUp = annotations[0] as PdfLoadedPopupAnnotation;
popUp.Border = new PdfAnnotationBorder(4, 0, 0);
popUp.Color = new PdfColor(Syncfusion.Drawing.Color.Red);
popUp.Text = "Modified annotation";
//Save the document into stream.
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
//Close the document.
lDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Removing annotations from an existing PDF

You can remove the annotation from the annotation collection, represented by the [PdfLoadedAnnotationCollection](#) of the loaded page. The following code illustrates this.

C#

```
//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("inputAnnotation.pdf");
//Gets the first page of the document
PdfLoadedPage page = lDoc.Pages[0] as PdfLoadedPage;
//Gets the annotation collection
PdfLoadedAnnotationCollection annotations = page.Annotations;
//Removes the first annotation
annotations.RemoveAt(0);
//Saves the document
lDoc.Save("sample.pdf");
lDoc.Close(true);
```

VB.NET

```
'Loads the document
Dim lDoc As New PdfLoadedDocument("inputAnnotation.pdf")
'Gets the first page from the document
Dim page As PdfLoadedPage = TryCast(lDoc.Pages(0), PdfLoadedPage)
'Gets the annotation collection
Dim annotations As PdfLoadedAnnotationCollection = page.Annotations
'Removes the first annotation
annotations.RemoveAt(0)
'Saves the document
lDoc.Save("sample.pdf")
lDoc.Close(True)
```

UWP

```
//Create the file open picker

Importing annotations from FDF file

FDF stands for Forms Data Format. FDF is a file format for representing annotations present in a PDF document. You can import annotation data from the FDF file to PDF using the [ImportAnnotations](#) method in [PdfLoadedDocument](#) class.

C#

```

//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
//Import annotation data from FDF file
lDoc.ImportAnnotations("Annotations.fdf", AnnotationDataFormat.Fdf);
//Saves the document
lDoc.Save("Annotation.pdf");
lDoc.Close(true);

```

VB.NET

```

'Loads the document
Dim lDoc As New PdfLoadedDocument("input.pdf")
'Import annotation data from FDF file
lDoc.ImportAnnotations("Annotations.fdf", AnnotationDataFormat.Fdf)
'Saves the document
lDoc.Save("Annotation.pdf")
lDoc.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through the Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Load the FDF file stream from the disk

```

```

Stream fdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Annotations.fdf");
'Import annotation data from FDF stream
lDoc.ImportAnnotations(fdfStream, AnnotationDataFormat.Fdf)
MemoryStream stream = new MemoryStream();
await lDoc.SaveAsync(stream);
//Close the document
lDoc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Annotation.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Import annotation data from FDF stream
FileStream fdfStream = new FileStream("Annotations.fdf", FileMode.Open,
FileAccess.Read);
lDoc.ImportAnnotations(fdfStream, AnnotationDataFormat.Fdf)
//Save the document into stream
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
stream.Position = 0;
//Closes the document
lDoc.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Annotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Import annotation data from FDF stream
Stream fdfStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Annotations.fdf");
lDoc.ImportAnnotations(fdfStream, AnnotationDataFormat.Fdf)
//Save the document into stream
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
//Close the document
lDoc.Close(true);
//Save the stream into PDF file

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android, and iOS platforms. Refer to the PDF/Xamarin section for respective code samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Annotation.pdf", "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Annotation.pdf", "application/pdf", stream);
}
```

Importing annotations from XFDF file

XFDF stands for XML Forms Data Format. XFDF is the XML version of FDF for representing annotations that are contained in a PDF document. You can import annotation data from the XFDF file to PDF using the [ImportAnnotations](#) method in [PdfLoadedDocument](#) class.

C#

```
//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
//Import annotation data from XFDF file
lDoc.ImportAnnotations("Annotations.xfdf", AnnotationDataFormat.XFdf);
//Saves the document
lDoc.Save("Annotation.pdf");
lDoc.Close(true);
```

VB.NET

```
'Loads the document
Dim lDoc As New PdfLoadedDocument("input.pdf")
'Import annotation data from XFDF file
lDoc.ImportAnnotations("Annotations.xfdf", AnnotationDataFormat.XFdf)
'Saves the document
lDoc.Save("Annotation.pdf")
lDoc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through the Open method of PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Load the XFDF file stream from the disk
```

```

Stream xfdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Annotations.xfdf");
'Import annotation data from XFDF stream
lDoc.ImportAnnotations(xfdfStream, AnnotationDataFormat.XFdf)
MemoryStream stream = new MemoryStream();
await lDoc.SaveChangesAsync();
//Close the document
lDoc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Annotation.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Import annotation data from XFDF stream
FileStream xfdfStream = new FileStream("Annotations.xfdf", FileMode.Open,
FileAccess.Read);
lDoc.ImportAnnotations(xfdfStream, AnnotationDataFormat.XFdf)
//Save the document into stream
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
stream.Position = 0;
//Closes the document
lDoc.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Annotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Import annotation data from XFDF stream
Stream xfdfStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Annotations.xfdf");
lDoc.ImportAnnotations(xfdfStream, AnnotationDataFormat.XFdf)
//Save the document into stream
MemoryStream stream = new MemoryStream();
lDoc.Save(stream);
//Close the document
lDoc.Close(true);
//Save the stream into PDF file

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the PDF/Xamarin section for respective code
//samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Annotation.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Annotation.pdf",
"application/pdf", stream);
}
```

Exporting annotations to FDF file

To export annotation data to the FDF file from PDF document, you can use the [ExportAnnotations](#) method in [PdfLoadedDocument](#) class.

C#

```
//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
//Export annotation data to FDF file
lDoc.ExportAnnotations("Annotations.fdf", AnnotationDataFormat.Fdf);
//Close the document
lDoc.Close(true);
```

VB.NET

```
'Loads the document
Dim lDoc As New PdfLoadedDocument("input.pdf")
'Export annotation data to FDF file
lDoc.ExportAnnotations("Annotations.fdf", AnnotationDataFormat.Fdf)
'Close the document
lDoc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through the Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Load the FDF file stream from the disk
Stream fdfStream = new MemoryStream();
//Export annotation data from FDF stream
lDoc.ExportAnnotations(fdfStream, AnnotationDataFormat.Fdf)
//Save the fdfStream as FDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
```

```
Save(fdfStream, "Annotations.fdf");
//Close the document
lDoc.Close(true);
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Export annotation data from FDF stream
Stream fdfStream = new MemoryStream();
lDoc.ExportAnnotations(fdfStream, AnnotationDataFormat.Fdf)
//Close the document
lDoc.Close(true);
fdfStream.Position = 0;
//Defining the ContentType for FDF file
string contentType = "application/fdf";
//Define the file name
string fileName = "Annotations.fdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(fdfStream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Export annotation data from FDF stream
Stream fdfStream = new MemoryStream();
lDoc.ExportAnnotations(fdfStream, AnnotationDataFormat.Fdf)
//Close the document
lDoc.Close(true);
//Save the stream into FDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Annotations.f
df", "application/fdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Annotations.fdf",
"application/fdf", fdfStream);
}
```

Exporting annotations to XFDF file

To export annotation data to the XFDF file from PDF document, you can use the [ExportAnnotations](#) method in [PdfLoadedDocument](#) class.

C#

```
//Loads the document
PdfLoadedDocument lDoc = new PdfLoadedDocument("input.pdf");
//Export annotation data to XFDF file
lDoc.ExportAnnotations("Annotations.xfdf", AnnotationDataFormat.XFdf);
//Close the document
lDoc.Close(true);
```

VB.NET

```
'Loads the document
Dim lDoc As New PdfLoadedDocument("input.pdf")
'Export annotation data to XFDF file
lDoc.ExportAnnotations("Annotations.xfdf", AnnotationDataFormat.XFdf)
'Close the document
lDoc.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument lDoc = new PdfLoadedDocument();
//Loads or opens an existing PDF document through the Open method of
PdfLoadedDocument class
await lDoc.OpenAsync(file);
//Load the XFDF file stream from the disk
Stream xfdfStream = new MemoryStream();
//Export annotation data from XFDF stream
lDoc.ExportAnnotations(xfdfStream, AnnotationDataFormat.XFdf)
//Save the xfdfStream as XFDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(xfdfStream, "Annotations.xfdf");
//Close the document
lDoc.Close(true);
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Export annotation data from XFDF stream
Stream xfdfStream = new MemoryStream();
lDoc.ExportAnnotations(xfdfStream, AnnotationDataFormat.XFdf)
//Close the document
lDoc.Close(true);
```

```
xfdfStream.Position = 0;
//Defining the ContentType for XFDF file
string contentType = "application/xfdf";
//Define the file name
string fileName = "Annotations.xfdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(xfdfStream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Export annotation data from XFDF stream
Stream xfdfStream = new MemoryStream();
lDoc.ExportAnnotations(xfdfStream, AnnotationDataFormat.XFdf)
//Close the document
lDoc.Close(true);
//Save the stream into XFDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Annotations.x
fdf", "application/xfdf", fdfStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Annotations.xfdf",
"application/xfdf", fdfStream);
}
```

Adding comments and review status to the PDF annotation

The PDF annotations may have an author-specific state associated with them. The state is not specified in the annotation itself, but it represents a separate text annotation ([Popup Annotation](#)).

The Essential PDF supports adding the annotation comments and review status to the PDF document annotations.

Adding comments to the PDF annotation

The following code example explains how to add comments to the PDF annotation.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create new rectangle annotation
PdfRectangleAnnotation rectangleAnnotation = new PdfRectangleAnnotation(new
RectangleF(0, 0, 100, 50), "Rectangle Annotation");
```

```

//Set author
rectangleAnnotation.Author = "Syncfusion";
rectangleAnnotation.Border.BorderWidth = 1;
rectangleAnnotation.Color = Color.Red;
rectangleAnnotation.ModifiedDate = DateTime.Now;
//Create a new comment annotation
PdfPopupAnnotation comment = new PdfPopupAnnotation();
//Set author
comment.Author = "John";
//Set comment text
comment.Text = "This is first comment";
//Set modification date
comment.ModifiedDate = DateTime.Now;
//Set subject
comment.Subject = "Annotation Comments";
//Add the comments to the annotation
rectangleAnnotation.Comments.Add(comment);
//Add the annotation to the PDF page
page.Annotations.Add(rectangleAnnotation);
//Save the document to disk
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Create a new page
Dim page As PdfPage = document.Pages.Add
'Create new rectangle annotation
Dim rectangleAnnotation As PdfRectangleAnnotation = New
PdfRectangleAnnotation(New RectangleF(0, 0, 100, 50), "Rectangle
Annotation")
'Set author
rectangleAnnotation.Author = "Syncfusion"
rectangleAnnotation.Border.BorderWidth = 1
rectangleAnnotation.Color = Color.Red
rectangleAnnotation.ModifiedDate = DateTime.Now
Dim comment As PdfPopupAnnotation = New PdfPopupAnnotation
'Set author
comment.Author = "John"
'Set Text
comment.Text = "This is first comment"
'Set modification date.
comment.ModifiedDate = DateTime.Now
'Set subject
comment.Subject = "Annotation Comments"
'Add the comment to the annotation.
rectangleAnnotation.Comments.Add(comment)
'Add the annotation to the PDF page.
page.Annotations.Add(rectangleAnnotation)
'Save the document to disk.
document.Save("Output.pdf")
'Close the document
document.Close(true)

```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create new rectangle annotation
PdfRectangleAnnotation rectangleAnnotation = new PdfRectangleAnnotation(new
RectangleF(0, 0, 100, 50), "Rectangle Annotation");
//Set author
rectangleAnnotation.Author = "Syncfusion";
rectangleAnnotation.Border.BorderWidth = 1;
rectangleAnnotation.Color = Color.Red;
rectangleAnnotation.ModifiedDate = DateTime.Now;
//Create a new comment annotation
PdfPopupAnnotation comment = new PdfPopupAnnotation();
//Set author
comment.Author = "John";
//Set Text
comment.Text = "This is first comment";
//Set modification date
comment.ModifiedDate = DateTime.Now;
//Set subject
comment.Subject = "Annotation Comments";
//Add the comment to the annotation
rectangleAnnotation.Comments.Add(comment);
//Add the annotation to the PDF page
page.Annotations.Add(rectangleAnnotation);
//Saves the document
MemoryStream stream = new MemoryStream();
//Save the PDF document to stream
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create new rectangle annotation
PdfRectangleAnnotation rectangleAnnotation = new PdfRectangleAnnotation(new
RectangleF(0, 0, 100, 50), "Rectangle Annotation");
//Set author
rectangleAnnotation.Author = "Syncfusion";
rectangleAnnotation.Border.BorderWidth = 1;
rectangleAnnotation.Color = Color.Red;
rectangleAnnotation.ModifiedDate = DateTime.Now;
//Create a new comment annotation
PdfPopupAnnotation comment = new PdfPopupAnnotation();
//Set author
```

```

comment.Author = "John";
//Set Text
comment.Text = "This is first comment";
//Set modification date
comment.ModifiedDate = DateTime.Now;
//Set subject
comment.Subject = "Annotation Comments";
//Add the comment to the annotation
rectangleAnnotation.Comments.Add(comment);
//Add the annotation to the PDF page
page.Annotations.Add(rectangleAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create new rectangle annotation
PdfRectangleAnnotation rectangleAnnotation = new PdfRectangleAnnotation(new
RectangleF(0, 0, 100, 50), "Rectangle Annotation");
//Set author
rectangleAnnotation.Author = "Syncfusion";
rectangleAnnotation.Border.BorderWidth = 1;
rectangleAnnotation.Color = Color.Red;
rectangleAnnotation.ModifiedDate = DateTime.Now;
//Create a new comments annotation
PdfPopupAnnotation comment = new PdfPopupAnnotation();
//Set author
comment.Author = "John";
//Set Text
comment.Text = "This is first comment";
//Set modification date
comment.ModifiedDate = DateTime.Now;
//Set subject
comment.Subject = "Annotation Comments";
//Add the comment to the annotation
rectangleAnnotation.Comments.Add(comment);
//Add the annotation to the PDF page
page.Annotations.Add(rectangleAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);

```

```

//Close the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

The following code example explains how to add comments to the existing PDF annotation.

C#

```

//Load the PDF document
PdfLoadedDocument ldoc = new PdfLoadedDocument("Input.pdf");
//Get the existing PDF page
PdfLoadedPage lpage = ldoc.Pages[0] as PdfLoadedPage;
//Get the existing PDF annotations
PdfLoadedAnnotationCollection annots = lpage.Annotations;
//Get the existing rectangle annotation
PdfLoadedRectangleAnnotation loadedRectangleAnnotation = annots[0] as
PdfLoadedRectangleAnnotation;
//Create a new comment annotation
PdfPopupAnnotation comment = new PdfPopupAnnotation();
//Set author
comment.Author = "John";
//Set Text
comment.Text = "This is first comment";
//Set modification date
comment.ModifiedDate = DateTime.Now;
//Set subject
comment.Subject = "Annotation Comments";
//Add the comment to the annotation
loadedRectangleAnnotation.Comments.Add(comment);
//Save the document
ldoc.Save("Output.pdf");
//Close the document
ldoc.Close(true);

```

VB.NET

```

'Load the PDF document
Dim ldoc As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get the existing PDF page
Dim lpage As PdfLoadedPage = CType(ldoc.Pages(0), PdfLoadedPage)
'Get the existing annotations

Adding review status to the PDF annotation

The following code example explains how to add a review status in a newly created PDF annotation.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create new rectangle annotation
PdfRectangleAnnotation rectangleAnnotation = new PdfRectangleAnnotation(new
RectangleF(0, 0, 100, 50), "Rectangle Annotation");
//Set author
rectangleAnnotation.Author = "Syncfusion";
rectangleAnnotation.Border.BorderWidth = 1;
rectangleAnnotation.Color = Color.Red;
rectangleAnnotation.ModifiedDate = DateTime.Now;
//Create a new review annotation
PdfPopupAnnotation review = new PdfPopupAnnotation();
//Set author
review.Author = "John";

```

```

//Set review state model
review.StateModel = PdfAnnotationStateModel.Review;
//Set review state
review.State = PdfAnnotationState.Accepted;
//Set modification date
review.ModifiedDate = DateTime.Now;
//Add the review to the annotation
rectangleAnnotation.ReviewHistory.Add(review);
//Add the annotation to the PDF page
page.Annotations.Add(rectangleAnnotation);
//Save the document to disk
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim document As PdfDocument = New PdfDocument
'Create a new page
Dim page As PdfPage = document.Pages.Add
'Create new rectangle annotation
Dim rectangleAnnotation As PdfRectangleAnnotation = New
PdfRectangleAnnotation(New RectangleF(0, 0, 100, 50), "Rectangle
Annotation")
'Set author
rectangleAnnotation.Author = "Syncfusion"
rectangleAnnotation.Border.BorderWidth = 1
rectangleAnnotation.Color = Color.Red
rectangleAnnotation.ModifiedDate = DateTime.Now
Dim review As PdfPopupAnnotation = New PdfPopupAnnotation
'Set author
review.Author = "John"
'Set review state model
review.StateModel = PdfAnnotationStateModel.Review
'Set review state
review.State = PdfAnnotationState.Accepted
'Set modification date.
review.ModifiedDate = DateTime.Now
'Add the review to the annotation.
rectangleAnnotation.ReviewHistory.Add(review)
'Add the annotation to the PDF page.
page.Annotations.Add(rectangleAnnotation)
'Save the document to disk.
document.Save("Output.pdf")
'Close the document
document.Close(true)

```

UWP

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create a new page
PdfPage page = document.Pages.Add();
//Create new rectangle annotation

```

```

PdfRectangleAnnotation rectangleAnnotation = new PdfRectangleAnnotation(new
RectangleF(0, 0, 100, 50), "Rectangle Annotation");
//Set author
rectangleAnnotation.Author = "Syncfusion";
rectangleAnnotation.Border.BorderWidth = 1;
rectangleAnnotation.Color = Color.Red;
rectangleAnnotation.ModifiedDate = DateTime.Now;
//Create a new review annotation
PdfPopupAnnotation review = new PdfPopupAnnotation();
//Set author

Removing comments and review status from PDF annotation

The Essential PDF supports removing comments and reviewing status from the PDF annotation.

The following code example explains how to remove comments from the existing PDF annotation.

C#

```

//Load the PDF document
PdfLoadedDocument ldoc = new PdfLoadedDocument("Input.pdf");
//Get the existing PDF page
PdfLoadedPage lpage = ldoc.Pages[0] as PdfLoadedPage;
//Get the existing annotations
PdfLoadedAnnotationCollection annots = lpage.Annotations;
//Get the rectangle annotation
PdfLoadedRectangleAnnotation loadedRectangleAnnotation = annots[0] as
PdfLoadedRectangleAnnotation;
//Get the annotation comments collection
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedRectangleAnnotation.Comments;
// Remove comments by index
commentsCollection.RemoveAt(0);
//Save the document
ldoc.Save("Output.pdf");
//Close the document
ldoc.Close(true);

```

VB.NET

```
'Load the PDF document
```

```

Dim ldoc As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf") 'Load the
PDF page
'Get the existing PDF page
Dim lpage As PdfLoadedPage = CType(ldoc.Pages(0), PdfLoadedPage)
'Get the existing annotations
Dim annots As PdfLoadedAnnotationCollection = lpage.Annotations
'Get the existing rectangle annotation
Dim loadedRectangleAnnotation As PdfLoadedRectangleAnnotation
=CType(annots(0), PdfLoadedRectangleAnnotation)
'Get the annotation comments collection
Dim commentsCollection As PdfLoadedPopupAnnotationCollection =
loadedRectangleAnnotation.Comments
' Remove comments by index
commentsCollection.RemoveAt(0)
'Save the document
ldoc.Save("Output.pdf")
'Close the document
ldoc.Close(true)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument ldoc = new PdfLoadedDocument();

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

The following code example explains how to modify review status to the existing PDF annotation.

C#

```

//Load the PDF document
PdfLoadedDocument ldoc = new PdfLoadedDocument("Input.pdf");
//Get the existing PDF page
PdfLoadedPage lpage = ldoc.Pages[0] as PdfLoadedPage;
//Get the existing annotations
PdfLoadedAnnotationCollection annots = lpage.Annotations;
//Get the existing rectangle annotation
PdfLoadedRectangleAnnotation loadedRectangleAnnotation = annots[0] as
PdfLoadedRectangleAnnotation;
//Get the annotation review collection
PdfLoadedPopupAnnotationCollection reviewCollection =
loadedRectangleAnnotation.ReviewHistory;
// Get the modified review state
PdfLoadedPopupAnnotation loadedReview = reviewCollection[0];
// Modify the review State
loadedReview.State = PdfAnnotationState.Rejected;
//Save the document
ldoc.Save("Output.pdf");
//Close the document
ldoc.Close(true);

```

VB.NET

```
'Loaded the PDF document
```

```

Dim ldoc As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get the existing PDF page
Dim lpage As PdfLoadedPage = CType(ldoc.Pages(0), PdfLoadedPage)
'Get the existing annotations
Dim annots As PdfLoadedAnnotationCollection = lpage.Annotations
'Get the existing rectangle annotation
Dim loadedRectangleAnnotation As PdfLoadedRectangleAnnotation =
CType(annots(0), PdfLoadedRectangleAnnotation)
'Get annotation review collection
Dim reviewCollection As PdfLoadedPopupAnnotationCollection =
loadedRectangleAnnotation.ReviewHistory
Dim loadedReview As PdfLoadedPopupAnnotation = reviewCollection(0)
' Modify the review State
loadedReview.State = PdfAnnotationState.Rejected
'Save the document
ldoc.Save("Output.pdf")
'Close the document
ldoc.Close(true)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file

Retrieve review status and comments from PDF annotation

The PDF annotations may have an author-specific state associated with them. The state is not specified in the annotation itself, but it represents a separate text annotation ([Popup Annotation](#)).

The Essential PDF supports retrieving the annotation comments and review history from the existing PDF document annotations.

Retrieve review status from PDF annotation

You can retrieve the annotation review history from the existing PDF document annotations through the [ReviewHistory](#) property.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the review history collection for the annotation
PdfLoadedPopupAnnotationCollection reviewCollection =
loadedMarkup.ReviewHistory;
//Get annotation state
PdfAnnotationState state = reviewCollection[0].State;
//Get annotation state model
PdfAnnotationStateModel model = reviewCollection[0].StateModel;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Get the review history of the comment
PdfLoadedPopupAnnotationCollection reviewCollection1 =
commentsCollection[0].ReviewHistory;
//Close the PDF document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")
```

```

'Get the existing PDF page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Get the annotation
Dim loadedMarkup As PdfLoadedTextMarkupAnnotation =
TryCast(loadedPage.Annotations(0), PdfLoadedTextMarkupAnnotation)
'Get the review history collection for the annotation
Dim reviewCollection As PdfLoadedPopupAnnotationCollection =
loadedMarkup.ReviewHistory
'Get annotation state
Dim state As PdfAnnotationState = reviewCollection(0).State
'Get annotation state model
Dim model As PdfAnnotationStateModel = reviewCollection(0).StateModel
'Get the comments of the annotation
Dim commentsCollection As PdfLoadedPopupAnnotationCollection =
loadedMarkup.Comments
'Get the review history of the comment
Dim reviewCollection1 As PdfLoadedPopupAnnotationCollection =
commentsCollection(0).ReviewHistory
'Close the PDF document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the review history collection for the annotation
PdfLoadedPopupAnnotationCollection reviewCollection =
loadedMarkup.ReviewHistory;
//Get annotation state
PdfAnnotationState state = reviewCollection[0].State;
//Get annotation state model
PdfAnnotationStateModel model = reviewCollection[0].StateModel;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Get the review history of the comment
PdfLoadedPopupAnnotationCollection reviewCollection1 =
commentsCollection[0].ReviewHistory;
//Close the document
loadedDocument.Close(true);

```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the review history collection for the annotation

//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the review history collection for the annotation
PdfLoadedPopupAnnotationCollection reviewCollection =
loadedMarkup.ReviewHistory;
//Get annotation state
PdfAnnotationState state = reviewCollection[0].State;
//Get annotation state model
PdfAnnotationStateModel model = reviewCollection[0].StateModel;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Get the review history of the comment
PdfLoadedPopupAnnotationCollection reviewCollection1 =
commentsCollection[0].ReviewHistory;
//Closes the document
loadedDocument.Close(true);
```

Retrieve comments from PDF annotation

The following code example explains how to retrieve the annotation comments from the existing PDF document annotations.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Close the PDF document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")
'Get the existing PDF page
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Get the annotation
Dim loadedMarkup As PdfLoadedTextMarkupAnnotation =
TryCast(loadedPage.Annotations(0), PdfLoadedTextMarkupAnnotation)
'Get the comments of the annotation
Dim commentsCollection As PdfLoadedPopupAnnotationCollection =
loadedMarkup.Comments
'Close the PDF document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and choose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Close the document
```

```
loadedDocument.Close(true);
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument lDoc = new PdfLoadedDocument(docStream);
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Closes the document
loadedDocument.Close(true);
```

XAMARIN

```
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the existing PDF page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Get the annotation
PdfLoadedTextMarkupAnnotation loadedMarkup = loadedPage.Annotations[0] as
PdfLoadedTextMarkupAnnotation;
//Get the comments of the annotation
PdfLoadedPopupAnnotationCollection commentsCollection =
loadedMarkup.Comments;
//Closes the document
loadedDocument.Close(true);
```

Printing Annotations

The Essential PDF supports printing the annotation in a PDF document by setting the annotation flag to **Print** using the [AnnotationFlags](#) property.

The following code example illustrates how to print annotation in the PDF document.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new PDF rubber stamp annotation
RectangleF rectangle = new RectangleF(40, 60, 80, 20);
PdfRubberStampAnnotation rubberStampAnnotation = new
PdfRubberStampAnnotation(rectangle, "Text Rubber Stamp Annotation");
rubberStampAnnotation.Icon = PdfRubberStampAnnotationIcon.Draft;
rubberStampAnnotation.Text = "Text Properties Rubber Stamp Annotation";
//Set the AnnotationFlags to print
```

```

rubberStampAnnotation.AnnotationFlags = PdfAnnotationFlags.Print;
//Adds annotation to the page
page.Annotations.Add(rubberStampAnnotation);
//Saves the document
document.Save("RubberStamp.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Creates a new PDF document
Dim document As PdfDocument = New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a new PDF rubber stamp annotation
Dim rectangle As RectangleF = New RectangleF(40, 60, 80, 20)
Dim rubberStampAnnotation As PdfRubberStampAnnotation = New
PdfRubberStampAnnotation(rectangle, " Text Rubber Stamp Annotation")
rubberStampAnnotation.Icon = PdfRubberStampAnnotationIcon.Draft
rubberStampAnnotation.Text = "Text Properties Rubber Stamp Annotation"
'Set the AnnotationFlags to print
rubberStampAnnotation.AnnotationFlags = PdfAnnotationFlags.Print
'Adds annotation to the page
page.Annotations.Add(rubberStampAnnotation)
'Saves the document
document.Save("RubberStamp.pdf")
'Close the document
document.Close(True)

```

UWP

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new PDF rubber stamp annotation
RectangleF rectangle = new RectangleF(40, 60, 80, 20);
PdfRubberStampAnnotation rubberStampAnnotation = new
PdfRubberStampAnnotation(rectangle, " Text Rubber Stamp Annotation");
rubberStampAnnotation.Icon = PdfRubberStampAnnotationIcon.Draft;
rubberStampAnnotation.Text = "Text Properties Rubber Stamp Annotation";
//Set the AnnotationFlags to print
rubberStampAnnotation.AnnotationFlags = PdfAnnotationFlags.Print;
//Adds annotation to the page
page.Annotations.Add(rubberStampAnnotation);
//Saves the document
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new PDF rubber stamp annotation
RectangleF rectangle = new RectangleF(40, 60, 80, 20);
PdfRubberStampAnnotation rubberStampAnnotation = new
PdfRubberStampAnnotation(rectangle, "Text Rubber Stamp Annotation");
rubberStampAnnotation.Icon = PdfRubberStampAnnotationIcon.Draft;
rubberStampAnnotation.Text = "Text Properties Rubber Stamp Annotation";
//Set the AnnotationFlags to print
rubberStampAnnotation.AnnotationFlags = PdfAnnotationFlags.Print;
//Adds annotation to the page
page.Annotations.Add(rubberStampAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "RubberStamp.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Creates a new PDF rubber stamp annotation
RectangleF rectangle = new RectangleF(40, 60, 80, 20);
PdfRubberStampAnnotation rubberStampAnnotation = new
PdfRubberStampAnnotation(rectangle, "Text Rubber Stamp Annotation");
rubberStampAnnotation.Icon = PdfRubberStampAnnotationIcon.Draft;
rubberStampAnnotation.Text = "Text Properties Rubber Stamp Annotation";
//Set the AnnotationFlags to print
rubberStampAnnotation.AnnotationFlags = PdfAnnotationFlags.Print;
//Adds annotation to the page
page.Annotations.Add(rubberStampAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
```

```

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("RubberStamp.pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("RubberStamp.pdf", "application/pdf", stream);
}

```

The following table explains annotation flags.

Member	Meaning
Invisible	If set, do not display the annotation if it does not belong to one of the standard annotation types and no annotation handler is available.
Hidden	If set, do not display or print the annotation, or allow user interact with annotation, regardless of annotation type or annotation handler.
Print	If set, prints the annotation when the page is printed.
NoZoom	If set, do not scale the annotation's appearance to match the magnification of the page.
NoRotate	If set, do not rotate the annotation's appearance to match the rotation of the page.
NoView	If set, do not display the annotation on the screens or allow user interact with annotation.
ReadOnly	If set, do not allow user interact with annotation.
Locked	If set, do not allow the annotation to be deleted or its properties to be modified by the user.
ToggleNoView	If set, inverts the interpretation of the NoView flag for certain events.

Add Custom Stamp using Rubber Stamp Annotation

Essential PDF supports adding custom stamp in an existing PDF document by using the [PdfRubberStampAnnotation](#) class along with different appearance settings through [PdfAppearance](#). This custom stamp is movable and resizable.

Rubber stamp annotation displays text or graphics intended to look like it is stamped on the page with a rubber stamp. When opened, it displays a pop-up window containing the text of the associated note.

The following code snippet explains how to add custom stamp in an existing PDF document using rubber stamp annotation.

C#

```

//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Get the page from loaded PDF document
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a new pdf rubber stamp annotation
RectangleF rectangleF = new RectangleF(350, 20, 200, 80);
PdfRubberStampAnnotation rubberStampAnnotation = new
PdfRubberStampAnnotation(rectangleF);
//Custom stamp the rubber stamp annotation
PdfSolidBrush brush = new PdfSolidBrush(new PdfColor(Color.LightBlue));
PdfPath path = RoundedRect(new RectangleF(0, 0, 200, 80), 20);
rubberStampAnnotation.Appearance.Normal.Graphics.DrawPath(brush, path);
//Add text in rubber stamp annotation
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12,
PdfFontStyle.Bold);
rubberStampAnnotation.Appearance.Normal.Graphics.DrawString("DD/2018/1234567
890", font, PdfBrushes.Black, new PointF(10, 20));
rubberStampAnnotation.Appearance.Normal.Graphics.DrawString(DateTime.Now.ToS
tring("dd-MM-yyyy HH:mm:ss"), font, PdfBrushes.Black, new PointF(10, 40));
//Set the content of annotation
rubberStampAnnotation.Text = "Text Properties Rubber Stamp Annotation";
//Add annotation to the page
loadedPage.Annotations.Add(rubberStampAnnotation);
//Save the PDF document
loadedDocument.Save("Output.pdf");
//Close the instance of PdfLoadedDocument
loadedDocument.Close(true);
public static PdfPath RoundedRect(RectangleF bounds, int radius)
{
    int diameter = radius * 2;
    SizeF size = new SizeF(diameter, diameter);
    RectangleF arc = new RectangleF(bounds.Location, size);
    PdfPath path = new PdfPath();
    if (radius == 0)
    {
        path.AddRectangle(bounds);
        return path;
    }
    //Draw the top left arc
    path.AddArc(arc, 180, 90);
    //Draw the top right arc
    arc.X = bounds.Right - diameter;
    path.AddArc(arc, 270, 90);
    //Draw the bottom right arc
    arc.Y = bounds.Bottom - diameter;
    path.AddArc(arc, 0, 90);
    //Draw the bottom left arc
    arc.X = bounds.Left;
    path.AddArc(arc, 90, 90);
    //Close the figure
    path.CloseFigure();
    //Return the path
    return path;
}

Working with Attachments

Essential PDF provides support for file attachments in PDF documents.

Attachments can contain any kind of file with detailed information.

Adding attachment to a PDF document

You can add a text file attachment to a PDF document using [PdfAttachment](#) class. The following code example illustrates this.

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt");
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";

```

```
attachment.MimeType = "application/txt";
//Adds the attachment to the document
document.Attachments.Add(attachment);
//Saves and closes the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Creates an attachment
Dim attachment As New PdfAttachment("Input.txt")
attachment.ModificationDate = DateTime.Now
attachment.Description = "Input.txt"
attachment.MimeType = "application/txt"
'Adds the attachment to the document
document.Attachments.Add(attachment)
'Saves and closes the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Load the file as stream
Stream fileStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.txt");
//Creates an attachment
PdfAttachment attachment = new PdfAttachment(@"Input.txt", fileStream);
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
//Adds the attachment to the document
document.Attachments.Add(attachment);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
Stream fileStream = new FileStream("Input.txt", FileMode.Open,
FileAccess.Read);
//Creates an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt", fileStream);
attachment.ModificationDate = DateTime.Now;
```

```

attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
//Adds the attachment to the document
document.Attachments.Add(attachment);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates an attachment
Stream fileStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.txt");
PdfAttachment attachment = new PdfAttachment("Input.txt", fileStream);
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
//Adds the attachment to the document
document.Attachments.Add(attachment);
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer pdf/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}

```

Essential PDF also provides support for adding the attachments to existing PDF documents. The following code example illustrates the same.

C#

```
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Create an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt");
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
if (loadedDocument.Attachments == null)
loadedDocument.CreateAttachment();
//Add the attachment to the document
loadedDocument.Attachments.Add(attachment);
//Saves and closes the PDF document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load an existing PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Create an attachment
Dim attachment As New PdfAttachment("Input.txt")
attachment.ModificationDate = DateTime.Now
attachment.Description = "Input.txt"
attachment.MimeType = "application/txt"
If loadedDocument.Attachments Is Nothing Then
loadedDocument.CreateAttachment()
End If
'Add the attachment to the document
loadedDocument.Attachments.Add(attachment)
'Saves and closes the PDF document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Load the file as stream
Stream fileStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.txt");
//Creates an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt", fileStream);
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
```

```

if (loadedDocument.Attachments == null)
loadedDocument.CreateAttachment();
//Add the attachment to the document
loadedDocument.Attachments.Add(attachment);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await loadedDocument.SaveAsync(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp
section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
Stream fileStream = new FileStream("Input.txt", FileMode.Open,
FileAccess.Read);
//Creates an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt", fileStream);
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
if (loadedDocument.Attachments == null)
loadedDocument.CreateAttachment();
//Add the attachment to the document
loadedDocument.Attachments.Add(attachment);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the documents.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Creates an attachment
Stream fileStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.txt");
PdfAttachment attachment = new PdfAttachment("Input.txt", fileStream);

```

```

attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
if (loadedDocument.Attachments == null)
loadedDocument.CreateAttachment();
//Add the attachment to the document
loadedDocument.Attachments.Add(attachment);
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
loadedDocument.Save(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer pdf/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}

```

Removing attachment from an existing PDF

Essential PDF allows you to remove the attachments from the existing document by using [Remove](#) method, as shown in the following code example.

C#

```

//Loads the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Removes an attachment
PdfAttachment attachment = document.Attachments[0];
document.Attachments.Remove(attachment);
document.Attachments.RemoveAt(1);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Loads the PDF document
Dim document As New PdfLoadedDocument("Input.pdf")
'Removes an attachments
Dim attachment As PdfAttachment = document.Attachments(0)
document.Attachments.Remove(attachment)
document.Attachments.RemoveAt(1)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await document.OpenAsync(file);
//Removes an attachment
PdfAttachment attachment = document.Attachments[0];
document.Attachments.Remove(attachment);
document.Attachments.RemoveAt(1);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Removes an attachment
PdfAttachment attachment = document.Attachments[0];
//document.Attachments.Remove(attachment);
document.Attachments.RemoveAt(0);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream

```

```

Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Removes an attachment
PdfAttachment attachment = document.Attachments[0];
document.Attachments.Remove(attachment);
//document.Attachments.RemoveAt(1);
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer pdf/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}

```

Extracting and saving an attachment to the disk.

Essential PDF provides support for extracting the attachments and saving them to the disk. The following code example explains how to extract and save an attachment.

C#

```

//Loads the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Sample.pdf");
//Iterates the attachments
foreach (PdfAttachment attachment in document.Attachments)
{
//Extracts the attachment and saves it to the disk
FileStream s = new FileStream(attachment.FileName, FileMode.Create);
s.Write(attachment.Data, 0, attachment.Data.Length);
s.Dispose();
}
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Loads the PDF document
Dim document As New PdfLoadedDocument("Sample.pdf")
'Iterates the attachments
For Each attachment As PdfAttachment In document.Attachments

```

```
'Extracts the attachment and saves it to the disk
Dim s As New FileStream(attachment.FileName, FileMode.Create)
s.Write(attachment.Data, 0, attachment.Data.Length)
s.Dispose()
Next
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

//PDF supports extracting and saving an attachment to the disk only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core platforms.

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Output.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Iterates the attachments
foreach (PdfAttachment attachment in document.Attachments)
{
//Extracts the attachment and saves it to the disk
FileStream s = new FileStream(attachment.FileName, FileMode.Create);
s.Write(attachment.Data, 0, attachment.Data.Length);
s.Dispose();
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

//PDF supports extracting and saving an attachment to the disk only in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core platforms.

Working with Security

Essential PDF allows you to protect the PDF document using encryption and set permission to the PDF document operations like printing, editing, copy content etc. using user password and owner password. Two types of encryption algorithms are available

1. Rivest Cipher 4 (RC4)

2. Advanced Encryption Standard (AES)

Working with RC4 Encryption

You can encrypt PDF document using RC4 algorithm with 40bit or 128bit key size. The following code snippet illustrates how to encrypt the PDF document with the [UserPassword](#).

User password: Prevents people from opening or viewing a PDF document. Once the User Password is set, to open the PDF document, Adobe Acrobat/Reader will prompt a user to enter this password. If it is not correct, the document will not open. By setting a PDF User password, you can secure the PDF document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key128Bit;
security.Algorithm = PdfEncryptionAlgorithm.RC4;
security.UserPassword = "password";
graphics.DrawString("Encrypted with RC4 128bit", font, brush, new PointF(0,
40));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim font As New PdfStandardFont(PdfFontFamily.TimesRoman, 20.0F,
PdfFontStyle.Bold)
Dim brush As PdfBrush = PdfBrushes.Black
'Document security.
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key128Bit
security.Algorithm = PdfEncryptionAlgorithm.RC4
security.UserPassword = "password"
graphics.DrawString("Encrypted with RC4 128bit", font, brush, New PointF(0,
40))
'Save and close the document.
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key128Bit;
security.Algorithm = PdfEncryptionAlgorithm.RC4;
security.UserPassword = "password";
graphics.DrawString("Encrypted with RC4 128bit", font, brush, new PointF(0,
40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key128Bit;
security.Algorithm = PdfEncryptionAlgorithm.RC4;
security.UserPassword = "password";
graphics.DrawString("Encrypted with RC4 128bit", font, brush, new PointF(0,
40));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key128Bit;
security.Algorithm = PdfEncryptionAlgorithm.RC4;
security.UserPassword = "password";
graphics.DrawString("Encrypted with RC4 128bit", font, brush, new PointF(0,
40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Note: While using both user and owner passwords, please specify different user and owner password while encrypting the PDF document for better security.

You can protect the PDF document from printing, editing, copying with the [OwnerPassword](#) by using the following code snippet.

