The Syncfusion PowerPoint library supports the following predefined slide layout types to create a slide as equivalent to Microsoft PowerPoint:

```
<ul>
<li>Blank</li>
<li>Comparison</li>
<li>Content with caption</li>
<li>Picture with caption</li>
<li>Section header</li>
<li>Title</li>
<li>Title and content</li>
<li>Title and vertical text</li>
<li>Title only</li>
<li>Two content</li>
<li>Vertical title and text</li>
</ul>
```

The following example demonstrates how to access a slide from the predefined blank slide layout type.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide of blank layout type
ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Save the PowerPoint file
pptxDoc.Save("Sample.pptx");
//Close the PowerPoint instance
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint file
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a slide of blank layout type
Dim slide1 As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Save the PowerPoint file
pptxDoc.Save("Sample.pptx")
'Close the PowerPoint instance
pptxDoc.Close()
```

UWP

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide of blank layout type
ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
```

```
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create a new instance of PowerPoint Presentation file
IPresentation pptxDoc = Presentation.Create();
//Add a slide of blank layout type
ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Release all resources of the stream
outputStream.Dispose();
//Close the PowerPoint presentation
pptxDoc.Close();
```

XAMARIN

```
//Create a new instance of PowerPoint Presentation file
IPresentation pptxDoc = Presentation.Create();
//Add a slide of blank layout type
ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

The following code example demonstrates how to add a slide with all other predefined slide layout types.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide of blank layout type
```

```

ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a slide of comparison type
ISlide slide2 = pptxDoc.Slides.Add(SlideLayoutType.Comparison);
//Add a slide of ContentWithCaption type
ISlide slide3 = pptxDoc.Slides.Add(SlideLayoutType.ContentWithCaption);
//Add a slide of PictureWithCaption type
ISlide slide4 = pptxDoc.Slides.Add(SlideLayoutType.PictureWithCaption);
//Add a slide of SectionHeader type
ISlide slide5 = pptxDoc.Slides.Add(SlideLayoutType.SectionHeader);
//Add a slide of Title type
ISlide slide6 = pptxDoc.Slides.Add(SlideLayoutType.Title);
//Add a slide of TitleAndContent type
ISlide slide7 = pptxDoc.Slides.Add(SlideLayoutType.TitleAndContent);
//Add a slide of TitleAndVerticalText type
ISlide slide8 = pptxDoc.Slides.Add(SlideLayoutType.TitleAndVerticalText);
//Add a slide of TitleOnly type
ISlide slide9 = pptxDoc.Slides.Add(SlideLayoutType.TitleOnly);
//Add a slide of TwoContent type
ISlide slide10 = pptxDoc.Slides.Add(SlideLayoutType.TwoContent);
//Add a slide of VerticalTitleAndText type
ISlide slide11 = pptxDoc.Slides.Add(SlideLayoutType.VerticalTitleAndText);
//Save the PowerPoint file
pptxDoc.Save("Sample.pptx");
//Close the PowerPoint instance
pptxDoc.Close();

```

VB.NET

```

'Create a PowerPoint file
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a slide of blank layout type
Dim slide1 As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a slide of comparison type
Dim ISlide As slide2 = pptxDoc.Slides.Add(SlideLayoutType.Comparison)
'Add a slide of ContentWithCaption type
Dim ISlide As slide3 =
pptxDoc.Slides.Add(SlideLayoutType.ContentWithCaption)
'Add a slide of PictureWithCaption type

stream);

```

Adding Custom layout slide

The slide layout are template design for the PowerPoint slides. Slide layout can contains formatting, positioning, and placeholders for a slide. There are 9 predefined layouts and custom slide layouts can also be designed.

The following code example demonstrates how to create and use a customized slide layout in PowerPoint presentation.

C#

```

//Open the template presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Add a new custom layout slide to the master collection with a specific
layout type and name
ILayoutSlide layoutSlide =
pptxDoc.Masters[0].LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout");
//Set background of the layout slide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89,
90);
//Get the stream of an image
Stream pictureStream = File.Open("Image.png", FileMode.Open);
//Add the picture into layout slide
layoutSlide.Shapes.AddPicture(pictureStream, 100, 100, 100, 100);
//Add a slide of new designed custom layout to the presentation
ISlide slide = pptxDoc.Slides.Add(layoutSlide);
//Save the presentation
pptxDoc.Save("Output.pptx");
//Close the presentation
pptxDoc.Close();

```

VB.NET

```

'Open the template presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Add a new custom layout slide to the master collection with a specific
layout type and name
Dim layoutSlide As ILayoutSlide =
pptxDoc.Masters(0).LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout")
'Set background of the layout slide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89,
90)
'Get the stream of an image
Dim pictureStream As Stream = File.Open("Image.png", FileMode.Open)
'Add the picture into layout slide
layoutSlide.Shapes.AddPicture(pictureStream, 100, 100, 100, 100)

```

```

'Add a slide of new designed custom layout to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(layoutSlide)
'Save the presentation
pptxDoc.Save("Output.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Add a new custom layout slide to the master collection with a specific layout type and name
ILayoutSlide layoutSlide =
pptxDoc.Masters[0].LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout");
//Set background of the layout slide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89, 90);
//Get the stream of an image
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream pictureStream =
assembly.GetManifestResourceStream("UWP.Data.Image.png");
//Add the picture into layout slide
layoutSlide.Shapes.AddPicture(pictureStream, 100, 100, 100, 100);
//Add a slide of new designed custom layout to the presentation
ISlide slide = pptxDoc.Slides.Add(layoutSlide);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Add a new custom layout slide to the master collection with a specific layout type and name
ILayoutSlide layoutSlide =
pptxDoc.Masters[0].LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout");
//Set background of the layout slide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89, 90);
//Get the stream of an image
FileStream pictureStream = new FileStream(inputImagePath, FileMode.Open);

```

```
//Add the picture into layout slide
layoutSlide.Shapes.AddPicture(pictureStream, 100, 100, 100, 100);
//Add a slide of new designed custom layout to the presentation
ISlide slide = pptxDoc.Slides.Add(layoutSlide);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Release all resources of the stream
outputStream.Dispose();
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Add a new custom layout slide to the master collection with a specific
//layout type and name
ILayoutSlide layoutSlide =
pptxDoc.Masters[0].LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout");
//Set background of the layout slide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89,
90);
//Get the stream of an image
Stream pictureStream = assembly.GetManifestResourceStream(picturePath);
//Add the picture into layout slide
layoutSlide.Shapes.AddPicture(pictureStream, 100, 100, 100, 100);
//Add a slide of new designed custom layout to the presentation
ISlide slide = pptxDoc.Slides.Add(layoutSlide);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
//and iOS platforms. Please refer presentation/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

The following code example demonstrates how to add a slide with an existing slide's layout.

C#

```

//Open the template presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Get the layout slide collection of the master
ILayoutSlides layoutSlides = pptxDoc.Masters[0].LayoutSlides;
ILayoutSlide slideLayout = null;
//Get each layout slide from the collection
foreach (ILayoutSlide layout in layoutSlides)
{
    //Check if the layout slide has desired custom layout name
    if (layout.Name == "CustomSlideLayout")
    {
        slideLayout = layout;
        break;
    }
}
//Add slide with the desired layout.
ISlide slide = pptxDoc.Slides.Add(slideLayout);
//Save the presentation
pptxDoc.Save("Output.pptx");
//Close the presentation
pptxDoc.Close();

```

VB.NET

```

'Open the template presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Get the layout slide collection of the master
Dim layoutSlides As ILayoutSlides = pptxDoc.Masters(0).LayoutSlides
Dim slideLayout As ILayoutSlide = Nothing
'Get each layout slide from the collection
For Each layout As ILayoutSlide In layoutSlides
    'Check if the layout slide has desired custom layout name
    If layout.Name = "CustomSlideLayout" Then
        slideLayout = layout
    End If
Next
'Add slide with the desired layout.
Dim slide As ISlide = pptxDoc.Slides.Add(slideLayout)
'Save the presentation
pptxDoc.Save("Output.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;

```

Cloning slide

You can create a deep copy of a slide by cloning the slide. The cloned slide is an independent copy of its source slide. This means the changes made in the cloned slide do not affect the source slide.

C#

```

//Opens an existing Presentation.
IPresentation pptxDoc = Presentation.Open("Presentation.pptx");
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Creates a cloned copy of slide.
ISlide slideClone = slide.Clone();

```

```
//Adds a new text box to the cloned slide.
IShape textboxShape = slideClone.AddTextBox(0, 0, 250, 250);
//Adds a paragraph with text content to the shape.
textboxShape.TextBody.AddParagraph("Hello Presentation");
//Adds the slide to the Presentation.
pptxDoc.Slides.Add(slideClone);
//Saves the Presentation to the file system.
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation.
Dim pptxDoc As IPresentation = Presentation.Open("Presentation.pptx")
'Retrieves the slide instance.
Dim slide As ISlide = pptxDoc.Slides(0)
'Creates a cloned copy of slide.
Dim slideClone As ISlide = slide.Clone()
'Adds a new text box to the cloned slide.
Dim textboxShape As IShape = slideClone.AddTextBox(0, 0, 250, 250)
'Adds a paragraph with text content to the shape.
textboxShape.TextBody.AddParagraph("Hello Presentation")
'Adds the slide to the Presentation.
pptxDoc.Slides.Add(slideClone)
'Saves the Presentation to the file system.
pptxDoc.Save("Output.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Creates a cloned copy of slide.
ISlide slideClone = slide.Clone();
//Adds a new text box to the cloned slide.
IShape textboxShape = slideClone.AddTextBox(0, 0, 250, 250);
//Adds a paragraph with text content to the shape.
textboxShape.TextBody.AddParagraph("Hello Presentation");
//Adds the slide to the Presentation.
pptxDoc.Slides.Add(slideClone);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Merging slide

The Essential Presentation provides ability to clone slides from one Presentation to another Presentation. With this ability, you can split a large Presentation into small ones and also merge multiple presentations to one Presentation. You can choose the theme for the cloned slide by using the enum PasteOption.