Owner password: Sets PDF document restrictions, which can include printing, content copying, editing, page extracting, commenting, and more. Once the owner password is set, Acrobat will require this password to make any changes to the PDF document. It further secures the PDF document to set a PDF Owner Password.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;

```

```

PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm.
security.KeySize = PdfEncryptionKeySize.Key128Bit;
security.Algorithm = PdfEncryptionAlgorithm.RC4;
security.OwnerPassword = "syncfusion";
//It allows printing and accessibility copy content
security.Permissions = PdfPermissionsFlags.Print |
PdfPermissionsFlags.AccessibilityCopyContent;
security.UserPassword = "password";
graphics.DrawString("This document is protected with owner password", font,
brush, new PointF(0, 40));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics

```

Working with AES Encryption

You can encrypt PDF document using AES algorithm with 40bit or 128bit or 256bit key size. The following code snippet illustrates how to encrypt the PDF document with the [UserPassword](#).

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm.
security.KeySize = PdfEncryptionKeySize.Key256Bit;

```

```

security.Algorithm = PdfEncryptionAlgorithm.AES;
security.UserPassword = "password";
graphics.DrawString("Encrypted with AES 256bit", font, brush, new PointF(0,
40));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Create a new PDF document.
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim font As New PdfStandardFont(PdfFontFamily.TimesRoman, 20.0F,
PdfFontStyle.Bold)
Dim brush As PdfBrush = PdfBrushes.Black
'Document security.
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm using 256 bit key in AES mode.
security.KeySize = PdfEncryptionKeySize.Key256Bit
security.Algorithm = PdfEncryptionAlgorithm.AES
security.UserPassword = "password"
graphics.DrawString("Encrypted with AES 256bit", font, brush, New PointF(0,
40))
'Save and close the document.
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
security.UserPassword = "password";
graphics.DrawString("Encrypted with AES 256bit", font, brush, new PointF(0,
40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
security.UserPassword = "password";
graphics.DrawString("Encrypted with AES 256bit", font, brush, new PointF(0,
40));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
security.UserPassword = "password";
graphics.DrawString("Encrypted with AES 256bit", font, brush, new PointF(0,
40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

You can protect the PDF document from printing, editing, copying with the [OwnerPassword](#) by using the following code snippet.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm using 256 bit key in AES mode.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
security.OwnerPassword = "syncfusion";
//It allows printing and accessibility copy content
security.Permissions = PdfPermissionsFlags.Print |
PdfPermissionsFlags.AccessibilityCopyContent;
security.UserPassword = "password";
graphics.DrawString("This document is protected with owner password", font,
brush, new PointF(0, 40));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim font As New PdfStandardFont(PdfFontFamily.TimesRoman, 20.0F,
PdfFontStyle.Bold)
Dim brush As PdfBrush = PdfBrushes.Black
'Document security.
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm using 256 bit key in RC4 mode.
security.KeySize = PdfEncryptionKeySize.Key256Bit
```

```

security.Algorithm = PdfEncryptionAlgorithm.AES
security.OwnerPassword = "syncfusion"
'It allows printing and accessibility copy content
security.Permissions = PdfPermissionsFlags.Print Or
PdfPermissionsFlags.AccessibilityCopyContent
security.UserPassword = "password"
graphics.DrawString("This document is protected with owner password", font,
brush, New PointF(0, 40))
'Save and close the document.
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security.
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm using 256 bit key in AES mode.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;

samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}

```

```

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Encryption Options

Now, the Syncfusion PDF library has provided options to encrypt the PDF document as follows:

- Encrypt all contents** – All contents of the document will be encrypted. *Encrypt all contents except Metadata* – All contents of the document will be encrypted except metadata. **Encrypt only attachments** – Encrypts only the file attachments, rest of the document will be left unencrypted.

The default value of EncryptionOptions is EncryptAllContents. You can choose any one of these options using the property “EncryptionOptions” available in the class [PdfSecurity](#).

Encrypt all contents

You can encrypt all the PDF content by using the EncryptAllContents option available in the EncryptionOptions. The following code snippet explains how to encrypt all contents of the PDF document.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptAllContents;
security.UserPassword = "password";
graphics.DrawString("Encrypted with AES 256bit", font, brush, new PointF(0,
40));
//Save and close the document
document.Save("Output.pdf");
document.Close();

```

VB.NET

```

'Create a new PDF document
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim font As New PdfStandardFont(PdfFontFamily.TimesRoman, 20.0F,
PdfFontStyle.Bold)

```

```

Dim brush As PdfBrush = PdfBrushes.Black
'Document security
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm using 256 bit key in AES mode
security.KeySize = PdfEncryptionKeySize.Key256Bit
security.Algorithm = PdfEncryptionAlgorithm.AES
'Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptAllContents;
security.UserPassword = "password"
graphics.DrawString("Encrypted with AES 256bit", font, brush, New PointF(0,
40))
'Save and close the document
document.Save("Output.pdf")
document.Close()

```

UWP

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptAllContents;
security.UserPassword = "password";
graphics.DrawString("Encrypted with AES 256bit", font, brush, new PointF(0,
40));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document

```

```
}

```

Encrypt all contents except metadata

The Syncfusion Essential PDF library now supports encrypting the PDF document except the document information (metadata) by using the `EncryptAllContentsExceptMetadata` option. The document information will not be encrypted when using this `EncryptionOption`.

The following code snippet explains how to encrypt all contents except metadata of the PDF document.

Note: Encrypt all contents except metadata is only supported in AES algorithms with 128bit, 256bit, and 256bit revision6 key size

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Specifies encryption option
security.EncryptionOptions =
PdfEncryptionOptions.EncryptAllContentsExceptMetadata;
security.UserPassword = "password";
graphics.DrawString("Encrypted all contents except metadata with AES
256bit", font, brush, new PointF(0, 40));
//Save and close the document
document.Save("Output.pdf");
document.Close();
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim font As New PdfStandardFont(PdfFontFamily.TimesRoman, 20.0F,
PdfFontStyle.Bold)
Dim brush As PdfBrush = PdfBrushes.Black
'Document security
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm using 256 bit key in AES mode
security.KeySize = PdfEncryptionKeySize.Key256Bit
security.Algorithm = PdfEncryptionAlgorithm.AES
'Specifies encryption option
security.EncryptionOptions =
PdfEncryptionOptions.EncryptAllContentsExceptMetadata
security.UserPassword = "password"
graphics.DrawString("Encrypted all contents except metadata with AES
256bit", font, brush, New PointF(0, 40))
```

```
'Save and close the document
document.Save("Output.pdf")
document.Close()
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Specifies encryption option
security.EncryptionOptions =
PdfEncryptionOptions.EncryptAllContentsExceptMetadata;
security.UserPassword = "password";
graphics.DrawString("Encrypted with all contents except metadata AES
256bit", font, brush, new PointF(0, 40));
//Save the PDF document to stream

}
```

Encrypt only attachments

You can encrypt only attachments present in the PDF document by using the `EncryptOnlyAttachments` option available in the `EncryptionOptions`.

The following code example explains how to create an encrypt only attachment document using the Syncfusion PDF Library.

Note: [UserPassword](#) is mandatory for encrypt only attachments and it is only supported in AES algorithms with 128bit, 256bit, and 256bit revision6 key size

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 20f,
PdfFontStyle.Bold);
PdfBrush brush = PdfBrushes.Black;
//Document security
PdfSecurity security = document.Security;
//Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments;
security.UserPassword = "password";
graphics.DrawString("Encrypted only attachments with AES 256bit", font,
brush, new PointF(0, 40));
//Creates an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt");
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
//Add the attachment to the document
document.Attachments.Add(attachment);
//Save and close the document
document.Save("Output.pdf");
document.Close();
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
Dim font As New PdfStandardFont(PdfFontFamily.TimesRoman, 20.0F,
PdfFontStyle.Bold)
Dim brush As PdfBrush = PdfBrushes.Black
'Document security
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm using 256 bit key in AES mode
security.KeySize = PdfEncryptionKeySize.Key256Bit
security.Algorithm = PdfEncryptionAlgorithm.AES
'Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments;
security.UserPassword = "password"
graphics.DrawString("Encrypted only attachments with AES 256bit", font,
brush, New PointF(0, 40))
'Creates an attachment
```

```

Dim attachment As New PdfAttachment("Input.txt")
attachment.ModificationDate = DateTime.Now
attachment.Description = "Input.txt"
attachment.MimeType = "application/txt"
Add the attachment to the document
document.Attachments.Add(attachment)
'Save and close the document
document.Save("Output.pdf")
document.Close()

```

UWP

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();

}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Opening an encrypt-only-attachment document

The Syncfusion Essential PDF library now provides support for loading the encrypt-only-attachment PDF documents. To access the attachments in the existing PDF document, the [UserPassword](#) is mandatory.

You can provide the [UserPassword](#) in following ways:

Load the PDF document with password. Provide password using the OnPdfPassword Event when accessing the attachments.

It is possible to access all the contents except attachment when loading the PDF document without [UserPassword](#).

The following code example explains how to load an encrypt-only-attachment document with password using Syncfusion PDF Library.

C#

```
//Load the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf", "password");
//Accessing the attachments
foreach (PdfAttachment attachment in document.Attachments)
{
    FileStream stream = new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
document.Close(true);
```

VB.NET

```
'Load the PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf",
"password")
'Accessing the attachments
For Each attachment As PdfAttachment In document.Attachments
    Dim stream = New FileStream(attachment.FileName, FileMode.Create)
    stream.Write(attachment.Data, 0, attachment.Data.Length)
```

```
stream.Dispose
Next
'Close the document
document.Close(true)
```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument(pdfStream, "password");
//Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream= new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
document.Close(true);
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream, "password");
//Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream = new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
document.Close(true);
```

XAMARIN

```
//Load the PDF document as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument(docStream, "password");
//Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream= new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
```

```
document.Close(true);
```

Set user password using event when accessing the attachment

The following code example illustrates how to provide the password when accessing attachments from encrypt-only-attachment document using the OnPdfPassword event.

C#

```
//Load the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
document.OnPdfPassword += LDoc_OnPdfPassword;
//Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream= new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
document.Close(true);
//Provide the user password in event
private static void LDoc_OnPdfPassword(object sender, OnPdfPasswordEventArgs
args)
{
    args.UserPassword = "syncfusion";
}
```

VB.NET

```
'Load the PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'document.OnPdfPassword += LDoc_OnPdfPassword()
AddHandler document.OnPdfPassword, AddressOf LDoc_OnPdfPassword
'Accessing the attachments
For Each attachment As PdfAttachment In document.Attachments
    Dim stream As FileStream = New FileStream(attachment.FileName,
    FileMode.Create)
    stream.Write(attachment.Data, 0, attachment.Data.Length)
    stream.Dispose()
Next
'Close the document
document.Close(True)
'Provide the user password in event
Private Sub LDoc_OnPdfPassword(ByVal sender As Object, ByVal args As
OnPdfPasswordEventArgs)
    args.UserPassword = "password"
End Sub
```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
```

```

PdfLoadedDocument document = new PdfLoadedDocument(pdfStream);
document.OnPdfPassword += LDoc_OnPdfPassword;
//Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream = new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
document.Close(true);
//Provide the user password in event
private static void LDoc_OnPdfPassword(object sender, OnPdfPasswordEventArgs
args)
{
    args.UserPassword = "syncfusion";
}

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
document.OnPdfPassword += LDoc_OnPdfPassword;
//Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream= new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}
//Close the document
document.Close(true);
//Provide the user password in event
private static void LDoc_OnPdfPassword(object sender, OnPdfPasswordEventArgs
args)
{
    args.UserPassword = "syncfusion";
}

```

XAMARIN

```

//Load the PDF document as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
document.OnPdfPassword += LDoc_OnPdfPassword;
// Accessing the attachments
foreach(PdfAttachment attachment in document.Attachments)
{
    FileStream stream= new FileStream(attachment.FileName, FileMode.Create);
    stream.Write(attachment.Data, 0, attachment.Data.Length);
    stream.Dispose();
}

```

```

}
//Close the document
document.Close(true);
//Provide the user password in event
private static void LDoc_OnPdfPassword(object sender, OnPdfPasswordEventArgs
args)
{
args.UserPassword = "syncfusion";
}

```

Protect attachments in existing PDF document

The Syncfusion PDF Library supports encrypting only the attachment files in an existing PDF document using the EncryptOnlyAttachments encryption option. Refer to the following code snippet.

Note: [UserPassword](#) is mandatory for this encryption option.

C#

```

//Load the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide user password
security.UserPassword = "password";
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments;
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Load the PDF document
Dim document As New PdfLoadedDocument("Input.pdf")
'PDF document security
Dim security As PdfSecurity = document.Security
'Specifies encryption key size, algorithm and permission
security.KeySize = PdfEncryptionKeySize.Key256Bit
security.Algorithm = PdfEncryptionAlgorithm.AES
'Provide user password
security.UserPassword = "password"
'Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(true)

```

UWP

```

//Load the PDF document as stream

```

```

Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument(pdfStream);
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide user password
security.UserPassword = "password";
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide user password
security.UserPassword = "password";
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments;
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream); stream.Position = 0;
//Close the documents
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the PDF document as stream

```

```

Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide user password
security.UserPassword = "password";
//Specifies encryption option
security.EncryptionOptions = PdfEncryptionOptions.EncryptOnlyAttachments;
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file //The operation in Save under Xamarin varies
between Windows Phone, Android, and iOS platforms. Refer to the PDF/Xamarin
section for respective code samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Protect an existing document

You can protect an existing PDF document with both [UserPassword](#) and [OwnerPassword](#) by using the following code snippet.

C#

```

//Load the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide owner and user password.
security.OwnerPassword = "ownerPassword256";
security.UserPassword = "userPassword256";
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);

```

VB.NET

```

'Load an existing document.
Dim document As New PdfLoadedDocument("Input.pdf")
'Document Security
Dim security As PdfSecurity = document.Security
'Specifies key size and encryption algorithm
security.KeySize = PdfEncryptionKeySize.Key128Bit
security.Algorithm = PdfEncryptionAlgorithm.RC4
'Provide owner and user password.
security.OwnerPassword = "ownerPassword256"
security.UserPassword = "userPassword256"
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

UWP

```

//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument(pdfStream);
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide owner and user password.
security.OwnerPassword = "ownerPassword256";
security.UserPassword = "userPassword256";
MemoryStream memoryStream = new MemoryStream();
//Save the document.
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp
section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide owner and user password.
security.OwnerPassword = "ownerPassword256";
security.UserPassword = "userPassword256";

```

```
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//PDF document security
PdfSecurity security = document.Security;
//Specifies encryption key size, algorithm and permission.
security.KeySize = PdfEncryptionKeySize.Key256Bit;
security.Algorithm = PdfEncryptionAlgorithm.AES;
//Provide owner and user password.
security.OwnerPassword = "ownerPassword256";
security.UserPassword = "userPassword256";
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Changing the password of the PDF document

You can change the [UserPassword](#) of the existing PDF document by using following code snippet.

C#

```
//Load the password protected PDF document
```

```

PdfLoadedDocument loadedDocument = new
PdfLoadedDocument("Input.pdf", "password");
//Change the user password
loadedDocument.Security.UserPassword = "NewPassword";
//Save the password changed PDF document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Load the password protected PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf", "password")
'Change the user password
loadedDocument.Security.UserPassword = "NewPassword"
'Save the password changed PDF document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)

```

UWP

```

//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument(pdfStream, "password");
//Change the user password
loadedDocument.Security.UserPassword = "NewPassword";
MemoryStream memoryStream = new MemoryStream();
//Save the document.
loadedDocument.Save(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp
section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream,
"password");
//Change the user password
loadedDocument.Security.UserPassword = "NewPassword";
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the documents.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";

```

```
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream,
"password");
//Change the user password
loadedDocument.Security.UserPassword = "NewPassword";
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Closes the document
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}
```

Change the permission of the PDF document

You can change the permission of the PDF document using the [Permissions](#). The following code snippet illustrates the same.

C#

```
//Load the password protected PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf",
"syncfusion");
//Change the permission
loadedDocument.Security.Permissions = PdfPermissionsFlags.CopyContent |
PdfPermissionsFlags.AssembleDocument;
//Save the PDF document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```

'Load the password protected PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf", "syncfusion")
'Change the permission
loadedDocument.Security.Permissions = PdfPermissionsFlags.CopyContent Or
PdfPermissionsFlags.AssembleDocument
'Save the PDF document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)

```

UWP

```

//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument(pdfStream, "syncfusion");
//Change the permission
loadedDocument.Security.Permissions = PdfPermissionsFlags.CopyContent |
PdfPermissionsFlags.AssembleDocument;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
loadedDocument.Save(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp
section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream,
"syncfusion");
//Change the permission
loadedDocument.Security.Permissions = PdfPermissionsFlags.CopyContent |
PdfPermissionsFlags.AssembleDocument;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the documents.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
    typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
    Input.pdf");
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument(docStream, "syncfusion");
//Change the permission
loadedDocument.Security.Permissions = PdfPermissionsFlags.CopyContent |
PdfPermissionsFlags.AssembleDocument;
//document.Attachments.RemoveAt(1);
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
loadedDocument.Save(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer pdf/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
    "application/pdf", memoryStream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
    "application/pdf", memoryStream);
}

```

Remove password from the user password PDF document

You can remove the [UserPassword](#) from the encrypted PDF document by using the following code snippet.

C#

```

//Load the password protected PDF document
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument("Input.pdf", "password");
//Change the user password
loadedDocument.Security.UserPassword = string.Empty;
//Save the password removed PDF document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Load the password protected PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf", "password")
'Change the user password
loadedDocument.Security.UserPassword = String.Empty
'Save the password removed PDF document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)

```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.Data.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument(pdfStream, "password");
//Change the user password
loadedDocument.Security.UserPassword = string.Empty;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
loadedDocument.Save(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to pdf/uwp
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream,
"password");
//Change the user password
loadedDocument.Security.UserPassword = string.Empty;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the documents.
loadedDocument.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument(docStream, "password");
//Change the user password
loadedDocument.Security.UserPassword = string.Empty;
//Save the document into stream.
```

```

MemoryStream memoryStream = new MemoryStream();
loadedDocument.Save(memoryStream);
//Close the documents.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer pdf/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
        "application/pdf", memoryStream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
        "application/pdf", memoryStream);
}

```

How to determine whether the PDF document is password protected or not?

You can determine whether the existing PDF document is password protected or not by catching the [PdfDocumentException](#) as shown below.

C#

```

try
{
    //Load the password protected PDF document without user password
    PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Output.pdf");
}
catch (PdfDocumentException exception)
{
    if (exception.Message == "Can't open an encrypted document. The password is
        invalid.")
    {
        MessageBox.Show("Cannot open an encrypted document without password");
    }
}

```

VB.NET

```

Try
    'Load the password protected PDF document without user password
    Dim loadedDocument As New PdfLoadedDocument("Output.pdf")
    Catch exception As PdfDocumentException
    If exception.Message = "Can't open an encrypted document. The password is
        invalid." Then
        MessageBox.Show("Cannot open an encrypted document without password")
    End If
End Try

```

UWP

```

try

```

```

{
    //Load the PDF document as stream
    Stream pdfStream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
    sets.Data.Output.pdf");
    //Creates an empty PDF loaded document instance
    PdfLoadedDocument loadedDocument = new PdfLoadedDocument(pdfStream);
}
catch (PdfDocumentException exception)
{
}
}

```

ASP.NET CORE

```

try
{
    //Load the PDF document
    FileStream docStream = new FileStream("Output.pdf", FileMode.Open,
    FileAccess.Read);
    PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
}
catch (PdfDocumentException exception)
{
}
}

```

XAMARIN

```

try
{
    //Load the file as stream
    Stream docStream =
    typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
    Output.pdf");
    PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
}
catch (PdfDocumentException exception)
{
}
}

```

How to determine whether the PDF document is protected by user or owner password
 Essential PDF supports identifying the document whether it is protected by user or owner.

The following table shows the various combination for loading the secured document with user or owner password:

Document type	Open with	User password	Owner password
PDF document secured with both the owner and user passwords.	User password	Returns user password	Returns null

Document type	Open with	User password	Owner password
PDF document secured with both the owner and user passwords.	Owner password	Returns user password Note: Returns null for AES 256 and AES 256 Revision 6 encryptions.	Returns owner password
PDF document secured with owner password alone.	Owner password	Returns null	Returns owner password
PDF document secured with user password alone.	User Password	Returns user password	Returns owner Password (owner password is same as the user password; it allows full permission to users).

Working with PDF Redaction

Removing sensitive content from the PDF document

Essential PDF supports removing or redacting the sensitive text and images from the PDF documents. Redaction is the process of permanently removing sensitive information from the PDF document, use the [PdfRedaction](#) class to remove content.

Note: Note: CJK text without TrueType font and complex script text cannot be redacted.

The following sample code snippet demonstrates the redaction of PDF documents from the specified bounds.

C#

```
//Load a PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
// Get first page from the document
PdfLoadedPage page = document.Pages[0] as PdfLoadedPage;
//Create PDF redaction for the page
PdfRedaction redaction = new PdfRedaction(new RectangleF(343, 147, 60, 17),
System.Drawing.Color.Black);
//Adds redaction to the loaded page
page.Redactions.Add(redaction);
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Load a PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Create PDF redaction for the page
Dim redaction As PdfRedaction = New PdfRedaction(New RectangleF(343, 147,
60, 17), System.Drawing.Color.Black)
'Adds redaction to the loaded page
page.Redactions.Add(redaction)
```

```
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

XAMARIN

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

Display text on the redacted area

You can draw overlay text on the redacted area using the [Appearance](#) property available in [PdfRedaction](#) class, and customize the overlay text with different font, style, color and brushes.

The following code snippet explains how to add overlay text in the redacted area.

C#

```
//Load a PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Get first page from the document
PdfLoadedPage page = document.Pages[0] as PdfLoadedPage;
//Create PDF redaction for the page
PdfRedaction redaction = new PdfRedaction(new RectangleF(343, 147, 60, 17));
//Font for the overlay text
PdfStandardFont font = new PdfStandardFont(PdfFontFamily.Courier, 10);
//Draw text on the redacted area
redaction.Appearance.Graphics.DrawString("Redacted", font, PdfBrushes.Red,
new PointF(5, 5));
//Adds redaction to the loaded page
page.Redactions.Add(redaction);
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Load a PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Create PDF redaction for the page
Dim redaction As PdfRedaction = New PdfRedaction(New RectangleF(343, 147,
60, 17))
'Font for the overlay text
Dim font As PdfStandardFont = New PdfStandardFont(PdfFontFamily.Courier, 10)
'Draw text on the redacted area
```

```
redaction.Appearance.Graphics.DrawString("Redacted", font, PdfBrushes.Red,
New PointF(5, 5))
'Adds redaction to the loaded page
page.Redactions.Add(redaction)
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

XAMARIN

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

Drawing image on the redacted area

You can draw the image on the redacted area using the [Appearance](#) property in [PdfRedaction](#) class.

The following code snippet explains how to redact the information from a page by drawing image on the redacted area using appearance.

C#

```
//Load a PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Get first page from the document
PdfLoadedPage page = document.Pages[0] as PdfLoadedPage;
//Create PDF redaction for the page
PdfRedaction redaction = new PdfRedaction(new RectangleF(63, 57, 182, 157));
//Draw image on the redacted bounds
PdfImage image = new PdfBitmap("Image.png");
redaction.Appearance.Graphics.DrawImage(image, new RectangleF(0, 0, 182,
157));
//Adds redaction to the loaded page
page.Redactions.Add(redaction);
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Load a PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Create PDF redaction for the page
Dim redaction As PdfRedaction = New PdfRedaction(New RectangleF(63, 57, 182,
157))
'Draw image on the redacted bounds
```

```

Dim image As PdfImage = New PdfBitmap("Image.png")
redaction.Appearance.Graphics.DrawImage(image, New RectangleF(0, 0, 182,
157))
'Draw image on the redacted bounds
page.Redactions.Add(redaction)
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

XAMARIN

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

Drawing pattern on the redacted area

You can draw the patterns on the redacted area using the [Appearance](#) property in [PdfRedaction](#) class.

The following code snippet explains how to redact the information from a page by drawing mosaic pattern on the redacted area using appearance.

C#

```

//Load a PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Get first page from the document
PdfLoadedPage page = document.Pages[0] as PdfLoadedPage;
//Create PDF redaction for the page
PdfRedaction redaction = new PdfRedaction(new RectangleF(341, 149, 64, 14));
//Draw mosaic pattern on the redaction bounds
RectangleF rect = new RectangleF(0, 0, 8, 8);
PdfTilingBrush tilingBrush = new PdfTilingBrush(rect);
tilingBrush.Graphics.DrawRectangle(PdfBrushes.Gray, new RectangleF(0, 0, 2,
2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.White, new RectangleF(2, 0,
2, 2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, new RectangleF(4,
0, 2, 2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.DarkGray, new RectangleF(6,
0, 2, 2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.White, new RectangleF(0, 2,
2, 2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, new RectangleF(2,
2, 2, 2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.Black, new RectangleF(4, 2,
2, 2));
tilingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, new RectangleF(6,
2, 2, 2));

```

```

tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, new RectangleF(0,
4, 2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.DarkGray, new RectangleF(2,
4, 2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, new RectangleF(4,
4, 2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.White, new RectangleF(6, 4,
2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.Black, new RectangleF(0, 6,
2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, new RectangleF(2,
6, 2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.Black, new RectangleF(4, 6,
2, 2));
tillingBrush.Graphics.DrawRectangle(PdfBrushes.DarkGray, new RectangleF(6,
6, 2, 2));
rect = new RectangleF(0, 0, 16, 14);
PdfTilingBrush tillingBrushNew = new PdfTilingBrush(rect);
tillingBrushNew.Graphics.DrawRectangle(tillingBrush, rect);
redaction.Appearance.Graphics.DrawRectangle(tillingBrushNew, new
RectangleF(0, 0, 64, 14));
//Adds redaction to the loaded page
page.Redactions.Add(redaction);
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Load a PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Create PDF redaction for the page
Dim redaction As PdfRedaction = New PdfRedaction(New RectangleF(341, 149,
64, 14))
'Draw mosaic pattern on the redaction bounds
Dim rect As RectangleF = New RectangleF(0, 0, 8, 8)
Dim tillingBrush As PdfTilingBrush = New PdfTilingBrush(rect)
tillingBrush.Graphics.DrawRectangle(PdfBrushes.Gray, New RectangleF(0, 0, 2,
2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.White, New RectangleF(2, 0,
2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, New RectangleF(4,
0, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.DarkGray, New RectangleF(6,
0, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.White, New RectangleF(0, 2,
2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, New RectangleF(2,
2, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.Black, New RectangleF(4, 2,
2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, New RectangleF(6,
2, 2, 2))

```

```

tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, New RectangleF(0,
4, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.DarkGray, New RectangleF(2,
4, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, New RectangleF(4,
4, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.White, New RectangleF(6, 4,
2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.Black, New RectangleF(0, 6,
2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.LightGray, New RectangleF(2,
6, 2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.Black, New RectangleF(4, 6,
2, 2))
tillingBrush.Graphics.DrawRectangle(PdfBrushes.DarkGray, New RectangleF(6,
6, 2, 2))
rect = New RectangleF(0, 0, 16, 14)
Dim tillingBrushNew As PdfTilingBrush = New PdfTilingBrush(rect)
tillingBrushNew.Graphics.DrawRectangle(tillingBrush, rect)
redaction.Appearance.Graphics.DrawRectangle(tillingBrushNew, New
RectangleF(0, 0, 64, 14))
'Adds redaction to the loaded page
page.Redactions.Add(redaction)
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

XAMARIN

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

Fill color on the redacted area

You can draw the filled rectangle on the redacted bounds using the [FillColor](#) property in [PdfRedaction](#) class.

The following code snippet explains how to redact the information from a page with filled rectangle.

C#

```

//Load a PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Get first page from the document
PdfLoadedPage page = document.Pages[0] as PdfLoadedPage;
//Create PDF redaction for the page
PdfRedaction redaction = new PdfRedaction(new RectangleF(343, 147, 60, 17));
//Set fill color for the redaction bounds
redaction.FillColor = System.Drawing.Color.Black;

```

```
//Adds redaction to the loaded page
page.Redactions.Add(redaction);
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Load a PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Create PDF redaction for the page
Dim redaction As PdfRedaction = New PdfRedaction(New RectangleF(343, 147,
60, 17))
'Set fill color for the redaction bounds
redaction.FillColor = System.Drawing.Color.Black
'Adds redaction to the loaded page
page.Redactions.Add(redaction)
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

XAMARIN

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

Redaction without fill color and appearance

You can redact PDF without drawing the filled rectangle or text on the redacted bounds.

The following code snippet explains how to redact the information from a page without drawing fill color and appearance on the redaction bounds.

C#

```
//Load a PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Get first page from the document
PdfLoadedPage page = document.Pages[0] as PdfLoadedPage;
//Create PDF redaction for the page
PdfRedaction redaction = new PdfRedaction(new RectangleF(343, 147, 60, 17));
//Adds redaction to the loaded page
page.Redactions.Add(redaction);
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```

'Load a PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get first page from the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Create PDF redaction for the page
Dim redaction As PdfRedaction = New PdfRedaction(New RectangleF(343, 147,
60, 17))
'Adds redaction to the loaded page
page.Redactions.Add(redaction)
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

ASP.NET CORE

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

XAMARIN

```
//PDF supports redaction only in Windows Forms, WPF, ASP.NET, ASP.NET MVC.
```

Working with Digital Signature

Adding a digital signature

The Essential PDF allows you to add digital signature to the PDF document. To add digital signature, you need a certificate with private keys. The Essential PDF provides support for digital signature by using PFX files, Hardware Security Module(HSM), Online Certificate Status Protocol (OCSP), Certificate Revocation List (CRL), and Windows Certificate Store.

The following code example explains how to add a digital signature to the PDF document.

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
PdfCertificate pdfCert = new PdfCertificate(@"PDF.pfx", "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(@"signature.jpg");
//Sets signature information

```

```
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPageBase = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
'Creates a certificate instance from PFX file with private key
Dim pdfCert As New PdfCertificate("PDF.pfx", "syncfusion")
'Creates a digital signature
Dim signature As New PdfSignature(document, page, pdfCert, "Signature")
'Sets an image for signature field
Dim signatureImage As New PdfBitmap("signature.jpg")
'Sets signature info
signature.Bounds = New RectangleF(New PointF(0, 0),
signatureImage.PhysicalDimension)
signature.ContactInfo = "johndoe@owned.us"
signature.LocationInfo = "Honolulu, Hawaii"
signature.Reason = "I am author of this document."
'Draws the signature image
graphics.DrawImage(signatureImage, 0, 0)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.signature.jpg");
```

```

PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
FileStream certificateStream = new FileStream("PDF.pfx", FileMode.Open,
FileAccess.Read);
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
FileStream imageStream = new FileStream("signature.jpg", FileMode.Open,
FileAccess.Read);
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";

```

```
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.signature.jpg");
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Adding a digital signature using stream

The following code example illustrates how to add a digital signature in the PDF document using stream as follows.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Gets a stream from .pfx file
Stream pfxStream = File.OpenRead("PDF.pfx");
//Creates a certificate instance from PFX file stream with private key
PdfCertificate pdfCert = new PdfCertificate(pfxStream, "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(@"signature.jpg");
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";

}

```

You can add a digital signature to an existing document as follows.

C#

```

//Loads the PDF document with signature field
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Gets the page
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Creates a signature field
PdfSignatureField signatureField = new PdfSignatureField(page,
"SignatureField");
signatureField.Bounds = new RectangleF(0, 0, 100, 100);
signatureField.Signature = new PdfSignature();
//Adds certificate to the signature field
signatureField.Signature.Certificate = new PdfCertificate(@"PDF.pfx",
"syncfusion");
signatureField.Signature.Reason = "I am author of this document";
//Adds the field
loadedDocument.Form.Fields.Add(signatureField);
//Saves the certified PDF document
loadedDocument.Save(@"Output.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Loads the PDF document with signature field
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Gets the page
Dim page As PdfLoadedPage = TryCast(loadedDocument.Pages(0), PdfLoadedPage)
'Creates a signature field
Dim signatureField As New PdfSignatureField(page, "SignatureField")
signatureField.Bounds = New RectangleF(0, 0, 100, 100)
signatureField.Signature = New PdfSignature()
'Adds certificate to the signature field

```

```
signatureField.Signature.Certificate = New PdfCertificate("PDF.pfx",
"syncfusion")
signatureField.Signature.Reason = "I am author of this document"
'Adds the field
loadedDocument.Form.Fields.Add(signatureField)
'Saves the certified PDF document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file

}
```

Adding a digital signature using X509Certificate2

The following code example illustrates how to add digital signature in a PDF document using X509Certificate2 as follows.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
X509Certificate2 certificate = new X509Certificate2("PDF.pfx",
"syncfusion");
PdfCertificate pdfCertificate = new PdfCertificate(certificate);
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCertificate,
"Signature");
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(@"signature.jpg");
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
```

```

'Creates a certificate instance from PFX file with private key
Dim certificate As New X509Certificate2("PDF.pfx", "syncfusion")
Dim pdfCertificate As New PdfCertificate(certificate)
'Creates a digital signature
Dim signature As New PdfSignature(document, page, pdfCertificate,
"Signature")
'Sets an image for signature field
Dim signatureImage As New PdfBitmap("signature.jpg")
'Sets signature information
signature.Bounds = New RectangleF(New PointF(0, 0),
signatureImage.PhysicalDimension)
signature.ContactInfo = "johndoe@owned.us"
signature.LocationInfo = "Honolulu, Hawaii"
signature.Reason = "I am author of this document."
'Draws the signature image
graphics.DrawImage(signatureImage, 0, 0)
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)

```

UWP

```

//Essential PDF supports adding a digital signature using X509Certificate2
only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, and ASP.NET Core
platforms.

```

ASP.NET CORE

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
X509Certificate2 certificate = new X509Certificate2("PDF.pfx",
"syncfusion");
PdfCertificate pdfCertificate = new PdfCertificate(certificate);
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCertificate,
"Signature");
//Sets an image for signature field
FileStream imageStream = new FileStream("signature.jpg", FileMode.Open,
FileAccess.Read);
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream

```

```
document.Save(stream);
//If the position is not set to '0', then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPage page = document.Pages.Add();

certificateStream.CopyTo(ms);
X509Certificate2 certificate = new X509Certificate2(ms.ToArray(),
"syncfusion");
PdfCertificate pdfCertificate = new PdfCertificate(certificate);
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCertificate,
"Signature");
//Sets an image for signature field
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.signature.jpg");
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the document as stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Signing an existing document

You can load the signature field from the existing PDF document and add certificate to the document as follows.

C#

```
//Loads a PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Gets the first page of the document
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Gets the first signature field of the PDF document
PdfLoadedSignatureField field = loadedDocument.Form.Fields[0] as
PdfLoadedSignatureField;
//Creates a certificate
PdfCertificate certificate = new PdfCertificate(@"PDF.pfx", "syncfusion");
field.Signature = new
PdfSignature(loadedDocument, page, certificate, "Signature", field);
//Saves the document
loadedDocument.Save("Output.pdf");
//Closes the document
loadedDocument.Close(true);
```

VB.NET

```
'Loads a PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Gets the first page of the document
Dim page As PdfLoadedPage = TryCast(loadedDocument.Pages(0), PdfLoadedPage)
'Gets the first signature field of the PDF document
Dim field As PdfLoadedSignatureField =
TryCast(loadedDocument.Form.Fields(0), PdfLoadedSignatureField)
'Creates a certificate
Dim certificate As New PdfCertificate("PDF.pfx", "syncfusion")
field.Signature = New PdfSignature(loadedDocument, page, certificate,
"Signature", field)
'Saves the document
loadedDocument.Save("Output.pdf")
'Closes the document
loadedDocument.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
```

```

StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Gets the first page of the document
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Gets the first signature field of the PDF document
PdfLoadedSignatureField field = loadedDocument.Form.Fields[0] as
PdfLoadedSignatureField;
//Creates a certificate
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.
PdfCertificate certificate = new PdfCertificate(certificateStream,
"syncfusion");
field.Signature = new PdfSignature(loadedDocument, page, certificate,
"Signature", field);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Gets the first page of the document
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Gets the first signature field of the PDF document
PdfLoadedSignatureField field = loadedDocument.Form.Fields[0] as
PdfLoadedSignatureField;
//Creates a certificate
FileStream certificateStream = new FileStream("PDF.pfx", FileMode.Open,
FileAccess.Read);
PdfCertificate certificate = new PdfCertificate(certificateStream,

}
```

Sign an existing document using stream

You can load the signature field from an existing PDF document and add certificate to the document using stream as follows.

C#

```
//Loads a PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Gets the first page of the document
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
```

```

//Gets the first signature field of the PDF document
PdfLoadedSignatureField field = loadedDocument.Form.Fields[0] as
PdfLoadedSignatureField;
//Gets the stream from .pfx file
Stream pfxStream = File.OpenRead("PDF.pfx");
//Creates a certificate instance from PFX file stream with private key
PdfCertificate certificate = new PdfCertificate(pfxStream, "syncfusion");
field.Signature = new PdfSignature(loadedDocument, page, certificate,
"Signature", field);
//Saves the document
loadedDocument.Save("Output.pdf");
//Closes the document
loadedDocument.Close(true);

```

VB.NET

```

'Loads a PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Gets the first page of the document
Dim page As PdfLoadedPage = TryCast(loadedDocument.Pages(0), PdfLoadedPage)
'Gets the first signature field of the PDF document
Dim field As PdfLoadedSignatureField =
TryCast(loadedDocument.Form.Fields(0), PdfLoadedSignatureField)
'Gets the stream from .pfx file
Dim pfxStream As Stream = File.OpenRead("PDF.pfx")
'Creates a certificate instance from PFX file stream with private key
Dim certificate As New PdfCertificate(pfxStream, "syncfusion")
field.Signature = New PdfSignature(loadedDocument, page, certificate,
"Signature", field)
'Saves the document
loadedDocument.Save("Output.pdf")
'Closes the document
loadedDocument.Close(True)

```

UWP

```

//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Gets the first page of the document
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Gets the first signature field of the PDF document

```

Externally sing a PDF document

You can sign the PDF document from external digital signature created from various sources such as HSM, USB token, smart card, or other cloud services such as DigitalSign.

The following code example shows how to sign the PDF document from external signature.

C#

```

//Load existing PDF document
PdfLoadedDocument document = new PdfLoadedDocument("PDF_Succinctly.pdf");
//Creates a digital signature

Create Long Term Validation (LTV) when signing PDF documents externally

You can create a Long Term validation (LTV) when signing PDF documents externally using your private/public certificates.

The following code example shows how to create an LTV when signing a PDF document from external signature.

C#

```

//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Get the page of the existing PDF document
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a new PDF signature without PdfCertificate instance
PdfSignature signature = new PdfSignature(loadedDocument, loadedPage, null,
"Signature1");
//Hook up the ComputeHash event
signature.ComputeHash += Signature_ComputeHash;
//Create X509Certificate2 from your certificate to create a long-term validity
X509Certificate2 x509 = new X509Certificate2("PDF.pfx", "password123");
//Create LTV with your public certificates
signature.CreateLongTermValidity(new List<X509Certificate2> { x509 });
//Save and close the PDF document
loadedDocument.Save("SignedDocument.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Load an existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get the page of the existing PDF document
Dim loadedPage As PdfLoadedPage = TryCast(loadedDocument.Pages(0),
PdfLoadedPage)
'Create a new PDF signature without PdfCertificate instance
Dim signature As PdfSignature = New PdfSignature(loadedDocument, loadedPage,
Nothing, "Signature1")
' Hook up the ComputeHash event
AddHandler signature.ComputeHash, AddressOf Signature_ComputeHash
'Create X509Certificate2 from your certificate to create a long-term validity
Dim x509 As X509Certificate2 = New X509Certificate2("PDF.pfx",
"password123")
'Create LTV with your public certificates
signature.CreateLongTermValidity(New List(Of X509Certificate2) From { x509
})
'Save and close the PDF document
loadedDocument.Save("SignedDocument.pdf")
loadedDocument.Close(True)

```

UWP

```

//Get the stream from the document
Stream documentStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Input.pdf");
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);
//Get the page of the existing PDF document
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a new PDF signature without PdfCertificate instance
PdfSignature signature = new PdfSignature(loadedDocument, loadedPage, null,
"Signature1");
//Hook up the ComputeHash event
signature.ComputeHash += Signature_ComputeHash;

```

```
//Create X509Certificate2 from your certificate to create a long-term
validity
X509Certificate2 x509 = new X509Certificate2("PDF.pfx", "password123");
//Create LTV with your public certificates
signature.CreateLongTermValidity(new List<X509Certificate2> { x509 });
//Save the PDF document
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Get the stream from the document
FileStream documentStream = new FileStream("Input.pdf ", FileMode.Open,
FileAccess.Read);
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);
//Get the page of the existing PDF document
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Create a new PDF signature without PdfCertificate instance
PdfSignature signature = new PdfSignature(loadedDocument, loadedPage, null,
"Signature1");
//Hook up the ComputeHash event
signature.ComputeHash += Signature_ComputeHash;
//Create X509Certificate2 from your certificate to create a long-term
validity
X509Certificate2 x509 = new X509Certificate2("PDF.pfx", "password123");
//Create LTV with your public certificates
signature.CreateLongTermValidity(new List<X509Certificate2> { x509 });
//Save the PDF document
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a File object by using the file contents, content type, and file
name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Get the stream from the document
Stream documentStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets. Input.pdf");
//Load an existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);
//Get the page of the existing PDF document
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
```

```

//Create a new PDF signature without PdfCertificate instance
PdfSignature signature = new PdfSignature(loadedDocument, loadedPage, null,
"Signature1");
//Hook up the ComputeHash event
signature.ComputeHash += Signature_ComputeHash;
//Create X509Certificate2 from your certificate to create a long-term validity
X509Certificate2 x509 = new X509Certificate2("PDF.pfx", "password123");
//Create LTV with your public certificates
signature.CreateLongTermValidity(new List<X509Certificate2> { x509 });
//Save the PDF document
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android, and iOS platforms. Refer to the PDF/Xamarin section for respective code samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf", "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf", "application/pdf", stream);
}

```

Adding a signature validation appearance based on the signature

You can add the dynamic signature validation appearance to the signature field by enabling the “EnableValidationAppearance” property available in the “PdfSignature” class, the appearance will change based on the PDF reader validation.

Refer to the following code sample.