C#

```

//Opens the source Presentation
IPresentation sourcePresentation =
Presentation.Open("SourcePresentation.pptx");
//Opens the destination Presentation
IPresentation destinationPresentation =
Presentation.Open("DestinationPresentation.pptx");
//Clones the first slide of the source Presentation
ISlide clonedSlide = sourcePresentation.Slides[0].Clone();
//Merges the cloned slide to the destination Presentation with paste option
- Destination Theme
destinationPresentation.Slides.Add(clonedSlide,
PasteOptions.UseDestinationTheme, sourcePresentation);
//Saves the destination Presentation
destinationPresentation.Save("Output.pptx");
//Closes the source presentation
sourcePresentation.Close();
//Closes the destination Presentation
destinationPresentation.Close();

```

VB.NET

```

'Opens the source Presentation
Dim sourcePresentation_1 As IPresentation =
Presentation.Open("SourcePresentation.pptx")
'Opens the destination Presentation
Dim destinationPresentation_1 As IPresentation =
Presentation.Open("DestinationPresentation.pptx")
'Clones the first slide of the source Presentation
Dim clonedSlide As ISlide = sourcePresentation_1.Slides(0).Clone()
'Merges the cloned slide to the destination Presentation with paste option -
Destination Theme
destinationPresentation_1.Slides.Add(clonedSlide,
PasteOptions.UseDestinationTheme, sourcePresentation_1)
'Saves the destination Presentation
destinationPresentation_1.Save("Output.pptx")
'Closes the source presentation
sourcePresentation.Close()

```

```
'Closes the destination Presentation
destinationPresentation.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile sourceStorageFile = await openPicker.PickSingleFileAsync();
//Opens the source Presentation
IPresentation sourcePresentation = await
Presentation.OpenAsync(sourceStorageFile);
//Creates a storage file from FileOpenPicker
StorageFile destinationStorageFile = await openPicker.PickSingleFileAsync();
//Opens the destination Presentation
IPresentation destinationPresentation = await
Presentation.OpenAsync(destinationStorageFile);
//Clones the first slide of the source Presentation
ISlide clonedSlide = sourcePresentation.Slides[0].Clone();
//Merges the cloned slide to the destination Presentation with paste option
- Destination Theme
destinationPresentation.Slides.Add(clonedSlide,
PasteOptions.UseDestinationTheme, sourcePresentation);
//Saves the destination Presentation
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await destinationPresentation.SaveAsync(storageFile);

Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Removing slide

The Essential Presentation provides the ability to delete a slide by its instance or by its index position in slide collection. The following code demonstrates how to delete a slide from a presentation.

C#

```
//Opens an existing presentation.
IPresentation pptxDoc = Presentation.Open("Presentation1.pptx");
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Removes the specified slide from the Presentation.
pptxDoc.Slides.Remove(slide);
```

```
// Removes the slide from the specified index.
pptxDoc.Slides.RemoveAt(1);
//Saves the destination Presentation
pptxDoc.Save("Output.pptx");
//Closes the Presentation instance
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation.
Dim pptxDoc As IPresentation = Presentation.Open("Presentation1.pptx")
'Retrieves the slide instance.
Dim slide As ISlide = pptxDoc.Slides(0)
'Removes the specified slide from the Presentation.
pptxDoc.Slides.Remove(slide)
'Removes the slide from the specified index.
pptxDoc.Slides.RemoveAt(1)
'Saves the destination Presentation
pptxDoc.Save("Output.pptx")
'Closes the Presentation instance
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Removes the specified slide from the Presentation.
pptxDoc.Slides.Remove(slide);
//Removes the slide from the specified index.
pptxDoc.Slides.RemoveAt(1);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the slide instance.
```

```

ISlide slide = pptxDoc.Slides[0];
//Removes the specified slide from the Presentation.
pptxDoc.Slides.Remove(slide);
// Removes the slide from the specified index.
pptxDoc.Slides.RemoveAt(1);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Release all resources of the stream
outputStream.Dispose();
//Closes the Presentation instance
pptxDoc.Close();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Removes the specified slide from the Presentation.
pptxDoc.Slides.Remove(slide);
// Removes the slide from the specified index.
pptxDoc.Slides.RemoveAt(1);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Converting to image

You can convert a presentation slide to image with Essential Presentation. The following code example converts the first slide of a PowerPoint presentation into image and saves the image to a file.

C#

```

//Opens a PowerPoint presentation file
IPresentation pptxDoc = Presentation.Open(fileName);

```

```
//Creates an instance of ChartToImageConverter and assigns it to
ChartToImageConverter
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Converts the first slide into image
Image image =
pptxDoc.Slides[0].ConvertToImage(Syncfusion.Drawing.ImageType.Metafile);
//Saves the image as file
image.Save("slide1.png");
//Closes the Presentation instance
pptxDoc.Close();
```

VB.NET

```
'Opens a PowerPoint presentation file
Dim pptxDoc As IPresentation = Presentation.Open(fileName)
'Creates an instance of ChartToImageConverter and assigns it to
ChartToImageConverter
pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Converts the first slide into image
Dim image As Image =
pptxDoc.Slides(0).ConvertToImage(Syncfusion.Drawing.ImageType.Metafile)
'Saves the image as file
image.Save("slide1.png")
'Closes the Presentation instance
pptxDoc.Close()
```

UWP

```
//Load the presentation file using open picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.FileTypeFilter.Add(".pptx");
StorageFile inputFile = await openPicker.PickSingleFileAsync();
IPresentation pptxDoc = await Presentation.OpenAsync(inputFile);
//Pick the folder to save the converted images.
FolderPicker folderPicker = new FolderPicker();
folderPicker.ViewMode = PickerViewMode.Thumbnail;
folderPicker.FileTypeFilter.Add("*");
StorageFolder storageFolder = await folderPicker.PickSingleFolderAsync();
//Create a cancellation token to cancel the image rendering instantly.
CancellationTokenSource cancellationToken = new CancellationTokenSource();
//Convert the slide to image.
ISlide slidel = pptxDoc.Slides[0];
StorageFile imageFile = await storageFolder.CreateFileAsync("Slide1.png",
CreationCollisionOption.ReplaceExisting);
await slidel.SaveAsImageAsync(imageFile, cancellationToken.Token);
//Close the presentation instance
pptxDoc.Close();
```

ASP.NET CORE

```
//PowerPoint Presentation to image conversion is not supported for ASP.NET
Core platforms.
```

XAMARIN

```
//PowerPoint Presentation to image conversion is not supported for Xamarin platforms.
```

For more details on assemblies required for converting a slide to image, see [Conversion](#)

Note: You can print the PowerPoint presentations by using its ability to convert the slides as images. For more details, refer to [Printing a PowerPoint presentation](#)

Changing Slide background

The following code example demonstrates setting the background for a slide.

C#

```
//Opens an existing Presentation.
IPresentation pptxDoc = Presentation.Open("Presentation1.pptx");
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Retrieves the background instance.
IBackground background = slide.Background;
//Sets the fill type of the background to gradient.
background.Fill.FillType = FillType.Gradient;
//Retrieves the fill of the background to the IGradientFill instance.
IGradientFill gradient = background.Fill.GradientFill;
//Adds the first gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Green, 20);
//Adds the second gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Yellow, 50);
//Saves the Presentation to the file system
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation.
Dim pptxDoc As IPresentation = Presentation.Open("Presentation1.pptx")
'Retrieves the slide instance.
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the background instance.
Dim background As IBackground = slide.Background
'Sets the fill type of the background to gradient.
background.Fill.FillType = FillType.Gradient
'Retrieves the fill of the background to the IGradientFill instance.
Dim gradient As IGradientFill = background.Fill.GradientFill
'Adds the first gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Green, 20)
'Adds the second gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Yellow, 50)
'Saves the Presentation to the file system
pptxDoc.Save("Output.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Retrieves the background instance.
IBackground background = slide.Background;
//Sets the fill type of the background to gradient.
background.Fill.FillType = FillType.Gradient;
//Retrieves the fill of the background to the IGradientFill instance.
IGradientFill gradient = background.Fill.GradientFill;
//Adds the first gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Green, 20);
//Adds the second gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Yellow, 50);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
//Retrieves the background instance.
IBackground background = slide.Background;
//Sets the fill type of the background to gradient.
background.Fill.FillType = FillType.Gradient;
//Retrieves the fill of the background to the IGradientFill instance.
IGradientFill gradient = background.Fill.GradientFill;
//Adds the first gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Green, 20);
//Adds the second gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Yellow, 50);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Release all resources of the stream
outputStream.Dispose();
//Closes the Presentation
pptxDoc.Close();

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
// Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
// Retrieves the slide instance.
ISlide slide = pptxDoc.Slides[0];
// Retrieves the background instance.
IBackground background = slide.Background;
// Sets the fill type of the background to gradient.
background.Fill.FillType = FillType.Gradient;
// Retrieves the fill of the background to the IGradientFill instance.
IGradientFill gradient = background.Fill.GradientFill;
// Adds the first gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Green, 20);
// Adds the second gradient stop of the gradient fill.
gradient.GradientStops.Add(ColorObject.Yellow, 50);
// Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
// Save Presentation in stream format.
pptxDoc.Save(stream);
// Close the presentation
pptxDoc.Close();
stream.Position = 0;
// The operation in Save under Xamarin varies between Windows Phone, Android
// and iOS platforms. Please refer presentation/xamarin section for respective
// code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);

```

Create and edit Master and Layout slides

To get all the slides in same format, you should perform those changes in the Slide Master or Layout Master. The changes will be applied to all the slides, which inherits the master slide or layout slide.