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Add a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics=page.Graphics;
//Creates a certificate instance from the PFX file with private key
PdfCertificate pdfCert = new PdfCertificate(@"PDF.pfx", "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert, "Signature");
//Sets an image for the signature field
PdfBitmap signatureImage = new PdfBitmap(@"signature.jpg");
//Sets enable signature validation appearance
signature.EnableValidationAppearance = true;
//Sets signature information
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";

```

```
signature.Reason = "I am author of this document.";
//Draw the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save and close documents
document.Save("Output.pdf");
document.Close( true );
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPageBase = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
'Creates a certificate instance from the PFX file with private key
Dim pdfCert As New PdfCertificate("PDF.pfx", "syncfusion")
'Creates a digital signature
Dim signature As New PdfSignature(document, page, pdfCert, "Signature")
'Sets an image for the signature field
Dim signatureImage As New PdfBitmap("signature.jpg")
'Sets enable signature validation appearance
signature.EnableValidationAppearance = True
'Sets signature info
signature.Bounds = New RectangleF(New PointF(0, 0),
signatureImage.PhysicalDimension)
signature.ContactInfo = "johndoe@owned.us"
signature.LocationInfo = "Honolulu, Hawaii"
signature.Reason = "I am author of this document."
'Draws the signature image
graphics.DrawImage(signatureImage, 0, 0)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from the PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.signature.jpg");
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets enable signature validation appearance
```

```
signature.EnableValidationAppearance = true;
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Creates a new PDF document

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Adding a timestamp in digital signature

Essential PDF allows you to add timestamp in the digital signature of the PDF document. The following code example explains the same.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
PdfCertificate pdfCert = new PdfCertificate(@"PDF.pfx", "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(page, pdfCert, "Signature");
//Sets an image for signature field
PdfBitmap image = new PdfBitmap(@"syncfusion_logo.gif");
//Adds time stamp by using the server URI and credentials
signature.TimeStampServer = new TimeStampServer(new
Uri("http://syncfusion.digistamp.com"), "user", "123456");
//Sets signature info
signature.Bounds = new RectangleF(new PointF(0, 0),
image.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(image, 0, 0);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
'Creates a certificate instance from PFX file with private key
Dim pdfCert As New PdfCertificate("PDF.pfx", "syncfusion")
'Creates a digital signature
Dim signature As New PdfSignature(page, pdfCert, "Signature")
'Sets an image for signature field
Dim image As New PdfBitmap("syncfusion_logo.gif")
```

```

'Adds time stamp by using the server URI and credentials
signature.TimeStampServer = New TimeStampServer(New
Uri("http://syncfusion.digistamp.com"), "user", "123456")
'Sets signature info
signature.Bounds = New RectangleF(New PointF(0, 0), image.PhysicalDimension)
signature.ContactInfo = "johndoe@owned.us"
signature.LocationInfo = "Honolulu, Hawaii"
signature.Reason = "I am author of this document."
'Draws the signature image
graphics.DrawImage(image, 0, 0)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("sample.pdf",
"application/pdf", stream);
}

```

Adding a timestamp to PDF document

You can add timestamp to the PDF document using the following code snippet.

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPage page = document.Pages.Add();
//Creates a digital signature
PdfSignature signature = new PdfSignature(page, "Signature");
//Add the time stamp by using the server URI
signature.TimeStampServer = new TimeStampServer(new
Uri("http://syncfusion.digistamp.com"), "user", "123456");

```

```
//Save and close the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPage = document.Pages.Add()
'Creates a digital signature
Dim signature As New PdfSignature(page, "Signature")
'Adds time stamp by using the server URI

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Adding a timestamp to existing PDF document

You can add timestamp to the existing PDF document using the following code snippet.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Add a new page
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Creates a digital signature
PdfSignature signature = new PdfSignature(page, "Signature");
//Add the time stamp by using the server URI
signature.TimeStampServer = new TimeStampServer(new
Uri("http://syncfusion.digistamp.com"), "user", "123456");
//Saves the document
loadedDocument.Save("Output.pdf");
//Closes the document
```

```
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document
Dim document As New PdfLoadedDocument("Input.pdf")
'Gets the first page of the document
Dim page As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Creates a digital signature
Dim signature As New PdfSignature(page, "Signature")
'Adds time stamp by using the server URI
signature.TimestampServer = New TimestampServer(New
Uri("http://syncfusion.digistamp.com"), "user", "123456")
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Gets the first page of the document
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Creates a digital signature
PdfSignature signature = new PdfSignature(page, "Signature");
//Add the time stamp by using the server URI
signature.TimestampServer = new TimestampServer(new
Uri("http://syncfusion.digistamp.com"), "user", "123456");
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document.
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Gets the page
PdfLoadedPage page = loadedDocument.Pages[0] as PdfLoadedPage;
//Creates a digital signature.
PdfSignature signature = new PdfSignature(page, "Signature");
//Add the time stamp by using the server URI
```

```
signature.TimeStampServer = new TimeStampServer(new
Uri("http://syncfusion.digistamp.com"), "user", "123456");
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Retrieve certificate details from an existing signed PDF document

The Essential PDF provides support to get the certificate details from an existing signed PDF document such as,

- Signed date
- Expiry date
- Signed name
- Subject name
- Issuer name
- Certificate distinguished names (country, state, street, email, organization, organization unit, locality, and more).

You can get the above certificate details from an existing signed PDF document by using the following code snippet.

C#

```
//Load the existing signed PDF
PdfLoadedDocument loadedDocument = new
PdfLoadedDocument("SignedDocument.pdf");
//Load the PDF form
PdfLoadedForm loadedForm = loadedDocument.Form as PdfLoadedForm;
//Get the signature field
PdfLoadedSignatureField signatureField = loadedForm.Fields[0] as
PdfLoadedSignatureField;
//Get the certificate
PdfCertificate certificate = signatureField.Signature.Certificate;
//Get the signed date
DateTime date = signatureField.Signature.SignedDate;
//Get the signed name
string name = signatureField.Signature.SignedName;
//Get the certificate names based on their distinguished name.
string subjectName = certificate.SubjectName;
string subjectCountry =
certificate.GetValue(PdfCertificateDistinguishedName.Country,
PdfCertificateField.Subject);
string subjectOrganization =
certificate.GetValue(PdfCertificateDistinguishedName.Organization,
PdfCertificateField.Subject);
//Issuer details
string issuerName = certificate.IssuerName;
string issuerOrganization =
certificate.GetValue(PdfCertificateDistinguishedName.Organization,
PdfCertificateField.Issuer);
string issuerCountry =
certificate.GetValue(PdfCertificateDistinguishedName.Country,
PdfCertificateField.Issuer);
//Get certificate validation date information
DateTime validFrom = certificate.ValidFrom;
DateTime validTo = certificate.ValidTo;
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing signed PDF
Dim loadedDocument As PdfLoadedDocument = New
PdfLoadedDocument("../Signed.pdf")
'Load the PDF form
```

```

Dim loadedForm As PdfLoadedForm = TryCast(loadedDocument.Form,
PdfLoadedForm)
'Get the signature field
Dim signatureField As PdfLoadedSignatureField =
TryCast(loadedForm.Fields(0), PdfLoadedSignatureField)
'Get the certificate
Dim certificate As PdfCertificate = signatureField.Signature.Certificate
'Get the signed date
Dim signedDate As DateTime = signatureField.Signature.SignedDate
'Get the signed name
Dim name As String = signatureField.Signature.SignedName
'Get the certificate names based on their distinguished name
Dim subjectName As String = certificate.SubjectName
Dim subjectCountry As String =
certificate.GetValue(PdfCertificateDistinguishedName.Country,
PdfCertificateField.Subject)
Dim subjectOrganization As String =
certificate.GetValue(PdfCertificateDistinguishedName.Organization,
PdfCertificateField.Subject)
'Issuer details
Dim issuerName As String = certificate.IssuerName
Dim issuerOrganization As String =
certificate.GetValue(PdfCertificateDistinguishedName.Organization,
PdfCertificateField.Issuer)
Dim issuerCountry As String =
certificate.GetValue(PdfCertificateDistinguishedName.Country,
PdfCertificateField.Issuer)
'Get certificate validation date information
Dim validFrom As DateTime = certificate.ValidFrom
Dim validTo As DateTime = certificate.ValidTo
loadedDocument.Close(True)

```

UWP

```

//Essential PDF supports retrieving certificate details from signed PDF
document only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Get the signature field
PdfLoadedSignatureField signatureField = loadedDocument.Form.Fields[0] as
PdfLoadedSignatureField;
//Get the certificate
PdfCertificate certificate = signatureField.Signature.Certificate;
//Get the signed date
DateTime date = signatureField.Signature.SignedDate;
//Get the signed name
string name = signatureField.Signature.SignedName;
//Gets the certificate subject's name
string subjectName = certificate.SubjectName;
//Gets the certificate issuer's name
string issuerName = certificate.IssuerName;

```

```
//Get certificate validation date information
DateTime validFrom = certificate.ValidFrom;
DateTime validTo = certificate.ValidTo;
//Close the document
loadedDocument.Close(true);
```

XAMARIN

```
//Essential PDF supports retrieving certificate details from signed PDF
document only in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms
```

Enable Long Term Validation (LTV) PDF signature

The Essential PDF supports creating long term signature validation when signing the PDF document. The LTV signature allows you to check the validity of a signature long after the document was signed. To achieve long term validation, all the required elements for signature validation must be embedded in the signed PDF.

Note: The resulted PDF document size will be large since all the necessary signature information, Certificate Revocation List (CRL), and Online Certificate Status Protocol (OCSP) are embedded.

The following code example explains how to create LTV PDF.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
PdfCertificate pdfCert = new PdfCertificate(@"PDF.pfx", "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(page, pdfCert, "Signature");
//Sets an image for signature field
PdfBitmap image = new PdfBitmap(@"syncfusion_logo.gif");
//Adds time stamp by using the server URI and credentials
signature.TimeStampServer = new TimeStampServer(new
Uri("http://syncfusion.digistamp.com"), "user", "123456");
//Enable LTV on Signature
signature.EnableLtv = true;
//Sets signature info
signature.Bounds = new RectangleF(new PointF(0, 0),
image.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(image, 0, 0);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
```

```

Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPage = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
'Creates a certificate instance from PFX file with private key
Dim pdfCert As New PdfCertificate("PDF.pfx", "syncfusion")
'Creates a digital signature
Dim signature As New PdfSignature(page, pdfCert, "Signature")
'Sets an image for signature field
Dim image As New PdfBitmap("syncfusion_logo.gif")
'Adds time stamp by using the server URI and credentials
signature.TimeStampServer = New TimeStampServer(New
Uri("http://syncfusion.digistamp.com"), "user", "123456")
'Enable LTV on Signature
signature.EnableLtv = True
'Sets signature info
signature.Bounds = New RectangleF(New PointF(0, 0), image.PhysicalDimension)
signature.ContactInfo = "johndoe@owned.us"
signature.LocationInfo = "Honolulu, Hawaii"
signature.Reason = "I am author of this document."
'Draws the signature image
graphics.DrawImage(image, 0, 0)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets an image for signature field
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.syncfusion_logo.gif");
PdfBitmap image = new PdfBitmap(imageStream);
//Adds time stamp by using the server URI and credentials

}
```

Adding a digital signature with customization

The [PdfSignatureSettings](#) allows you to add customized digital signatures to the PDF document.

Adding a digital signature with CADES format

As per the PDF specification 2.0, now Syncfusion PDF library supports digital signature based on CADES (CMS Advanced Electronics Signature). The CADES based digital signature can remain valid for long periods, even if underlying cryptographic algorithms are broken. Using the API [CryptographicStandard](#), you can change the standard between CMS (Cryptographic Message Syntax) and CADES.

The following code example explains how to add a digital signature with cryptographic standard (CADES) to the PDF document.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
PdfCertificate pdfCert = new PdfCertificate(@"PDF.pfx", "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets signature settings to customize cryptographic standard specified
PdfSignatureSettings settings = signature.Settings;
settings.CryptographicStandard = CryptographicStandard.CADES;
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(@"signature.jpg");
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim document As New PdfDocument()
'Adds a new page
Dim page As PdfPageBase = document.Pages.Add()
Dim graphics As PdfGraphics = page.Graphics
'Creates a certificate instance from PFX file with private key
Dim pdfCert As New PdfCertificate("PDF.pfx", "syncfusion")
'Creates a digital signature
```

```

Dim signature As New PdfSignature(document, page, pdfCert, "Signature")
'Sets signature settings to customize cryptographic standard specified
Dim settings As PdfSignatureSettings = signature.Settings
settings.CryptographicStandard = CryptographicStandard.CADES
'Sets an image for signature field
Dim signatureImage As New PdfBitmap("signature.jpg")
'Sets signature info
signature.Bounds = New RectangleF(New PointF(0, 0),
signatureImage.PhysicalDimension)
signature.ContactInfo = "johndoe@owned.us"
signature.LocationInfo = "Honolulu, Hawaii"
signature.Reason = "I am author of this document."
'Draws the signature image
graphics.DrawImage(signatureImage, 0, 0)
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets signature settings to customize cryptographic standard specified
PdfSignatureSettings settings = signature.Settings;
settings.CryptographicStandard = CryptographicStandard.CADES;
//Sets an image for signature field
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.signature.jpg");
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);

```

```
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
FileStream certificateStream = new FileStream("PDF.pfx", FileMode.Open,
FileAccess.Read);
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
"syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets signature settings to customize cryptographic standard specified
PdfSignatureSettings settings = signature.Settings;
settings.CryptographicStandard = CryptographicStandard.CADES;
//Sets an image for signature field
FileStream imageStream = new FileStream("signature.jpg", FileMode.Open,
FileAccess.Read);
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the documents
document.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
```

```

//Creates a certificate instance from PFX file with private key
Stream certificateStream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.PDF.pfx");
PdfCertificate pdfCert = new PdfCertificate(certificateStream,
    "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
    "Signature");
//Sets signature settings to customize cryptographic standard specified
PdfSignatureSettings settings = signature.Settings;
settings.CryptographicStandard = CryptographicStandard.CADES;
//Sets an image for signature field
Stream imageStream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.signature.jpg");
PdfBitmap signatureImage = new PdfBitmap(imageStream);
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
    signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
        "application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
        "application/pdf", stream);
}

```

Customize digestion algorithm

In addition, you can now set the different message digest algorithm to sign PDF document using the [DigestAlgorithm](#) enum available in the class [PdfSignatureSettings](#).

The following message digest algorithms are now supported:

- SHA1
- SHA256
- SHA384

- SHA512
- RIPEMD160

The following code example explains how to add a digital signature with various digest algorithms to the PDF document.

C#

```
//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Adds a new page
PdfPageBase page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
//Creates a certificate instance from PFX file with private key
PdfCertificate pdfCert = new PdfCertificate(@"PDF.pfx", "syncfusion");
//Creates a digital signature
PdfSignature signature = new PdfSignature(document, page, pdfCert,
"Signature");
//Sets signature settings to customize digest algorithm specified
PdfSignatureSettings settings = signature.Settings;
settings.DigestAlgorithm = DigestAlgorithm.SHA256;
//Sets an image for signature field
PdfBitmap signatureImage = new PdfBitmap(@"signature.jpg");
//Sets signature information
signature.Bounds = new RectangleF(new PointF(0, 0),
signatureImage.PhysicalDimension);
signature.ContactInfo = "johndoe@owned.us";
signature.LocationInfo = "Honolulu, Hawaii";
signature.Reason = "I am author of this document.";
//Draws the signature image
graphics.DrawImage(signatureImage, 0, 0);
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

```

Digital signature validation

Added the support to validate the digital signatures in an existing PDF document. Digital signature validation covers the following steps to ensure the validity of the signatures:

- Validate the document modification.
- Validate the certificate chain.
- Ensure the signature with timestamp time.
- Check the revocation status of the certificate with OCSP and CRL.
- Ensure the multiple digital signatures.

You can use the [ValidateSignature](#) method available in the [PdfLoadedSignatureField](#) class to validate the digital signature.

You can get the overall status from the [IsSignatureValid](#) property available in the [PdfSignatureValidationResult](#) class.

The following code example explains how to validate the digitally signed PDF document signature.

C#

```

//Load an existing signed PDF document

```

```

PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Get signature field
PdfLoadedSignatureField signatureField = loadedDocument.Form.Fields[0] as
PdfLoadedSignatureField;
//X509Certificate2Collection to check the signer's identity using root
certificates
X509CertificateCollection collection = new X509CertificateCollection();
//Create new X509Certificate2 with the root certificate
X509Certificate2 certificate = new X509Certificate2("PDF.pfx",
"syncfusion");
//Add the certificate to the collection
collection.Add(certificate);
//Validate signature and get the validation result
PdfSignatureValidationResult result =
signatureField.ValidateSignature(collection);
//Checks whether the signature is valid or not
SignatureStatus status = result.SignatureStatus;
//Checks whether the document is modified or not
bool isModified = result.IsDocumentModified;
//Signature details
string issuerName = signatureField.Signature.Certificate.IssuerName;
DateTime validFrom = signatureField.Signature.Certificate.ValidFrom;
DateTime validTo = signatureField.Signature.Certificate.ValidTo;
string signatureAlgorithm = result.SignatureAlgorithm;
DigestAlgorithm digestAlgorithm = result.DigestAlgorithm;
//Revocation validation details
RevocationResult revocationDetails = result.RevocationResult;
RevocationStatus revocationStatus = revocationDetails.OcspRevocationStatus;
bool isRevokedCRL = revocationDetails.IsRevokedCRL;
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load an existing signed PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get signature field
Dim signatureField As PdfLoadedSignatureField =
loadedDocument.Form.Fields[0] As PdfLoadedSignatureField
'X509Certificate2Collection to check the signer's identity using root
certificates
Dim collection As X509CertificateCollection = New
X509CertificateCollection()
'Create new X509Certificate2 with the root certificate
Dim certificate As X509Certificate2 = New X509Certificate2("PDF.pfx",
"syncfusion")
'Add the certificate to the collection
collection.Add(certificate)
'Validate signature and get the validation result
Dim result As PdfSignatureValidationResult =
signatureField.ValidateSignature(collection)
'Checks whether the signature is valid or not
Dim status As SignatureStatus = result.SignatureStatus
'Checks whether the document is modified or not
Dim isModified As Boolean = result.IsDocumentModified
'Signature details

```

```

Dim issuerName As String = signatureField.Signature.Certificate.IssuerName
Dim validFrom As DateTime = signatureField.Signature.Certificate.ValidFrom
Dim validTo As DateTime = signatureField.Signature.Certificate.ValidTo
Dim signatureAlgorithm As String = result.SignatureAlgorithm
Dim digestAlgorithm As DigestAlgorithm = result.DigestAlgorithm
'Revocation validation details
Dim revocationDetails As RevocationResult = result.RevocationResult
Dim revocationStatus As RevocationStatus =
revocationDetails.OcspRevocationStatus

//Close the document
loadedDocument.Close(true);

```

Validate all signatures in PDF document

Added the support to validate all the digital signatures in an existing PDF document.

You can use the `ValidateSignatures` method available in the [PdfLoadedFormFieldCollection](#) class to validate all the digital signatures. You can get the list of [PdfSignatureValidationResult](#) from the `ValidateSignatures` method.

The following code example explains how to validate all the signatures in digitally signed PDF document.

C#

```

//Load an existing signed PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//X509Certificate2Collection to check the signer's identity using root
certificates
X509CertificateCollection collection = new X509CertificateCollection();
//Create new X509Certificate2 with the root certificate
X509Certificate2 certificate = new X509Certificate2("PDF.pfx",
"syncfusion");
//Add the certificate to the collection
collection.Add(certificate);
//Validate all signatures in loaded PDF document and get the list of
validation result
List<PdfSignatureValidationResult> results;

```

```

bool isValid = loadedDocument.Form.Fields.ValidateSignatures(collection, out
results);
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load an existing signed PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'X509Certificate2Collection to check the signer's identity using root
certificates
Dim collection As X509CertificateCollection = New
X509CertificateCollection()
'Create new X509Certificate2 with the root certificate
Dim certificate As X509Certificate2 = New X509Certificate2("PDF.pfx",
"syncfusion")
'Add the certificate to the collection
collection.Add(certificate)
'Validate all signatures in loaded PDF document and get the list of
validation result
Dim results As List<PdfSignatureValidationResult>
Dim isValid As Boolean =
loadedDocument.Form.Fields.ValidateSignatures(collection, out results)
'Close the document
loadedDocument.Close(true)

```

UWP

```

//Get the stream from the document
Stream documentStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Input.pdf");
//Load an existing signed PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);
//X509Certificate2Collection to check the signer's identity using root
certificates
X509CertificateCollection collection = new X509CertificateCollection();
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.PDF.pfx");
byte[] data = new byte[certificateStream.Length];
certificateStream.Read(data, 0, data.Length);
//Create new X509Certificate2 with the root certificate
X509Certificate2 certificate = new X509Certificate2(data, "syncfusion");
//Add the certificate to the collection
collection.Add(certificate);
//Validate all signatures in loaded PDF document and get the list of
validation result
List<PdfSignatureValidationResult> results;
bool isValid = loadedDocument.Form.Fields.ValidateSignatures(collection, out
results);
//Close the document
loadedDocument.Close(true);

```

ASP.NET CORE

```
//Get the stream from the document
FileStream documentStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
//Load an existing signed PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);
//X509Certificate2Collection to check the signer's identity using root
certificates
X509CertificateCollection collection = new X509CertificateCollection();
//Creates a certificate instance from PFX file with private key
FileStream certificateStream = new FileStream("PDF.pfx", FileMode.Open,
FileAccess.Read);
byte[] data = new byte[certificateStream.Length];
certificateStream.Read(data, 0, data.Length);
//Create new X509Certificate2 with the root certificate
X509Certificate2 certificate = new X509Certificate2(data, "syncfusion");
//Add the certificate to the collection
collection.Add(certificate);
//Validate all signatures in loaded PDF document and get the list of
validation result
List<PdfSignatureValidationResult> results;
bool isValid = loadedDocument.Form.Fields.ValidateSignatures(collection, out
results);
//Close the document
loadedDocument.Close(true);
```

XAMARIN

```
//Get the stream from the document
Stream documentStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Input.pdf");
//Load an existing signed PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(documentStream);
//X509Certificate2Collection to check the signer's identity using root
certificates
X509CertificateCollection collection = new X509CertificateCollection();
//Creates a certificate instance from PFX file with private key
Stream certificateStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.PDF.pfx");
byte[] data = new byte[certificateStream.Length];
certificateStream.Read(data, 0, data.Length);
//Create new X509Certificate2 with the root certificate
X509Certificate2 certificate = new X509Certificate2(data, "syncfusion");
//Add the certificate to the collection
collection.Add(certificate);
//Validate all signatures in loaded PDF document and get the list of
validation result
List<PdfSignatureValidationResult> results;
bool isValid = loadedDocument.Form.Fields.ValidateSignatures(collection, out
results);
//Close the document
loadedDocument.Close(true);
```

Working with Barcode

Essential PDF provides support to add barcodes to the PDF document. The following barcode types are supported.

- 10 one-dimensional barcodes including Code 39 and Code 32 barcodes.
- 2 two-dimensional barcodes such as QR and DataMatrix barcode

Adding a one dimensional barcode to the PDF document

The below code snippet shows how to add Code39 barcode using the [PdfCode39Barcode](#) class to a PDF document.

C#

```
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Drawing Code39 barcode
PdfCode39Barcode barcode = new PdfCode39Barcode();
//Setting height of the barcode
barcode.BarHeight = 45;
barcode.Text = "CODE39$";
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Saving the Document
doc.Save("CODE39.pdf");
```

VB.NET

```
'Creating new PDF Document
Dim doc As New PdfDocument()
'Adding new page to PDF document
Dim page As PdfPage = doc.Pages.Add()
'Drawing Code39 barcode
Dim barcode As New PdfCode39Barcode()
'Setting height of the barcode
barcode.BarHeight = 45
barcode.Text = "CODE39$"
'Printing barcode on to the Pdf.
barcode.Draw(page, New PointF(25, 70))
'Saving the Document
doc.Save("CODE39.pdf")
```

UWP

```
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Drawing Code39 barcode
PdfCode39Barcode barcode = new PdfCode39Barcode();
//Setting height of the barcode
barcode.BarHeight = 45;
barcode.Text = "CODE39$";
```

```
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Drawing Code39 barcode
PdfCode39Barcode barcode = new PdfCode39Barcode();
//Setting height of the barcode
barcode.BarHeight = 45;
barcode.Text = "CODE39$";
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
doc.Save(stream);
stream.Position = 0;
//Close the documents.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = " CODE39.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Drawing Code39 barcode
PdfCode39Barcode barcode = new PdfCode39Barcode();
//Setting height of the barcode
barcode.BarHeight = 45;
barcode.Text = "CODE39$";
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Closes the document
doc.Close(true);
```

```
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Adding a two dimensional barcode to a PDF document

The below code snippet shows how to add a QR code using [PdfQRBarcode](#) class to the PDF document.

C#

```
//Drawing QR Barcode
PdfQRBarcode barcode = new PdfQRBarcode();
//Set Error Correction Level
barcode.ErrorCorrectionLevel = PdfErrorCorrectionLevel.High;
//Set XDimension
barcode.XDimension = 3;
barcode.Text = "http://www.syncfusion.com";
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Saving the Document
doc.Save("QRBarcode.pdf");
```

VB.NET

```
'Drawing QR Barcode
Dim barcode As New PdfQRBarcode()
'Set Error Correction Level
barcode.ErrorCorrectionLevel = PdfErrorCorrectionLevel.High
'Set XDimension
barcode.XDimension = 3
barcode.Text = "http://www.syncfusion.com"
'Creating new PDF Document
Dim doc As New PdfDocument()
'Adding new page to PDF document
Dim page As PdfPage = doc.Pages.Add()
'Printing barcode on to the Pdf.
barcode.Draw(page, New PointF(25, 70))
'Saving the Document
doc.Save("QRBarcode.pdf")
```

UWP

```
//Drawing QR Barcode
PdfQRBarcode barcode = new PdfQRBarcode();
//Set Error Correction Level
barcode.ErrorCorrectionLevel = PdfErrorCorrectionLevel.High;
//Set XDimension
barcode.XDimension = 3;
barcode.Text = "http://www.syncfusion.com";
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Drawing QR Barcode
PdfQRBarcode barcode = new PdfQRBarcode();
//Set Error Correction Level
barcode.ErrorCorrectionLevel = PdfErrorCorrectionLevel.High;
//Set XDimension
barcode.XDimension = 3;
barcode.Text = "http://www.syncfusion.com";
barcode.Text = "http://www.syncfusion.com";
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Printing barcode on to the Pdf.
barcode.Draw(page, new PointF(25, 70));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
doc.Save(stream);
stream.Position = 0;
//Close the documents.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "QRBarcode.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Drawing QR Barcode
PdfQRBarcode barcode = new PdfQRBarcode();

"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Set location and size to the barcode

The following code snippets show how to set [Size](#) and [Location](#) for Codabar barcode using [PdfCodabarBarcode](#) class to a PDF document.

C#

```
//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Create new instance for Codabar barcode
PdfCodabarBarcode barcode = new PdfCodabarBarcode();
//Setting location of the barcode
barcode.Location = new PointF(100, 100);
//Setting size of the barcode
barcode.Size = new SizeF(200, 100);
barcode.Text = "123456789$";
//Printing barcode on to the Pdf.
barcode.Draw(page);
//Save and close the Document
doc.Save("CODABAR.pdf");
doc.Close(true);
```

VB.NET

```

'Creating new PDF Document
Dim doc As New PdfDocument()
'Adding new page to PDF document
Dim page As PdfPage = doc.Pages.Add()
'Create new instance for Codabar barcode
Dim barcode As PdfCodabarBarcode = New PdfCodabarBarcode()
'Setting location of the barcode
barcode.Location = New PointF(100, 100)
'Setting size of the barcode
barcode.Size = New SizeF(200, 100)
barcode.Text = "123456789$"
'Printing barcode on to the Pdf.
barcode.Draw(page)
'Save and close the Document
doc.Save("CODABAR.pdf")
doc.Close(True)

```

UWP

```

//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Create new instance for Codabar barcode
PdfCodabarBarcode barcode = new PdfCodabarBarcode();
//Setting location of the barcode
barcode.Location = new PointF(100, 100);
//Setting size of the barcode
barcode.Size = new SizeF(200, 100);
barcode.Text = "123456789$";
//Printing barcode on to the Pdf.
barcode.Draw(page);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();
//Create new instance for Codabar barcode
PdfCodabarBarcode barcode = new PdfCodabarBarcode();
//Setting location of the barcode
barcode.Location = new PointF(100, 100);
//Setting size of the barcode

```

```

barcode.Size = new SizeF(200, 100);
barcode.Text = "123456789$";
//Printing barcode on to the Pdf.
barcode.Draw(page);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
doc.Save(stream);
stream.Position = 0;
//Close the documents.
doc.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = " CODABAR.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creating new PDF Document
PdfDocument doc = new PdfDocument();
//Adding new page to PDF document
PdfPage page = doc.Pages.Add();

}

```

Export Barcode as Image

Essential PDF supports converting one dimensional barcodes such as Code 39, Code 39 Extended, Code 11, Codabar, Code 32, Code 93, Code 93 Extended, Code 128A, Code 128B, UPC bar code, and Code 128C barcodes to image using the [ToImage](#) method of [PdfUnidimensionalBarcode](#) instance.

Note: To export barcode as image in .NET Core, the following assembly should be referenced in your application [Syncfusion.Pdf.Imaging.Portable](#) .

The following code snippet explains this.

C#

```
//Initialize a new PdfCode39Barcode instance
PdfCode39Barcode barcode = new PdfCode39Barcode();
//Set the height and text for barcode
barcode.BarHeight = 45;
barcode.Text = "CODE39$";
//Convert the barcode to image
Image barcodeImage = barcode.ToImage(new SizeF(300, 200));
//Save the image
barcodeImage.Save("Image.png", ImageFormat.Png);
```

VB.NET

```
'Initialize a new PdfCode39Barcode instance
Dim barcode As PdfCode39Barcode = New PdfCode39Barcode
'Set the height and text for barcode
barcode.BarHeight = 45
barcode.Text = "CODE39$"
'Convert the barcode to image
Dim barcodeImage As Image = barcode.ToImage(New SizeF(300, 200))
'Save the image
barcodeImage.Save("Image.png", ImageFormat.Png)
```

UWP

```
//PDF supports conversion of Barcode to Image only in Windows Forms, WPF,
ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Initialize a new PdfCode39Barcode instance
PdfCode39Barcode barcode = new PdfCode39Barcode();
//Set the height and text for barcode
barcode.BarHeight = 45;
barcode.Text = "CODE39$";
//Convert the barcode to image
Image barcodeImage = barcode.ToImage(new SizeF(300, 200));
using (MemoryStream stream = new MemoryStream())
{
    //Save image to stream.
    barcodeImage.Save(stream, ImageFormat.Png);
}
```

XAMARIN

//PDF supports conversion of Barcode to Image only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

Essential PDF supports converting two-dimensional barcodes such as QR Code and Data Matrix barcode to image. The following code snippet explains how to convert a QR code to image using the [ToImage](#) method of [PdfQRBarcode](#) instance.

C#

```
//Initialize a new PdfQRBarcode instance
PdfQRBarcode barcode = new PdfQRBarcode();
//Set the XDimension and text for barcode
barcode.XDimension = 3;
barcode.Text = "http://www.google.com";
//Convert the barcode to image
Image barcodeImage = barcode.ToImage(new SizeF(300, 300));
//Save the image
barcodeImage.Save("Image.png", ImageFormat.Png);
```

VB.NET

```
'Initialize a new PdfQRBarcode instance
Dim barcode As PdfQRBarcode = New PdfQRBarcode
'Set the XDimension and text for barcode
barcode.XDimension = 3
barcode.Text = "http://www.google.com"
'Convert the barcode to image
Dim barcodeImage As Image = barcode.ToImage(New SizeF(300, 300))
'Save the image
barcodeImage.Save("Image.jpg", ImageFormat.Png)
```

UWP

//PDF supports conversion of Barcode to Image only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

ASP.NET CORE

```
//Initialize a new PdfQRBarcode instance
PdfQRBarcode barcode = new PdfQRBarcode();
//Set the XDimension and text for barcode
barcode.XDimension = 3;
barcode.Text = "http://www.google.com";
//Convert the barcode to image
Image barcodeImage = barcode.ToImage(new SizeF(300, 300));
using (MemoryStream stream = new MemoryStream())
{
    //Save image to stream.
    barcodeImage.Save(stream, ImageFormat.Png);
}
```

XAMARIN

//PDF supports conversion of Barcode to Image only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

Customizing the barcode appearance

The height of the barcode can be changed using the [BarHeight](#) property. The equivalent property to change the block size for two dimensional barcode is [XDimension](#). You can also customize the barcode color by changing the DarkBarColor and LightBarColor properties.

Note: This color customization is possible only for one dimensional barcodes and it is not supported for two dimensional barcodes.

Supported barcode types

The following table contains the supported types and associated valid characters.

Symbol	Supported characters	Length
QR Code	[0-9]; [A-Z (upper-case only)]; [space \$ % * + - . / , :]; [Shift JIS characters]	variable
DataMatrix	All ASCII characters	
Code 39	[0-9]; [A-Z]; [- . \$ / + % SPACE]	variable
Code 39 Extended	[0-9]; [A-Z]; [a-z]	variable
Code 11	[0-9]; [-]	variable
Codabar	[0-9]; [- \$: / . +]	variable
Code 32	[0-9]	8
Code 93	[0-9]; [A-Z]; [- . \$ / + % SPACE]	variable
Code 93 Extended	All 128 ASCII characters	variable
Code 128A	[0-9]; [A-Z]; [NUL (0x00) SOH (0x01) STX (0x02) ETX (0x03) EOT(0x04) ENQ (0x05) ACK (0x06) BEL (0x07) BS (0x08) HT (0x09) LF (0x0A) VT(0x0B) FF (0x0C) CR (0x0D) SO (0x0E) SI (0x0F) DLE (0x10) DC1 (0x11) DC2(0x12) DC3 (0x13) DC4 (0x14) NAK (0x15) SYN (0x16) ETB (0x17) CAN(0x18) EM (0x19) SUB (0x1A) ESC (0x1B) FS (0x1C) GS (0x1D) RS (0x1E) US(0x1F) SPACE (0x20)]; [" ! # \$ % & ' () * + , - . / ; < = > ? @ [/] ^ _]	variable

Symbol	Supported characters	Length
Code 128B	[0-9]; [A-Z]; [a-z]; [SPACE (0x20) ! " # \$ % & ' () * + , - . / : ; < = > ? @ [/] ^ _ ` { } ~ DEL (â€¢)]	variable
Code 128C	ASCII 00-99(encodes each two digit with one code)	variable

Working with Actions

Essential PDF supports different actions that can be triggered by different events and user interactions.

Adding an action to the PDF

You can add the action to the PDF document using the below code snippet.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create and add new launch action to the document
PdfLaunchAction action = new PdfLaunchAction("../Data/logo.png");
document.Actions.AfterOpen = action;
//Save the document
document.Save("LaunchAction.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
'Create and add new launch action to the document
Dim action As New PdfLaunchAction("../Data/logo.png")
document.Actions.AfterOpen = action
'Save the document
document.Save("LaunchAction.pdf")
document.Close(True)
```

UWP

```
//PDF supports adding Launch action to the PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//PDF supports adding Launch action to the PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

XAMARIN

```
//PDF supports adding Launch action to the PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.
```

Supported action types

Essential PDF supports the following types of actions.

- [PdfSoundAction](#) that plays the music file
- [PdfJavaScriptAction](#) that executes PDF JavaScript code
- [PdfUriAction](#) that launches the URI
- [PdfGoToAction](#) that goes to the specified page of the document
- [PdfLaunchAction](#) that launches the application or opens the document
- [PdfNamedAction](#) that goes to the named destination: next, previous, first or last page
- [PdfSubmitAction](#) that submits the data that is entered into the PDF form
- [PdfResetAction](#) that resets the fields of the PDF form

Sound action

[PdfSoundAction](#) plays a specified music file in the PDF document. Volume and repeat can be specified for the sound action.

C#

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create a sound action
PdfSoundAction soundAction = new PdfSoundAction("../Data/Startup.wav");
soundAction.Sound.Bits = 16;
soundAction.Sound.Channels = PdfSoundChannels.Stereo;
soundAction.Sound.Encoding = PdfSoundEncoding.Signed;
soundAction.Volume = 0.9f;
//Set the sound action
document.Actions.AfterOpen = soundAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document
Dim document As New PdfDocument()
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create a sound action
Dim soundAction As New PdfSoundAction("../Data/Startup.wav")
soundAction.Sound.Bits = 16
soundAction.Sound.Channels = PdfSoundChannels.Stereo
soundAction.Sound.Encoding = PdfSoundEncoding.Signed
soundAction.Volume = 0.9F
'Set the sound action
document.Actions.AfterOpen = soundAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

//PDF supports sound action only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms.

ASP.NET CORE

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create a sound action
FileStream fileStream = new FileStream("Startup.wav", FileMode.Open,
    FileAccess.Read);
PdfSoundAction soundAction = new PdfSoundAction(fileStream);
soundAction.Sound.Bits = 16;
soundAction.Sound.Channels = PdfSoundChannels.Stereo;
soundAction.Sound.Encoding = PdfSoundEncoding.Signed;
soundAction.Volume = 0.9f;
//Set the sound action
document.Actions.AfterOpen = soundAction;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create a sound action
Stream stream =
    typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Startup.wav");
PdfSoundAction soundAction = new PdfSoundAction(stream);
soundAction.Sound.Bits = 16;
soundAction.Sound.Channels = PdfSoundChannels.Stereo;
soundAction.Sound.Encoding = PdfSoundEncoding.Signed;
soundAction.Volume = 0.9f;
//Set the sound action
document.Actions.AfterOpen = soundAction;
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
//and iOS platforms. Please refer PDF/Xamarin section for respective code
//samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

JavaScript action

A [PdfJavaScriptAction](#) allows execution of **JavaScript** code embedded in the **PDF** document.

C#

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document
Dim document As New PdfDocument()
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create JavaScript action
Dim scriptAction As New PdfJavaScriptAction("app.alert(\"\"Hello World!!!\"")")
'Add the JavaScript action
document.Actions.AfterOpen = scriptAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create JavaScript action
```

```

PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create a new document
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Note: You can refer more PDF JavaScript code in **PdfJavaScriptAction** from the below developer guide.

<http://www.adobe.com/content/dam/Adobe/en/devnet/acrobat/pdfs/jsdeveloperpage.pdf>

URI action

PdfUriAction allows you to create a hyperlink that can open web page in a web browser.

C#

```
//Create a new document with PDF/A standard.
PdfDocument document = new PdfDocument();
//Create a uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Add the action to the document
document.Actions.AfterOpen = uriAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document with PDF/A standard.
Dim document As New PdfDocument()
'Create a uri action
Dim uriAction As New PdfUriAction("http://www.google.com")
'Add the action to the document
document.Actions.AfterOpen = uriAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new document with PDF/A standard.
PdfDocument document = new PdfDocument();
//Create a uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Add the action to the document
document.Actions.AfterOpen = uriAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
```

```
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new document with PDF/A standard.
PdfDocument document = new PdfDocument();
//Create a uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Add the action to the document
document.Actions.AfterOpen = uriAction;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new document with PDF/A standard.
PdfDocument document = new PdfDocument();

samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

```
}

```

GoTo action

[PdfGoToAction](#) displays the specified page in the current document. The location can be specified for the destination page.

C#

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add first page
PdfPage page = document.Pages.Add();
//Add second page
PdfPage secondPage = document.Pages.Add();
//Set the goto action
PdfGoToAction gotoAction = new PdfGoToAction(secondPage);
//Set destination location
gotoAction.Destination = new PdfDestination(secondPage, new PointF(0, 100));
document.Actions.AfterOpen = gotoAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```
'Create a new document
Dim document As New PdfDocument()
'Add first page
Dim page As PdfPage = document.Pages.Add()
'Add second page
Dim secondPage As PdfPage = document.Pages.Add()
'Set the goto action
Dim gotoAction As New PdfGoToAction(secondPage)
'Set destination location
gotoAction.Destination = New PdfDestination(secondPage, New PointF(0, 100))
document.Actions.AfterOpen = gotoAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)

```

UWP

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add first page
PdfPage page = document.Pages.Add();
//Add second page
PdfPage secondPage = document.Pages.Add();
//Set the goto action
PdfGoToAction gotoAction = new PdfGoToAction(secondPage);
//Set destination location
gotoAction.Destination = new PdfDestination(secondPage, new PointF(0, 100));
document.Actions.AfterOpen = gotoAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document.

```

```
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add first page
PdfPage page = document.Pages.Add();
//Add second page
PdfPage secondPage = document.Pages.Add();
//Set the goto action
PdfGoToAction gotoAction = new PdfGoToAction(secondPage);
//Set destination location
gotoAction.Destination = new PdfDestination(secondPage, new PointF(0, 100));
document.Actions.AfterOpen = gotoAction;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```

```

Launch action

A [PdfLaunchAction](#) allows execution of an external file. The code snippet below explains how to add a launch action.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Create and add new launch Action to the document
PdfLaunchAction action = new PdfLaunchAction("../Data/logo.png");
document.Actions.AfterOpen = action;
//Save the document
document.Save("LaunchAction.pdf");
document.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim document As New PdfDocument()
'Create and add new launch Action to the document
Dim action As New PdfLaunchAction("../Data/logo.png")
document.Actions.AfterOpen = action
'Save the document
document.Save("LaunchAction.pdf")
document.Close(True)

```

UWP

```

//PDF supports launch action only in Windows Forms, WPF, ASP.NET and ASP.NET
MVC platforms.

```

ASP.NET CORE

```

//PDF supports launch action only in Windows Forms, WPF, ASP.NET and ASP.NET
MVC platforms.

//PDF supports launch action only in Windows Forms, WPF, ASP.NET and ASP.NET
MVC platforms.

```

Named action

[PdfNamedAction](#) allows execution of predefined **PDF** actions.

The following predefined PDF actions are available:

- Go to next page
- Go to previous page
- Go to first page and
- Go to last page.

C#

```
//Create a new document
PdfDocument document = new PdfDocument();
document.Pages.Add();
document.Pages.Add();
//Create a named action
PdfNamedAction namedAction = new
PdfNamedAction(PdfActionDestination.LastPage);
//Add the named action
document.Actions.AfterOpen = namedAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document
Dim document As New PdfDocument()
document.Pages.Add()
document.Pages.Add()
'Create a named action
Dim namedAction As New PdfNamedAction(PdfActionDestination.LastPage)
'Add the named action
document.Actions.AfterOpen = namedAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new document
PdfDocument document = new PdfDocument();
document.Pages.Add();
document.Pages.Add();
//Create a named action
PdfNamedAction namedAction = new
PdfNamedAction(PdfActionDestination.LastPage);
//Add the named action
document.Actions.AfterOpen = namedAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
```

```
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new document
PdfDocument document = new PdfDocument();
document.Pages.Add();
document.Pages.Add();
//Create a named action
PdfNamedAction namedAction = new
PdfNamedAction(PdfActionDestination.LastPage);
//Add the named action
document.Actions.AfterOpen = namedAction;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new document
PdfDocument document = new PdfDocument();
document.Pages.Add();
document.Pages.Add();
//Create a named action
PdfNamedAction namedAction = new
PdfNamedAction(PdfActionDestination.LastPage);
//Add the named action
document.Actions.AfterOpen = namedAction;
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
```

```
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
    "application/pdf", memoryStream);
}
```

Submit action

[PdfSubmitAction](#) allows submission of data that is entered in the PDF form.

C#

```
//Create a PDF document
PdfDocument document = new PdfDocument();
//Add a new page
PdfPage page = document.Pages.Add();
// Create a Button field.
PdfButtonField submitButton = new PdfButtonField(page, "Submit data");
submitButton.Bounds = new RectangleF(100, 60, 50, 20);
submitButton.ToolTip = "Submit";
document.Form.Fields.Add(submitButton);
// Create a submit action. It submit the data of the form fields to the
mentioned URL
PdfSubmitAction submitAction = new
PdfSubmitAction("http://www.syncfusionforms.com/Submit.aspx");
submitAction.DataFormat = SubmitDataFormat.Html;
submitButton.Actions.GotFocus = submitAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a PDF document
Dim document As New PdfDocument()
'Add a new page
Dim page As PdfPage = document.Pages.Add()
' Create a Button field.
Dim submitButton As New PdfButtonField(page, "Submit data")
submitButton.Bounds = New RectangleF(100, 60, 50, 20)
submitButton.ToolTip = "Submit"
document.Form.Fields.Add(submitButton)
' Create a submit action. It submit the data of the form fields to the
mentioned URL
Dim submitAction As New PdfSubmitAction("http://
www.example.com/Submit.aspx")
submitAction.DataFormat = SubmitDataFormat.Html
submitButton.Actions.GotFocus = submitAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a PDF document
PdfDocument document = new PdfDocument();
//Add a new page
```

```

PdfPage page = document.Pages.Add();
// Create a Button field.
PdfButtonField submitButton = new PdfButtonField(page, "Submit data");
submitButton.Bounds = new RectangleF(100, 60, 50, 20);
submitButton.ToolTip = "Submit";
document.Form.Fields.Add(submitButton);
// Create a submit action. It submit the data of the form fields to the
mentioned URL
PdfSubmitAction submitAction = new
PdfSubmitAction("http://www.syncfusionforms.com/Submit.aspx");
submitAction.DataFormat = SubmitDataFormat.Html;
submitButton.Actions.GotFocus = submitAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");

```

ASP.NET CORE

```

//Create a PDF document
PdfDocument document = new PdfDocument();
//Add a new page
PdfPage page = document.Pages.Add();
// Create a Button field.
PdfButtonField submitButton = new PdfButtonField(page, "Submit data");
submitButton.Bounds = new RectangleF(100, 60, 50, 20);
submitButton.ToolTip = "Submit";
document.Form.Fields.Add(submitButton);
// Create a submit action. It submit the data of the form fields to the
mentioned URL
PdfSubmitAction submitAction = new
PdfSubmitAction("http://www.syncfusionforms.com/Submit.aspx");
submitAction.DataFormat = SubmitDataFormat.Html;

"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Reset action

A [PdfResetAction](#) allows execution of reset of all the form fields in the PDF document.

C#

```
//Create a PDF document
PdfDocument document = new PdfDocument();
//Add a new page
PdfPage page = document.Pages.Add();
// Create a Text box field.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
//Set properties to the textbox.
textBoxField.BorderColor = new PdfColor(Color.Gray);
textBoxField.BorderStyle = PdfBorderStyle.Beveled;
textBoxField.Bounds = new RectangleF(80, 0, 100, 20);
textBoxField.Text = "First Name";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
// Create a Button field.
PdfButtonField clearButton = new PdfButtonField(page, "Clear");
clearButton.Bounds = new RectangleF(100, 60, 50, 20);
clearButton.ToolTip = "Clear";
document.Form.Fields.Add(clearButton);
```

```
// Create an instance of reset action
PdfResetAction resetAction = new PdfResetAction();
clearButton.Actions.GotFocus = resetAction;
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a PDF document
Dim document As New PdfDocument()
'Add a new page
Dim page As PdfPage = document.Pages.Add()
' Create a Text box field.
Dim textBoxField As New PdfTextBoxField(page, "FirstName")
'Set properties to the textbox.
textBoxField.BorderColor = New PdfColor(Color.Gray)
textBoxField.BorderStyle = PdfBorderStyle.Beveled
textBoxField.Bounds = New RectangleF(80, 0, 100, 20)
textBoxField.Text = "First Name"
'Add the form field to the document
document.Form.Fields.Add(textBoxField)
' Create a Button field.
Dim clearButton As New PdfButtonField(page, "Clear")
clearButton.Bounds = New RectangleF(100, 60, 50, 20)
clearButton.ToolTip = "Clear"
document.Form.Fields.Add(clearButton)
' Create an instance of reset action
Dim resetAction As New PdfResetAction()
clearButton.Actions.GotFocus = resetAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a PDF document
PdfDocument document = new PdfDocument();
//Add a new page
PdfPage page = document.Pages.Add();
// Create a Text box field.
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "FirstName");
//Set properties to the textbox.
textBoxField.BorderColor = new PdfColor(128, 128, 128);
textBoxField.BorderStyle = PdfBorderStyle.Beveled;
textBoxField.Bounds = new RectangleF(80, 0, 100, 20);
textBoxField.Text = "First Name";
//Add the form field to the document
document.Form.Fields.Add(textBoxField);
// Create a Button field.
PdfButtonField clearButton = new PdfButtonField(page, "Clear");
clearButton.Bounds = new RectangleF(100, 60, 50, 20);

"application/pdf", memoryStream);
}

```

Adding an action to the form field

Essential PDF provides support to add various actions to the form fields.

[PdfFieldActions](#) class is used to create form field actions.

The following code example illustrates this.

C#

```

//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PDF \")");
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document.
document.Form.Fields.Add(submitButton);

```

```
//Save document to disk.
document.Save("fieldAction.pdf");
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Create a new PdfButtonField
Dim submitButton As New PdfButtonField(page, "submitButton")
submitButton.Bounds = New RectangleF(25, 160, 100, 20)
submitButton.Text = "Apply"
submitButton.BackColor = New PdfColor(181, 191, 203)
'Create a new PdfJavaScriptAction
Dim scriptAction As New PdfJavaScriptAction("app.alert(\"\"You are looking at
Form field action of PDF \"\")")
'Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction
'Add the submit button to the new document.
document.Form.Fields.Add(submitButton)
'Save document to disk.
document.Save("fieldAction.pdf")
document.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"\"You
are looking at Form field action of PDF \"\")");
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document.
document.Form.Fields.Add(submitButton);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PD
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document.
document.Form.Fields.Add(submitButton);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PDF \")");
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document.
document.Form.Fields.Add(submitButton);
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
```

```
//The operation in Save under Xamarin varies between Windows Phone, Android
//and iOS platforms. Please refer PDF/Xamarin section for respective code
//samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Adding an action to the bookmarks

Essential PDF provides support to add the various actions to the [Bookmarks](#). The code snippet below shows how to add an URI action to bookmark.

C#

```
//Create a new document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Set the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.Red;
//Create a Uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Set the Uri action
bookmark.Action = uriAction;
//Save and close the PDF document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document.
Dim document As New PdfDocument()
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create document bookmarks.
Dim bookmark As PdfBookmark = document.Bookmarks.Add("Page 1")
'Set the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold
bookmark.Color = Color.Red
'Create a Uri action
Dim uriAction As New PdfUriAction("http://www.google.com")
'Set the Uri action
bookmark.Action = uriAction
'Save and close the PDF document.
document.Save("Output.pdf")
```

```
document.Close(True)
```

UWP

```
//Create a new document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Set the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.FromArgb(0,255,0,0);
//Create a Uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Set the Uri action
bookmark.Action = uriAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "fieldAction.pdf");
```

ASP.NET CORE

```
//Create a new document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Set the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Color.Red;
//Create a Uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Set the Uri action
bookmark.Action = uriAction;
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```

//Create a new document.
PdfDocument document = new PdfDocument();
//Add a page.
PdfPage page = document.Pages.Add();
//Create document bookmarks.
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
//Set the text style and color.
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Color = Syncfusion.Drawing.Color.Red;
//Create a Uri action
PdfUriAction uriAction = new PdfUriAction("http://www.google.com");
//Set the Uri action
bookmark.Action = uriAction;
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}

```

Note: The action assigned to the bookmark works only when destination of bookmark is not set.

Working with Watermarks

Essential PDF provides you support to add watermark in the PDF document using PdfGraphics.

Adding text watermark in PDF document

Essential PDF allows you to draw the text watermark in PDF document using graphics elements.

The below code illustrates how to draw the text watermark in new PDF document:

C#

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
PdfGraphics graphics = pdfPage.Graphics;
//set the font
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//watermark text.
PdfGraphicsState state = graphics.Save();

```

```
graphics.SetTransparency(0.25f);
graphics.RotateTransform(-40);
graphics.DrawString("Imported using Essential PDF", font, PdfPens.Red,
PdfBrushes.Red, new PointF(-150, 450));
//Save and close the document.
pdfDocument.Save("watermark.pdf");
pdfDocument.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
'Add a page to the PDF document.
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
Dim graphics As PdfGraphics = pdfPage.Graphics
'set the font
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
' watermark text.
Dim state As PdfGraphicsState = graphics.Save()
graphics.SetTransparency(0.25F)
graphics.RotateTransform(-40)
graphics.DrawString("Imported using Essential PDF", font, PdfPens.Red,
PdfBrushes.Red, New PointF(-150, 450))
'Save and close the document.
pdfDocument.Save("watermark.pdf")
pdfDocument.Close(True)
```

UWP

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
PdfGraphics graphics = pdfPage.Graphics;
//set the font
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//watermark text.
PdfGraphicsState state = graphics.Save();
graphics.SetTransparency(0.25f);
graphics.RotateTransform(-40);
graphics.DrawString("Imported using Essential PDF", font, PdfPens.Red,
PdfBrushes.Red, new PointF(-150, 450));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await pdfDocument.SaveAsync(stream);
//Close the document
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
```

```
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
PdfGraphics graphics = pdfPage.Graphics;
//set the font
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
//watermark text.
PdfGraphicsState state = graphics.Save();
graphics.SetTransparency(0.25f);
graphics.RotateTransform(-40);
graphics.DrawString("Imported using Essential PDF", font, PdfPens.Red,
PdfBrushes.Red, new PointF(-150, 450));
//Save the document into stream.
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
stream.Position = 0;
//Close the document.

The following screenshot shows the output of adding text watermark to an existing PDF document.

Adding image watermark in PDF document

To add the image watermark in PDF document, you can draw the image with transparency in PdfGraphics.

The below code illustrates how to draw the image watermark in new PDF document:

C#

```
//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
PdfGraphics graphics = pdfPage.Graphics;
//Image watermark.
PdfImage image = new PdfBitmap("GifImage.gif");
PdfGraphicsState state = graphics.Save();
graphics.SetTransparency(0.25f);
graphics.DrawImage(image, new PointF(0, 0), pdfPage.Graphics.ClientSize);
//Save and close the document.
pdfDocument.Save("watermark.pdf");
pdfDocument.Close(true);
```

VB.NET

```

'Create a new PDF document.
Dim pdfDocument As New PdfDocument()
'Add a page to the PDF document.
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
Dim graphics As PdfGraphics = pdfPage.Graphics
'Image watermark.
Dim image As PdfImage = New PdfBitmap("GifImage.gif")
Dim state As PdfGraphicsState = graphics.Save()
graphics.SetTransparency(0.25F)
graphics.DrawImage(image, New PointF(0, 0), pdfPage.Graphics.ClientSize)
'Save and close the document.
pdfDocument.Save("watermark.pdf")
pdfDocument.Close(True)

```

UWP

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
PdfGraphics graphics = pdfPage.Graphics;
//Load the image as stream.
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.GifImage.gif");
//Image watermark.
PdfImage image = new PdfBitmap(imageStream);
PdfGraphicsState state = graphics.Save();
graphics.SetTransparency(0.25f);
graphics.DrawImage(image, new PointF(0, 0), pdfPage.Graphics.ClientSize);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await pdfDocument.SaveAsync(stream);
//Close the document
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Create a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
PdfGraphics graphics = pdfPage.Graphics;
//Load the image as stream.
FileStream imageStream = new FileStream("GifImage.gif", FileMode.Open,
FileAccess.Read);
//Image watermark.
PdfImage image = new PdfBitmap(imageStream);
PdfGraphicsState state = graphics.Save();
graphics.SetTransparency(0.25f);
graphics.DrawImage(image, new PointF(0, 0), pdfPage.Graphics.ClientSize);

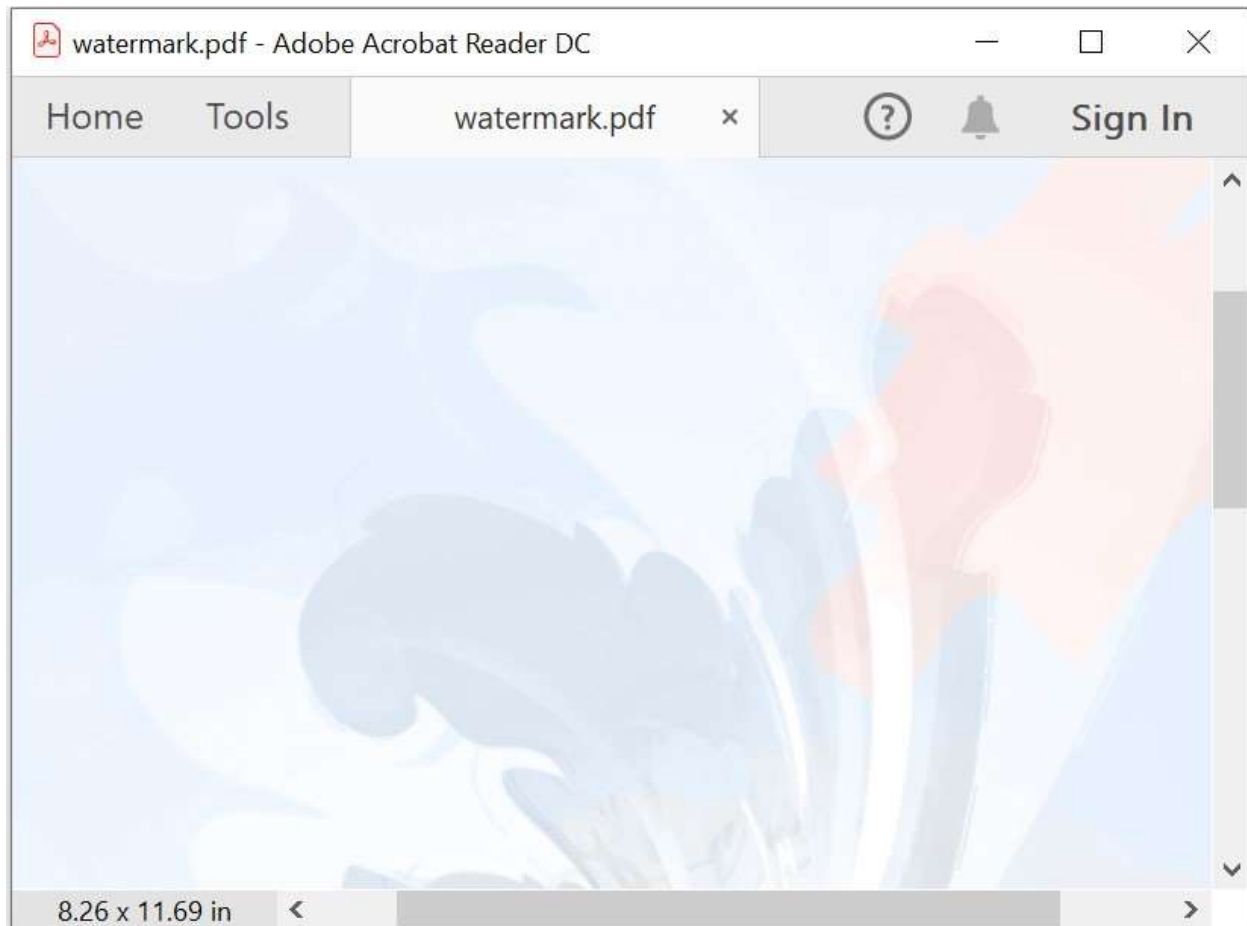

```

```

The following screenshot shows the output of adding image watermark to an existing PDF document.

Working with Portfolio

PDF Portfolios allows the user to bring together content from a variety of sources, including documents, drawings, images, e-mail, spreadsheets and web pages. Essential PDF allows the user to create portfolios and also to extract the files from them.

Creating a PDF portfolio

You can create a portfolio using [PdfPortfolioInformation](#) class and attach a variety of documents. The following code snippet illustrates this.

C#

```
// Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Create a new portfolio
document.PortfolioInformation = new PdfPortfolioInformation();
//set the view mode of the portfolio
document.PortfolioInformation.ViewMode = PdfPortfolioViewMode.Tile;
//Create the attachment
PdfAttachment pdfFile = new
PdfAttachment("../Data/CorporateBrochure.pdf");
pdfFile.FileName = "CorporateBrochure.pdf";
//Set the startup document to view
document.PortfolioInformation.StartupDocument = pdfFile;
//Add the attachment to the document
document.Attachments.Add(pdfFile);
// Save and close the document.
document.Save("Sample.pdf");
document.Close(true);
```

VB.NET

```

' Create a new instance of PdfDocument class.
Dim document As New PdfDocument()
'Create a new portfolio
document.PortfolioInformation = New PdfPortfolioInformation()
'Set the view mode of the portfolio
document.PortfolioInformation.ViewMode = PdfPortfolioViewMode.Tile
'Create the attachment
Dim pdfFile As New PdfAttachment("../Data/CorporateBrochure.pdf")
pdfFile.FileName = "CorporateBrochure.pdf"
'Set the startup document to view
document.PortfolioInformation.StartupDocument = pdfFile
'Add the attachment to the document
document.Attachments.Add(pdfFile)
'Save and close the document.
document.Save("Sample.pdf")
document.Close(True)

```

UWP

```

// Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Create a new portfolio
document.PortfolioInformation = new PdfPortfolioInformation();
//set the view mode of the portfolio
document.PortfolioInformation.ViewMode = PdfPortfolioViewMode.Tile;
//Create the attachment
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Sample.pdf");
PdfAttachment pdfFile = new PdfAttachment("Sample.pdf", pdfStream);
pdfFile.FileName = "Sample.pdf";
//Set the startup document to view
document.PortfolioInformation.StartupDocument = pdfFile;
//Add the attachment to the document
document.Attachments.Add(pdfFile);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

// Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Create a new portfolio
document.PortfolioInformation = new PdfPortfolioInformation();
//set the view mode of the portfolio
document.PortfolioInformation.ViewMode = PdfPortfolioViewMode.Tile;
//Create the attachment

```

```

FileStream pdfStream = new FileStream("CorporateBrochure.pdf",
    FileMode.Open, FileAccess.Read);
PdfAttachment pdfFile = new PdfAttachment("CorporateBrochure.pdf",
    pdfStream);
pdfFile.FileName = "CorporateBrochure.pdf";
//Set the startup document to view
document.PortfolioInformation.StartupDocument = pdfFile;
//Add the attachment to the document
document.Attachments.Add(pdfFile);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Sample.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

// Create a new instance of PdfDocument class.
PdfDocument document = new PdfDocument();
//Create a new portfolio
document.PortfolioInformation = new PdfPortfolioInformation();
//set the view mode of the portfolio
document.PortfolioInformation.ViewMode = PdfPortfolioViewMode.Tile;
//Create the attachment
Stream docStream =
    typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
    Sample.pdf");
PdfAttachment pdfFile = new PdfAttachment("Sample.pdf", docStream);
pdfFile.FileName = "Sample.pdf";
//Set the startup document to view
document.PortfolioInformation.StartupDocument = pdfFile;
//Add the attachment to the document
document.Attachments.Add(pdfFile);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
    "application/pdf", stream);
}

```

```
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Extracting file from PDF Portfolio

Essential PDF also provides support for extracting the files from the PDF Portfolio and saving it to the disk. The following code snippet shows the steps to extract files from PDF Portfolio.

C#

```
//Load the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Sample.pdf");
//Iterate the attachments
foreach (PdfAttachment attachment in document.Attachments)
{
//Extract the attachment and save to the disk
FileStream s = new FileStream(attachment.FileName, FileMode.Create);
s.Write(attachment.Data, 0, attachment.Data.Length);
s.Dispose();
}
//Save and close the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Load the PDF document
Dim document As New PdfLoadedDocument("Sample.pdf")
'Iterate the attachments
For Each attachment As PdfAttachment In document.Attachments
'Extracting the attachment and saving into the local disk
Dim s As New FileStream(attachment.FileName, FileMode.Create)
s.Write(attachment.Data, 0, attachment.Data.Length)
s.Dispose()
Next
'Save and close the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//PDF supports extracting file from PDF Portfolio only in Windows Forms,
WPF, ASP.NET and ASP.NET MVC platforms.
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Sample.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Iterate the attachments
foreach (PdfAttachment attachment in document.Attachments)
```

```
{
//Extract the attachment and save to the disk
FileStream s = new FileStream(attachment.FileName, FileMode.Create);
s.Write(attachment.Data, 0, attachment.Data.Length);
s.Dispose();
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//PDF supports extracting file from PDF Portfolio only in Windows Forms,
WPF, ASP.NET and ASP.NET MVC platforms.
```

Removing files from PDF Portfolio

You can also remove the files from PDF Portfolio using following code.

C#

```
//Load the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Sample.pdf");
//Remove the file from the Portfolio
document.Attachments.RemoveAt(1);
//Save and close the document
document.Save("Output.pdf");
document.Close();
```

VB.NET

```
'Load the PDF document
Dim document As New PdfLoadedDocument("Sample.pdf")
'Remove the file from the Portfolio
document.Attachments.RemoveAt(1)
'Save and close the document
document.Save("Output.pdf")
document.Close()
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
```

```

//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await document.OpenAsync(file);
//Remove the file from the Portfolio
document.Attachments.RemoveAt(1);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Sample.pdf", FileMode.Open, FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Remove the file from the Portfolio
document.Attachments.RemoveAt(0);
//Save and close the document
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content type, and file name.
return File(stream, contentType, fileName);

```

XAMARIN

```

// Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.Sample.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Remove the file from the Portfolio
document.Attachments.RemoveAt(0);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Closes the document
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer PDF/Xamarin section for respective code samples

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Working with Layers

Layers, also known as Option Content refers to sections of content in a PDF document that can be selectively viewed or hidden by document authors or consumers. This capability is useful in items such as CAD drawings, layered artwork, maps, and multi-language documents.

Essential PDF provides support to create, add and merge the layers into PDF document.

Adding Layers in a PDF document

Essential PDF allows the users to create a layer in a PDF page using [PdfPageLayer](#) class. The below code snippet illustrates how to add the multiple layers in a new PDF document.

C#

```

//Create PDF document.
PdfDocument document = new PdfDocument();
PdfPage page = document.Pages.Add();
//Add the first layer.
PdfPageLayer layer = page.Layers.Add("Layer1");
PdfGraphics graphics = layer.Graphics;
graphics.TranslateTransform(100, 60);
//Draw arc.
PdfPen pen = new PdfPen(System.Drawing.Color.Red, 50);
RectangleF bounds = new RectangleF(0, 0, 50, 50);
graphics.DrawArc(pen, bounds, 360, 360);
//Add another layer on the page.
PdfPageLayer layer2 = page.Layers.Add("Layer2");
graphics = layer2.Graphics;
graphics.TranslateTransform(100, 180);
//Draw ellipse.
graphics.DrawEllipse(pen, bounds);
//Save the document.
document.Save("Sample.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Create PDF document.
Dim document As New PdfDocument()
Dim page As PdfPage = document.Pages.Add()
'Add the first layer.
Dim layer As PdfPageLayer = page.Layers.Add("Layer1")
Dim graphics As PdfGraphics = layer.Graphics

```

```

graphics.TranslateTransform(100, 60)
'Draw arc.
Dim pen As New PdfPen(System.Drawing.Color.Red, 50)
Dim bounds As New RectangleF(0, 0, 50, 50)

Adding annotation to layer

Essential PDF allows the users to add [Annotation](#) to layers in the PDF document. Refer to the following code snippet.

C#

```
//Create new PDF document
PdfDocument document = new PdfDocument();
//Add page
PdfPage page = document.Pages.Add();
//Add the layer
PdfLayer layer = document.Layers.Add("Layer");
//Create graphics for layer
PdfGraphics graphics = layer.CreateGraphics(page);
//Draw ellipse
graphics.DrawEllipse(PdfPens.Red, new RectangleF(50, 50, 40, 40));
//Create square annotation
PdfSquareAnnotation annotation = new PdfSquareAnnotation(new RectangleF(200,
260, 50, 50), "Square annotation");
annotation.Color = new PdfColor(Color.Red);
//Set layer to annotation
annotation.Layer = layer;
//Add annotation to the created page
page.Annotations.Add(annotation);
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Create new PDF document
Dim document As New PdfDocument()
'Add page
Dim page As PdfPage = document.Pages.Add()
'Add the layer
Dim Layer As PdfLayer = document.Layers.Add("Layer")
'Create graphics for layer
Dim graphics As PdfGraphics = Layer.CreateGraphics(page)
'Draw ellipse
graphics.DrawEllipse(PdfPens.Red, New RectangleF(50, 50, 40, 40))
'Create square annotation
Dim annotation As New PdfSquareAnnotation(New RectangleF(200, 260, 50, 50),
"Square annotation")
annotation.Color = New PdfColor(Color.Red)
'Set layer to annotation
annotation.Layer = Layer
'Add annotation to the created page
page.Annotations.Add(annotation)
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)
```

UWP

```

//Create new PDF document
PdfDocument document = new PdfDocument();
//Add page
PdfPage page = document.Pages.Add();
//Add the layer
PdfLayer layer = document.Layers.Add("Layer");
//Create graphics for layer
PdfGraphics graphics = layer.CreateGraphics(page);
//Draw ellipse
graphics.DrawEllipse(PdfPens.Red, new RectangleF(50, 50, 40, 40));
//Create square annotation
PdfSquareAnnotation annotation = new PdfSquareAnnotation(new RectangleF(200,
260, 50, 50), "Square annotation");
annotation.Color = new PdfColor(Color.FromArgb(0, 255, 0, 0));
//Set layer to annotation
annotation.Layer = layer;
//Add annotation to the created page
page.Annotations.Add(annotation);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Sample.pdf");

```

ASP.NET CORE

```

{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Removing layers from an existing PDF document

You can remove the layers from layer collection, represented by the [PdfPageLayerCollection](#) of the loaded page. This is illustrated in the following code sample.

C#

```

//Load the existing PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Gets the first page from the document
PdfLoadedPage loadedPage = document.Pages[0] as PdfLoadedPage;
//Get the layer collection
PdfPageLayerCollection layers = loadedPage.Layers;
//Remove the layer
layers.RemoveAt(0);
//Save the document
document.Save("Output.pdf");

```

```
//Close the document
document.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Gets the first page from the document
Dim loadedPage As PdfLoadedPage = TryCast(document.Pages(0), PdfLoadedPage)
'Get the layer collection
Dim layers As PdfPageLayerCollection = loadedPage.Layers
'Remove the layer.
layers.RemoveAt(0)
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await document.OpenAsync(file);
//Gets the first page from the document
PdfLoadedPage loadedPage = document.Pages[0] as PdfLoadedPage;
//Get the layer collection
PdfPageLayerCollection layers = loadedPage.Layers;
//Remove the layer
layers.RemoveAt(0);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Gets the first page from the document
PdfLoadedPage loadedPage = document.Pages[0] as PdfLoadedPage;
//Get the layer collection
PdfPageLayerCollection layers = loadedPage.Layers;
```

```
//Remove the layer
layers.RemoveAt(0);
//Save and close the document
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Gets the first page from the document
PdfLoadedPage loadedPage = document.Pages[0] as PdfLoadedPage;
//Get the layer collection
PdfPageLayerCollection layers = loadedPage.Layers;
//Remove the layer
document.Layers.RemoveAt(0);
//Save the document into stream.
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

Flattening the layers in an existing PDF document

You can flatten a layer in a PDF document by removing it from the [PdfDocumentLayerCollection](#). The following code snippet explains this.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Layers.pdf");
//Get the layer collection
PdfDocumentLayerCollection layers = loadedDocument.Layers;
//Flatten a layer in the PDF document
layers.RemoveAt(0);
//Save the PDF document
loadedDocument.Save("Output.pdf");
//Close the instance of PdfLoadedDocument
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New
PdfLoadedDocument("Layers.pdf")
'Get the layer collection
Dim layers As PdfDocumentLayerCollection = loadedDocument.Layers
'Flatten a layer in the PDF document
layers.RemoveAt(0)
'Save the PDF document
loadedDocument.Save("Output.pdf")
'Close the instance of PdfLoadedDocument
loadedDocument.Close(True)
```

UWP

```
//Load the existing PDF document
Stream inputStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Layers.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(inputStream);
//Get the layer collection
PdfDocumentLayerCollection layers = loadedDocument.Layers;
//Flatten a layer in the PDF document
layers.RemoveAt(0);
//Create memory stream
MemoryStream stream = new MemoryStream();
//Open the document in browser after saving it
loadedDocument.Save(stream);
//Close the instance of PdfLoadedDocument
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Load the existing PDF document
FileStream inputStream = new FileStream("Layers.pdf", FileMode.Open);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(inputStream);
//Get the layer collection
PdfDocumentLayerCollection layers = loadedDocument.Layers;
//Flatten a layer in the PDF document
layers.RemoveAt(0);
```

```
//Saving the PDF to the MemoryStream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Set the position as '0'
stream.Position = 0;
//Download the PDF document in the browser
FileStreamResult fileStreamResult = new FileStreamResult(stream,
"application/pdf");
fileStreamResult.FileNameDownloadName = "Output.pdf";
return fileStreamResult;
```

XAMARIN

```
//Load the existing PDF document
Stream inputStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Layers.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(inputStream);
//Get the layer collection
PdfDocumentLayerCollection layers = loadedDocument.Layers;
//Flatten a layer in the PDF document
layers.RemoveAt(0);
//Save the document to the stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Toggle the visibility of layers

The visibility of a layer can be mentioned while creating a new page layer.

The below code illustrates how to toggle the visibility of layers in new PDF document.

C#

```
//Create the document
PdfDocument document = new PdfDocument();
//Create a page
PdfPage page = document.Pages.Add();
//Add the first layer and enable the visibility.
PdfPageLayer layer = page.Layers.Add("Layer1", true);
```

```

PdfGraphics graphics = layer.Graphics;
graphics.TranslateTransform(100, 60);
//Draw Arc.
PdfPen pen = new PdfPen(System.Drawing.Color.Red, 50);
RectangleF bounds = new RectangleF(0, 0, 50, 50);
graphics.DrawArc(pen, bounds, 360, 360);
//Add another layer on the page and disable the visibility.
PdfPageLayer layer2 = page.Layers.Add("Layer2", false);
graphics = layer2.Graphics;
graphics.TranslateTransform(100, 180);
//Draw ellipse.
graphics.DrawEllipse(pen, bounds);
//Save the document.
document.Save("Sample.pdf");
//close the document
document.Close(true);

```

VB.NET

```

'Create the document
Dim document As New PdfDocument()
'Create a page
Dim page As PdfPage = document.Pages.Add()
'Add the first layer and enable the visibility.
Dim layer As PdfPageLayer = page.Layers.Add("Layer1", True)
Dim graphics As PdfGraphics = layer.Graphics
graphics.TranslateTransform(100, 60)
'Draw Arc.
Dim pen As New PdfPen(System.Drawing.Color.Red, 50)
Dim bounds As New RectangleF(0, 0, 50, 50)
graphics.DrawArc(pen, bounds, 360, 360)
'Add another layer on the page and disable the visibility.
Dim layer2 As PdfPageLayer = page.Layers.Add("Layer2", False)
graphics = layer2.Graphics
graphics.TranslateTransform(100, 180)
'Draw ellipse.
graphics.DrawEllipse(pen, bounds)
'Save the document.
document.Save("Sample.pdf")
'close the document
document.Close(True)

```

UWP

```

//Create the document
PdfDocument document = new PdfDocument();
//Create a page
PdfPage page = document.Pages.Add();
//Add the first layer and enable the visibility.
PdfPageLayer layer = page.Layers.Add("Layer1", true);
PdfGraphics graphics = layer.Graphics;
graphics.TranslateTransform(100, 60);
//Draw Arc.
PdfPen pen = new PdfPen(new PdfColor(255, 0, 0), 50);
RectangleF bounds = new RectangleF(0, 0, 50, 50);
graphics.DrawArc(pen, bounds, 360, 360);

```

```
//Add another layer on the page and disable the visibility.
PdfPageLayer layer2 = page.Layers.Add("Layer2", false);
graphics = layer2.Graphics;
graphics.TranslateTransform(100, 180);
//Draw ellipse.
graphics.DrawEllipse(pen, bounds);
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create the document
PdfDocument document = new PdfDocument();
//Create a page
PdfPage page = document.Pages.Add();
//Add the first layer and enable the visibility.
PdfPageLayer layer = page.Layers.Add("Layer1", true);
PdfGraphics graphics = layer.Graphics;
graphics.TranslateTransform(100, 60);
//Draw Arc.
PdfPen pen = new PdfPen(Syncfusion.Drawing.Color.Red, 50);
RectangleF bounds = new RectangleF(0, 0, 50, 50);
graphics.DrawArc(pen, bounds, 360, 360);
//Add another layer on the page and disable the visibility.
PdfPageLayer layer2 = page.Layers.Add("Layer2", false);
graphics = layer2.Graphics;
graphics.TranslateTransform(100, 180);
//Draw ellipse.
graphics.DrawEllipse(pen, bounds);
//Save and close the document
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document.
document.Close(true);
//Defining the ContentType for pdf file.
string contentType = "application/pdf";
//Define the file name.
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name.
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create the document
PdfDocument document = new PdfDocument();
//Create a page
PdfPage page = document.Pages.Add();
//Add the first layer and enable the visibility.
```

```

PdfPageLayer layer = page.Layers.Add("Layer1", true);
PdfGraphics graphics = layer.Graphics;
graphics.TranslateTransform(100, 60);
//Draw Arc.
PdfPen pen = new PdfPen(Syncfusion.Drawing.Color.Red, 50);
RectangleF bounds = new RectangleF(0, 0, 50, 50);
graphics.DrawArc(pen, bounds, 360, 360);
//Add another layer on the page and disable the visibility.
PdfPageLayer layer2 = page.Layers.Add("Layer2", false);
graphics = layer2.Graphics;
graphics.TranslateTransform(100, 180);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document.
document.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pdf",
"application/pdf", stream);
}

```

The following code illustrates how to toggle the visibility of layers in an existing PDF document by disabling the [Visible](#) property of [PdfLayer](#).

C#

```

//Load the existing PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Input.pdf");
//Gets the first layer from the layer collection
PdfLayer layer = document.Layers[0];
//Disable the visibility
layer.Visible = false;
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Load the existing PDF document
Dim document As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Get the first layer from the layer collection
Dim layer As PdfLayer = document.Layers(0)
'Disable the visibility
layer.Visible = False

```

```
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)
```

UWP

```
//Load the PDF document as stream
Stream pdfStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Input.pdf");
//Creates an empty PDF loaded document instance
PdfLoadedDocument document = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of
PdfLoadedDocument class
await document.OpenAsync(pdfStream);
//Gets the first layer from the layer collection
PdfLayer layer = document.Layers[0];
//Disable the visibility
layer.Visible = false;
MemoryStream memoryStream = new MemoryStream();
//Save the document.
await document.SaveAsync(memoryStream);
//Close the documents.
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples.
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument document = new PdfLoadedDocument(docStream);
//Gets the first layer from the layer collection
PdfLayer layer = document.Layers[0];
//Disable the visibility

Tagged PDF

Introduction

The Tagged PDF is a PDF that includes structure in terms for a set of instruction that defines reading order and meaning of significant elements such as figures, images, lists, tables and more. Tagged PDF documents created using Syncfusion PDF library are compliant with section 508 (PDF/UA) standard or WCAG 2.0 standard (ISO 14289-1:2014).

Usually tagged PDF used to making content accessible to users who rely on assistive technology.

This section explains how to add tags to PDF elements such as text element, image, shapes, form fields, annotations, table, list, and more

Adding tag to text element

You can add tag to text or paragraphs in PDF document by using the [PdfTag](#) property available in the [PdfTextElement](#) class and specifying the tag type as [Paragraph](#) of [PdfTagType](#) Enum in the [PdfStructureElement](#) class.

The following code sample explains you how to add tag for the text element in PDF document.

C#

```
//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "PdfTextElement";
```

```

//Creates new page
PdfPage page = doc.Pages.Add();
//Initialize the structure element with tag type paragraph
PdfStructureElement structureElement = new
PdfStructureElement(PdfTagType.Paragraph);
//represents the text that is exact replacement for PdfTextElement
structureElement.ActualText = "Simple paragraph element";
string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Initialize the PDF text element
PdfTextElement element = new PdfTextElement(text);
//Adding tag to the text element
element.PdfTag = structureElement;
//Creates font for the text element
element.Font = new PdfStandardFont(PdfFontFamily.TimesRoman, 12);
element.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
//Draws text
PdfLayoutResult result = element.Draw(page, new RectangleF(0, 0,
page.Graphics.ClientSize.Width, 200));
//Save the document and dispose it
doc.Save("Output.pdf");
doc.Close(true);

```

VB.NET

```

'Creates new PDF document
Dim doc As PdfDocument = New PdfDocument()
'Set the document title
doc.DocumentInformation.Title = "PdfTextElement"
'Creates new page
Dim page As PdfPage = doc.Pages.Add()
'Initialize the structure element with tag type paragraph
Dim structureElement As PdfStructureElement = New
PdfStructureElement(PdfTagType.Paragraph)
'represents the text that is exact replacement for PdfTextElement
structureElement.ActualText = "Simple paragraph element"
Dim text As String = "Adventure Works Cycles, the fictitious company on
which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company. The company manufactures and sells
metal and composite bicycles to North American, European and Asian
commercial markets. While its base operation is located in Washington with
290 employees, several regional sales teams are located throughout their
market base."
'Initialize the PDF text element
Dim element As PdfTextElement = New PdfTextElement(text)
'Adding tag to the text element
element.PdfTag = structureElement
'Creates font for the text element
element.Font = New PdfStandardFont(PdfFontFamily.TimesRoman, 12)
element.Brush = New PdfSolidBrush(New PdfColor(89, 89, 93))
'Draws text

```

```

Dim result As PdfLayoutResult = element.Draw(page, New RectangleF(0, 0,
page.Graphics.ClientSize.Width, 200))
'Save the document and dispose it
doc.Save("Output.pdf")
doc.Close(True)

```

UWP

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "PdfTextElement";
//Creates new page
PdfPage page = doc.Pages.Add();
//Initialize the structure element with tag type paragraph.
PdfStructureElement structureElement = new
PdfStructureElement(PdfTagType.Paragraph);
//Represents the text that is exact replacement for PdfTextElement
structureElement.ActualText = "Simple paragraph element";
string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Initialize the PDF text element
PdfTextElement element = new PdfTextElement(text);

element.PdfTag = structureElement;
//Creates font for the text element
element.Font = new PdfStandardFont(PdfFontFamily.TimesRoman, 12);
element.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
//Draws text
PdfLayoutResult result = element.Draw(page, new RectangleF(0, 0,
page.Graphics.ClientSize.Width, 200));
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "PdfTextElement";
//Creates new page
PdfPage page = doc.Pages.Add();
//Initialize the structure element with tag type paragraph
PdfStructureElement structureElement = new
PdfStructureElement(PdfTagType.Paragraph);
//Represents the text that is exact replacement for PdfTextElement

```

```

structureElement.ActualText = "Simple paragraph element";
string text = "Adventure Works Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Initialize the PDF text element
PdfTextElement element = new PdfTextElement(text);
//Adding tag to the text element
element.PdfTag = structureElement;
//Creates font for the text element
element.Font = new PdfStandardFont(PdfFontFamily.TimesRoman, 12);
element.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
//Draws text
PdfLayoutResult result = element.Draw(page, new RectangleF(0, 0,
page.Graphics.ClientSize.Width, 200));
//Save the document into stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
stream.Position = 0;
//Closes the document
doc.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "PdfTextElement";
//Creates new page
PdfPage page = doc.Pages.Add();

Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

Adding tag to image

You can add tag to image in the PDF document by using the [PdfTag](#) property available in the [PdfBitmap](#) class and specifying the tag type as [Figure](#) of [PdfTagType](#) Enum in the [PdfStructureElement](#) class. You can add alternate text to image by using the [AlternateText](#) property available in the [PdfStructureElement](#) class.

The following code explains how to add tag for image element in PDF document.

C#

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "Image";
//Creates new page
PdfPage page = doc.Pages.Add();
//Draw string
page.Graphics.DrawString("JPEG Image:", new
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, new PointF(0, 0));
//Create a new PDF bitmap object
PdfBitmap bitmap = new PdfBitmap("syncfusion.jpg");
//Set the tag type
PdfStructureElement imageElement = new
PdfStructureElement(PdfTagType.Figure);
//Set the alternate text
imageElement.AlternateText = "GreenTree";
//adding tag to the PDF image
bitmap.PdfTag = imageElement;
//Draw image
bitmap.Draw(page.Graphics, new PointF(50, 20));

```

```
//Save the document and dispose it
doc.Save("Image.pdf");
doc.Close(true);
```

VB.NET

```
'Creates new PDF document
Dim doc As PdfDocument = New PdfDocument()
'Set the document title
doc.DocumentInformation.Title = "Image"
'Creates new page
Dim page As PdfPage = doc.Pages.Add()
'Draw string
page.Graphics.DrawString("JPEG Image:", New
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, New PointF(0, 0))
'Create a new PDF bitmap object
Dim bitmap As PdfBitmap = New PdfBitmap("syncfusion.jpg")
'Set the tag type
Dim imageElement As PdfStructureElement = New
PdfStructureElement(PdfTagType.Figure)
'Set the alternate text
imageElement.AlternateText = "GreenTree"
'adding tag to the PDF image
bitmap.PdfTag = imageElement
'Draw image
bitmap.Draw(page.Graphics, New PointF(50, 20))
'Save the document and dispose it
doc.Save("Image.pdf")
doc.Close(True)
```

UWP

```
//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "Image";
//Creates new page
PdfPage page = doc.Pages.Add();
//Draw string
page.Graphics.DrawString("JPEG Image:", new
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, new PointF(0, 0));
//Load the image as stream
Stream imageStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.syncfusion.jpg");
//Create a new PDF bitmap object
PdfBitmap bitmap = new PdfBitmap(imageStream);
//Set the tag type
PdfStructureElement imageElement = new
PdfStructureElement(PdfTagType.Figure);
//Set the alternate text
imageElement.AlternateText = "GreenTree";
//Adding tag to the PDF image

Adding tag to shapes

You can add tag to shapes such as rectangle, line, circle, polygon, and more by using the [PdfTag](#) property and specifying the tag type as [Figure](#) of [PdfTagType](#) Enum. You can add alternate text to shapes by using the [AlternateText](#) property available in the [PdfStructureElement](#) class.

The following code explains how to add tag for shape element in the PDF document.