The [Syncfusion PowerPoint library](#) supports the following:

-
- Access the MasterSlide in PowerPoint file.
- Add LayoutSlide to the MasterSlide.
- Customize the LayoutSlide.
- Create a slide with 9 pre-defined layout slides.
- Customize the layout slides to fit your own scenarios.
-

Access the MasterSlide

In PowerPoint presentation, the **MasterSlide** is the top slide that controls all information about the theme, layout, background, color, fonts, and positioning of all slides. Using this MasterSlide, you can easily adjust the look of an existing theme or make overall changes to all your slides.

The following code example demonstrates how to access the **MasterSlide** in a PowerPoint presentation.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Access the first master slide in PowerPoint file
IMasterSlide masterSlide = pptxDoc.Masters[0];
//Get the first shape name from the master slide
string shapeName = masterSlide.Shapes[0].ShapeName;
//Save the PowerPoint file
pptxDoc.Save("Sample.pptx");
//Close the Presentation instance
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Access the first master slide in PowerPoint file.
Dim masterSlide As IMasterSlide = pptxDoc.Masters(0)
'Get the first shape name from the master slide
Dim shapeName As String = masterSlide.Shapes(0).ShapeName
'Save the PowerPoint file.
pptxDoc.Save("AccessMasterSlide.pptx")
'Close the Presentation instance
pptxDoc.Close()
```

Create a custom LayoutSlide

The real-world scenarios always require more predefined templates. The Syncfusion PowerPoint library lets you build your own custom layout designs and use them to create individual slides.

The following code example demonstrates how to create new custom layout slide and access layout slide in Presentation.

C#

```
//Create a PowerPoint instance
IPresentation pptxDoc = Presentation.Create();
//Add a new LayoutSlide to the PowerPoint file
ILayoutSlide layoutSlide =
pptxDoc.Masters[0].LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout");
//Add a shape to the LayoutSlide
IShape shape = layoutSlide.Shapes.AddShape(AutoShapeType.Diamond, 30, 20,
400, 300);
//Change the background color for LayoutSlide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89,
90);
//Save the PowerPoint file
pptxDoc.Save("LayoutSlide.pptx");
//Close the Presentation instance
```

```
pptxDoc.Close();
```

VB.NET

```
'Creates a PowerPoint instance
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a new LayoutSlide to the PowerPoint file
Dim layoutSlide As ILayoutSlide =
pptxDoc.Masters(0).LayoutSlides.Add(SlideLayoutType.Blank, "CustomLayout")
'Add a shape to the LayoutSlide
Dim shape As IShape = layoutSlide.Shapes.AddShape(AutoShapeType.Diamond, 30,
20, 400, 300)
'Change the background color for LayoutSlide
layoutSlide.Background.Fill.SolidFill.Color = ColorObject.FromArgb(78, 89,
90)
'Save the PowerPoint file
pptxDoc.Save("LayoutSlide.pptx")
'Close the Presentation instance
pptxDoc.Close()
```

Working with Paragraph

Adding Paragraph to slide

All the textual contents in a Presentation document is represented by Paragraphs. You can have any number of paragraphs within a TextBody of a textbox or shape in a PowerPoint presentation.

The following code example demonstrates how to add a paragraph in a slide.

C#

```
//Creates PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the PowerPoint
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
//Adds a TextPart to the paragraph
ITextPart textPart = paragraph.AddTextPart();
//Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Saves the Presentation
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Creates PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
```

```

'Adds slide to the PowerPoint
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds textbox to the slide
Dim textboxShape As IShape = slide.AddTextBox(0, 0, 500, 500)
'Adds paragraph to the textbody of textbox
Dim paragraph As IParagraph = textboxShape.TextBody.AddParagraph()
'Adds a TextPart to the paragraph
Dim textPart As ITextPart = paragraph.AddTextPart()
'Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base."
'Saves the Presentation
pptxDoc.Save("Output.pptx")
'Closes the Presentation
pptxDoc.Close()

```

UWP

```

//Creates PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the PowerPoint
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
//Adds a TextPart to the paragraph
ITextPart textPart = paragraph.AddTextPart();
//Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Creates PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the PowerPoint
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);

```

```
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
//Adds a TextPart to the paragraph
ITextPart textPart = paragraph.AddTextPart();
//Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation
pptxDoc.Close();
```

XAMARIN

```
//Creates PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the PowerPoint
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
//Adds a TextPart to the paragraph
ITextPart textPart = paragraph.AddTextPart();
//Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Applying Paragraph formatting

Each paragraph in a slide can has its own formatting types such as alignment, indent etc. The following code example demonstrates how to format a paragraph in PowerPoint presentation.