C#

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "LineShape";

```

```

//Add new page
PdfPage page = doc.Pages.Add();
//Draw text
page.Graphics.DrawString("Line Shape:", new
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, new PointF(30, 80));
//Initialize structure element with tag type as Figure
PdfStructureElement element = new PdfStructureElement(PdfTagType.Figure);
//Set alternate text
element.AlternateText = "Line Sample";
//Initialize the line shape
PdfLine line = new PdfLine(100, 100, 100, 300);
line.Pen = new PdfPen(Color.Red);
//Adding tag to the line element
line.PdfTag = element;
//Draws the line
line.Draw(page.Graphics);
//Save the document and dispose it
doc.Save("Output.pdf");

```

VB.NET

```

'Creates new PDF document
Dim doc As PdfDocument = New PdfDocument()
'Set the document title
doc.DocumentInformation.Title = "LineShape"
'Add new page
Dim page As PdfPage = doc.Pages.Add()
'Draw text
page.Graphics.DrawString("Line Shape:", New
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, New PointF(30, 80))
'Initialize structure element with tag type as Figure
Dim element As PdfStructureElement = New
PdfStructureElement(PdfTagType.Figure)
'Set alternate text
element.AlternateText = "Line Sample"
'Initialize the line shape
Dim line As PdfLine = New PdfLine(100, 100, 100, 300)
line.Pen = New PdfPen(Color.Red)
'Adding tag to the line element
line.PdfTag = element
'Draws the line
line.Draw(page.Graphics)
'Save the document and dispose it
doc.Save("Output.pdf")

```

UWP

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "LineShape";
//Add new page
PdfPage page = doc.Pages.Add();
//Draw text

```

```

page.Graphics.DrawString("Line Shape:", new
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, new PointF(30, 80));
//Initialize structure element with tag type as Figure
PdfStructureElement element = new PdfStructureElement(PdfTagType.Figure);
//Set alternate text
element.AlternateText = "Line Sample";
//Initialize the line shape
PdfLine line = new PdfLine(100, 100, 100, 300);
line.Pen = new PdfPen(new PdfColor(255, 0, 0));
//Adding tag to the line element
line.PdfTag = element;
//Draws the line
line.Draw(page.Graphics);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await doc.SaveAsync(stream);
//Close the document
doc.Close(true);
//Save the stream as PDF document file in local machine. Refer to the

Adding tag to Form Fields

You can tag the form fields in the PDF document by using the [PdfTag](#) and specifying the tag type as Form of [PdfTagType](#) Enum.

The following code explains how to add tag for the form fields in PDF document.

C#

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
doc.DocumentInformation.Title = "Form Fields";
//Adds new page
PdfPage page = doc.Pages.Add();
// Create a text box field
PdfTextBoxField textBoxField = new PdfTextBoxField(page, "This is form field
text box");
//Adding tag to the text box field
textBoxField.PdfTag = new PdfStructureElement(PdfTagType.Form);
textBoxField.Text = "Filled text box";
//Set properties to the text box
textBoxField.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 12);
textBoxField.BorderColor = new PdfColor(Color.Gray);
textBoxField.BorderStyle = PdfBorderStyle.Beveled;
textBoxField.Bounds = new RectangleF(200, 0, 90, 20);
textBoxField.ToolTip = "TextBox field";
doc.Form.Fields.Add(textBoxField);
//Save the document and dispose it
doc.Save("Output.pdf");
doc.Close(true);

```

VB.NET

```

'Creates new PDF document
Dim doc As PdfDocument = New PdfDocument()
doc.DocumentInformation.Title = "Form Fields"
'Adds new page
Dim page As PdfPage = doc.Pages.Add()
' Create a text box field
Dim textBoxField As PdfTextBoxField = New PdfTextBoxField(page, "This is
form field text box")
'Adding tag to the text box field
textBoxField.PdfTag = New PdfStructureElement(PdfTagType.Form)
textBoxField.Text = "Filled text box"
'Set properties to the text box
textBoxField.Font = New PdfStandardFont(PdfFontFamily.Helvetica, 12)
textBoxField.BorderColor = New PdfColor(Color.Gray)
textBoxField.BorderStyle = PdfBorderStyle.Beveled
textBoxField.Bounds = New RectangleF(200, 0, 90, 20)
textBoxField.ToolTip = "TextBox field"

Adding tag to Annotation

You can add tags to annotation in PDF document by using the [PdfTag](#) property and specifying the tag type as **Annotation** of [PdfTagType](#) Enum.

The following code explains how to add tag for the annotations in PDF document.

C#

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title
doc.DocumentInformation.Title = "LineShape";
//Add new page
PdfPage page = doc.Pages.Add();
//Initialize the structure element with tag type as annotation
PdfStructureElement structureElement = new
PdfStructureElement(PdfTagType.Annotation);
structureElement.AlternateText = "Popup Annotation";

```

```

RectangleF rectangle = new RectangleF(10, 40, 30, 30);
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle, "Test
popup annotation");
//Adding tag for the annotation
popupAnnotation.PdfTag = structureElement;
popupAnnotation.Border.Width = 4;
popupAnnotation.Border.HorizontalRadius = 20;
popupAnnotation.Border.VerticalRadius = 30;
//Sets the PDF pop-up icon
popupAnnotation.Icon = PdfPopupIcon.NewParagraph;
//Adds this annotation to a new page
page.Annotations.Add(popupAnnotation);
//Saves the document to disk
doc.Save("PopupAnnotation.pdf");
//Close the PDF document
doc.Close(true);

```

VB.NET

```

'Creates new PDF document
Dim doc As PdfDocument = New PdfDocument()
'Set the document title
doc.DocumentInformation.Title = "LineShape"
'Add new page
Dim page As PdfPage = doc.Pages.Add()
'Initialize the structure element with tag type as annotation
Dim structureElement As PdfStructureElement = New
PdfStructureElement(PdfTagType.Annotation)
structureElement.AlternateText = "Popup Annotation"
Dim rectangle As RectangleF = New RectangleF(10, 40, 30, 30)
Dim popupAnnotation As PdfPopupAnnotation = New
PdfPopupAnnotation(rectangle, "Test popup annotation")
'Adding tag for the annotation
popupAnnotation.PdfTag = structureElement
popupAnnotation.Border.Width = 4
popupAnnotation.Border.HorizontalRadius = 20
popupAnnotation.Border.VerticalRadius = 30
'Sets the PDF pop-up icon
popupAnnotation.Icon = PdfPopupIcon.NewParagraph
'Adds this annotation to a new page
page.Annotations.Add(popupAnnotation)
'Saves the document to disk
doc.Save("PopupAnnotation.pdf")
'Close the PDF document
doc.Close(True)

```

UWP

```

//Creates new PDF document
PdfDocument doc = new PdfDocument();
//Set the document title

"application/pdf", stream);
}
```

Adding tag to Hyperlink

You can tag the hyperlink present in the PDF document by using [PdfTag](#) available in the [PdfTextWebLink](#) class and specifying the tag type as [Link](#) of [PdfTagType](#) Enum.

The following code example shows how to add tag for hyperlink in PDF document

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
document.DocumentInformation.Title = "Link";
//Add a page to the document
PdfPage page = document.Pages.Add();
//Creates new PDF structure element with tag type link
PdfStructureElement linkStructureElement = new
PdfStructureElement(PdfTagType.Link);
//Create the font
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 12f);
//Create the text web link
PdfTextWebLink textLink = new PdfTextWebLink();
//Adding tag to text web link
textLink.PdfTag = linkStructureElement;
//Set the hyperlink
textLink.Url = "http://www.syncfusion.com";
//Set the link text
textLink.Text = "Syncfusion .NET components and controls";
//Set the font
textLink.Font = font;
textLink.Brush = PdfBrushes.Blue;
//Draw the hyperlink in PDF page
textLink.DrawTextWebLink(page, new PointF(10, 40));
//Save the document
document.Save("Output.pdf");
//Close the document
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As PdfDocument = New PdfDocument()
document.DocumentInformation.Title = "Link"
'Add a page to the document
Dim page As PdfPage = document.Pages.Add()
'Creates new PDF structure element with tag type link
Dim linkStructureElement As PdfStructureElement = New
PdfStructureElement(PdfTagType.Link)
'Create the font
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 12.0F)
'Create the text web link
Dim textLink As PdfTextWebLink = New PdfTextWebLink()
'Adding tag to text web link
textLink.PdfTag = linkStructureElement
'Set the hyperlink
textLink.Url = "http://www.syncfusion.com"
'Set the link text
textLink.Text = "Syncfusion .NET components and controls"
'Set the font
textLink.Font = font
textLink.Brush = PdfBrushes.Blue
'Draw the hyperlink in PDF page
textLink.DrawTextWebLink(page, New PointF(10, 40))
```

```
'Save the document
document.Save("Output.pdf")
'Close the document
document.Close(True)
```

UWP

```
//Create a new PDF document

Adding tag to Template

You can add tags to template in PDF document by using the [PdfTag](#) property available in the [PdfTemplate](#) class.

The following code sample explains how to add tag support for the template element.

C#

```

//Creates a new PDF document
PdfDocument pdfDocument = new PdfDocument();
pdfDocument.DocumentInformation.Title = "TemplateDocument";
//Add a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
pdfPage.Graphics.DrawString("Rectangle:", new
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, new PointF(0, 0));
//Create a PDF template
PdfTemplate template = new PdfTemplate(100, 50);
//Initialize the structure element with tag type figure
PdfStructureElement structureElement = new
PdfStructureElement(PdfTagType.Figure);
//Set alternative description for figure
structureElement.AlternateText = "Template Figure";
//Adding tag to the template element
template.PdfTag = structureElement;
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 14);
PdfBrush brush = new PdfSolidBrush(Color.Pink);
//Draw rectangle using template graphics
template.Graphics.DrawRectangle(brush, new RectangleF(0, 30, 150, 90));
//Draw the template on the page graphics of the document
pdfPage.Graphics.DrawPdfTemplate(template, PointF.Empty);
//Save the document and dispose it
pdfDocument.Save("Output.pdf");
pdfDocument.Close(true);

```

VB.NET

```

'Creates a new PDF document
Dim pdfDocument As PdfDocument = New PdfDocument()
pdfDocument.DocumentInformation.Title = "TemplateDocument"
'Add a page to the PDF document
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()

```

```

pdfPage.Graphics.DrawString("Rectangle:", New
PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold),
PdfBrushes.Blue, New PointF(0, 0))
'Create a PDF template
Dim template As PdfTemplate = New PdfTemplate(100, 50)
'Initialize the structure element with tag type figure
Dim structureElement As PdfStructureElement = New
PdfStructureElement(PdfTagType.Figure)
'Set alternative description for figure
structureElement.AlternateText = "Template Figure"
'Adding tag to the template element
template.PdfTag = structureElement
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 14)
Dim brush As PdfBrush = New PdfSolidBrush(Color.Pink)
'Draw rectangle using template graphics
template.Graphics.DrawRectangle(brush, New RectangleF(0, 30, 150, 90))
'Draw the template on the page graphics of the document
pdfPage.Graphics.DrawPdfTemplate(template, PointF.Empty)
'Save the document and dispose it
pdfDocument.Save("Output.pdf")
pdfDocument.Close(True)

```

Adding tag to Table

You can tag the table in the PDF document by specifying the tag type as **Table** of [PdfTagType](#) Enum. The following tag types are used to mention the table header, rows, and cells:

1. PdfTagType.TableHeader
2. PdfTagType.TableRow
3. PdfTagType.TableDataCell

The following code snippet illustrates how to add tag for table element.

C#

```
//Creates a new PDF document
PdfDocument pdfDocument = new PdfDocument();
pdfDocument.DocumentInformation.Title = "Table";
//Adds new page
PdfPage pdfPage = pdfDocument.Pages.Add();
//Initialize the new structure element with tag type table
PdfStructureElement element = new PdfStructureElement(PdfTagType.Table);
//Create a new PdfGrid
PdfGrid pdfGrid = new PdfGrid();
//Adding tag to PDF grid
pdfGrid.PdfTag = element;
//Add three columns
pdfGrid.Columns.Add(3);
//Add header
pdfGrid.Headers.Add(1);
PdfGridRow pdfGridHeader = pdfGrid.Headers[0];
pdfGridHeader.Style.Font = new PdfStandardFont(PdfFontFamily.Helvetica, 12, PdfFontStyle.Bold);
pdfGridHeader.Style.TextBrush = PdfBrushes.Brown;
//Adding tag for each row with tag type TR
pdfGridHeader.PdfTag = new PdfStructureElement(PdfTagType.TableRow);
pdfGridHeader.Cells[0].Value = "Employee ID";
//Adding tag for header cell with tag type TH
pdfGridHeader.Cells[0].PdfTag = new PdfStructureElement(PdfTagType.TableHeader);
pdfGridHeader.Cells[1].Value = "Employee Name";
//Adding tag for header cell with tag type TH
pdfGridHeader.Cells[1].PdfTag = new PdfStructureElement(PdfTagType.TableHeader);
pdfGridHeader.Cells[2].Value = "Salary";
//Adding tag for header cell with tag type TH
pdfGridHeader.Cells[2].PdfTag = new PdfStructureElement(PdfTagType.TableHeader);
//Add rows.
PdfGridRow pdfGridRow = pdfGrid.Rows.Add();
pdfGridRow.PdfTag = new PdfStructureElement(PdfTagType.TableRow);
pdfGridRow.Cells[0].Value = "E01";
pdfGridRow.Cells[1].Value = "Clay";
pdfGridRow.Cells[2].Value = "$10,000";
//Adding tag for each cell with tag type TD
pdfGridRow.Cells[0].PdfTag = new PdfStructureElement(PdfTagType.TableDataCell);
```

```
pdfGridRow.Cells[1].PdfTag = new
PdfStructureElement(PdfTagType.TableDataCell);
pdfGridRow.Cells[2].PdfTag = new
PdfStructureElement(PdfTagType.TableDataCell);
//Draw the PdfGrid
pdfGrid.Draw(pdfPage, PointF.Empty);
//save the document and dispose it
pdfDocument.Save("Output.pdf");
pdfDocument.Close(true);
```

VB.NET

```
'Creates a new PDF document
Dim pdfDocument As PdfDocument = New PdfDocument()
pdfDocument.DocumentInformation.Title = "Table"
'Adds new page
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
'Initialize the new structure element with tag type table

Adding tag to List Element

You can add the tags to list element in PDF document by specifying the tag type as **List** of [PdfTagType](#) Enum available in the [PdfStructureElement](#) class.

The following code example illustrates how to add tag support for list element.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Sets document title
document.DocumentInformation.Title = "List";
//Add a new page to the document
PdfPage page = document.Pages.Add();
PdfGraphics graphics = page.Graphics;
SizeF size = page.Graphics.ClientSize;
//Create font

```

```

PdfFont font = new PdfStandardFont(PdfFontFamily.TimesRoman, 10,
PdfFontStyle.Italic);
graphics.DrawString("List:", new PdfStandardFont(PdfFontFamily.Helvetica,
12, PdfFontStyle.Bold), PdfBrushes.Blue, new Point(10, 0));
string[] products = { "Tools", "Grid", "Chart", "Edit", "Diagram", "XlsIO",
"Grouping", "Calculate", "PDF", "HTMLUI", "DocIO" };
//Create string format
PdfStringFormat format = new PdfStringFormat();
format.LineSpacing = 10f;
//Initialize new structure element with tag type List.
PdfStructureElement listElement = new PdfStructureElement(PdfTagType.List);
//Create ordered list
PdfOrderedList pdfList = new PdfOrderedList();
//Adding tag for list element
pdfList.PdfTag = listElement;
pdfList.Marker.Brush = PdfBrushes.Black;
pdfList.Indent = 20;
//Set format for sub list
pdfList.Font = font;
pdfList.StringFormat = format;
for (int i = 0; i < products.Length; i++)
{
pdfList.Items.Add(string.Concat("Essential ", products[i]));
//Adding tag for the list item
pdfList.Items[i].PdfTag = new PdfStructureElement(PdfTagType.ListItem);
}
//Draw the list
pdfList.Draw(page, new RectangleF(0, 20, size.Width, size.Height));
//Save and close the document
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

}

```

Marking PDF content as an artifact

Artifacts in the PDF document can be graphic objects or other markings that are not a part of the authored content and will include such things as: headers, footers, page numbers, watermarks, cut marks, color bars, background images, lines separating content, or decorative images.

You can add artifact tag to PDF element by using the [PdfArtifact](#) class. The artifact type can be specified by using the [ArtifactType](#) property available in the [PdfArtifact](#) class.

The following code explains how to add tag for header and footers in the PDF document.

C#

```

//Creates new PDF document
PdfDocument pdfDocument = new PdfDocument();
//Add a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
pdfDocument.DocumentInformation.Title = "HeaderFooter";
//Creating artifact type for the header
PdfArtifact headerArtifact = new PdfArtifact(PdfArtifactType.Pagination, new
RectangleF(30, 40, 100, 100), new PdfAttached(PdfEdge.Top),
PdfArtifactSubType.Header);
//Create a header and draw the image
RectangleF bounds = new RectangleF(0, 0,
pdfDocument.Pages[0].GetClientSize().Width, 50);
PdfPageTemplateElement header = new PdfPageTemplateElement(bounds);
//Adding artifact to the header
header.PdfTag = headerArtifact;
PdfImage image = new PdfBitmap("syncfusion.jpg");
//Draw the image in the header
header.Graphics.DrawImage(image, new PointF(200, 0), new SizeF(100, 50));
//Add the header at the top
pdfDocument.Template.Top = header;
//Creating artifact type for the footer
PdfArtifact footerArtifact = new PdfArtifact(PdfArtifactType.Pagination, new
PdfAttached(PdfEdge.Bottom), PdfArtifactSubType.Footer);
//Create a Page template that can be used as footer
PdfPageTemplateElement footer = new PdfPageTemplateElement(bounds);
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 7);
PdfBrush brush = new PdfSolidBrush(Color.Black);
//Create page number field
PdfPageNumberField pageNumber = new PdfPageNumberField(font, brush);
//Create page count field
PdfPageCountField count = new PdfPageCountField(font, brush);
//Add the fields in composite fields

```

```

PdfCompositeField compositeField = new PdfCompositeField(font, brush, "Page
{0} of {1}", pageNumber, count);
compositeField.Bounds = footer.Bounds;
//Adding artifact type to the footer
compositeField.PdfTag = footerArtifact;
//Draw the composite field in footer
compositeField.Draw(footer.Graphics, new PointF(470, 40));
//Add the footer template at the bottom
pdfDocument.Template.Bottom = footer;
//Save the document and dispose it
pdfDocument.Save("HeaderFooter.pdf");
pdfDocument.Close(true);

```

VB.NET

```

'Creates new PDF document
Dim pdfDocument As PdfDocument = New PdfDocument()
'Add a page to the PDF document

Tag Reading Order

Basically, the element which draws first takes precedence over the tag reading order. You can re-order the tagged elements in document using the [Order](#) property.

The following code example illustrates how to order the tagged elements in a PDF document.

C#

```

//Create a new PDF document
PdfDocument document = new PdfDocument();
//Sets document title
document.DocumentInformation.Title = "Order";
//Add a new page to the document
PdfPage page = document.Pages.Add();
//Initialize the structure element with tag type paragraph
PdfStructureElement structureElement = new
PdfStructureElement(PdfTagType.Paragraph);
//Order the tag in third position
structureElement.Order = 3;
PdfTextElement element = new PdfTextElement("This is paragraph ONE.", new
PdfStandardFont(PdfFontFamily.Helvetica, 12));
element.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
//Adding tag to the text element
element.PdfTag = structureElement;
element.Draw(page, new RectangleF(0, 0, page.Graphics.ClientSize.Width / 2,
200));
//Initialize the structure element with tag type paragraph
PdfStructureElement paraStruct1 = new
PdfStructureElement(PdfTagType.Paragraph);
//Order the tag in first position
paraStruct1.Order = 1;
//Creates new text element
PdfTextElement element1 = new PdfTextElement("This is paragraph TWO.", new
PdfStandardFont(PdfFontFamily.Helvetica, 12));
element1.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
//Adding tag to the text element

```

```

element1.PdfTag = paraStruct1;
element1.Draw(page, new RectangleF(0, 50, page.Graphics.ClientSize.Width /
2, 200));
//Initialize the structure element with tag type paragraph
PdfStructureElement paraStruct2 = new
PdfStructureElement(PdfTagType.Paragraph);
//Order the tag in second position
paraStruct2.Order = 2;
//Creates new text element
PdfTextElement element2 = new PdfTextElement("This is paragraph THREE.", new
PdfStandardFont(PdfFontFamily.Helvetica, 12));
element2.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
//Adding tag to the text element
element2.PdfTag = paraStruct2;
element2.Draw(page.Graphics, new PointF(0, 100));
//Save the document and dispose it
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Create a new PDF document

Auto Tagging a new document

When the auto-tag feature is enabled, all the elements in the document is tagged with appropriate tag type that is **Paragraph**, **Figure**, **Annotation**, and more from [PdfTagType](#) Enum.

The following code example explains how to auto-tag the elements in a PDF document.

Note: Enabling the auto-tag feature will never add alternate texts/descriptions for figures, images, and other properties related to tag.

C#

```

//Creates new PDF document
PdfDocument document = new PdfDocument();
//Set true to auto tag all elements in document
document.AutoTag = true;
document.DocumentInformation.Title = "AutoTag";
// Add a new page to the document
PdfPage page = document.Pages.Add();
//Creates new text element
PdfTextElement element = new PdfTextElement("This is paragraph ONE.", new
PdfStandardFont(PdfFontFamily.Helvetica, 12));
element.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
element.Draw(page, new RectangleF(0, 0, page.Graphics.ClientSize.Width / 2,
200));
//Creates new text element
PdfTextElement element1 = new PdfTextElement("This is paragraph TWO.", new
PdfStandardFont(PdfFontFamily.Helvetica, 12));
element1.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
element1.Draw(page, new RectangleF(0, 50, page.Graphics.ClientSize.Width /
2, 200));
//Creates new text element
PdfTextElement element2 = new PdfTextElement("This is paragraph THREE.", new
PdfStandardFont(PdfFontFamily.Helvetica, 12));

```

```

element2.Brush = new PdfSolidBrush(new PdfColor(89, 89, 93));
element2.Draw(page.Graphics, new PointF(0, 100));
//Save the document and dispose it
document.Save("AutoTag.pdf");
document.Close(true);

```

VB.NET

```

'Creates new PDF document
Dim document As PdfDocument = New PdfDocument()
'Set true to auto tag all elements in document

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("AutoTag.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("AutoTag.pdf",
"application/pdf", stream);
}

```

Note: After the document is auto tagged and if any element tagged manually, then the manually tagged element takes the precedence.

How to pass accessibility full check

To pass the full check accessibility, follow the below conventions while tagging the document:

1. Mention the PDF document "Title" in the document properties.
2. Make sure that the images in the document has alternate text or marked as artifact.

3. The bookmarks should be included for tagged PDF with more than 21 pages.
4. All the form fields require text description (tooltip).
5. All tables in a document should have a header.
6. Tables must contain same number of columns in each row.
7. A list element must contain list item element (LI), and list item element can only contain label (Lb1) or body elements(LBody).

Tagged PDF support for converting HTML to PDF

Essential PDF provides support to convert HTML to TaggedPDF by using the MSHTML rendering library.

The Tagged PDF is a stylized use of PDF that builds the logical structure Framework. It defines a set of standard structure types and attributes that allows the page content (text, graphics, and images) to be extracted and reused. The contents are accessible to users with visual impairments.

To convert HTML to Tagged PDF, you can use the [ConvertToTaggedPDF](#) method in [HtmlConverter](#) class.

The following code illustrates how to convert HTML to TaggedPDF.

C#

```
//Creates a new PdfDocument
PdfDocument document = new PdfDocument();
//Creates a new instance of HtmlConverter class
using (HtmlConverter html = new HtmlConverter())
{
    //Enable JavaScript
    html.EnableJavaScript = true;
    //Converts to Tagged PDF
    html.ConvertToTaggedPDF(document, "http://www.google.com");
}
//Saves and closes the document
document.Save("Sample.pdf");
document.Close(true);
```

VB.NET

```
'Creates a new PdfDocument
Dim document As New PdfDocument()
'Creates a new instance of HtmlConverter class
Using html As New HtmlConverter()
    'Enables JavaScript
    html.EnableJavaScript = True
    'Converts to Tagged PDF
    html.ConvertToTaggedPDF(document, "http://www.google.com")
End Using
'Saves and closes the document
document.Save("Sample.pdf")
document.Close(True)
```

Note: Hyperlinks are not supported in tagged PDF

Converting Word document to Tagged PDF

This setting allows you to determine whether to preserve document structured tags in the converted PDF document for accessibility (508 compliance) support. This property will set the title and description

for images, diagrams, and other objects in the generated PDF document. This information will be useful for people with vision or cognitive impairments who cannot see or understand the object.

The following code sample shows how to preserve document structured tags in the converted PDF document.

C#

```
//Loads an existing Word document
WordDocument wordDocument = new WordDocument("Sample.docx",
FormatType.Docx);
//Creates an instance of the DocToPDFConverter - responsible for Word to PDF conversion
DocToPDFConverter converter = new DocToPDFConverter();
//Sets true to preserve document structured tags in the converted PDF document
converter.Settings.AutoTag = true;
//Converts Word document into PDF document
PdfDocument pdfDocument = converter.ConvertToPDF(wordDocument);
//Saves the PDF file to file system
pdfDocument.Save("WordtoPDF.pdf");
//Closes the instance of document objects
pdfDocument.Close(true);
wordDocument.Close();
```

VB.NET

```
'Loads an existing Word document
Dim wordDocument As New WordDocument("Sample.docx", FormatType.Docx)
'Creates an instance of the DocToPDFConverter - responsible for Word to PDF conversion
Dim converter As New DocToPDFConverter()
'Sets true to preserve document structured tags in the converted PDF document
converter.Settings.AutoTag = True
'Converts Word document into PDF document
Dim pdfDocument As PdfDocument = converter.ConvertToPDF(wordDocument)
'Saves the PDF file to file system
pdfDocument.Save("WordtoPDF.pdf")
'Closes the instance of document objects
pdfDocument.Close(True)
wordDocument.Close()
```

ASP.NET CORE

```
//Open the file as Stream
FileStream docStream = new FileStream(@"D:\Template.docx", FileMode.Open,
FileAccess.Read);
//Loads file stream into Word document
WordDocument wordDocument = new WordDocument(docStream,
Syncfusion.DocIO.FormatTypeAutomatic);
//Instantiation of DocIORenderer for Word to PDF conversion
DocIORenderer render = new DocIORenderer();
//Sets true to preserve document structured tags in the converted PDF document
render.Settings.AutoTag = true;
```

```
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(wordDocument);
//Releases all resources used by the Word document and DocIO Renderer
objects
render.Dispose();
wordDocument.Dispose();
//Saves the PDF file
MemoryStream outputStream = new MemoryStream();
pdfDocument.Save(outputStream);
//Closes the instance of PDF document object
pdfDocument.Close();
```

XAMARIN

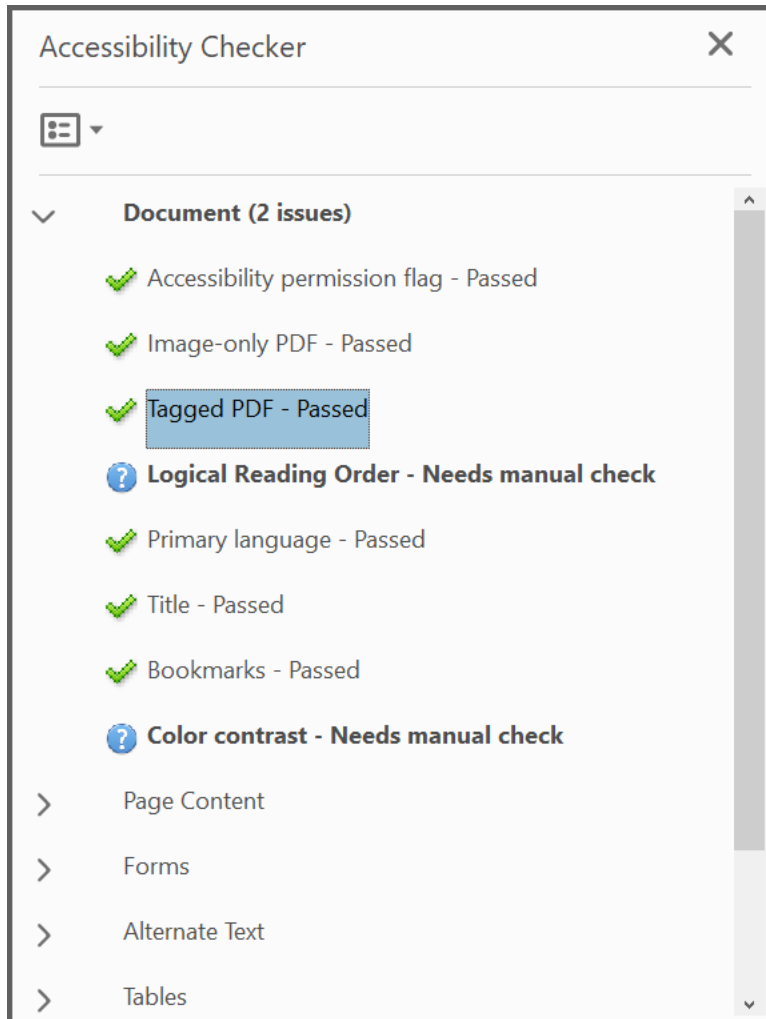

```
//Load the Word document as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Sample.docx");
//Loads the stream into Word Document.
WordDocument wordDocument = new WordDocument(docStream,
Syncfusion.DocIO.FormatType.Automatic);
//Instantiation of DocIORenderer for Word to PDF conversion
DocIORenderer render = new DocIORenderer();
//Sets true to preserve document structured tags in the converted PDF
document
render.Settings.AutoTag = true;
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(wordDocument);
//Releases all resources used by the Word document and DocIO Renderer
objects
render.Dispose();
wordDocument.Dispose();
//Saves the PDF file
MemoryStream outputStream = new MemoryStream();
pdfDocument.Save(outputStream);
//Closes the instance of PDF document object
pdfDocument.Close();
```

Validating tagged PDF in Acrobat

Follow the below steps to validate the tagged PDF information in Adobe Acrobat:

1. Choose Tools > Accessibility. 2. In the secondary toolbar, click Full Check. 3. The Accessibility Checker Option dialog box will be displayed, from that you can ensure the validity of tagged information.

The following screenshot shows the Accessibility checker dialog box.

Working with Compression

Essential PDF allows you to compress the PDF document and thereby reduce the file size in the following three ways.

1. Compress an existing PDF document
2. Content compression for a new document
3. Image compression for a new document

Note: PDF supports compressing PDF document only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

Compressing existing PDF document

You can compress the existing PDF document by using [PdfLoadedDocument](#) and [PdfCompressionOptions](#). The following compression techniques are used to compress the existing PDF document.

1. Compress the image with image quality
2. Optimizing embedded font
3. Optimizing page content

4. Remove metadata information

Compressing images with image quality

You can compress all the images of an existing PDF document by enabling the [CompressImages](#) property and assigning [ImageQuality](#) available in [PdfCompressionOptions](#) class. The [ImageQuality](#) property is used to reduce the quality of the image based on percentage value, where 100 is unchanged quality and 10 is low quality.

The following example code snippet illustrates how to compress the images in existing PDF document.

C#

```
//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Create a new compression option.
PdfCompressionOptions options = new PdfCompressionOptions();
//Enable the compress image.
options.CompressImages = true;
//Set the image quality.
options.ImageQuality = 50;
//Assign the compression option to the document
loadedDocument.CompressionOptions = options;
//Save the PDF document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")
'Create a new compression option.
Dim options As PdfCompressionOptions = New PdfCompressionOptions()
'Enable the compress image.
options.CompressImages = True
'Set the image quality.
options.ImageQuality = 50
'Assign the compression option to the document
loadedDocument.CompressionOptions = options
'Save the PDF document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)
```

Optimizing embedded font

You can optimize the embedded fonts in an existing PDF document by enabling the [OptimizeFont](#) property available in the [PdfCompressionOptions](#) class. This technique reduces the font file size by removing all the unused glyph data.

The following example code snippet illustrates how to optimize embedded font in existing PDF document.

C#

```
//Load the existing PDF document
```

```

PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Create a new compression option.
PdfCompressionOptions options = new PdfCompressionOptions();
//Enable the optimize font option
options.OptimizeFont = true;
//Assign the compression option to the document
loadedDocument.CompressionOptions = options;
//Save the PDF document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")
'Create a new compression option.
Dim options As PdfCompressionOptions = New PdfCompressionOptions()
'Enable the optimize font option
options.OptimizeFont = True
'Assign the compression option to the document
loadedDocument.CompressionOptions = options
'Save the PDF document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)

```

Note: The font compression support only in TrueType and Type2 embedded fonts.

Optimizing page contents

You can compress the page contents in an existing PDF document by enabling the [OptimizePageContents](#) property available in the [PdfCompressionOptions](#) class. This technique removes the unwanted data in the content streams such as commented lines, white spaces, etc.,

The following example code snippet illustrates how to optimize page contents in existing PDF document.

C#

```

//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Create a new compression option.
PdfCompressionOptions options = new PdfCompressionOptions();
//Enable the optimize page contents.
options.OptimizePageContents = true;
//Assign the compression option to the document
loadedDocument.CompressionOptions = options;
//Save the PDF document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")

```

```

'Create a new compression option.
Dim options As PdfCompressionOptions = New PdfCompressionOptions()
'Enable the optimize page contents.
options.OptimizePageContents = True
'Assign the compression option to the document
loadedDocument.CompressionOptions = options
'Save the PDF document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)

```

Remove metadata information

You can reduce the PDF file size by removing the PDF document metadata information. This can be achieved by enabling the [RemoveMetadata](#) property available in the [PdfCompressionOptions](#) class.

The following example code snippet illustrates how to optimize page contents in existing PDF document.

C#

```

//Load the existing PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("input.pdf");
//Create a new compression option.
PdfCompressionOptions options = new PdfCompressionOptions();
//Set to remove the metadata information.
options.RemoveMetadata = true;
//Assign the compression option to the document
loadedDocument.CompressionOptions = options;
//Save the PDF document
loadedDocument.Save("Output.pdf");
//Close the document
loadedDocument.Close(true);

```

VB.NET

```

'Load the existing PDF document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("input.pdf")
'Create a new compression option.
Dim options As PdfCompressionOptions = New PdfCompressionOptions()
'Set to remove the metadata information.
options.RemoveMetadata = True
'Assign the compression option to the document
loadedDocument.CompressionOptions = options
'Save the PDF document
loadedDocument.Save("Output.pdf")
'Close the document
loadedDocument.Close(True)

```

Compressing the PDF content

Essential PDF allows you to control the compression level of the document by using the [PdfCompressionLevel](#) Enum. The compression level can be set to best, normal, none etc...

Content compression involves,

- 1) Removing all extra space characters.
- 2) Inserting a single repeat character to indicate a string of repeated characters.
- 3) Substituting smaller bit strings for frequently occurring characters.

The following code snippet illustrates how to compress the content of the PDF document.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Set the compression level to best
document.Compression = PdfCompressionLevel.Best;
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Set the font.
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 20);
string text = "Hello World!!!";
PdfTextElement textElement = new PdfTextElement(text, font);
PdfLayoutResult result = textElement.Draw(page, new RectangleF(0, 0,
font.MeasureString(text).Width, page.GetClientSize().Height));
for (int i = 0; i < 1000; i++)
{
    result = textElement.Draw(result.Page, new RectangleF(0,
    result.Bounds.Bottom + 10, font.MeasureString(text).Width,
    page.GetClientSize().Height));
}
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Set the compression level to best
document.Compression = PdfCompressionLevel.Best
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Set the font.
Dim font As PdfFont = New PdfStandardFont(PdfFontFamily.Helvetica, 20)
Dim text As String = "Hello World!!!"
Dim textElement As New PdfTextElement(text, font)
Dim result As PdfLayoutResult = textElement.Draw(page, New RectangleF(0, 0,
font.MeasureString(text).Width, page.GetClientSize().Height))
For i As Integer = 0 To 999
    result = textElement.Draw(result.Page, New RectangleF(0,
    result.Bounds.Bottom + 10, font.MeasureString(text).Width,
    page.GetClientSize().Height))
Next
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)
```

You can compress the existing PDF document by using the following code snippet.

C#

```
//Load the PDF document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = false;
//Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best;
//Save and close the document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load the PDF document
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = False
'Set the compression level
loadedDocument.Compression = PdfCompressionLevel.Best
'Save and close the document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

Compressing images

Essential PDF allows you to compress/change the quality of the image in the PDF document by using the following code snippet.

C#

```
//Create a new PDF document.
PdfDocument document = new PdfDocument();
//Add a page to the document.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
PdfBitmap image = new PdfBitmap("Input.jpg");
//Reduce the quality of the image
image.Quality = 50;
image.Draw(page, new PointF(0, 0));
//Save the document.
document.Save("Output.pdf");
//Close the document.
document.Close(true);
```

VB.NET

```
'Create a new PDF document.
Dim document As New PdfDocument()
'Add a page to the document.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
Dim image As New PdfBitmap("Input.jpg")
'Reduce the quality of the image
```

```

image.Quality = 50
image.Draw(page, New PointF(0, 0))
'Save the document.
document.Save("Output.pdf")
'Close the document.
document.Close(True)

```

You can compress the images in the existing PDF document by using the following code snippet.

C#

```

//Load the PDF document which c images
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = false;
//iterate all the pages to replace images
foreach (PdfPageBase page in loadedDocument.Pages)
{
    //Extract the images from the document
    Image[] extractedImages = page.ExtractImages();
    //Iterate all the image
    for (int j = 0; j < extractedImages.Count(); j++)
    {
        PdfBitmap image = new PdfBitmap(extractedImages[j]);
        //reduce the quality of the image
        image.Quality = 50;
        //replace the compressed image with old image in the PDF document
        page.ReplaceImage(j, image);
    }
}
//Save and close the document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);

```

VB.NET

```

'Load the PDF document which consist of images
Dim loadedDocument As New PdfLoadedDocument("Input.pdf")
'Disable the incremental update
loadedDocument.FileStructure.IncrementalUpdate = False
'iterate all the pages to replace images
For Each page As PdfPageBase In loadedDocument.Pages
    'Extract the images from the document
    Dim extractedImages As Image() = page.ExtractImages()
    'Iterate all the image
    For j As Integer = 0 To extractedImages.Count() - 1
        Dim image As New PdfBitmap(extractedImages(j))
        'reduce the quality of the image
        image.Quality = 50
        'replace the compressed image with old image in the PDF document
        page.ReplaceImage(j, image)
    Next
Next
'Save and close the document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)

```

Working with PDF Conformance

The Essential PDF currently supports the following PDF conformances:

- PDF/A-1a conformance
- PDF/A-1b conformance
- PDF/X-1a conformance
- PDF/A-2a conformance
- PDF/A-2b conformance
- PDF/A-2u conformance
- PDF/A-3a conformance
- PDF/A-3b conformance
- PDF/A-3u conformance

Note: 1. To know more details about PDF/A standard refer

<https://en.wikipedia.org/wiki/PDF/A#Description>

2. To know more details about PDF/X standard refer <https://en.wikipedia.org/wiki/PDF/X>

Note: Essential PDF supports PDF conformances only in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms.

PDF/A-1b conformance

You can create a PDF/A-1b document by specifying the conformance level as Pdf_A1B through PdfConformanceLevel Enum when creating the new PDF document, as shown below.

C#

```
//Create a new document with PDF/A-1b standard.
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A1B);
//Add a page.
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Color.Black);
Font font = new Font("Arial", 20f, FontStyle.Regular);
//Set the font.
PdfFont pdfFont = new PdfTrueTypeFont(font, FontStyle.Regular, 12, false,
true);
//Draw the text.
graphics.DrawString("Hello world!", pdfFont, brush, new PointF(20, 20));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document with PDF/A-1b standard.
Dim document As New PdfDocument(PdfConformanceLevel.Pdf_A1B)
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page.
```

```

Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush.
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
Dim font As New Font("Arial", 20.0F, FontStyle.Regular)
'Set the font.
Dim pdfFont As PdfFont = New PdfTrueTypeFont(font, FontStyle.Regular, 12,
False, True)
'Draw the text.
graphics.DrawString("Hello world!", pdfFont, brush, New PointF(20, 20))
'Save and close the document.
document.Save("Output.pdf")
document.Close(True)

```

UWP

```

//Create a new document with PDF/A-1b standard
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A1B);
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TrueType font from the local file
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Arial.ttf");
//Initialize the PDF TrueType font
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document into memory stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respected code samples
Save(stream, "Output.pdf");

```

ASP.NET CORE

```

//Create a new document with PDF/A-1b standard
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A1B);
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TrueType font from the local file
FileStream fontStream = new FileStream("Arial.ttf", FileMode.Open,
FileAccess.Read);
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Creating the stream object
MemoryStream stream = new MemoryStream();

```

```
//Save the document into memory stream
document.Save(stream);
//If the position is not set to '0', then the PDF will be empty
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new document with PDF/A-1b standard

PDF/A-2b conformance

You can create a PDF/A-2b document by specifying the conformance level as Pdf_A2B through [PdfConformanceLevel](#) Enum when creating the new PDF document as follows.

C#

```

//Create a new document with PDF/A-2b standard
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A2B);
//Add a page
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a solid brush
PdfBrush brush = new PdfSolidBrush(Color.Black);
Font font = new Font("Arial", 20f, FontStyle.Regular);
//Set the font
PdfFont pdfFont = new PdfTrueTypeFont(font, FontStyle.Regular, 12, false,
true);
//Draw the text
graphics.DrawString("Hello world!", pdfFont, brush, new PointF(20, 20));
//Save and close the document
document.Save("Output.pdf");
document.Close(true);

```

VB.NET

```

'Create a new document with PDF/A-2b standard
Dim document As New PdfDocument(PdfConformanceLevel.Pdf_A2B)
'Add a page
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
Dim font As New Font("Arial", 20.0F, FontStyle.Regular)
'Set the font
Dim pdfFont As PdfFont = New PdfTrueTypeFont(font, FontStyle.Regular, 12,
False, True)
'Draw the text
graphics.DrawString("Hello world!", pdfFont, brush, New PointF(20, 20))
'Save and close the document
document.Save("Output.pdf")
document.Close(True)

PDF/A-3b conformance

The PDF/A-3b conformance supports the external files as attachment to the PDF document, so you can attach any document format such as Excel, Word, HTML, CAD, or XML files.

You can create a PDF/A-3b document by specifying the conformance level as Pdf_A3B through [PdfConformanceLevel](#) Enum when creating the new PDF document as follows.

C#

```

//Create a new document with PDF/A-3b standard
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
//Add a page
PdfPage page = document.Pages.Add();
//Creates an attachment
PdfAttachment attachment = new PdfAttachment("Input.txt");
attachment.Relationship = PdfAttachmentRelationship.Alternative;
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
//Adds the attachment to the document
document.Attachments.Add(attachment);
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a solid brush
PdfBrush brush = new PdfSolidBrush(Color.Black);
Font font = new Font("Arial", 20f, FontStyle.Regular);
//Set the font
PdfFont pdfFont = new PdfTrueTypeFont(font, FontStyle.Regular, 12, false,
true);
//Draw the text
graphics.DrawString("Hello world!", pdfFont, brush, new PointF(20, 20));
//Save and close the document
document.Save("Output.pdf");

```

```
document.Close(true);
```

VB.NET

```
'Create a new document with PDF/A-3b standard
Dim document As New PdfDocument(PdfConformanceLevel.Pdf_A3B)
'Add a page
Dim page As PdfPage = document.Pages.Add()
'Creates an attachment
Dim attachment As New PdfAttachment("Input.txt")
attachment.Relationship = PdfAttachmentRelationship.Alternative
attachment.ModificationDate = DateTime.Now
attachment.Description = "Input.txt"

}
```

PDF/A-2u conformance

PDF/A-2u conformance includes all PDF/A-2b requirements, and additionally Unicode mapping for all text in the document.

You can create a PDF/A-2u document by specifying the conformance level as Pdf_A2U through [PdfConformanceLevel](#) Enum when creating the new PDF document as follows.