C#

```
//Loads the PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets the slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets the shape in slide
IShape textboxShape = slide.Shapes[0] as IShape;
//Gets instance of a paragraph in a textbox
IParagraph paragraph = textboxShape.TextBody.Paragraphs[0];
//Applies the first line indent of the paragraph
paragraph.FirstLineIndent = 10;
//Applies the horizontal alignment of the paragraph to center.
paragraph.HorizontalAlignment = HorizontalAlignmentType.Left;

```

Working with text

With Essential Presentation, you can add or modify the text in a Presentation. Within the paragraph, textual contents are grouped into one or more child elements as TextParts. Each TextPart represents a region of text with a common set of formatted text. The following code example demonstrates how to add text with different formatting into a single paragraph.

C#

```

//Creates the PowerPoint Presentation instance
IPresentation pptxDoc = Presentation.Create();
//Gets the slide from Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds textbox to the slide
IShape textboxShape2 = slide.AddTextBox(500, 0, 400, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph2 = textboxShape2.TextBody.AddParagraph();
//Adds a TextPart to the paragraph
ITextPart textPartFormatting = paragraph2.AddTextPart();

```

```

//Adds text to the TextPart
textPartFormatting.Text = "In 2000, AdventureWorks Cycles bought a small
manufacturing plant, located in Mexico. The plant manufactures several
critical subcomponents for the AdventureWorks Cycles product line. These
subcomponents are shipped to the another location for final product
assembly. In 2001, the plant, became the sole manufacturer and distributor
of the touring bicycle product group.";
//Sets the underline color
textPartFormatting.UnderlineColor.SystemColor = Color.Black;
//Retrieves the existing font for modification
IFont font = textPartFormatting.Font;
//Sets the underline type
font.Underline = TextUnderlineType.Single;
//Sets the font weight
font.Bold = true;
//Adds a TextPart to the paragraph
ITextPart textPartFormatting2 = paragraph2.AddTextPart();
//Adds text to the TextPart
textPartFormatting2.Text = "In 2000, AdventureWorks Cycles bought a small
manufacturing plant, located in Mexico.";
//Retrieves the existing font for modification
IFont font2 = textPartFormatting2.Font;
//Sets the font color
font2.Color.SystemColor = Color.Blue;
//Sets the underline type
font2.Underline = TextUnderlineType.WavyDouble;
//Saves the Presentation
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Loads the PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Gets the slide from Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds textbox to the slide
Dim textboxShape2 As IShape = slide.AddTextBox(500, 0, 400, 500)
'Adds paragraph to the textbox of textbox
Dim paragraph2 As IParagraph = textboxShape2.TextBody.AddParagraph()
'Adds a TextPart to the paragraph
Dim textPartFormatting As ITextPart = paragraph2.AddTextPart()

Modifying text

You can modify a text by accessing the existing paragraphs in a Presentation. The following code example demonstrates how to modify the content in a paragraph.

C#

```
//Opens an existing Presentation from file system.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape.
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Retrieves the first TextPart of the shape.
ITextPart textPart = paragraph.TextParts[0];
//Modifies the text content of the TextPart.
textPart.Text = "Hello Presentation";
//Saves the presentation to the file system.
pptxDoc.Save("Result.pptx");
//Closes the Presentation.
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation from file system.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first shape.
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Retrieves the first paragraph of the shape.
Dim paragraph As IParagraph = shape.TextBody.Paragraphs(0)
'Retrieves the first TextPart of the shape.
Dim textPart As ITextPart = paragraph.TextParts(0)
'Modifies the text content of the TextPart.
textPart.Text = "Hello Presentation"
'Saves the presentation to the file system.
pptxDoc.Save("Result.pptx")
'Closes the Presentation.
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
```

```

//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape.
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Retrieves the first TextPart of the shape.
ITextPart textPart = paragraph.TextParts[0];
//Modifies the text content of the TextPart.
textPart.Text = "Hello Presentation";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Result";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape.
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Retrieves the first TextPart of the shape.
ITextPart textPart = paragraph.TextParts[0];
//Modifies the text content of the TextPart.
textPart.Text = "Hello Presentation";
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation.
pptxDoc.Close();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape.
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Retrieves the first TextPart of the shape.

```

```

ITextPart textPart = paragraph.TextParts[0];
//Modifies the text content of the TextPart.
textPart.Text = "Hello Presentation";
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Enabling shrink text on overflow option

In a PowerPoint slide, if you add a text more than a shape can hold, the text will overflow from the shape. But by using a Shrink text on overflow option, you can fit a large text within a shape. The following code example demonstrates how to enable this property.