C#

```
//Create a new document with PDF/A-2u standard
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A2U);
//Add a page
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Create a solid brush
PdfBrush brush = new PdfSolidBrush(Color.Black);
Font font = new Font("Arial", 20f, FontStyle.Regular);
//Set the font
PdfFont pdfFont = new PdfTrueTypeFont(font, FontStyle.Regular, 12, false,
true);
//Draw the text
graphics.DrawString("Hello world!", pdfFont, brush, new PointF(20, 20));
//Save and close the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document with PDF/A-2u standard
Dim document As New PdfDocument(PdfConformanceLevel.Pdf_A2U)
'Add a page
Dim page As PdfPage = document.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
Dim font As New Font("Arial", 20.0F, FontStyle.Regular)
'Set the font
Dim pdfFont As PdfFont = New PdfTrueTypeFont(font, FontStyle.Regular, 12,
False, True)
```

```
'Draw the text
graphics.DrawString("Hello world!", pdfFont, brush, New PointF(20, 20))
'Save and close the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new document with PDF/A-2u standard
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A2U);
//Add a page to the document
PdfPage page = document.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TrueType font from the local file
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.Arial.ttf");
//Initialize the PDF TrueType font
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new PointF(0,
0));
//Save the document into memory stream
MemoryStream stream = new MemoryStream();
await document.SaveAsync(stream);
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(stream, "Output.pdf");
```

attachment.Relationship = PdfAttachmentRelationship.Alternative;
attachment.ModificationDate = DateTime.Now;
attachment.Description = "Input.txt";
attachment.MimeType = "application/txt";
//Adds the attachment to the document
document.Attachments.Add(attachment);
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the TrueType font
Stream fontStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Arial.ttf");
//Initialize the PDF TrueType font
PdfFont font = new PdfTrueTypeFont(fontStream, 14);
//Draw the text
graphics.DrawString("Hello World!!!", font, PdfBrushes.Black, new
Syncfusion.Drawing.PointF(0, 0));
//Save the document into memory stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{

```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

PDF/X-1a conformance

You can create a PDF/X-1a document by specifying the conformance level as Pdf_X1A2001 through PdfConformanceLevel Enum when creating the new PDF document, as shown below.

C#

```
//Create a new document with PDF/x standard.
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_X1A2001);
//Add a page.
PdfPage page = document.Pages.Add();
document.ColorSpace = PdfColorSpace.CMYK;
//Create Pdf graphics for the page.
PdfGraphics graphics = page.Graphics;
//Create a solid brush.
PdfBrush brush = new PdfSolidBrush(Color.Black);
Font font = new Font("Arial", 20f, FontStyle.Regular);
//Set the font.
PdfFont pdfFont = new PdfTrueTypeFont(font, FontStyle.Regular, 12, false,
true);
//Draw the text.
graphics.DrawString("Hello world!", pdfFont, brush, new PointF(20, 20));
//Save and close the document.
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document with PDF/x standard.
Dim document As New PdfDocument(PdfConformanceLevel.Pdf_X1A2001)
'Add a page.
Dim page As PdfPage = document.Pages.Add()
'set ColorSpace
document.ColorSpace = PdfColorSpace.CMYK
'Create Pdf graphics for the page.
Dim graphics As PdfGraphics = page.Graphics
'Create a solid brush.
Dim brush As PdfBrush = New PdfSolidBrush(Color.Black)
Dim font As New Font("Arial", 20.0F, FontStyle.Regular)
'Set the font.
Dim pdfFont As PdfFont = New PdfTrueTypeFont(font, FontStyle.Regular, 12,
False, True)
'Draw the text.
graphics.DrawString("Hello world!", font, brush, New PointF(20, 20))
'Save and close the document.
document.Save("Output.pdf")
document.Close(True)
```

PDF to PDF/A-1b conversion

An existing PDF document can be converted to PDF/A-1b conformance document, by setting the [Conformance](#) value in the [PdfLoadedDocument](#) to Pdf_A1B of [PdfConformanceLevel](#). Refer the below code snippet to achieve the same.

C#

```
//Load an existing PDF.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Set the conformance for PDF/A-1b conversion.
loadedDocument.Conformance = PdfConformanceLevel.Pdf_A1B;
//Save and close the document.
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load an existing PDF.
Dim document As New PdfLoadedDocument("Input.pdf")
'Set the conformance for PDF/A-1b conversion.
loadedDocument.Conformance = PdfConformanceLevel.Pdf_A1B
'Save and close the document.
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

Note: 1. Converting PDF to PDF/X-1a conformance document is not supported.

2. CMYK color space images and symbolic fonts are not supported.

Working with ZUGFeRD invoice

The ZUGFeRD invoice is one of the uniformed data format for electronic invoices based on the ISO standard PDF/A-3, which is specifically designed for long term archiving. The ZUGFeRD invoice contains both human-readable invoice and machine-readable structured invoice data (XML).

The Essential PDF provides support to create PDF document with ZUGFeRD invoice.

Generating ZUGFeRD invoice

The Essential PDF has support to create PDF document with PDF/A-3b conformance, which allow to add external file to the PDF document as attachment.

The ZUGFeRD has two versions, ZugferdVersion 1.0 and ZugferdVersion 2.0. The Zugferd 2.0 is an updated version of Zugferd 1.0.

The ZUGFeRD has five conformance levels

- Basic: Represents the structured data for simple invoices. Additional information can be included as free text.
- Comfort: Represents the structured data for fully automated invoice processing.
- Extended: Represents the additional structured data for exchanging invoice across different industry segments.
- Minimum: Represents the basic invoice details compatible with the French Standard Factur-X.

- EN16931: Represents the fully compliant with the EU Standard, though it only defines the core elements of an invoice.

Note: * The ZUGFeRD conformance levels “Minimum” and “EN16931” are only supported in ZugferdVersion2.0.

Using PDF/A-3b conformance, you can create a ZUGFeRD invoice.

C#

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic;
```

VB.NET

```
'Create ZUGFeRD invoice PDF
Dim document As PdfDocument = New PdfDocument(PdfConformanceLevel.Pdf_A3B)
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic
```

UWP

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic;
```

ASP.NET CORE

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic;
```

XAMARIN

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic;
```

Using PDF/A-3b conformance, you can create a ZUGFeRD invoice with ZugferdVersion2.0. By default, ZugferdVersion1.0 used.

C#

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
//Specifies ZugferdVersion
document.ZugferdVersion = ZugferdVersion.ZugferdVersion2_0;
```

VB.NET

```
'Create ZUGFeRD invoice PDF
Dim document As PdfDocument = New PdfDocument(PdfConformanceLevel.Pdf_A3B)
'Specifies ZugferdVersion
document.ZugferdVersion = ZugferdVersion.ZugferdVersion2_0
```

UWP

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
//Specifies ZugferdVersion
document.ZugferdVersion = ZugferdVersion.ZugferdVersion2_0;
```

ASP.NET CORE

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
//Specifies ZugferdVersion
document.ZugferdVersion = ZugferdVersion.ZugferdVersion2_0;
```

XAMARIN

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
//Specifies ZugferdVersion
document.ZugferdVersion = ZugferdVersion.ZugferdVersion2_0;
```

Adding ZUGFeRD structured data as attachment

The PDF/A-3 conformance supports the external files as attachment to the PDF document, so you can attach the ZUGFeRD data as attachment to the PDF document.

C#

```
//Creates an attachment
FileStream invoiceStream = new FileStream("../.. / Data / ZUGFeRD -
invoice.xml", FileMode.Open, FileAccess.Read);
PdfAttachment attachment = new PdfAttachment("ZUGFeRD-
invoice.xml", invoiceStream);
attachment.Relationship = PdfAttachmentRelationship.Alternative;
attachment.ModificationDate = DateTime.Now;
attachment.Description = "ZUGFeRD-invoice";
attachment.MimeType = "application/xml";
document.Attachments.Add(attachment);
```

VB.NET

```
'Creates an attachment
Dim invoiceStream As FileStream = New FileStream("../.. / Data / ZUGFeRD -
invoice.xml", FileMode.Open, FileAccess.Read)
Dim attachment As PdfAttachment = New PdfAttachment("ZUGFeRD-invoice.xml",
invoiceStream)
attachment.Relationship = PdfAttachmentRelationship.Alternative
attachment.ModificationDate = DateTime.Now
attachment.Description = "ZUGFeRD-invoice"
attachment.MimeType = "application/xml"
document.Attachments.Add(attachment)
```

UWP

```
//Creates an attachment
Stream invoiceStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.ZUGFeRD-invoice.xml");
PdfAttachment attachment = new PdfAttachment("ZUGFeRD-
invoice.xml", invoiceStream);
attachment.Relationship = PdfAttachmentRelationship.Alternative;
attachment.ModificationDate = DateTime.Now;
attachment.Description = "ZUGFeRD-invoice";
attachment.MimeType = "application/xml";
document.Attachments.Add(attachment);
```

ASP.NET CORE

```
//Creates an attachment
FileStream fontStream = new FileStream("../.. / Data / ZUGFeRD -
invoice.xml", FileMode.Open, FileAccess.Read);
PdfAttachment attachment = new PdfAttachment("ZUGFeRD-
invoice.xml", invoiceStream);
attachment.Relationship = PdfAttachmentRelationship.Alternative;
attachment.ModificationDate = DateTime.Now;
attachment.Description = "ZUGFeRD-invoice";
attachment.MimeType = "application/xml";
document.Attachments.Add(attachment);
```

XAMARIN

```
//Creates an attachment
Stream invoiceStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.Data.ZUGFeRD-invoice.xml");
PdfAttachment attachment = new PdfAttachment("ZUGFeRD-
invoice.xml", invoiceStream);
attachment.Relationship = PdfAttachmentRelationship.Alternative;
attachment.ModificationDate = DateTime.Now;
attachment.Description = "ZUGFeRD-invoice";
attachment.MimeType = "application/xml";
document.Attachments.Add(attachment);
```

Note: * As per the ZUGFeRD standard guidelines, the XML name must be ZUGFeRD-invoice.xml.

Complete code

The complete code snippet is given as follows.

C#

```
//Create ZUGFeRD invoice PDF
PdfDocument document = new PdfDocument(PdfConformanceLevel.Pdf_A3B);
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic;
//Creates an attachment
FileStream invoiceStream = new FileStream("../.. / Data / ZUGFeRD -
invoice.xml", FileMode.Open, FileAccess.Read);
PdfAttachment attachment = new PdfAttachment("ZUGFeRD-
invoice.xml", invoiceStream);
attachment.Relationship = PdfAttachmentRelationship.Alternative;
```

```
attachment.ModificationDate = DateTime.Now;
attachment.Description = "ZUGFeRD-invoice";
attachment.MimeType = "application/xml";
document.Attachments.Add(attachment);
// Save and close the document
document.Save("Zugferd.pdf");
document.Close(true);
```

VB.NET

```
'Create ZUGFeRD invoice PDF
Dim document As PdfDocument = New PdfDocument(PdfConformanceLevel.Pdf_A3B)
document.ZugferdConformanceLevel = ZugferdConformanceLevel.Basic
'Creates an attachment
Dim invoiceStream As FileStream = New FileStream("../.. / Data / ZUGFeRD -
invoice.xml", FileMode.Open, FileAccess.Read)

document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Zugferd.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Zugferd.pdf",
"application/pdf", stream);
}

```

```
}

```

Extract ZUGFeRD invoice from PDF

You can extract the ZUGFeRD invoice using the following code.

C#

```
//Loads the PDF document
PdfLoadedDocument document = new PdfLoadedDocument("Sample.pdf");
//Iterates the attachments
foreach (PdfAttachment attachment in document.Attachments)
{
    //Extracts the ZUGFeRD invoice attachment and saves it to the disk
    FileStream s = new FileStream(attachment.FileName, FileMode.Create);
    s.Write(attachment.Data, 0, attachment.Data.Length);
    s.Dispose();
}
//Saves and closes the document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Loads the PDF document
Dim document As New PdfLoadedDocument("Sample.pdf")
'Iterates the attachments
For Each attachment As PdfAttachment In document.Attachments
    'Extracts the attachment and saves it to the disk
    Dim s As New FileStream(attachment.FileName, FileMode.Create)
    s.Write(attachment.Data, 0, attachment.Data.Length)
    s.Dispose()
Next
'Saves and closes the document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create the file open picker
var picker = new FileOpenPicker();
picker.FileTypeFilter.Add(".pdf");
//Browse and chose the file
StorageFile file = await picker.PickSingleFileAsync();
//Creates an empty PDF loaded document instance
PdfLoadedDocument loadedDocument = new PdfLoadedDocument();
//Loads or opens an existing PDF document through Open method of PdfLoadedDocument class
await loadedDocument.OpenAsync(file);
//Iterates the attachments
foreach (PdfAttachment attachment in loadedDocument.Attachments)
{
    //Extracts the ZUGFeRD invoice attachment and saves it to the disk
    FileStream s = new FileStream(attachment.FileName, FileMode.Create);
    s.Write(attachment.Data, 0, attachment.Data.Length);
    s.Dispose();
}
```

```

}
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await loadedDocument.SaveAsync(stream);
//Close the document
loadedDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "output.pdf");

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Iterates the attachments
foreach (PdfAttachment attachment in loadedDocument.Attachments)
{
//Extracts the ZUGFeRD invoice attachment and saves it to the disk
FileStream s = new FileStream(attachment.FileName, FileMode.Create);
s.Write(attachment.Data, 0, attachment.Data.Length);
s.Dispose();
}
//Save the document into stream
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Closes the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Iterates the attachments
foreach (PdfAttachment attachment in loadedDocument.Attachments)
{
//Extracts the ZUGFeRD invoice attachment and saves it to the disk
FileStream s = new FileStream(attachment.FileName, FileMode.Create);
s.Write(attachment.Data, 0, attachment.Data.Length);
s.Dispose();
}
//Save the document into stream.
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);

```

```
//Close the document.
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("output.pdf",
"application/pdf", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("output.pdf",
"application/pdf", stream);
}
```

Validating ZUGFeRD invoices using Adobe Acrobat

The ZUGFeRD invoices can be validated as follows:

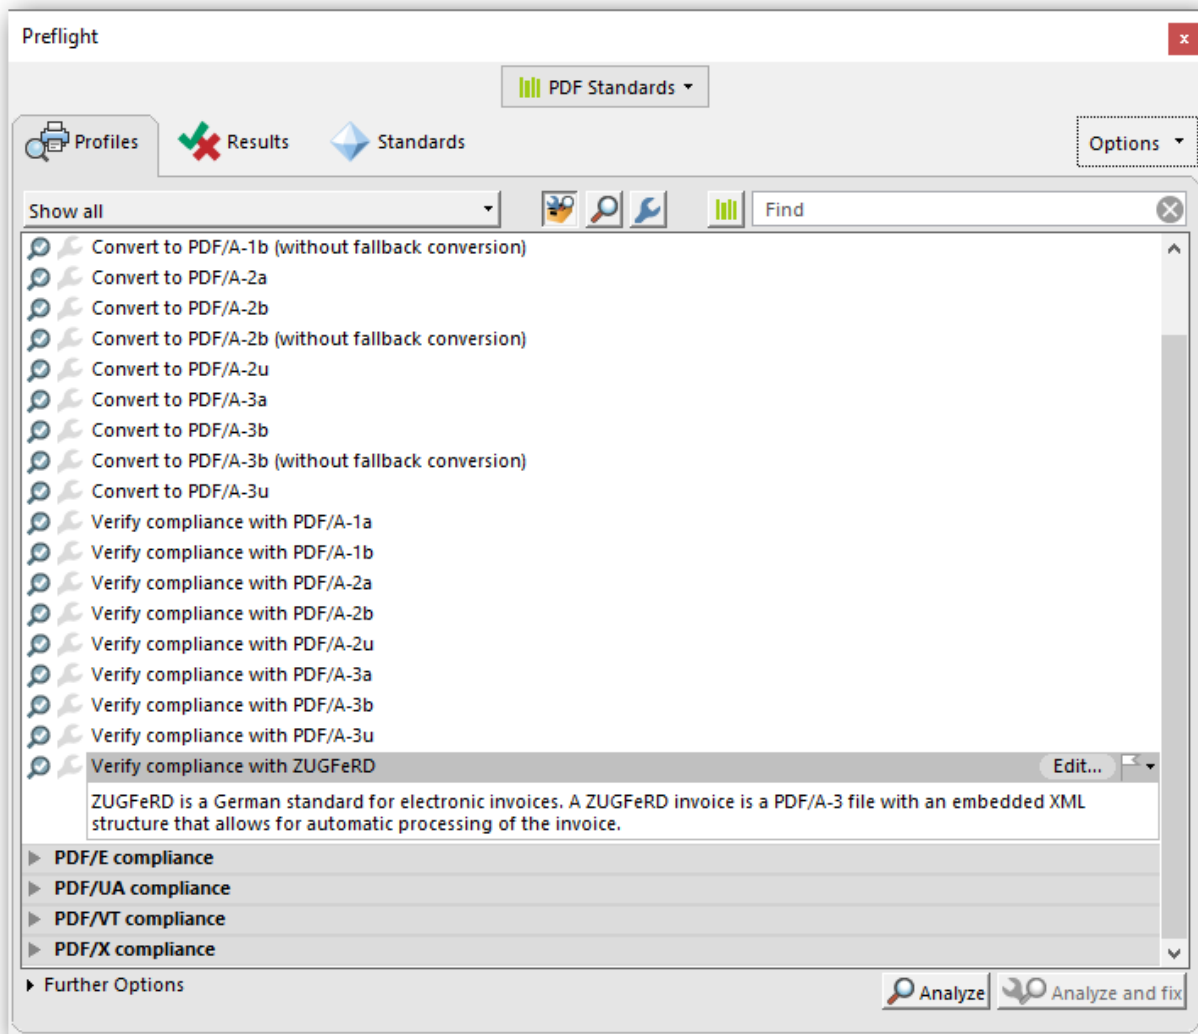

1. Conformance to the PDF/A-3b standard can be checked with Preflight function in Adobe acrobat.
 - Open the PDF and choose Tools > Print Production > Preflight in the right pane.
 - Select the PDF/A-3b profile and click the Analyze button.

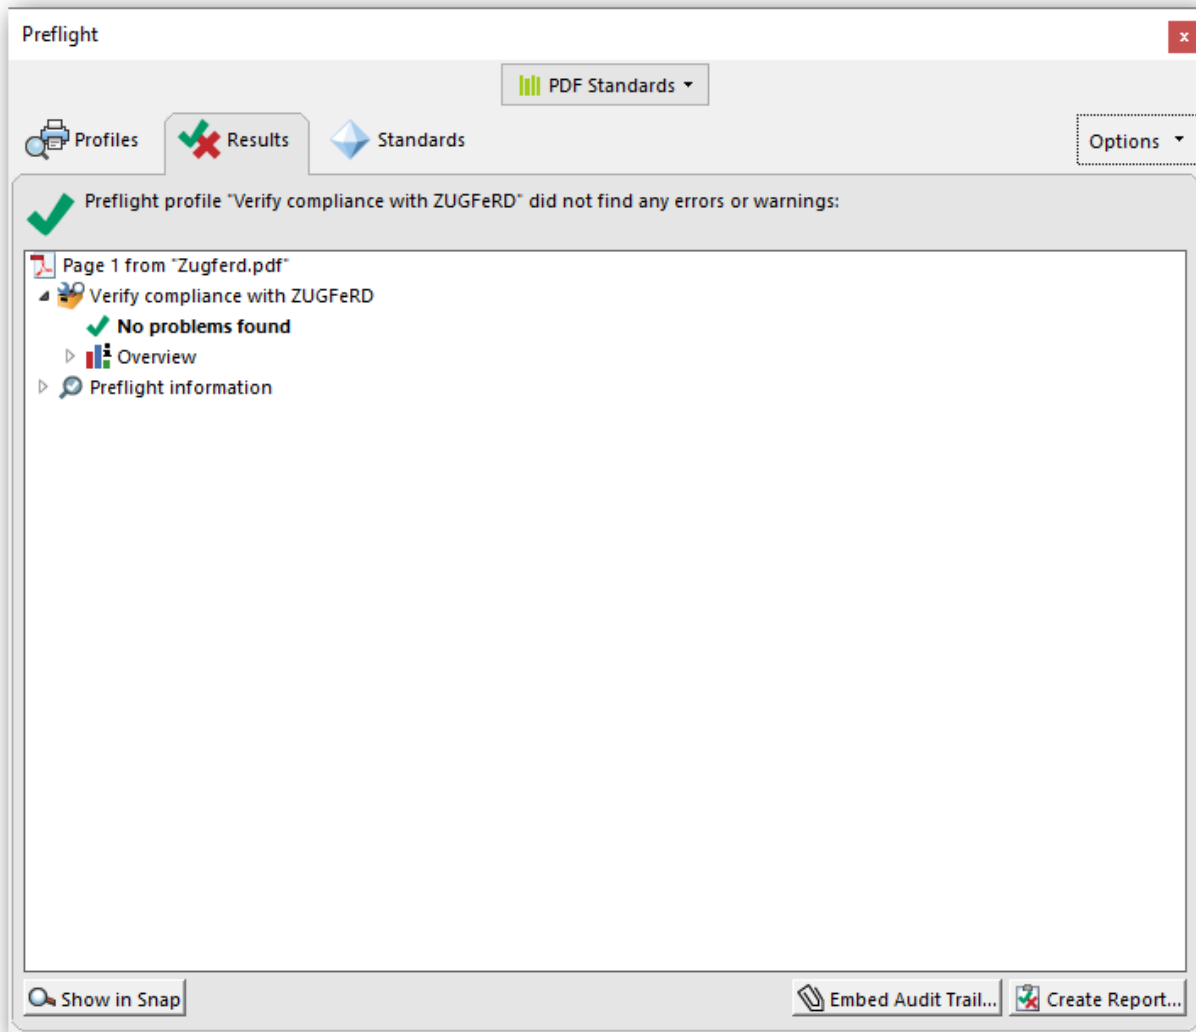

- Check the result

2. Conformance to the ZUGFeRD invoice can be checked as follows: *Open the PDF and choose Tools > Print Production > Preflight in the right pane.* Select the ZUGFeRD profile and click the Analyze button.

- Check the result

Working with Metadata (XMP)

Metadata is a data that describes the characteristics or properties of a document.

Metadata includes document information properties such as author, modification date, and copyright status.

Working with the XMP metadata

In order to work multiple applications effectively with metadata, there must be a common standard that they understand. XMP-the Extensible Metadata Platform is designed to provide such a standard.

XMP standardizes the definition, creation, and processing of metadata.

Adding XMP metadata in a PDF document

You can add XMP metadata in a PDF document using [XmpMetadata](#) class as shown in the code snippet below.

C#

```
//Create a PDF document  
PdfDocument pdfDoc = new PdfDocument();
```

```

//Create a page
PdfPage page = pdfDoc.Pages.Add();
//Get XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//save the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);

```

VB.NET

```

'Create a PDF document
Dim pdfDoc As New PdfDocument()
'Create a page
Dim page As PdfPage = pdfDoc.Pages.Add()
'Get XMP object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP Basic Schema
Dim basic As BasicSchema = metaData.BasicSchema
'set the basic details of the document
basic.Advisory.Add("advisory")
basic.BaseURL = New Uri("http://google.com")
basic.CreateDate = DateTime.Now
basic.CreatorTool = "creator tool"
basic.Identifier.Add("identifier")
basic.Label = "label"
basic.MetadataDate = DateTime.Now
basic.ModifyDate = DateTime.Now
basic.Nickname = "nickname"
basic.Rating.Add(-25)
'save the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)

```

UWP

```

//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms

```

ASP.NET CORE

```

//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();

```

```
//Create a page
PdfPage page = pdfDoc.Pages.Add();
//Get XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//Set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentInformation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();
//Create a page
PdfPage page = pdfDoc.Pages.Add();
//Get XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//Set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
pdfDoc.Save(memoryStream);
//Close the documents
```

```
pdfDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DocumentInfor
mation.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentInformation.pdf",
"application/pdf", memoryStream);
}
```

Adding XMP metadata in an existing PDF document

You can add metadata in an existing PDF document using [XmpMetadata](#) class, as follows.

C#

```
//Load the document
PdfLoadedDocument pdfDoc = new PdfLoadedDocument("input.pdf");
// Get XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
// XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//save the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Load the document
Dim pdfDoc As New PdfLoadedDocument("input.pdf")
'Get metaData object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP Basic Schema
Dim basic As BasicSchema = metaData.BasicSchema
'Set the basic details of the document
basic.Advisory.Add("advisory")
basic.BaseURL = New Uri("http://google.com")
basic.CreateDate = DateTime.Now
basic.CreatorTool = "creator tool"
```

```

basic.Identifier.Add("identifier")
basic.Label = "label"
basic.MetadataDate = DateTime.Now
basic.ModifyDate = DateTime.Now
basic.Nickname = "nickname"
basic.Rating.Add(-25)
'Save the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)

```

UWP

```

//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and Xamarin platforms

```

ASP.NET CORE

```

//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument pdfDoc = new PdfLoadedDocument(docStream);
//Get XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//Set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document.
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentInformation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Load the file as stream

```

```

Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument pdfDoc = new PdfLoadedDocument(docStream);
//Get XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//Set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
pdfDoc.Save(memoryStream);
//Close the documents
pdfDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DocumentInfor
mation.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentInformation.pdf",
"application/pdf", memoryStream);
}

```

Supported Schema types

XMP is provided with the following schemas:

- Basic Schema
- Dublin Core Schema
- Rights Management Schema
- Basic Job Ticket Schema
- Paged-Text Schema
- PDF Schema

Basic Schema

Basic Schema contains properties that provide basic descriptive information such as,

- Base URL
- Creation date
- Creator tool
- Label
- Modified date.
- Meta data date
- Nickname
- Rating

[BasicSchema](#) class is used to create the basic schema properties.

Refer the following code sample to create XMP basic schema.

C#

```
//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();
//Create a page
PdfPage page = pdfDoc.Pages.Add();
//Get metaData object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//Set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//Save the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Create a PDF document
Dim pdfDoc As New PdfDocument()
'Create a page
Dim page As PdfPage = pdfDoc.Pages.Add()
'Get metaData object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP Basic Schema
Dim basic As BasicSchema = metaData.BasicSchema
'Set the basic details of the document
basic.Advisory.Add("advisory")
basic.BaseURL = New Uri("http://google.com")
basic.CreateDate = DateTime.Now
basic.CreatorTool = "creator tool"
basic.Identifier.Add("identifier")
basic.Label = "label"
```

```

basic.MetadataDate = DateTime.Now
basic.ModifyDate = DateTime.Now
basic.Nickname = "nickname"
basic.Rating.Add(-25)
'Save the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)

```

UWP

//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms

ASP.NET CORE

```

//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();
//Create a page
PdfPage page = pdfDoc.Pages.Add();
//Get metaData object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Basic Schema
BasicSchema basic = metaData.BasicSchema;
//Set the basic details of the document
basic.Advisory.Add("advisory");
basic.BaseURL = new Uri("http://google.com");
basic.CreateDate = DateTime.Now;
basic.CreatorTool = "creator tool";
basic.Identifier.Add("identifier");
basic.Label = "label";
basic.MetadataDate = DateTime.Now;
basic.ModifyDate = DateTime.Now;
basic.Nickname = "nickname";
basic.Rating.Add(-25);
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";

mation.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentInformation.pdf",
"application/pdf", memoryStream);
}

```

Dublin Core Schema

The Dublin Core schema provides a set of commonly used properties such as,

- Contributor
- Coverage
- Creator
- Date
- Description
- Format
- Language
- Publisher
- Title

[DublinCoreSchema](#) class is used to create the Dublin core schema properties.

C#

```

//Create new PDF document
PdfDocument pdfDoc = new PdfDocument();

```

```

PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Dublin core Schema
DublinCoreSchema dublin = metaData.DublinCoreSchema;
//Set the Dublin Core Schema details of the document
dublin.Creator.Add("Syncfusion");
dublin.Description.Add("Title", "Essential PDF creator");
dublin.Title.Add("Resource name", "Documentation");
dublin.Type.Add("PDF");
dublin.Publisher.Add("Essential PDF");
//Saves the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);

```

VB.NET

```

'Create new PDF document
Dim pdfDoc As New PdfDocument()
Dim page As PdfPage = pdfDoc.Pages.Add()
'Gets XMP object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP Dublin core Schema
Dim dublin As DublinCoreSchema = metaData.DublinCoreSchema
'Set the Dublin Core Schema details of the document
dublin.Creator.Add("Syncfusion")
dublin.Description.Add("Title", "Essential PDF creator")
dublin.Title.Add("Resource name", "Documentation")
dublin.Type.Add("PDF")
dublin.Publisher.Add("Essential PDF")
'Saves the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)

```

UWP

```

//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms

```

"application/pdf", memoryStream);
}

```

Rights Management Schema

This schema includes properties related to rights management. These properties provide information regarding the legal restrictions associated with a resource.

- Certificate

- Marked
- Owner
- UsageTerm
- WebStatement

[RightsManagementSchema](#) class is used to create the Rights management schema properties.

C#

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Rights Management Schema
RightsManagementSchema rights = metaData.RightsManagementSchema;
//Set the Rights Management Schema details of the document
rights.Certificate = new Uri("http://syncfusion.com");
rights.Owner.Add("Syncfusion");
rights.Marked = true;
//Save and close the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Create PDF document
Dim pdfDoc As New PdfDocument()
Dim page As PdfPage = pdfDoc.Pages.Add()
'Gets XMP object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP Rights Management Schema
Dim rights As RightsManagementSchema = metaData.RightsManagementSchema
'Set the Rights Management Schema details of the document
rights.Certificate = New Uri("http://syncfusion.com")
rights.Owner.Add("Syncfusion")
rights.Marked = True
'Save and close the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)
```

UWP

```
//Essential PDF does not support Metadata (XMP) in UWP platform
```

ASP.NET CORE

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Rights Management Schema
RightsManagementSchema rights = metaData.RightsManagementSchema;
//Set the Rights Management Schema details of the document
```

```

rights.Certificate = new Uri("http://syncfusion.com");
rights.Owner.Add("Syncfusion");
rights.Marked = true;
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentInformation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

}
```

Paged-Text Schema

The Paged-Text schema is used for text appearance on page in a document.

- MaxPageSize
- NPages
- Colorants
- PlateNames

[PagedTextSchema](#) class is used for creating Paged-Text schema properties.

C#

```

//Create a Pdf document
PdfDocument pdfDoc = new PdfDocument();
//Create a Page
PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP Page text Schema
PagedTextSchema pagedText = metaData.PagedTextSchema;
//Sets the Page text Schema details of the document
pagedText.MaxPageSize.Width = 500;
pagedText.MaxPageSize.Height = 750;
pagedText.NPages = 1;
pagedText.PlateNames.Add("Sample page");
//Saves the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);

```

VB.NET

```

'Create a Pdf document
Dim pdfDoc As New PdfDocument()
'Create a Page
Dim page As PdfPage = pdfDoc.Pages.Add()
'Gets XMP object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP Page text Schema
Dim pagedText As PagedTextSchema = metaData.PagedTextSchema
'Sets the Page text Schema details of the document
pagedText.MaxPageSize.Width = 500
pagedText.MaxPageSize.Height = 750
pagedText.NPages = 1
pagedText.PlateNames.Add("Sample page")
'Saves the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)

```

UWP

```

//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms

```

ASP.NET CORE

```

PDF schema

This schema specifies properties used with Adobe PDF documents.

[PDFSchema](#) class is used to create the PDF Schema. It has the following set of properties.

C#

```
//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();
//Add a page
PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP PDF Schema
PDFSchema pdfSchema = metaData.PDFSchema;
//Set the PDF Schema details of the document
pdfSchema.Producer = "Syncfusion";
pdfSchema.PDFVersion = "1.5";
pdfSchema.Keywords = "Essential PDF";
//Save and Close the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Create a PDF document
Dim pdfDoc As New PdfDocument()
'Add a page
Dim page As PdfPage = pdfDoc.Pages.Add()
'Gets XMP object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'XMP PDF Schema
Dim pdfSchema As PDFSchema = metaData.PDFSchema
'Set the PDF Schema details of the document
pdfSchema.Producer = "Syncfusion"
pdfSchema.PDFVersion = "1.5"
pdfSchema.Keywords = "Essential PDF"
'Save and Close the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)
```

UWP

```
//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and Xamarin platforms
```

ASP.NET CORE

```
//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();
//Add a page
PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP PDF Schema
PDFSchema pdfSchema = metaData.PDFSchema;
//Set the PDF Schema details of the document
pdfSchema.Producer = "Syncfusion";
pdfSchema.PDFVersion = "1.5";
pdfSchema.Keywords = "Essential PDF";
```

```
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentInformation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a PDF document
PdfDocument pdfDoc = new PdfDocument();
//Add a page
PdfPage page = pdfDoc.Pages.Add();
//Gets XMP object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//XMP PDF Schema
PDFSchema pdfSchema = metaData.PDFSchema;
//Set the PDF Schema details of the document
pdfSchema.Producer = "Syncfusion";
pdfSchema.PDFVersion = "1.5";
pdfSchema.Keywords = "Essential PDF";
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
pdfDoc.Save(memoryStream);
//Close the documents
pdfDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DocumentInfor
mation.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentInformation.pdf",
"application/pdf", memoryStream);
}
```

Custom Schema

A custom schema defines the structure of the customized information records. You can use the [CustomSchema](#) class to:

- Define custom metadata files and,

- Add them to the PDF document

Add the following code to define a custom schema.

C#

```
//Create Pdf document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Get metaData object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//Create custom schema field
CustomSchema customSchema = new CustomSchema(metaData, "custom",
"http://www.syncfusion.com");
customSchema["Author"] = "Syncfusion";
customSchema["creationDate"] = DateTime.Now.ToString();
customSchema["DOCID"] = "SYNCSAM001";
customSchema["Encryption"] = "Standard";
customSchema["Project"] = "Data processing";
//Save the document
pdfDoc.Save("DocumentInformation.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Create Pdf document
Dim pdfDoc As New PdfDocument()
Dim page As PdfPage = pdfDoc.Pages.Add()
'Get metaData object
Dim metaData As XmpMetadata = pdfDoc.DocumentInformation.XmpMetadata
'Create custom schema field
Dim customSchema As New CustomSchema(metaData, "custom",
"http://www.syncfusion.com")
customSchema("Author") = "Syncfusion"
customSchema("creationDate") = DateTime.Now.ToString()
customSchema("DOCID") = "SYNCSAM001"
customSchema("Encryption") = "Standard"
customSchema("Project") = "Data processing"
'Save the document
pdfDoc.Save("DocumentInformation.pdf")
pdfDoc.Close(True)
```

UWP

```
//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and Xamarin platforms
```

ASP.NET CORE

```
//Create Pdf document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Get metaData object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//Create custom schema field
```

```

CustomSchema customSchema = new CustomSchema(metaData, "custom",
"http://www.syncfusion.com");
customSchema["creationDate"] = DateTime.Now.ToString();
customSchema["DOCID"] = "SYNCSAM001";
customSchema["Encryption"] = "Standard";
customSchema["Project"] = "Data processing";
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "DocumentInformation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create Pdf document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Get metaData object
XmpMetadata metaData = pdfDoc.DocumentInformation.XmpMetadata;
//Create custom schema field
CustomSchema customSchema = new CustomSchema(metaData, "custom",
"http://www.syncfusion.com");
customSchema["creationDate"] = DateTime.Now.ToString();
customSchema["DOCID"] = "SYNCSAM001";
customSchema["Encryption"] = "Standard";
customSchema["Project"] = "Data processing";
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
pdfDoc.Save(memoryStream);
//Close the documents
pdfDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("DocumentInfor
mation.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("DocumentInformation.pdf",
"application/pdf", memoryStream);
}

```

Adding Custom Schema to the PDF document

Essential PDF allows you to add required metadata (custom schema) to a PDF document.

You can add custom schema using [XmpMetadata](#) class. The following code illustrates this.

C#

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Create XML Document container
XmpMetadata metaData = new
XmpMetadata(pdfDoc.DocumentInformation.XmpMetadata.XmlData);
//Create custom schema
CustomSchema customSchema = new CustomSchema(metaData, "custom",
"http://www.syncfusion.com");
customSchema["Author"] = "Syncfusion";
customSchema["creationDate"] = DateTime.Now.ToString();
customSchema["DOCID"] = "SYNCSAM001";
//Save and close the document
pdfDoc.Save("CustomMetaField.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Create PDF document
Dim pdfDoc As New PdfDocument()
Dim page As PdfPage = pdfDoc.Pages.Add()
'Create XML Document container
Dim metaData As New
XmpMetadata(pdfDoc.DocumentInformation.XmpMetadata.XmlData)
'Create custom schema
Dim customSchema As New CustomSchema(metaData, "custom",
"http://www.syncfusion.com")
customSchema("Author") = "Syncfusion"
customSchema("creationDate") = DateTime.Now.ToString()
customSchema("DOCID") = "SYNCSAM001"
'Save and close the document
pdfDoc.Save("CustomMetaField.pdf")
pdfDoc.Close(True)
```

UWP

```
//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and Xamarin platforms
```

ASP.NET CORE

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Create XML Document container
XmpMetadata metaData = new
XmpMetadata(pdfDoc.DocumentInformation.XmpMetadata.XmlData);
//Create custom schema
```

```

CustomSchema customSchema = new CustomSchema(metaData, "custom",
"http://www.syncfusion.com");
customSchema["Author"] = "Syncfusion";
customSchema["creationDate"] = DateTime.Now.ToString();
customSchema["DOCID"] = "SYNCSAM001";
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "CustomMetaField.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
PdfPage page = pdfDoc.Pages.Add();
//Create XML Document container
XmpMetadata metaData = new
XmpMetadata(pdfDoc.DocumentInformation.XmpMetadata.XmlData);
//Create custom schema
CustomSchema customSchema = new CustomSchema(metaData, "custom",
"http://www.syncfusion.com");
customSchema["Author"] = "Syncfusion";
customSchema["creationDate"] = DateTime.Now.ToString();
customSchema["DOCID"] = "SYNCSAM001";
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
pdfDoc.Save(memoryStream);
//Close the documents
pdfDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("CustomMetaFie
ld.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("CustomMetaField.pdf",
"application/pdf", memoryStream);
}

```

Adding Custom Metadata to the PDF document

The custom metadata can be added in PDF document by using the [CustomMetadata](#) property. Refer to the following code.

C#

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
//Add new PDF page
PdfPage page = pdfDoc.Pages.Add();
//Add Custom MetaData
pdfDoc.DocumentInformation.CustomMetadata["ID"] = "IO1";
pdfDoc.DocumentInformation.CustomMetadata["CompanyName"] = "Syncfusion";
pdfDoc.DocumentInformation.CustomMetadata["Key"] = "DocumentKey";
//Save and close the document
pdfDoc.Save("AddCustomField.pdf");
pdfDoc.Close(true);
```

VB.NET

```
'Create PDF document
Dim pdfDoc As New PdfDocument()
'Add new PDF page
Dim page As PdfPage = pdfDoc.Pages.Add()
'Add Custom MetaData
pdfDoc.DocumentInformation.CustomMetadata("ID") = "IO1"
pdfDoc.DocumentInformation.CustomMetadata("CompanyName") = "Syncfusion"
pdfDoc.DocumentInformation.CustomMetadata("Key") = "DocumentKey"
'Save and close the document
pdfDoc.Save("AddCustomField.pdf")
pdfDoc.Close(True)
```

UWP

```
//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and Xamarin platforms
```

ASP.NET CORE

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
//Add new PDF page
PdfPage page = pdfDoc.Pages.Add();
//Add Custom MetaData
pdfDoc.DocumentInformation.CustomMetadata["ID"] = "IO1";
pdfDoc.DocumentInformation.CustomMetadata["CompanyName"] = "Syncfusion";
pdfDoc.DocumentInformation.CustomMetadata["Key"] = "DocumentKey";
//Save and close the document
MemoryStream stream = new MemoryStream();
pdfDoc.Save(stream);
stream.Position = 0;
//Close the document
pdfDoc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
```

```
//Define the file name
string fileName = "AddCustomField.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create PDF document
PdfDocument pdfDoc = new PdfDocument();
//Add new PDF page
PdfPage page = pdfDoc.Pages.Add();
//Add Custom MetaData
pdfDoc.DocumentInformation.CustomMetadata["ID"] = "IO1";
pdfDoc.DocumentInformation.CustomMetadata["CompanyName"] = "Syncfusion";
pdfDoc.DocumentInformation.CustomMetadata["Key"] = "DocumentKey";
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
pdfDoc.Save(memoryStream);
//Close the documents
pdfDoc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("AddCustomFiel
d.pdf", "application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("AddCustomField.pdf",
"application/pdf", memoryStream);
}
```

Removing Custom Metadata from an existing PDF document

You can remove the custom metadata from an existing PDF document as follows.

C#

```
//Load the document
PdfLoadedDocument loadedDocument = new PdfLoadedDocument("Input.pdf");
//Remove custom metadata using key name
loadedDocument.DocumentInformation.CustomMetadata.Remove("Key");
//Save and close the document
loadedDocument.Save("Output.pdf");
loadedDocument.Close(true);
```

VB.NET

```
'Load the document
Dim loadedDocument As PdfLoadedDocument = New PdfLoadedDocument("Input.pdf")
'Remove custom metadata using key name
```

```
loadedDocument.DocumentInformation.CustomMetadata.Remove("Key")
'Save and close the document
loadedDocument.Save("Output.pdf")
loadedDocument.Close(True)
```

UWP

```
//Essential PDF supports Metadata (XMP) only in Windows Forms, WPF, ASP.NET,
ASP.NET MVC, ASP.NET Core and Xamarin platforms
```

ASP.NET CORE

```
//Load the PDF document
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Remove custom metadata using key name
loadedDocument.DocumentInformation.CustomMetadata.Remove("Key");
//Save and close the document
MemoryStream stream = new MemoryStream();
loadedDocument.Save(stream);
stream.Position = 0;
//Close the document
loadedDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Load the file as stream
Stream docStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Input.pdf");
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Remove custom metadata using key name
loadedDocument.DocumentInformation.CustomMetadata.Remove("Key");
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
loadedDocument.Save(memoryStream);
//Close the documents
loadedDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
```

```

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}

```

Working with image metadata

Image metadata is a data that describes the characteristics or properties of an image which is embedded in the image file.

Adding XMP metadata along with an image in a PDF document

You can extract the XMP metadata along with an image and add it with an image to the PDF document as shown in the code snippet below.

C#

```

//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image file from the disk which contains XMP metadata
PdfBitmap image = new PdfBitmap("Autumn Leaves.jpg", true);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document
doc.Save("Output.pdf");
//Close the document
doc.Close(true);

```

VB.NET

```

'Create a new PDF document
Dim doc As New PdfDocument()
'Add a page to the document
Dim page As PdfPage = doc.Pages.Add()
'Create PDF graphics for the page
Dim graphics As PdfGraphics = page.Graphics
'Load the image file from the disk which contains XMP metadata
Dim image As New PdfBitmap("Autumn Leaves.jpg", True)
'Draw the image
graphics.DrawImage(image, 0, 0)
'Save the document
doc.Save("Output.pdf")
'Close the document
doc.Close(True)

```

UWP

```

//Essential PDF supports adding XMP metadata along with an image only in
Windows Forms, WPF, ASP.NET, ASP.NET MVC, ASP.NET Core and Xamarin platforms

```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image as stream which contains XMP metadata
FileStream imageStream = new FileStream("Autumn Leaves.jpg", FileMode.Open,
FileAccess.Read);
PdfBitmap image = new PdfBitmap(imageStream, true);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Creating the stream object
MemoryStream stream = new MemoryStream();
//Save the document as stream
doc.Save(stream);
stream.Position = 0;
//Close the document
doc.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document
PdfDocument doc = new PdfDocument();
//Add a page to the document
PdfPage page = doc.Pages.Add();
//Create PDF graphics for the page
PdfGraphics graphics = page.Graphics;
//Load the image as stream which contains XMP metadata
Stream imageStream =
typeof(App).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.Assets.
Autumn Leaves.jpg");
PdfBitmap image = new PdfBitmap(imageStream, true);
//Draw the image
graphics.DrawImage(image, 0, 0);
//Save the document as stream
MemoryStream stream = new MemoryStream();
doc.Save(stream);
//Close the document
doc.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}
```

Extracting XMP metadata from PDF image

To extract the [XmpMetadata](#) from an image in an existing PDF document, you can use the [ImagesInfo](#) property in the [PdfPageBase](#) class.

Refer to the following code snippet to extract the image metadata from a PDF image.

C#

```
//Load an existing PDF
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Load the first page
PdfPageBase pageBase = loadedDocument.Pages[0];
//Extracts all the images info from first page
PdfImageInfo[] imagesInfo= pageBase.ImagesInfo;
//Extracts the XMP metadata from PDF image
XmpMetadata metadata = imagesInfo[0].XmpMetadata;
//Close the document
loadedDocument.Close(true);
```

VB.NET

```
'Load an existing PDF
Dim loadedDocument As New PdfLoadedDocument(fileName)
'Load the first page
Dim pageBase As PdfPageBase = loadedDocument.Pages(0)
'Extracts all the images info from first page
Dim imagesInfo As PdfImageInfo[] = pageBase.ImagesInfo
'Extracts the XMP metadata from PDF image
XmpMetadata metadata = imagesInfo[0].XmpMetadata;
'Close the document
loadedDocument.Close(True)
```

UWP

```
//PDF supports extracting the image information from PDF document only in
Windows Forms, WPF, ASP.NET, ASP.NET Core and ASP.NET MVC platforms
```

ASP.NET CORE

```
//Load an existing PDF
FileStream docStream = new FileStream("Input.pdf", FileMode.Open,
FileAccess.Read);
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(docStream);
//Load the first page
PdfPageBase pageBase = loadedDocument.Pages[0];
//Extracts all the images info from first page
```

```
PdfImageInfo[] imagesInfo= pageBase.GetImagesInfo();
//Extracts the XMP metadata from PDF image
XmpMetadata metadata = imagesInfo[0].XmpMetadata;
//Close the document
loadedDocument.Close(true);
```

XAMARIN

```
//PDF supports extracting the image information from PDF document only in
Windows Forms, WPF, ASP.NET, ASP.NET Core and ASP.NET MVC platforms
```

Note: To extract the image information from PDF page in .NET Core, you need to include [Syncfusion.Pdf.Imaging.Portable](#) assembly reference in .NET Core project.

Working with Color Spaces

Essential PDF allows you to set the color spaces in the following different ways.

- Document Color Space
- Graphics Color Space

Working with color space in document

You can set the color space by using [ColorSpace](#) property in PDF document.

It supports the following types

- Device color Spaces
- CIE-based Color Spaces
- ICC-based Color Spaces

Device Color Space

Device color space simply describes the range of colors that a camera can see, a printer can print, or a monitor can display. These color spaces depend upon the device where it is displayed. It contains the following types.

- DeviceGray
- DeviceRGB
- DeviceCMYK

CIE-based Color Spaces

CIE-based color space in the PDF document is classified as,

- CalGray
- CalRGB
- Lab

You can draw a rectangle on new PDF document with **CalGray** brush using [PdfCalGrayColorSpace](#) class. The following code snippet explains this.

C#

```

//Creates a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Adds a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Acquires graphics of the page.
PdfGraphics graphics = pdfPage.Graphics;
//Creates CalGray color space.
PdfCalGrayColorSpace calGrayColorSpace = new PdfCalGrayColorSpace();
//Updates color values.
calGrayColorSpace.Gamma = 0.7;
calGrayColorSpace.WhitePoint = new double[] { 0.2, 1, 0.8 };
PdfCalGrayColor calGrayColorSpace1 = new PdfCalGrayColor(calGrayColorSpace);
calGrayColorSpace1.Gray = 0.1;
PdfBrush brush = new PdfSolidBrush(calGrayColorSpace1);
RectangleF bounds = new RectangleF(0, 0, 300, 300);
//Draws rectangle by using the PdfBrush
graphics.DrawRectangle(brush, bounds);
//Saves the document.
pdfDocument.Save("Output.pdf");
//closes the document
pdfDocument.Close(true);

```

VB.NET

```

'Creates a new PDF document.
Dim pdfDocument As New PdfDocument()
'Adds a page to the PDF document
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
'Acquires graphics of the page.
Dim graphics As PdfGraphics = pdfPage.Graphics
'Creates CalGray color space.
Dim calGrayColorSpace As New PdfCalGrayColorSpace()
'Updates color values.
calGrayColorSpace.Gamma = 0.7
calGrayColorSpace.WhitePoint = New Double() {0.2, 1, 0.8}
Dim calGrayColorSpace1 As New PdfCalGrayColor(calGrayColorSpace)
calGrayColorSpace1.Gray = 0.1
Dim brush As PdfBrush = New PdfSolidBrush(calGrayColorSpace1)
Dim bounds As New RectangleF(0, 0, 300, 300)
'Draws rectangle using the PdfBrush
graphics.DrawRectangle(brush, bounds)
'Saves the document.
pdfDocument.Save("Output.pdf")
'closes the document
pdfDocument.Close(True)

```

UWP

```

//Creates a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Adds a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Acquires graphics of the page.
PdfGraphics graphics = pdfPage.Graphics;
//Creates CalGray color space.
PdfCalGrayColorSpace calGrayColorSpace = new PdfCalGrayColorSpace();

```

```
//Updates color values.
calGrayColorSpace.Gamma = 0.7;
calGrayColorSpace.WhitePoint = new double[] { 0.2, 1, 0.8 };
PdfCalGrayColor calGrayColorSpace1 = new PdfCalGrayColor(calGrayColorSpace);
calGrayColorSpace1.Gray = 0.1;
PdfBrush brush = new PdfSolidBrush(calGrayColorSpace1);
RectangleF bounds = new RectangleF(0, 0, 300, 300);
//Draws rectangle by using the PdfBrush
graphics.DrawRectangle(brush, bounds);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
await pdfDocument.SaveAsync(stream);
//Close the document
pdfDocument.Close(true);
//Save the stream as PDF document file in local machine. Refer to PDF/UWP
section for respected code samples
Save(stream, "Output.pdf");
```

ASP.NET CORE

```
//Creates a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Adds a page to the PDF document
PdfPage pdfPage = pdfDocument.Pages.Add();
//Acquires graphics of the page.
PdfGraphics graphics = pdfPage.Graphics;
//Creates CalGray color space.
PdfCalGrayColorSpace calGrayColorSpace = new PdfCalGrayColorSpace();
//Updates color values.
calGrayColorSpace.Gamma = 0.7;
calGrayColorSpace.WhitePoint = new double[] { 0.2, 1, 0.8 };
PdfCalGrayColor calGrayColorSpace1 = new PdfCalGrayColor(calGrayColorSpace);
calGrayColorSpace1.Gray = 0.1;
PdfBrush brush = new PdfSolidBrush(calGrayColorSpace1);
RectangleF bounds = new RectangleF(0, 0, 300, 300);
//Draws rectangle by using the PdfBrush
graphics.DrawRectangle(brush, bounds);
//Save the document into stream
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
stream.Position = 0;
//Closes the document
pdfDocument.Close(true);
//Defining the ContentType for pdf file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Creates a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Adds a page to the PDF document
```

```

PdfPage pdfPage = pdfDocument.Pages.Add();
//Acquires graphics of the page.
PdfGraphics graphics = pdfPage.Graphics;
//Creates CalGray color space.
PdfCalGrayColorSpace calGrayColorSpace = new PdfCalGrayColorSpace();
//Updates color values.
calGrayColorSpace.Gamma = 0.7;
calGrayColorSpace.WhitePoint = new double[] { 0.2, 1, 0.8 };
PdfCalGrayColor calGrayColorSpace1 = new PdfCalGrayColor(calGrayColorSpace);
calGrayColorSpace1.Gray = 0.1;
PdfBrush brush = new PdfSolidBrush(calGrayColorSpace1);
RectangleF bounds = new RectangleF(0, 0, 300, 300);
//Draws rectangle by using the PdfBrush
graphics.DrawRectangle(brush, bounds);
//Save the document into stream.
MemoryStream stream = new MemoryStream();
pdfDocument.Save(stream);
//Close the document.
pdfDocument.Close(true);
//Save the stream into pdf file
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer PDF/Xamarin section for respective code
samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", stream);
}

```

The following code example illustrates how to draw a rectangle with **CalGray** brush in existing PDF document.

C#

```

//Loads the existing PDF document.
PdfLoadedDocument loadedDocument = new PdfLoadedDocument(fileName);
//Loads the page
PdfLoadedPage loadedPage = loadedDocument.Pages[0] as PdfLoadedPage;
//Acquires graphics of the page.
PdfGraphics graphics = loadedPage.Graphics;
//Creates CalGray color space.
PdfCalGrayColorSpace calGrayColorSpace = new PdfCalGrayColorSpace();
//Updates color values.
calGrayColorSpace.Gamma = 0.7;
calGrayColorSpace.WhitePoint = new double[] { 0.2, 1, 0.8 };
PdfCalGrayColor calGrayColorSpace1 = new PdfCalGrayColor(calGrayColorSpace);
calGrayColorSpace1.Gray = 0.1;
PdfBrush brush = new PdfSolidBrush(calGrayColorSpace1);
RectangleF bounds = new RectangleF(0, 0, 300, 300);
//Draws rectangle by using the PdfBrush

```

```
graphics.DrawRectangle(brush, bounds);
//Saves the modified document.
loadedDocument.Save("Output.pdf");
//Closes the document
loadedDocument.Close(true);
```

VB.NET

```
'Loads the existing PDF document.
Dim loadedDocument As New PdfLoadedDocument(fileName)

```

ICC-based Color Spaces

To create color for brush/pen to render shape or text in the PDF document, you can use ICC based color spaces.

It contains the following types:

- Special color spaces –Pantone colors
- Indexed
- Separation

The following code example illustrates how to set the indexed ICC color space using [PdfCalRGBColorSpace](#) class in new PDF document.

C#

```

//Creates a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Adds a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
//Acquires graphics of the page.
PdfGraphics graphics = pdfPage.Graphics;
//Creates ICCBased color space.

```

```

PdfCalRGBColorSpace calRgbCS = new PdfCalRGBColorSpace();
calRgbCS.Gamma = new double[] { 7.6, 5.1, 8.5 };
calRgbCS.Matrix = new double[] { 1, 0, 0, 0, 1, 0, 0, 0, 1 };
calRgbCS.WhitePoint = new double[] { 0.7, 1, 0.8 };
//Reads the ICC profile.
FileStream fileStream = new FileStream(@"input.icc", FileMode.Open,
FileAccess.Read);
byte[] profileData = new byte[fileStream.Length];
fileStream.Read(profileData, 0, profileData.Length);
fileStream.Close();
//Instantiates ICC color space.
PdfICCColorSpace iccBasedCS = new PdfICCColorSpace();
iccBasedCS.ProfileData = profileData;
iccBasedCS.AlternateColorSpace = calRgbCS;
iccBasedCS.ColorComponents = 3;
iccBasedCS.Range = new double[] { 0.0, 1.0, 0.0, 1.0, 0.0, 1.0 };
PdfICCColor red = new PdfICCColor(iccBasedCS);
red.ColorComponents = new double[] { 1, 0, 1 };
PdfBrush brush = new PdfSolidBrush(red);
RectangleF bounds = new RectangleF(0, 0, 300, 300);
//Draws rectangle by using the PdfBrush.
graphics.DrawRectangle(brush, bounds);
//Saves the document.
pdfDocument.Save("Output.pdf");
//Closes the document
pdfDocument.Close(true);

```

VB.NET

```

'Creates a new PDF document.

Pantone colors

The following code example illustrates how to draw the graphics elements by using Pantone colors through [PdfSeparationColorSpace](#) class in new PDF document.

C#

```

// Creates a new document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
// Creates exponential interpolation function
PdfExponentialInterpolationFunction function = new
PdfExponentialInterpolationFunction(true);
float[] numberArray = new float[4];
numberArray[0] = 0.38f;
numberArray[1] = 0.88f;
function.C1 = numberArray;
// Creates SeparationColorSpace
PdfSeparationColorSpace colorSpace = new PdfSeparationColorSpace();
colorSpace.TintTransform = function;
colorSpace.Colorant = "PANTONE Orange 021 C";
PdfSeparationColor color = new PdfSeparationColor(colorSpace);
color.Tint = 0.7;
RectangleF bounds = new RectangleF(20, 70, 200, 100);
PdfPen pen = new PdfPen(color);
//Draws the rectangle
page.Graphics.DrawRectangle(pen, bounds);
//Saves the document
document.Save("SeparationColor.pdf");
//Closes the document
document.Close(true);

```

VB.NET

```

' Creates a new document

Working with color space in graphics

You can set the color spaces to the particular object in the PDF document by using the [ColorSpace](#) property in [PdfGraphics](#) class.

The following code illustrates how to use the color spaces in particular objects in new PDF document.

C#

```

//Creates a new PDF document.
PdfDocument pdfDocument = new PdfDocument();
//Adds a page to the PDF document.
PdfPage pdfPage = pdfDocument.Pages.Add();
//Acquires graphics of the page.

```

```

PdfGraphics graphics = pdfPage.Graphics;
PdfPen pen = new PdfPen(Color.Red);
PdfBrush brush = new PdfSolidBrush(Color.Blue);
RectangleF rectangle = new RectangleF(0, 0, 100, 100);
//Default color space.
graphics.DrawRectangle(pen, brush, rectangle);
graphics.Save();
//GrayScale color space.
graphics.ColorSpace = PdfColorSpace.GrayScale;
graphics.DrawRectangle(pen, brush, rectangle);
//CMYK color space.
graphics.ColorSpace = PdfColorSpace.CMYK;
graphics.DrawRectangle(pen, brush, rectangle);
graphics.Restore();
//Default color space.
graphics.DrawRectangle(pen, brush, rectangle);
//Draws by using the PdfBrush.
graphics.DrawRectangle(brush, rectangle);
//Saves the document.
pdfDocument.Save("Output.pdf");
//Closes the document
pdfDocument.Close(true);

```

VB.NET

```

'Creates a new PDF document.
Dim pdfDocument As New PdfDocument()
'Adds a page to the PDF document.
Dim pdfPage As PdfPage = pdfDocument.Pages.Add()
'Acquires graphics of the page.
Dim graphics As PdfGraphics = pdfPage.Graphics
Dim pen As New PdfPen(Color.Red)
Dim brush As PdfBrush = New PdfSolidBrush(Color.Blue)
Dim rectangle As New RectangleF(0, 0, 100, 100)
'Default color space.
graphics.DrawRectangle(pen, brush, rectangle)
graphics.Save()
'GrayScale color space.
graphics.ColorSpace = PdfColorSpace.GrayScale
graphics.DrawRectangle(pen, brush, rectangle)
'CMYK color space.
graphics.ColorSpace = PdfColorSpace.CMYK
graphics.DrawRectangle(pen, brush, rectangle)
graphics.Restore()
'Default color space.
graphics.DrawRectangle(pen, brush, rectangle)
'Draws by using the PdfBrush.
graphics.DrawRectangle(brush, rectangle)
'Saves the document.
pdfDocument.Save("Output.pdf")
'Closes the document
pdfDocument.Close(True)

```

UWP

```

//Creates a new PDF document.

```

```

Working with JavaScript

A JavaScript action allows execution of JavaScript code embedded in the PDF document. Essential PDF supports adding JavaScript action to the PDF document in the following:

- Document level JavaScript action
- JavaScript action to the form fields
- JavaScript in 3D Annotation

Document level JavaScript action

You can add the JavaScript action to the PDF document by using [PdfJavaScriptAction](#) class. The following code sample illustrates this.

C#

```

//Create a new document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;

```

```
//Save and close the PDF document
document.Save("Output.pdf");
document.Close(true);
```

VB.NET

```
'Create a new document
Dim document As New PdfDocument()
'Add a page
Dim page As PdfPage = document.Pages.Add()
'Create JavaScript action
Dim scriptAction As New PdfJavaScriptAction("app.alert(""Hello World!!!"")")
'Add the JavaScript action
document.Actions.AfterOpen = scriptAction
'Save and close the PDF document
document.Save("Output.pdf")
document.Close(True)
```

UWP

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
MemoryStream memoryStream = new MemoryStream();
//Save the document
await document.SaveAsync(memoryStream);
//Close the documents
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document
document.Close(true);
```

```
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new document
PdfDocument document = new PdfDocument();
//Add a page
PdfPage page = document.Pages.Add();
//Create JavaScript action
PdfJavaScriptAction scriptAction = new
PdfJavaScriptAction("app.alert(\"Hello World!!!\")");
//Add the JavaScript action
document.Actions.AfterOpen = scriptAction;
//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
"application/pdf", memoryStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
"application/pdf", memoryStream);
}
```

JavaScript action to the form fields

You can add the JavaScript actions to various form fields using [PdfJavaScriptAction](#) instance. The [PdfFieldActions](#) class is used to create form field actions.

The following code snippet illustrate this.

C#

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
```

```
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PDF \")");
//Set the script action to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document
document.Form.Fields.Add(submitButton);
//Save document to disk
document.Save("fieldAction.pdf");
//Save document to disk
document.Close(true);
```

VB.NET

```
'Create a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Create a new PdfButtonField
Dim submitButton As New PdfButtonField(page, "submitButton")
submitButton.Bounds = New RectangleF(25, 160, 100, 20)
submitButton.Text = "Apply"
submitButton.BackColor = New PdfColor(181, 191, 203)
'Create a new PdfJavaScriptAction
Dim scriptAction As New PdfJavaScriptAction("app.alert(\"You are looking at
Form field action of PDF \")")
'Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction
'Add the submit button to the new document
document.Form.Fields.Add(submitButton)
'Save document to disk
document.Save("fieldAction.pdf")
'Close the document
document.Close(True)
```

UWP

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PDF \")");
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document
document.Form.Fields.Add(submitButton);
MemoryStream memoryStream = new MemoryStream();
//Save the document
await document.SaveAsync(memoryStream);
```

```
//Close the document
document.Close(true);
//Save the stream as PDF document file in local machine. Refer to the
PDF/UWP section for respective code samples
Save(memoryStream, "Output.pdf");
```

ASP.NET CORE

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PDF \")");
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document
document.Form.Fields.Add(submitButton);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Close the document
document.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "Output.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);
```

XAMARIN

```
//Create a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PdfButtonField
PdfButtonField submitButton = new PdfButtonField(page, "submitButton");
submitButton.Bounds = new RectangleF(25, 160, 100, 20);
submitButton.Text = "Apply";
submitButton.BackColor = new PdfColor(181, 191, 203);
//Create a new PdfJavaScriptAction
PdfJavaScriptAction scriptAction = new PdfJavaScriptAction("app.alert(\"You
are looking at Form field action of PDF \")");
//Set the scriptAction to submitButton
submitButton.Actions.MouseDown = scriptAction;
//Add the submit button to the new document
document.Form.Fields.Add(submitButton);
```

```

//Save the document into stream
MemoryStream memoryStream = new MemoryStream();
document.Save(memoryStream);
//Close the documents
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pdf",
    "application/pdf", memoryStream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pdf",
    "application/pdf", memoryStream);
}

```

JavaScript in 3D Annotation

3D Annotations are used to represent 3D artworks in a PDF document. You can add a JavaScript code to 3D annotation using the [OnInstantiate](#) property in [Pdf3DAnnotation](#) instance. The JavaScript script is executed when the 3D artwork is instantiated. The following code snippet illustrate this.

C#

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
//Create a new PDF 3D annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), @"Input.u3d");
//Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")";
//Handles the activation of the 3D annotation
Pdf3DActivation activation = new Pdf3DActivation();
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation;
activation.ShowToolbar = true;
pdf3dAnnotation.Activation = activation;
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the document to disk
document.Save("Output.pdf");
//Close the document
document.Close(true);

```

VB.NET

```

'Creates a new PDF document
Dim document As New PdfDocument()
'Creates a new page
Dim page As PdfPage = document.Pages.Add()
'Create a new PDF 3D annotation

```

```

Dim pdf3dAnnotation As New Pdf3DAnnotation(New RectangleF(10, 50, 300, 150),
"Input.u3d")
'Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")"
'Handles the activation of the 3D annotation
Dim activation As New Pdf3DActivation()
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation
activation.ShowToolbar = True
pdf3dAnnotation.Activation = activation
'Adds annotation to page
page.Annotations.Add(pdf3dAnnotation)
'Save the document to disk
document.Save("Output.pdf")
'Close the document
document.Close(True)

```

UWP

```

//PDF supports 3D annotation only in Windows Forms, WPF, ASP.NET, ASP.NET
MVC, and ASP.NET Core platforms

```

ASP.NET CORE

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
FileStream inputStream = new FileStream("3DAnnotation.U3D", FileMode.Open,
FileAccess.Read);
//Creates a new PDF 3D annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), inputStream);
//Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")";
//Handles the activation of the 3D annotation
Pdf3DActivation activation = new Pdf3DActivation();
activation.ActivationMode = Pdf3DActivationMode.ExplicitActivation;
activation.ShowToolbar = true;
pdf3dAnnotation.Activation = activation;
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the document into stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
stream.Position = 0;
//Closes the document
document.Close(true);
//Defining the ContentType for PDF file
string contentType = "application/pdf";
//Define the file name
string fileName = "3DAnnotation.pdf";
//Creates a FileContentResult object by using the file contents, content
type, and file name
return File(stream, contentType, fileName);

```

XAMARIN

```

//Creates a new PDF document
PdfDocument document = new PdfDocument();
//Creates a new page
PdfPage page = document.Pages.Add();
Stream inputStream =
typeof(MainPage).GetTypeInfo().Assembly.GetManifestResourceStream("Sample.As
sets.3DAnnotation.u3d");
//Creates a new PDF 3d annotation
Pdf3DAnnotation pdf3dAnnotation = new Pdf3DAnnotation(new RectangleF(10, 50,
300, 150), inputStream);
//Assign JavaScript script
pdf3dAnnotation.OnInstantiate = "host.getURL(\"http://www.google.com\")";
//Adds annotation to page
page.Annotations.Add(pdf3dAnnotation);
//Save the PDF document to stream
MemoryStream stream = new MemoryStream();
document.Save(stream);
//Close the document
document.Close(true);
//Save the stream into PDF file
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the PDF/Xamarin section for respective code
samples
if (Device.RuntimePlatform == Device.UWP)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("3DAnnotation.
pdf", "application/pdf", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().Save("3DAnnotation.pdf",
"application/pdf", stream);
}

```

Supported and Unsupported Features

The following table shows the various features available in the Essential PDF and their availability in different platforms.

Features	.NET Framework	UWP	Xamarin and .NET Core	Blazor Client-Side	Blazor Server-Side & Hosted Application
Drawing Text	Yes	Yes	Yes	Yes	Yes
Text Formatting	Yes	Yes	Yes	Yes	Yes
Multilingual Support	Yes	No	No	No	No
Drawing RTL text	Yes	Yes	Yes	Yes	Yes

Features	.NET Framework	UWP	Xamarin and .NET Core	Blazor Client-Side	Blazor Server-Side & Hosted Application
Drawing complex script text	Yes	Yes	Yes	Yes	Yes
Text Extraction	Yes	Yes	No	No	No
Unicode	Yes	Yes	Yes	Yes	Yes
Pagination	Yes	Yes	Yes	Yes	Yes

Graphics:

Features	.NET Framework	UWP	Xamarin and .NET Core	Blazor Client-Side	Blazor Server-Side & Hosted Application
Pen and Brush	Yes	Yes	Yes	Yes	Yes
Layers	Yes	Yes	Yes	Yes	Yes
Transparent Graphics	Yes	No	No	No	No
Color Spaces	Yes	Yes	Yes	Yes	Yes
Image Extraction	Yes	No	No	No	No
Enhanced Printing Support	Yes	Yes	Yes	Yes	Yes
Barcode	Yes	Yes	Yes	Yes	Yes

Document-level Operations :

Features	.NET Framework	UWP	Xamarin and .NET Core	Blazor Client-Side	Blazor Server-Side & Hosted Application
Merge Documents	Yes	Yes	Yes	Yes	Yes
Split Document	Yes	Yes	Yes	Yes	Yes

Features	.NET Framework	UWP	Xamarin and .NET Core	Blazor Client-Side	Blazor Server-Side & Hosted Application
Overlay Documents	Yes	Yes	Yes	Yes	Yes
Import Pages	Yes	Yes	Yes	Yes	Yes
Stamp	Yes	Yes	Yes	Yes	Yes
Booklet	Yes	Yes	Yes	Yes	Yes

Presentation

Overview of PowerPoint Presentation

Essential Presentation is a native **.NET** class library that can be used by developers to create, read, and write Microsoft PowerPoint files by using C#, VB.NET, and managed C++ code. The library can be used in Windows Forms, WPF, ASP.NET, ASP.NET MVC, UWP and Xamarin platforms.

It is a non-UI component that provides a full-fledged PowerPoint presentation instance that facilitates accessing and manipulating the presentations without any dependency of Microsoft Office COM libraries and Microsoft Office.

Key features

- Support to [create](#) PowerPoint presentation from scratch.
- [Open](#), [modify](#), and [save](#) existing presentations.
- Ability to [convert PowerPoint presentation to PDF](#).
- Ability to [convert PowerPoint slides to images](#).
- Ability to [create](#) and [edit](#) charts.
- Ability to [convert chart in a slide to image](#).
- Ability to [clone](#) and [merge](#) slides in presentation
- Ability to [create](#) and [edit](#) animations.
- Ability to [create](#) and [edit](#) transition effects.
- Ability to [create](#) and [edit](#) comments.
- Ability to [encrypt](#) and [decrypt](#) PowerPoint presentation.
- Ability to [set and remove write protection](#) of PowerPoint presentation.
- Ability to access the [Built-in](#) and [Custom](#) document properties.
- Ability to [create](#) and [modify](#) sections in PowerPoint presentation.

Compatible Microsoft PowerPoint Versions

- Microsoft PowerPoint 2007
- Microsoft PowerPoint 2010
- Microsoft PowerPoint 2013
- Microsoft PowerPoint 2016
- Microsoft PowerPoint 2019

Note: 1. The current version of Essential Presentation supports the .PPTX, .PPTM, .POTX, .POTM file formats only.

2. The current version of Essential Presentation does not support some features in Microsoft PowerPoint such as Word Art, creation and editing of Handouts, equations, create and edit audio and video content, built-in themes, and its variants.

Assemblies Required

The following assemblies need to be referenced in your application

Platform(s)	Assembly
WPF, Windows Forms, ASP. NET and ASP.NET MVC	Syncfusion.Presentation.Base Syncfusion.Compression.Base Syncfusion.OfficeChart.Base
ASP.NET Core, Xamarin and Blazor	Syncfusion.Presentation.Portable Syncfusion.Compression.Portable Syncfusion.OfficeChart.Portable
Universal Windows Platform	Syncfusion.Presentation.UWP Syncfusion.OfficeChart.UWP

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your applications to use our components.

Converting PowerPoint Presentation to PDF

For converting a PowerPoint Presentation to PDF, the following assemblies needed to be referenced in your application

Platform(s)	Assembly
WPF, Windows Forms, ASP. NET and ASP.NET MVC	Syncfusion.Presentation.Base Syncfusion.Compression.Base Syncfusion.OfficeChart.Base Syncfusion.Pdf.Base Syncfusion.PresentationToPDFConverter.Base
ASP.NET Core, Xamarin and Blazor	Syncfusion.Presentation.Portable Syncfusion.Compression.Portable Syncfusion.OfficeChart.Portable Syncfusion.Pdf.Portable

	Syncfusion.PresentationRenderer.Portable Syncfusion.SkiaSharpHelper.Portable Skiasharp
--	--

The following assemblies are required to be referred in addition to the above mentioned assemblies for converting the chart present in the PowerPoint Presentation into PDF.

Platform(s)	Assembly
WPF, Windows Forms, ASP. NET and ASP.NET MVC	Syncfusion.OfficeChartToImageConverter.WPF Syncfusion.SfChart.WPF

Note: 1.The “Syncfusion.OfficeChartToImageConverter.WPF” assembly is supported from .NET Framework 4.0 onwards

NuGet Packages Required

To work with PowerPoint Presentations, install the following NuGet packages in your application:

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.Presentation.WinForms.nupkg
WPF	Syncfusion.Presentation.Wpf.nupkg
.NET Framework 3.5 or 4.0 Client Profile	Syncfusion.Presentation.ClientProfile.nupkg
ASP.NET Web Forms	Syncfusion.Presentation.AspNet.nupkg
ASP.NET MVC4	Syncfusion.Presentation.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.Presentation.AspNet.Mvc5.nupkg
UWP	Syncfusion.Presentation.UWP.nupkg
ASP.NET Core, Console Application (Targeting .NET Core) and Blazor	Syncfusion.Presentation.Net.Core.nupkg
Xamarin	Syncfusion.Xamarin.Presentation.nupkg

Note: 1.Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, add the "Syncfusion.Licensing" assembly reference and include a license key in your projects. Refer to this [link](#) to learn about registering Syncfusion license key in your applications to use the components.

2.From the Essential Studio 2018 Volume 3 release(v16.3.0.21), Syncfusion has changed some of the NuGet package names to search and find the required Syncfusion NuGet packages in nuget.org easily based on the control and its platforms.

Converting PowerPoint Presentation into PDF

For converting PowerPoint Presentation into PDF, install the following NuGet packages in your application:

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.PresentationToPDFConverter.WinForms.nupkg
WPF	Syncfusion.PresentationToPDFConverter.Wpf.nupkg
.NET Framework 3.5 or 4.0 Client Profile	Syncfusion.PresentationToPDFConverter.ClientProfile.nupkg
ASP.NET Web	Syncfusion.PresentationToPDFConverter.AspNet.nupkg
ASP.NET MVC4	Syncfusion.PresentationToPDFConverter.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.PresentationToPDFConverter.AspNet.Mvc5.nupkg
UWP, ASP.NET Core, Console Application (Targeting .NET Core) and Blazor	Syncfusion.PresentationRenderer.Net.Core.nupkg
	Syncfusion.SkiaSharpHelper.Net.Core.nupkg
Xamarin	Syncfusion.Xamarin.PresentationRenderer.nupkg
	Syncfusion.Xamarin.SkiaSharpHelper.nupkg

Note: PowerPoint Presentation to PDF conversion is supported from .NET Standard 1.4 onwards for ASP.NET Core and Xamarin.

Converting PowerPoint Presentation to image

For converting a PowerPoint Presentation to image, install the following NuGet packages in your application:

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.Presentation.WinForms.nupkg
WPF	Syncfusion.Presentation.Wpf.nupkg
.NET Framework 3.5 or 4.0 Client Profile	Syncfusion.Presentation.ClientProfile.nupkg
ASP.NET Web Forms	Syncfusion.Presentation.AspNet.nupkg
ASP.NET MVC4	Syncfusion.Presentation.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.Presentation.AspNet.Mvc5.nupkg
UWP	Syncfusion.Presentation.UWP.nupkg
ASP.NET Core, Console Application (Targeting .NET Core) and Blazor	Syncfusion.PresentationRenderer.Net.Core.nupkg
	Syncfusion.SkiaSharpHelper.Net.Core.nupkg

Xamarin	Syncfusion.Xamarin.PresentationRenderer.nupkg
	Syncfusion.Xamarin.SkiaSharpHelper.nupkg

Note: PowerPoint Presentation to image conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards for ASP.NET Core and Xamarin.

Converting charts in Presentation

The following NuGet package should be installed additionally to convert the charts present in PowerPoint Presentation:

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.OfficeChartToImageConverter.WinForms.nupkg
WPF	Syncfusion.OfficeChartToImageConverter.Wpf.nupkg
ASP.NET Web	Syncfusion.OfficeChartToImageConverter.AspNet.nupkg
ASP.NET MVC4	Syncfusion.OfficeChartToImageConverter.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.OfficeChartToImageConverter.AspNet.Mvc5.nupkg
UWP	Syncfusion.OfficeChartToImageConverter.UWP.nupkg
ASP.NET Core, Console Application (Targeting .NET Core) and Blazor	Syncfusion.PresentationRenderer.Net.Core.nupkg
	Syncfusion.SkiaSharpHelper.Net.Core.nupkg
Xamarin	Syncfusion.Xamarin.PresentationRenderer.nupkg
	Syncfusion.Xamarin.SkiaSharpHelper.nupkg

Note: 1. The "Syncfusion.OfficeChartToImageConverter.Wpf.nupkg" NuGet package is supported only from 4.0 .NET Framework onwards.

2. The "Syncfusion.Xamarin.PresentationRenderer.nupkg" and "Syncfusion.PresentationRenderer.Net.Core.nupkg" NuGet packages supports chart to image conversion only from .NET Standard 2.0 onwards.

NuGet package installation and uninstallation

To use NuGet package in your project, refer to the NuGet package [Installation](#) and [Uninstallation](#) sections.

The PowerPoint Presentation NuGet packages can be installed and uninstalled using the Package Manager Console. In Visual Studio, select **Tools > NuGet Package Manager > Package Manager Console** and execute the following commands in respective platforms.

Note: The Syncfusion components are available in nuget.org

Platform(s)	Install	Uninstall
Windows Forms	<i>Install-package</i> <i>Syncfusion.Presentation.WinForms</i> Install-package Syncfusion.PresentationToPdfConverter.WinForms * Install-package Syncfusion.OfficeChartToImageConverter.WinForms	<i>Uninstall-package</i> <i>Syncfusion.Presentation.WinForms - RemoveDependencies</i> Uninstall-package Syncfusion.PresentationToPdfConverter.WinForms -RemoveDependencies * Uninstall-package Syncfusion.OfficeChartToImageConverter.WinForms -RemoveDependencies
WPF	<i>Install-package Syncfusion.Presentation.Wpf</i> Install-package Syncfusion.PresentationToPdfConverter.Wpf * Install-package Syncfusion.OfficeChartToImageConverter.Wpf	<i>Uninstall-package</i> <i>Syncfusion.Presentation.Wpf - RemoveDependencies</i> Uninstall-package Syncfusion.PresentationToPdfConverter.Wpf - RemoveDependencies * Uninstall-package Syncfusion.OfficeChartToImageConverter.Wpf -RemoveDependencies
ASP.NET Web	<i>Install-package</i> <i>Syncfusion.Presentation.AspNet</i> Install-package Syncfusion.PresentationToPdfConverter.AspNet * Install-package Syncfusion.OfficeChartToImageConverter.AspNet	<i>Uninstall-package</i> <i>Syncfusion.Presentation.AspNet - RemoveDependencies</i> Uninstall-package Syncfusion.PresentationToPdfConverter.AspNet -RemoveDependencies * Uninstall-package Syncfusion.OfficeChartToImageConverter.AspNet -RemoveDependencies
ASP.NET MVC4	<i>Install-package</i> <i>Syncfusion.Presentation.AspNet.MVC4</i> Install-package Syncfusion.PresentationToPdfConverter.AspNet.MVC4 * Install-package Syncfusion.OfficeChartToImageConverter.AspNet.MVC4	<i>Uninstall-package</i> <i>Syncfusion.Presentation.AspNet.MVC4 - RemoveDependencies</i> Uninstall-package Syncfusion.PresentationToPdfConverter.AspNet.MVC4 -RemoveDependencies * Uninstall-package

		Syncfusion.OfficeChartToImageConverter.AspNet.MVC4 -RemoveDependencies
ASP.NET MVC5	<i>Install-package</i> Syncfusion.Presentation.AspNet.MVC5 Install-package Syncfusion.PresentationToPdfConverter.AspNet.MVC5 * Install-package Syncfusion.OfficeChartToImageConverter.AspNet.MVC5	<i>Uninstall-package</i> Syncfusion.Presentation.AspNet.MVC5 - RemoveDependencies Uninstall-package Syncfusion.PresentationToPdfConverter.AspNet.MVC5 -RemoveDependencies * Uninstall-package Syncfusion.OfficeChartToImageConverter.AspNet.MVC5 -RemoveDependencies
UWP	<i>Install-package</i> Syncfusion.Presentation.UWP Install-package Syncfusion.OfficeChartToImageConverter.UWP	<i>Uninstall-package</i> Syncfusion.Presentation.UWP â€”RemoveDependencies Uninstall-package Syncfusion.OfficeChartToImageConverter.UWP -RemoveDependencies
ASP.NET Core and Blazor	<i>Install-package</i> Syncfusion.Presentation.Net.Core Install-package Syncfusion.PresentationRenderer.Net.Core * Install-package Syncfusion.SkiaSharpHelper.Net.Core	<i>Uninstall-package</i> Syncfusion.Presentation.Net.Core â€”RemoveDependencies Uninstall-package Syncfusion.PresentationRenderer.Net.Core - RemoveDependencies * Uninstall-package Syncfusion.SkiaSharpHelper.Net.Core â€” RemoveDependencies
Xamarin	<i>Install-package</i> Syncfusion.Xamarin.Presentation Install-package Syncfusion.Xamarin.PresentationRenderer * Install-package Syncfusion.Xamarin.SkiaSharpHelper	<i>Uninstall-package</i> Syncfusion.Xamarin.Presentation â€”RemoveDependencies Uninstall-package Syncfusion.Xamarin.PresentationRenderer - RemoveDependencies * Uninstall-package Syncfusion.Xamarin.SkiaSharpHelper - RemoveDependencies

Getting Started

Creating a simple PowerPoint Presentation with basic elements from scratch

In this page, you can learn how to create a simple PowerPoint Presentation by using Essential Presentation API.

For creating and manipulating a PowerPoint Presentation, include the following assemblies in the application.

Assembly Name	Short Description
Syncfusion.Presentation.Base	This assembly contains the core features required for creating, reading, manipulating a Presentation file.
Syncfusion.Compression.Base	This assembly is used to package the Presentation contents.
Syncfusion.OfficeChart.Base	This assembly contains the office chart object model and core features needed for chart creation.

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your applications to use our components.

Include the following namespace in your .cs or .vb code as shown below

C#

```
using Syncfusion.Presentation;
```

VB.NET

```
Imports Syncfusion.Presentation
```

UWP

```
using Syncfusion.Presentation;
```

ASP.NET CORE

```
using Syncfusion.Presentation;
```

XAMARIN

```
using Syncfusion.Presentation;
```

An entire PowerPoint Presentation is represented by an instance of 'IPresentation' interface and it is the root element of Essential Presentation's DOM.

The following code example demonstrates how to create an instance of 'IPresentation' interface.

C#

```
//Creates a new instance of PowerPoint presentation
```

```
IPresentation pptxDoc = Presentation.Create();
```

VB.NET

```
'Creates a new instance of PowerPoint presentation  
Dim pptxDoc As IPresentation = Presentation.Create()
```

UWP

```
//Creates a new instance of PowerPoint presentation  
IPresentation pptxDoc = Presentation.Create();
```

ASP.NET CORE

```
//Creates a new instance of PowerPoint presentation  
IPresentation pptxDoc = Presentation.Create();
```

XAMARIN

```
//Creates a new instance of PowerPoint presentation  
IPresentation pptxDoc = Presentation.Create();
```

'IPresentation' instance has a slide collection that represents the individual slides present within PowerPoint presentation. A slide may contain textual and other graphics contents like shapes, images, charts etc.

The following code example demonstrates how to add a blank slide to a PowerPoint Presentation.

C#

```
//Adds a slide to the PowerPoint Presentation  
ISlide firstSlide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
```

VB.NET

```
'Adds a slide to the PowerPoint Presentation  
Dim firstSlide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
```

UWP

```
//Adds a slide to the PowerPoint Presentation  
ISlide firstSlide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
```

ASP.NET CORE

```
//Adds a slide to the PowerPoint Presentation  
ISlide firstSlide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
```

XAMARIN

```
//Adds a slide to the PowerPoint Presentation  
ISlide firstSlide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
```

Note: The 'Point' typographic units are used to add or manipulate any element in a Presentation.

All the textual contents in a Presentation document are represented by paragraphs. Within the paragraph, textual contents are grouped into one or more child elements as 'TextParts'. Each 'TextPart' represents a region of text with a common set of formatted text.

The following code example demonstrates how to add text into a presentation.

C#

```
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph into the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Set the horizontal alignment of paragraph
paragraph.HorizontalAlignment = HorizontalAlignmentType.Center;
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Hello Presentation");
//Applies font formatting to the text
textPart.Font.FontSize = 80;
textPart.Font.Bold = true;
```

VB.NET

```
'Adds a textbox in a slide by specifying its position and size
Dim textShape As IShape = firstSlide.AddTextBox(100, 75, 756, 200)
'Adds a paragraph into the textShape
Dim paragraph As IParagraph = textShape.TextBody.AddParagraph()
'Set the horizontal alignment of paragraph
paragraph.HorizontalAlignment = HorizontalAlignmentType.Center
'Add a textPart in the paragraph
Dim textPart As ITextPart = paragraph.AddTextPart("Hello Presentation")
'Applies font formatting to the text
textPart.Font.FontSize = 80
textPart.Font.Bold = True
```

UWP

```
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph into the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Set the horizontal alignment of paragraph
paragraph.HorizontalAlignment = HorizontalAlignmentType.Center;
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Hello Presentation");
//Applies font formatting to the text
textPart.Font.FontSize = 80;
textPart.Font.Bold = true;
```

ASP.NET CORE

```
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
```

```
//Adds a paragraph into the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Set the horizontal alignment of paragraph
paragraph.HorizontalAlignment = HorizontalAlignmentType.Center;
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Hello Presentation");
//Applies font formatting to the text
textPart.Font.FontSize = 80;
textPart.Font.Bold = true;
```

XAMARIN

```
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph into the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Set the horizontal alignment of paragraph
paragraph.HorizontalAlignment = HorizontalAlignmentType.Center;
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Hello Presentation");
//Applies font formatting to the text
textPart.Font.FontSize = 80;
textPart.Font.Bold = true;
```

Essential Presentation allows you to create simple and multi-level lists that make the content easier for reading. The following code example demonstrates how to add a bulleted list in a paragraph.