C#

```

// Create a new PowerPoint file.
using (IPresentation ppDoc = Presentation.Create())
{
    // Add a slide to the PowerPoint file.
    ISlide slide = ppDoc.Slides.Add(SlideLayoutType.Blank);
    // Add a text box to the slide
    IShape textBox = slide.Shapes.AddTextBox(100, 100, 100, 100);
    //Add text to the text box.
    textBox.TextBody.AddParagraph("AdventureWorks Cycles, the fictitious company
on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.");
    //Set the property to shrink text on overflow.
    textBox.TextBody.FitTextOption = FitTextOption.ShrinkTextOnOverflow;
    // Save the PowerPoint file
    ppDoc.Save("Sample.pptx");
}

```

VB.NET

```

'Create a new PowerPoint file
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds slide to the PowerPoint
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds textbox to the slide
Dim textboxShape As IShape = slide.AddTextBox(0, 0, 500, 500)

```

```

'Adds paragraph to the textbody of textbox
Dim paragraph As IParagraph =
textboxShape.TextBody.AddParagraph("AdventureWorks Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company.")
'Set the property to shrink text on overflow.
textboxShape.TextBody.FitTextOption = FitTextOption.ShrinkTextOnOverflow
'Save the PowerPoint file
pptxDoc.Save("Output.pptx")
'Close the PowerPoint file
pptxDoc.Close()

```

Note: The shrink text on overflow is not supported in UWP, ASP.NET CORE and Xamarin platforms.

Removing the paragraph

The following code example demonstrates how to remove a paragraph from a slide.

C#

```

//Opens an existing Presentation from file system.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Removes the first paragraph from the textbody of the shape
shape.TextBody.Paragraphs.Remove(paragraph);
//Saves the presentation to the file system
pptxDoc.Save("Result.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Opens an existing Presentation from file system.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first shape.
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Retrieves the first paragraph of the shape.
Dim paragraph As IParagraph = shape.TextBody.Paragraphs(0)
'Removes the first paragraph from the textbody of the shape.
shape.TextBody.Paragraphs.Remove(paragraph)
'Saves the presentation to the file system.
pptxDoc.Save("Result.pptx")
'Closes the Presentation.
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();

```

```

openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape.
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Removes the first paragraph from the textbody of the shape
shape.TextBody.Paragraphs.Remove(paragraph);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Result";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape
IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Removes the first paragraph from the textbody of the shape
shape.TextBody.Paragraphs.Remove(paragraph);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation
pptxDoc.Close();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape

```

```

IShape shape = slide.Shapes[0] as IShape;
//Retrieves the first paragraph of the shape
IParagraph paragraph = shape.TextBody.Paragraphs[0];
//Removes the first paragraph from the textbody of the shape
shape.TextBody.Paragraphs.Remove(paragraph);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Working with lists

Creating a simple list

Essential Presentation allows you to create simple and multi-level lists that make the content easier for reading. In PowerPoint, Presentation lists consists of the following types

1. Numbered list
2. Bulleted list
3. Picture list

Numbered List

The following code example illustrates how to create a numbered list:

C#

```

//Creates a new Presentation instance.
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide into the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
// Adds a textbox to hold the list
IShape textBoxShape = slide.AddTextBox(65, 140, 410, 270);
// Adds a new paragraph with the text in the left hand side textbox.
IParagraph paragraph = textBoxShape.TextBody.AddParagraph("AdventureWorks
Cycles, the fictitious company on which the AdventureWorks sample databases
are based, is a large, multinational manufacturing company.");
//Sets the list type as Numbered
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as Arabic number following by
period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.ArabicPeriod;

```

```

//Sets the starting value as 1
paragraph.ListFormat.StartValue = 1;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
// Sets the bullet character size. Here, 100 means 100% of its text.
//Possible values can range from 25 to 400.
paragraph.ListFormat.Size = 100;
// Adds another paragraph with the text in the left hand side textbox.
paragraph = textBoxShape.TextBody.AddParagraph("The company manufactures and

Bulleted list

The following code example demonstrates how to create a simple bulleted list.

C#

```

//Creates a new Presentation instance.
IPresentation pptxDoc = Presentation.Create();
//Adds the slide into the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
// Adds a textbox to hold the list
IShape textBoxShape = slide.AddTextBox(65, 140, 410, 250);
// Adds a new paragraph with the text in the left hand side textbox.