C#

```
//Adds a new paragraph with text.
paragraph = textShape.TextBody.AddParagraph("AdventureWorks Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the bullet character for this list
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183);
//Sets the font of the bullet character
paragraph.ListFormat.FontName = "Symbol";
//Sets the hanging value as 20
paragraph.FirstLineIndent = -20;
```

VB.NET

```
'Adds a new paragraph with text.
paragraph = textShape.TextBody.AddParagraph("AdventureWorks Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company.")
'Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted
'Sets the bullet character for this list
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183)
'Sets the font of the bullet character
paragraph.ListFormat.FontName = "Symbol"
'Sets the hanging value as 20
```

```
paragraph.FirstLineIndent = -20
```

UWP

```
//Adds a new paragraph with text.
paragraph = textShape.TextBody.AddParagraph("AdventureWorks Cycles, the
fictitious company on which the AdventureWorks sample databases are based,
is a large, multinational manufacturing company.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the bullet character for this list
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183);
//Sets the font of the bullet character
paragraph.ListFormat.FontName = "Symbol";
//Sets the hanging value as 20
paragraph.FirstLineIndent = -20;
```

ASP.NET CORE

```
//Adds a new paragraph with text.
paragraph = textShape.TextBody.AddParagraph("AdventureWorks Cycles, the
fictitious company on which the AdventureWorks sample databases are based,
is a large, multinational manufacturing company.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the bullet character for this list
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183);
//Sets the font of the bullet character
paragraph.ListFormat.FontName = "Symbol";
//Sets the hanging value as 20
paragraph.FirstLineIndent = -20;
```

XAMARIN

```
//Adds a new paragraph with text.
paragraph = textShape.TextBody.AddParagraph("AdventureWorks Cycles, the
fictitious company on which the AdventureWorks sample databases are based,
is a large, multinational manufacturing company.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the bullet character for this list
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183);
//Sets the font of the bullet character
paragraph.ListFormat.FontName = "Symbol";
//Sets the hanging value as 20
paragraph.FirstLineIndent = -20;
```

In PowerPoint Presentation, the multilevel lists are used for presenting the content in a hierarchy. You can create a multi-level list by setting the indentation levels. By default, the level begins at 0 and increments by 1 for each level. The following code example demonstrates how to add multi-level list in a paragraph.

C#

```
//Adds a new paragraph
paragraph = textShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the list level as 2. Possible values can range from 0 to 8
paragraph.IndentLevelNumber = 2;
```

VB.NET

```
'Adds a new paragraph
paragraph = textShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.")
'Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted
'Sets the list level as 2. Possible values can range from 0 to 8
paragraph.IndentLevelNumber = 2
```

UWP

```
//Adds a new paragraph
paragraph = textShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the list level as 2. Possible values can range from 0 to 8
paragraph.IndentLevelNumber = 2;
```

ASP.NET CORE

```
//Adds a new paragraph
paragraph = textShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the list level as 2. Possible values can range from 0 to 8
paragraph.IndentLevelNumber = 2;
```

XAMARIN

```
//Adds a new paragraph
paragraph = textShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.");
//Sets the list type as bullet
paragraph.ListFormat.Type = ListType.Bulleted;
//Sets the list level as 2. Possible values can range from 0 to 8
paragraph.IndentLevelNumber = 2;
```

You can add images to the Presentation by adding them in the picture collection of a slide. The following code example demonstrates how to add an image in a presentation.

C#

```
//Gets the image from file path
Image image = Image.FromFile(@"image.jpg");
// Adds the image to the slide by specifying position and size
firstSlide.Pictures.AddPicture(new MemoryStream(image.ImageData), 300, 270,
410, 250);
```

VB.NET

```
'Gets the image from file path
Dim image__1 As Image = Image.FromFile("image.jpg")
' Adds the image to the slide by specifying position and size
firstSlide.Pictures.AddPicture(New MemoryStream (image__1.ImageData), 300,
270, 410, 250)
```

UWP

```
//Gets the image from file path
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream imageStream =
assembly.GetManifestResourceStream("UWP.Data.tablet.jpg");
// Adds the image to the slide by specifying position and size
firstSlide.Pictures.AddPicture(imageStream, 300, 270, 410, 250);
```

ASP.NET CORE

```
//Gets the image from file path
FileStream imageStream = new FileStream(@"Image.png", FileMode.Open,
FileAccess.Read);
// Adds the image to the slide by specifying position and size
firstSlide.Pictures.AddPicture(imageStream, 300, 270, 410, 250);
```

XAMARIN

```
//Gets the image from file path
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream imageStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.tablet.jpg");
// Adds the image to the slide by specifying position and size
firstSlide.Pictures.AddPicture(imageStream, 300, 270, 410, 250);
```

Finally, save the Presentation in file system and close its instance.

C#

```
//Saves the Presentation in the given name
pptxDoc.Save("Output.pptx");
//Releases the resources occupied
pptxDoc.Close();
```

VB.NET

```
'Saves the Presentation in the given name
pptxDoc.Save("Output.pptx")
'Releases the resources occupied
pptxDoc.Close()
```

UWP

```
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
//Releases the resources occupied
pptxDoc.Close();
```

ASP.NET CORE

```
//Saving the PowerPoint Presentation as stream
FileStream stream = new FileStream("Sample.pptx", FileMode.Create,
FileAccess.ReadWrite);
pptxDoc.Save(stream);
//Dispose stream
stream.Dispose();
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

The resultant PowerPoint Presentation looks as follows.

Hello Presentation

- Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company.
 - The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets.

Converting PowerPoint Presentation to PDF

Essential Presentation allows you to convert a PowerPoint Presentation into PDF document. The following assemblies are required for the Presentation to PDF conversion.

Assembly Name	Short Description
Syncfusion.Presentation.Base	This assembly contains the core features required for creating, reading, manipulating a Presentation file.
Syncfusion.Compression.Base	This assembly is used to pack the Presentation contents.
Syncfusion.OfficeChart.Base	This assembly contains the office chart object model and core features needed for chart creation.
Syncfusion.OfficeChartToImageConverter.WPF	This assembly is used to convert Office Chart into Image.
Syncfusion.Pdf.Base	This assembly is used for PDF file creation.
Syncfusion.PresentationToPDFConverter.Base	This assembly is used to convert Presentation file into PDF.
Syncfusion.SfChart.WPF	Supporting assembly for Syncfusion.OfficeChartToImageConverter.WPF

Include the following namespaces in your .cs or .vb code as shown below

C#

```
using Syncfusion.Presentation;
```

```
using Syncfusion.OfficeChartToImageConverter;
using Syncfusion.Pdf;
using Syncfusion.PresentationToPdfConverter;
```

VB.NET

```
Imports Syncfusion.Presentation
Imports Syncfusion.OfficeChartToImageConverter
Imports Syncfusion.Pdf
Imports Syncfusion.PresentationToPdfConverter
```

PresentationToPdfConverter class is responsible for converting an entire Presentation or a slide into PDF. The following code example demonstrates how to convert the PowerPoint presentation to PDF.

C#

```
//Opens a PowerPoint Presentation file
IPresentation pptxDoc = Presentation.Open(fileName);
//Creates an instance of ChartToImageConverter and assigns it to
ChartToImageConverter property of Presentation
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Converts the PowerPoint Presentation into PDF document
PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc);
//Saves the PDF document
pdfDocument.Save(@"SampleWithoutSetting.pdf");
//Closes the PDF document
pdfDocument.Close(true);
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Opens a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open(fileName)
'Creates an instance of ChartToImageConverter and assigns it to
ChartToImageConverter property of Presentation
pptxDoc.ChartToImageConverter = New ChartToImageConverter ()
'Converts the PowerPoint Presentation into PDF document
Dim pdfDocument As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc)
'Saves the PDF document
pdfDocument.Save("SampleWithoutSetting.pdf")
'Closes the PDF document
pdfDocument.Close(True)
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Essential Presentation Library does not support presentation to Pdf
conversion in UWP platform.
```

ASP.NET CORE

```
//Open the existing PowerPoint presentation.
```

```

string basePath = _hostingEnvironment.WebRootPath;
FileStream fileStreamInput = new FileStream(basePath +
@"/Presentation/ConversionTemplate.pptx", FileMode.Open, FileAccess.Read);
IPresentation pptxDoc = Presentation.Open(fileStreamInput);
//Convert the PowerPoint document to PDF document.
PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc);
//Save the converted PDF document to Memory stream.
MemoryStream pdfStream = new MemoryStream();
pdfDocument.Save(pdfStream);
pdfStream.Position = 0;
//Close the PDF document.
pdfDocument.Close(true);
//Close the PowerPoint Presentation.
pptxDoc.Close();
//Initialize the file stream to download the converted PDF.
FileStreamResult fileStreamResult = new FileStreamResult(pdfStream,
"application/pdf");
//Set the file name.
fileStreamResult.FileNameDownloadName = "Sample.pdf";
return fileStreamResult;

```

XAMARIN

```

string resourcePath =
"SampleBrowser.Presentation.Samples.Templates.Template.pptx";
Assembly assembly = typeof(GettingStarted).GetTypeInfo().Assembly;
Stream fileStream = assembly.GetManifestResourceStream(resourcePath);
//Open a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open(fileStream);
//Convert the PowerPoint document to PDF document.
PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc);
//Save the converted PDF document.
MemoryStream pdfStream = new MemoryStream();
pdfDocument.Save(pdfStream);
pdfStream.Position = 0;
//Close the PDF document.
pdfDocument.Close(true);
//Close the PowerPoint Presentation.
pptxDoc.Close();
if (Device.RuntimePlatform == Device.UWP)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("PPTXToPDF.pdf",
"application/pdf", pdfStream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("PPTXToPDF.pdf",
"application/pdf", pdfStream);

```

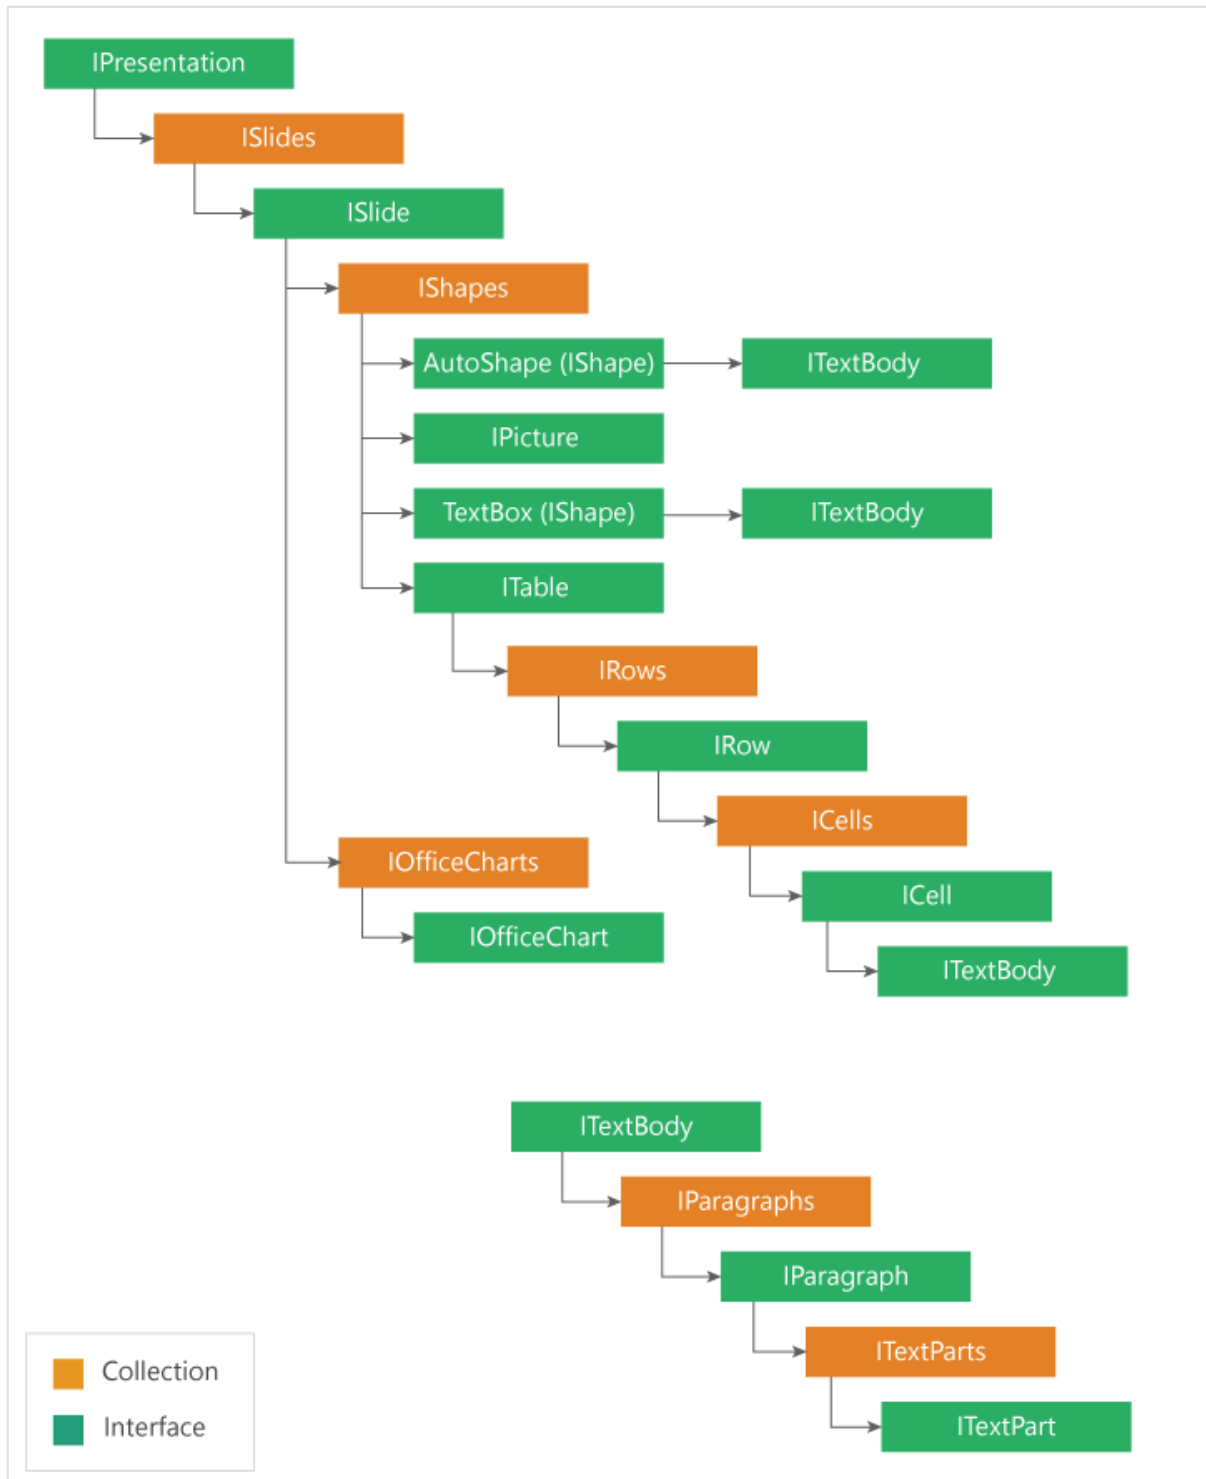

Note: * Creating an instance of **ChartToImageConverter** class is mandatory to convert the charts in the PowerPoint presentation to PDF/Image format. Otherwise, the charts are not exported to the converted PDF/Image.

* **ChartToImageConverter** is supported from .NET Framework 4.0 onwards

PresentationToPdfConverterSettings can be used to customize the conversion of Presentation to PDF document. **ChartToImageConverter** class can be further used to improve the quality of converted charts in the PDF/Image. For more information about this, see [Conversion](#).

Document Object Model representation

In order to create and modify a PowerPoint Presentation, you need to know how the elements are organized in Essential Presentation's document object model (DOM). The following figure illustrates this DOM.

Load and save the Presentation

Opening an existing Presentation from file system

You can open an existing PowerPoint Presentation by using the file name and its physical path.

C#

```
//Opens an existing Presentation from file system  
IPresentation pptxDoc = Presentation.Open(fileName);
```

VB.NET

```
'Opens an existing Presentation from file system  
Dim pptxDoc As IPresentation = Presentation.Open(fileName)
```

UWP

```
//Instantiates the File Picker  
FileOpenPicker openPicker = new FileOpenPicker();  
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;  
openPicker.FileTypeFilter.Add(".pptx");  
//Creates a storage file from FileOpenPicker  
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation  
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Open(inputStream)
```

XAMARIN

```
/"App" is the class of Portable project  
Assembly assembly = typeof(App).GetTypeInfo().Assembly;  
Stream inputStream = assembly.GetManifestResourceStream("Sample.pptx");  
//Loads or open an existing PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Open(inputStream);
```

Opening an existing Presentation from stream

You can open an existing PowerPoint Presentation from stream by using the overloads of Open method.

C#

```
//Opens an existing Presentation from stream  
IPresentation pptxDoc = Presentation.Open(presentationStream);
```

VB.NET

```
'Opens an existing Presentation from stream  
Dim pptxDoc As IPresentation = Presentation.Open(presentationStream)
```

UWP

```
//Create new Presentation without slides.  
Assembly assembly = typeof(App).GetTypeInfo().Assembly;  
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Open(inputStream);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation  
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
```

XAMARIN

```
//Create new Presentation without slides.  
Assembly assembly = typeof(App).GetTypeInfo().Assembly;  
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Open(inputStream);
```

Opening an encrypted Presentation

You can open an encrypted PowerPoint presentation from either file path or stream by using the following overloads of Open method as follows.

C#

```
//Opens an existing encrypted Presentation from stream  
IPresentation pptxDoc = Presentation.Open(presentationStream, password);
```

VB.NET

```
'Opens an existing encrypted Presentation from stream  
Dim pptxDoc As IPresentation = Presentation.Open(presentationStream,  
password)
```

UWP

```
//Opens an existing encrypted Presentation from stream  
IPresentation pptxDoc = Presentation.OpenAsync(presentationStream,  
password);
```

ASP.NET CORE

```
//Essential Presentation Library does not provides support to Encryption and  
Decryption in ASP.NET Core platforms.
```

XAMARIN

```
//Essential Presentation Library does not provides support to Encryption and  
Decryption in ASP.NET Core platforms.
```

C#

```
//Opens an existing encrypted Presentation from file system  
IPresentation pptxDoc = Presentation.Open(fileName, password);
```

VB.NET

```
'Opens an existing encrypted Presentation from file system  
Dim pptxDoc As IPresentation = Presentation.Open(fileName, password)
```

UWP

```
//Opens an existing encrypted Presentation from file system  
IPresentation pptxDoc = Presentation.OpenAsync(fileName, password);
```

ASP.NET CORE

```
//Essential Presentation Library does not provides support to Encryption and  
Decryption in ASP.NET Core platforms.
```

XAMARIN

```
//Essential Presentation Library does not provides support to Encryption and  
Decryption in ASP.NET Core platforms.
```

Saving a PowerPoint Presentation to file system

You can save the created or manipulated PowerPoint Presentation to file system by using Save() method of **IPresentation** interface. Default format type is *.PPTX.

C#

```
//Opens an existing PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Open(fileName);  
//To-Do some manipulation  
//To-Do some manipulation  
//Saves the Presentation in file system  
pptxDoc.Save("Output.pptx");
```

VB.NET

```
'Opens an existing PowerPoint Presentation  
Dim pptxDoc As IPresentation = Presentation.Open(fileName)  
'To-Do some manipulation  
'To-Do some manipulation  
'Saves the Presentation in file system  
pptxDoc.Save("Output.pptx")
```

UWP

```
//Instantiates the File Picker  
FileOpenPicker openPicker = new FileOpenPicker();  
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;  
openPicker.FileTypeFilter.Add(".pptx");
```

```

//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
//To-Do some manipulation
//To-Do some manipulation
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(fileName, FileMode.Open);
//To-Do some manipulation
//To-Do some manipulation
FileStream outputStream = new FileStream("output.pptx", FileMode.Create);
pptxDoc.SaveAs(outputStream);

```

XAMARIN

```

//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);

```

Saving a PowerPoint Presentation to stream

You can save the created or manipulated PowerPoint Presentation to stream by using overloads of Save method.

C#

```
//Opens an existing PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(fileName);
//To-Do some manipulation
//To-Do some manipulation
//Creates an instance of memory stream
MemoryStream stream = new MemoryStream();
//Saves the Presentation to stream
pptxDoc.Save(stream);
```

VB.NET

```
'Opens an existing PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open(fileName)
'To-Do some manipulation
'To-Do some manipulation
'Creates an instance of memory stream
Dim stream As New MemoryStream()
'Saves the Presentation to stream
pptxDoc.Save(stream)
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
//To-Do some manipulation
//To-Do some manipulation
//Saves changes to the specified storage file
MemoryStream outputStream = new MemoryStream();
await pptxDoc.SaveAsync(outputStream);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
//To-Do some manipulation
//To-Do some manipulation
FileStream outputStream = new FileStream(outputFileName, FileMode.Create);
pptxDoc.SaveAs(outputStream);
```

XAMARIN

```
/"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
```

```
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
MemoryStream outputStream = new MemoryStream();
pptxDoc.Save(outputStream);
```

Sending to a client browser

You can save and send the Presentation to a client browser from a website or web application by invoking the overload of Save method. This method explicitly make use of an instance of `HttpResponse` as its parameter in order to stream the presentation to client browser. So, this overload is suitable for web application that refer to [System.Web](#) assembly.

C#

```
//Opens an existing PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(fileName);
//To-Do some manipulation
//To-Do some manipulation
//Saves the Presentation to the client browser
pptxDoc.Save("Output.pptx", FormatType.Pptx, Response);
```

VB.NET

```
'Opens an existing PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open(fileName)
'To-Do some manipulation
'To-Do some manipulation
'Saves the Presentation to the client browser
pptxDoc.Save("Output.pptx", FormatType.Pptx, Response)
```

UWP

```
//Saving and sending the workbook to a client browser from a web site is
suitable for web applications alone.
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
//To-Do some manipulation
//To-Do some manipulation
//Initialize content type
string ContentType = null;
//Save the PowerPoint Presentation to stream
MemoryStream outputStream = new MemoryStream();
pptxDoc.Save(outputStream);
outputStream.Position = 0;
//Return the file with content type
return File(outputStream, ContentType, outputFileName);
```

XAMARIN

```
//Saving and sending the workbook to a client browser from a web site is  
suitable for web applications alone.
```

Closing a PowerPoint Presentation

When you are done with the Presentation instance, you should close the instance of **IPresentation** in order to release the memory consumed by Essential Presentation library. The following code example illustrates how to close an IPresentation instance.

C#

```
//Opens an existing Presentation from file system  
IPresentation pptxDoc = Presentation.Open(fileName);  
//To-Do some manipulation  
//To-Do some manipulation  
//Creates an instance of memory stream  
MemoryStream stream = new MemoryStream();  
//Saves the Presentation to stream  
pptxDoc.Save(stream);  
//Closes the Presentation instance and free the memory consumed.  
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation from file system  
Dim pptxDoc As IPresentation = Presentation.Open(fileName)  
'To-Do some manipulation  
'To-Do some manipulation  
'Creates an instance of memory stream  
Dim stream As New MemoryStream()  
'Saves the Presentation to stream  
pptxDoc.Save(stream)  
'Closes the Presentation instance and free the memory consumed.  
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker  
FileOpenPicker openPicker = new FileOpenPicker();  
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;  
openPicker.FileTypeFilter.Add(".pptx");  
//Creates a storage file from FileOpenPicker  
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);  
//MemoryStream outputStream = new MemoryStream();  
//await pptxDoc.SaveAsync(outputStream);  
//Initializes FileSavePicker  
FileSavePicker savePicker = new FileSavePicker();  
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;  
savePicker.SuggestedFileName = "Sample";  
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {  
".pptx" });  
//Creates a storage file from FileSavePicker  
StorageFile storageFile = await savePicker.PickSaveFileAsync();  
//Saves changes to the specified storage file
```

```
await pptxDoc.SaveAsync(storageFile);
//Close the instance of PowerPoint Presentation
pptxDoc.Close();
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Close the instance of PowerPoint Presentation
pptxDoc.Close();
```

XAMARIN

```
///"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Working with PowerPoint presentation

Cloning a PowerPoint presentation

Cloning a PowerPoint presentation creates a new copy of the PowerPoint presentation and the changes made in the cloned copy of the presentation do not affect the source PowerPoint presentation.

C#

```
//Opens a PowerPoint presentation
```

```

IPresentation sourcePresentation = Presentation.Open(fileName);
//Clones the Presentation
IPresentation clonedPresentation = sourcePresentation.Clone();
//Gets the first slide from the cloned PowerPoint presentation
ISlide firstSlide = clonedPresentation.Slides[0];
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph in the body of the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Essential Presentation");
//Saves the modified cloned PowerPoint presentation
clonedPresentation.Save("ClonedPresentation.pptx");

```

VB.NET

```

'Opens a PowerPoint presentation
Dim sourcePresentation_1 As IPresentation = Presentation.Open(fileName)
'Clones the Presentation
Dim clonedPresentation_1 As IPresentation = sourcePresentation_1.Clone()
'Gets the first slide from the cloned PowerPoint presentation
Dim firstSlide As ISlide = clonedPresentation_1.Slides(0)
'Adds a textbox in a slide by specifying its position and size
Dim textShape As IShape = firstSlide.AddTextBox(100, 75, 756, 200)
'Adds a paragraph in the body of the textShape
Dim paragraph As IParagraph = textShape.TextBody.AddParagraph()
'Adds a textPart in the paragraph
Dim textPart As ITextPart = paragraph.AddTextPart("Essential Presentation")
'Saves the modified cloned PowerPoint presentation
clonedPresentation_1.Save("ClonedPresentation.pptx")

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation sourcePresentation = await
Presentation.OpenAsync(inputStorageFile);
//Clones the Presentation
IPresentation clonedPresentation = sourcePresentation.Clone();
//Gets the first slide from the cloned PowerPoint presentation
ISlide firstSlide = clonedPresentation.Slides[0];
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph in the body of the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Essential Presentation");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "ClonedPresentation";

```

```

savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await clonedPresentation.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Clones the Presentation
IPresentation clonedPresentation = pptxDoc.Clone();
String ContentType=null;
//Gets the first slide from the cloned PowerPoint presentation
ISlide firstSlide = clonedPresentation.Slides[0];
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph in the body of the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Essential Presentation");
//Save the PowerPoint Presentation to stream
FileStream outputStream = new FileStream(outputFileName, FileMode.Create);
clonedPresentation.SaveAs(outputStream);

```

XAMARIN

```

//Loads the PowerPoint Presentation as stream.
Assembly assembly =
typeof(GettingStartedPresentation).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Clones the Presentation
IPresentation clonedPresentation = pptxDoc.Clone();
//Gets the first slide from the cloned PowerPoint presentation
ISlide firstSlide = clonedPresentation.Slides[0];
//Adds a textbox in a slide by specifying its position and size
IShape textShape = firstSlide.AddTextBox(100, 75, 756, 200);
//Adds a paragraph in the body of the textShape
IParagraph paragraph = textShape.TextBody.AddParagraph();
//Adds a textPart in the paragraph
ITextPart textPart = paragraph.AddTextPart("Essential Presentation");
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
clonedPresentation.Save(stream);
//Close the presentation
clonedPresentation.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Printing a PowerPoint presentation

You can print the Presentation document by converting the PowerPoint presentation slides to images. For more information about converting the PowerPoint presentation slides to images, see [Conversion](#). You can use the System.Drawing.Printing.[PrintDocument](#) class to print the converted images by the default printer or to any of the available printer with customized settings.

The following code example demonstrates how to convert the slides of a PowerPoint presentation to images.

C#

```
//Opens a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Converts the slides to images
Image[] images =
pptxDoc.RenderAsImages(Syncfusion.Drawing.ImageType.Bitmap);
//Closes the PowerPoint presentation
pptxDoc.Close();
```

VB.NET

```
'Opens a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Converts the slides to images
Dim images As Image() = pptxDoc.RenderAsImages(Syncfusion.Drawing.
ImageType.Bitmap)
'Closes the PowerPoint presentation
pptxDoc.Close()
```

The following code example demonstrates how to print the converted images.

C#

```
//Initializes the start and page for printing
int startPageIndex = 1;
int endPageIndex = images.Length;
//Creates new PrintDialog instance.
System.Windows.Forms.PrintDialog printDialog = new
System.Windows.Forms.PrintDialog();
//Sets new PrintDocument instance to print dialog.
printDialog.Document = new PrintDocument();
//Enables the print current page option.
printDialog.AllowCurrentPage = true;
//Enables the print selected pages option.
printDialog.AllowSomePages = true;
//Sets the start and end page index
printDialog.PrinterSettings.FromPage = 1;
```

```
printDialog.PrinterSettings.ToPage = images.Length;
//Opens the print dialog box.
if (printDialog.ShowDialog() == System.Windows.Forms.DialogResult.OK)
{
    //Checks whether the selected page range is valid or not
    if (printDialog.PrinterSettings.FromPage > 0 &&
        printDialog.PrinterSettings.ToPage <= images.Length)
    {
        //Updates the start page of the document to print.
        startPageIndex = printDialog.PrinterSettings.FromPage - 1;
        //Updates the end page of the document to print.
        endPageIndex = printDialog.PrinterSettings.ToPage;
        //Hooks the PrintPage event to handle be drawing pages for printing.
        printDialog.Document.PrintPage += new
        PrintPageEventHandler(PrintPageMethod);
        //Prints the document.
        printDialog.Document.Print();
    }
}

private void PrintPageMethod (object sender, PrintPageEventArgs e)
{
    //Gets the print start page width.
    int currentPageWidth = images[startPageIndex].Width;
    //Gets the print start page height.
    int currentPageHeight = images[startPageIndex].Height;
    //Gets the visible bounds width for print.
    int visibleClipBoundsWidth = (int)e.Graphics.VisibleClipBounds.Width;
    //Gets the visible bounds height for print.
    int visibleClipBoundsHeight = (int)e.Graphics.VisibleClipBounds.Height;
    //Checks whether the page layout is landscape or portrait.
    if (currentPageWidth > currentPageHeight)
    {
        //Translates the position.
        e.Graphics.TranslateTransform(0, visibleClipBoundsHeight);
        //Rotates the object at 270 degrees
        e.Graphics.RotateTransform(270.0f);
        //Draws the current page image.
        e.Graphics.DrawImage(images[startPageIndex], new System.Drawing.Rectangle(0,
        0, currentPageWidth, currentPageHeight));
    }
    else
    {
        //Draws the current page image.
        e.Graphics.DrawImage(images[startPageIndex], new System.Drawing.Rectangle(0,
        0, visibleClipBoundsWidth, visibleClipBoundsHeight));
    }
    //Disposes the current page image after drawing.
    images[startPageIndex].Dispose();
    //Increments the start page index.
    startPageIndex++;
    //Updates whether the document contains more pages to print or not.
    if (startPageIndex < endPageIndex)
    {
        e.HasMorePages = true;
    }
    else
    {
        startPageIndex = 0;
    }
}
```

VB.NET

```

Dim endPageIndex As Integer = images.Length
'Creates new PrintDialog instance.
Dim printDialog As New System.Windows.Forms. PrintDialog()
'Sets new PrintDocument instance to print dialog.
printDialog.Document = New PrintDocument()
'Enables the print current page option.
printDialog.AllowCurrentPage = True
'Enables the print selected pages option.
printDialog.AllowSomePages = True
'Sets the start and end page index
printDialog.PrinterSettings.FromPage = 1
printDialog.PrinterSettings.ToPage = images.Length
'Opens the print dialog box.
If printDialog.ShowDialog() = System.Windows.Forms.DialogResult.OK Then
'Checks whether the selected page range is valid or not.
If printDialog.PrinterSettings.FromPage > 0 AndAlso
printDialog.PrinterSettings.ToPage <= images.Length Then
'Updates the start page of the document to print.
startPageIndex = printDialog.PrinterSettings.FromPage - 1
'Updates the end page of the document to print.
endPageIndex = printDialog.PrinterSettings.ToPage
'Hooks the PrintPage event to handle the drawing pages for printing.
printDialog.Document.PrintPage += New PrintPageEventHandler(PrintPageMethod)
'Prints the document.
printDialog.Document.Print()
End If
End If
Private Sub PrintPageMethod(sender As Object, e As PrintPageEventArgs)
'Gets the print start page width.
Dim currentPageWidth As Integer = images(startPageIndex).Width
'Gets the print start page height.
Dim currentPageHeight As Integer = images(startPageIndex).Height
'Gets the visible bounds width for print.
Dim visibleClipBoundsWidth As Integer =
CInt(e.Graphics.VisibleClipBounds.Width)
'Gets the visible bounds height for print.
Dim visibleClipBoundsHeight As Integer =
CInt(e.Graphics.VisibleClipBounds.Height)
'Checks whether the page layout is landscape or portrait.
If currentPageWidth > currentPageHeight Then
'Translates the position.
e.Graphics.TranslateTransform(0, visibleClipBoundsHeight)
'Rotates the object at 270 degrees.
e.Graphics.RotateTransform(270.0F)
'Draws the current page image.
e.Graphics.DrawImage(images(startPageIndex), New System.Drawing.Rectangle
(0, 0, currentPageWidth, currentPageHeight))
Else
'Draws the current page image.
e.Graphics.DrawImage(images(startPageIndex), New System.Drawing.Rectangle
(0, 0, visibleClipBoundsWidth, visibleClipBoundsHeight))
End If
'Disposes the current page image after drawing.

```

```

images(startPageIndex).Dispose()
'Increments the start page index.
startPageIndex += 1
'Updates whether the document contains more pages to print or not.
If startPageIndex < endPageIndex Then
e.HasMorePages = True
Else
startPageIndex = 0
End If
End Sub

```

Working with PowerPoint presentation properties

Document properties, also known as meta data, are details about a file that describe or identify it. Document properties are classified into two categories.

- **Built-in Document Properties** - that include details such as title, author name, subject, and keywords that identify the document's topic or contents.
- **Custom Document properties** - define the user-defined document properties.

Built-in Document Properties

You can access and modify the built in document properties of a PowerPoint presentation with Essential Presentation library. The Built-in document properties of a PowerPoint presentation is represented by **IBuiltInDocumentProperties** type.

Accessing and Modifying Built-in Document Properties

The following code example demonstrates how to access the existing built in document property.

C#

```

//Opens a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Accesses the built-in document properties
Console.WriteLine("Title - {0}", pptxDoc.BuiltInDocumentProperties.Title);
Console.WriteLine("Author - {0}", pptxDoc.BuiltInDocumentProperties.Author);
//Closes the PowerPoint presentation
pptxDoc.Close();

```

VB.NET

```

'Opens a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Accesses the built-in document properties
Console.WriteLine("Title - {0}",
presentationDocument.BuiltInDocumentProperties.Title)
Console.WriteLine("Author - {0}",
presentationDocument.BuiltInDocumentProperties.Author)
'Closes the PowerPoint presentation
pptxDoc.Close()

```

The following code example demonstrates how to modify the existing built in document property

C#

```
//Opens a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Modifies the Built-in document properties
pptxDoc.BuiltInDocumentProperties.Category = "Sales reports";
pptxDoc.BuiltInDocumentProperties.Company = "Northwind traders";
//Saves the modified PowerPoint presentation
pptxDoc.Save("Output.pptx");
//Closes the modified PowerPoint presentation
pptxDoc.Close();
```

VB.NET

```
'Opens a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Modifies the Built-in document properties
pptxDoc.BuiltInDocumentProperties.Category = "Sales reports"
pptxDoc.BuiltInDocumentProperties.Company = "Northwind traders"
'Saves the modified PowerPoint presentation
pptxDoc.Save("Output.pptx")
'Closes the modified PowerPoint presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
//Modifies the Built-in document properties
pptxDoc.BuiltInDocumentProperties.Category = "Sales reports";
pptxDoc.BuiltInDocumentProperties.Company = "Northwind traders";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```

        stream);

```

Custom Document properties

You can create and modify the custom document properties of a PowerPoint presentation with Essential Presentation library. The collection of custom document properties in a PowerPoint presentation is represented by **ICustomDocumentProperties** object.

Adding Custom Document properties

The following code example demonstrates how to add new custom document property.

C#

```

// Creates a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
// Adds custom document properties
ICustomDocumentProperties documentProperty =
    pptxDoc.CustomDocumentProperties;
documentProperty.Add("PropertyA");
documentProperty["PropertyA"].Text = "@!123";
documentProperty.Add("PropertyB");
documentProperty["PropertyB"].Text = "B";
// Saves the PowerPoint presentation

```

```
pptxDoc.Save("Output.pptx");
//Closes the PowerPoint presentation
pptxDoc.Close();
```

VB.NET

```
'Creates a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds custom document properties
Dim documentProperty As ICustomDocumentProperties =
pptxDoc.CustomDocumentProperties
documentProperty.Add("PropertyA")
documentProperty("PropertyA").Text = "@!123"
documentProperty.Add("PropertyB")
documentProperty("PropertyB").Text = "B"
'Saves the PowerPoint presentation
pptxDoc.Save("Output.pptx")
'Closes the PowerPoint presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
//Adds custom document properties
ICustomDocumentProperties documentProperty =
pptxDoc.CustomDocumentProperties;
documentProperty.Add("PropertyA");
documentProperty["PropertyA"].Text = "@!123";
documentProperty.Add("PropertyB");
documentProperty["PropertyB"].Text = "B";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Adds custom document properties
```

```

ICustomDocumentProperties documentProperty =
pptxDoc.CustomDocumentProperties;
documentProperty.Add("PropertyA");
documentProperty["PropertyA"].Text = "@!123";
documentProperty.Add("PropertyB");
documentProperty["PropertyB"].Text = "B";
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the PowerPoint presentation
pptxDoc.Close();

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
// Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
// Adds custom document properties
ICustomDocumentProperties documentProperty =
pptxDoc.CustomDocumentProperties;
documentProperty.Add("PropertyA");
documentProperty["PropertyA"].Text = "@!123";
documentProperty.Add("PropertyB");
documentProperty["PropertyB"].Text = "B";
// Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
// Save Presentation in stream format.
pptxDoc.Save(stream);
// Close the presentation
pptxDoc.Close();
stream.Position = 0;
// The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Accessing and Modifying Custom Document Properties

The following code example demonstrates how to access and modify an existing custom document property:

C#

```

// Opens a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
// Accesses an existing custom document property

```

```

IDocumentProperty property = pptxDoc.CustomDocumentProperties["PropertyA"];
//Modifies the value of DocumentProperty
property.Value = "Hello world";
//Saves the PowerPoint presentation
pptxDoc.Save("Output.pptx");
//Closes the PowerPoint presentation
pptxDoc.Close();

```

VB.NET

```

'Opens a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Accesses an existing custom document property
Dim [property] As IDocumentProperty =
pptxDoc.CustomDocumentProperties("PropertyA")
'Modifies the value of DocumentProperty
[property].Value = "Hello world"
'Saves the PowerPoint presentation
pptxDoc.Save("Output.pptx")
'Closes the PowerPoint presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
//Accesses an existing custom document property
IDocumentProperty property = pptxDoc.CustomDocumentProperties["PropertyA"];
//Modifies the value of DocumentProperty
property.Value = "Hello world";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Accesses an existing custom document property
IDocumentProperty property = pptxDoc.CustomDocumentProperties["PropertyA"];
//Modifies the value of DocumentProperty

```

```
property.Value = "Hello world";
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Accesses an existing custom document property
IDocumentProperty property = pptxDoc.CustomDocumentProperties["PropertyA"];
//Modifies the value of DocumentProperty
property.Value = "Hello world";
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Marking a PowerPoint presentation as final

PowerPoint presentation can be made read-only to prevent the readers from making inadvertent changes to it. However, making presentation as final is not a security feature. Anyone can disable the final status and edit the presentation.

Below code snippet demonstrates how to create a final non – editable presentation,

C#

```
//Create an instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Mark the presentation as final
pptxDoc.Final = true;
//Save the presentation
pptxDoc.Save("MarkAsFinal.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Create an instance for PowerPoint presentation  
Dim pptxDoc As IPresentation = Presentation.Create()  
'Add slide to the presentation  
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)  
'Mark the presentation as final  
pptxDoc.Final = True  
'Save the presentation  
pptxDoc.Save("MarkAsFinal.pptx")  
'Close the presentation  
pptxDoc.Close()
```

UWP

```
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Create();  
//Add slide to the presentation  
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);  
//Mark the presentation as final  
pptxDoc.Final = true;  
//Initializes FileSavePicker  
FileSavePicker savePicker = new FileSavePicker();  
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;  
savePicker.SuggestedFileName = "MarkAsFinal";  
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {  
    ".pptx" });  
//Creates a storage file from FileSavePicker  
StorageFile storageFile = await savePicker.PickSaveFileAsync();  
//Saves changes to the specified storage file  
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create an instance for PowerPoint presentation  
IPresentation pptxDoc = Presentation.Create();  
//Add slide to the presentation  
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);  
//Mark the presentation as final  
pptxDoc.Final = true;  
//Save the PowerPoint Presentation as stream  
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);  
pptxDoc.Save(outputStream);  
//Close the presentation  
pptxDoc.Close();
```

XAMARIN

```
//Create an instance for PowerPoint presentation  
IPresentation pptxDoc = Presentation.Create();  
//Add slide to the presentation  
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);  
//Mark the presentation as final  
pptxDoc.Final = true;
```

```
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("MarkFinal.ppt
x", "application/vnd.openxmlformats-
officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("MarkFinal.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Working with Slides in PowerPoint

Adding slide to the PowerPoint presentation

In PowerPoint presentation, a slide is a container for the elements like shapes, images, charts, text box etc. The slides may inherit the formatting and layout properties from its 'Master' and 'Layout' slides.

The following code example demonstrates how to add a blank slide to the Presentation.

C#

```
//Creates a PowerPoint instance
IPresentation pptxDoc = Presentation.Create();
//Adds a slide to the PowerPoint presentation
ISlide slide = pptxDoc.Slides.Add();
//Saves the Presentation to the file system.
pptxDoc.Save("Sample.pptx");
//Closes the Presentation instance
pptxDoc.Close();
```

VB.NET

```
'Creates a PowerPoint instance
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a slide to the PowerPoint presentation
Dim slide As ISlide = pptxDoc.Slides.Add()
'Saves the Presentation to the file system.
pptxDoc.Save("Sample.pptx")
'Closes the Presentation instance
pptxDoc.Close()
```

UWP

```
//Creates a PowerPoint instance
IPresentation pptxDoc = Presentation.Create();
//Adds new Blank type of slide.
ISlide slide = pptxDoc.Slides.Add();
```

```
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Creates a PowerPoint instance
IPresentation pptxDoc = Presentation.Create();
//Adds a slide to the PowerPoint presentation
ISlide slide = pptxDoc.Slides.Add();
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Release all resources of the stream
outputStream.Dispose();
//Closes the Presentation instance
pptxDoc.Close();
```

XAMARIN

```
//Creates a PowerPoint instance
IPresentation pptxDoc = Presentation.Create();
//Adds a slide to the PowerPoint presentation
ISlide slide = pptxDoc.Slides.Add();
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
```

Create a slide with predefined LayoutSlide