```

```
IParagraph paragraph = textBoxShape.TextBody.AddParagraph("AdventureWorks  
Cycles, the fictitious company on which the AdventureWorks sample databases  
are based, is a large, multinational manufacturing company.");  
//Sets the list type as bulleted  
paragraph.ListFormat.Type = ListType.Bulleted;  
//Sets the bullet character for this list  
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183);  
//Sets the hanging value  
paragraph.FirstLineIndent = -20;  
//Sets the list level as 1  
paragraph.IndentLevelNumber = 1;  
// Sets the font for the bullet character  
paragraph.ListFormat.FontName = "Symbol";  
// Sets the bullet character size. Here, 100 means 100% of its text.  
Possible values can range from 25 to 400.  
paragraph.ListFormat.Size = 100;  
// Adds another paragraph with the text in the left hand side textbox.  
paragraph = textBoxShape.TextBody.AddParagraph("The company manufactures and  
sells metal and composite bicycles to North American, European and Asian  
commercial markets.");  
//Sets the list type as bulleted  
paragraph.ListFormat.Type = ListType.Bulleted;  
//Sets the bullet character for this list  
paragraph.ListFormat.BulletCharacter = Convert.ToChar(183);  
//Sets the hanging value  
paragraph.FirstLineIndent = -20;  
//Sets the list level as 1  
paragraph.IndentLevelNumber = 1;  
// Sets the font for the bullet character  
paragraph.ListFormat.FontName = "Symbol";  
// Sets the bullet character size. Here, 100 means 100% of its text.  
Possible values can range from 25 to 400.  
paragraph.ListFormat.Size = 100;  
// Adds another paragraph with the text in the left hand side textbox.  
paragraph = textBoxShape.TextBody.AddParagraph("While its base operation is  
located in Washington with 290 employees, several regional sales teams are  
located throughout their market base.");

```

Picture List

The following code example demonstrates how to create a simple picture list.

C#

```
//Creates a new Presentation instance.
IPresentation pptxDoc = Presentation.Create();
//Adds the slide into the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
// Adds a textbox to hold the list
IShape textBoxShape = slide.AddTextBox(65, 140, 410, 270);
// Adds a new paragraph with the text in the left hand side textbox.
IParagraph paragraph = textBoxShape.TextBody.AddParagraph("AdventureWorks
Cycles, the fictitious company on which the AdventureWorks sample databases
are based, is a large, multinational manufacturing company.");
//Sets the list type as Numbered
paragraph.ListFormat.Type = ListType.Picture;
//Sets the image for the list.
paragraph.ListFormat.Picture(new
MemoryStream(Syncfusion.Drawing.Image.FromFile("Image.png").ImageData));
// Sets the picture size. Here, 100 means 100% of its text. Possible values
can range from 25 to 400.
paragraph.ListFormat.Size = 150;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
// Adds another paragraph with the text in the left hand side textbox.
paragraph = textBoxShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.");
//Sets the list type as picture
paragraph.ListFormat.Type = ListType.Picture;
//Sets the image for the list.
paragraph.ListFormat.Picture(new
MemoryStream(Syncfusion.Drawing.Image.FromFile("Image.png").ImageData));
// Sets the picture size. Here, 100 means 100% of its text. Possible values
can range from 25 to 400.
paragraph.ListFormat.Size = 150;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
//Saves the Presentation to the file system.
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```

```

Creating a Multilevel List

You can create a multi-level list by setting the indentation levels. By default, the level begins at 0 and increments by 1 for each level. A list can be incremented or decremented from levels 0 to 8 as like Microsoft PowerPoint.

The following code example demonstrates how to create a multilevel list.

C#

```

//Creates a new Presentation instance.
IPresentation pptxDoc = Presentation.Create();
//Adds the slide into the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a textbox to hold the bulleted list
IShape textBoxShape = slide.AddTextBox(65, 140, 410, 250);
//Adds paragraph to the textbox
IParagraph paragraph = textBoxShape.TextBody.AddParagraph("AdventureWorks
Cycles, the fictitious company on which the AdventureWorks sample databases
are based, is a large, multinational manufacturing company.");
//Sets the list type as Numbered list
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as Arabic number following by
period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.ArabicPeriod;
//Sets the starting value as 1
paragraph.ListFormat.StartValue = 1;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
//Adds paragraph to the textbox

```

```

paragraph = textBoxShape.TextBody.AddParagraph("The company manufactures and
sells metal and composite bicycles to North American, European and Asian
commercial markets.");
//Sets the list type as Numbered list
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as lower case alphabet following
by period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.AlphaLcPeriod;
//Sets the list level as 2
paragraph.IndentLevelNumber = 2;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
//Add paragraph to the textbox
paragraph = textBoxShape.TextBody.AddParagraph("While its base operation is
located Washington with 290 employees, several regional sales teams are
located throughout their market base.");
//Sets the list type as Numbered list
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as roman number lower casing
following by period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.RomanLcPeriod;
//Sets the list level as 3
paragraph.IndentLevelNumber = 3;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
//Adds paragraph to the textbox
paragraph = textBoxShape.TextBody.AddParagraph("These subcomponents are
shipped to another location for final product assembly");
//Sets the list type as Numbered list
paragraph.ListFormat.Type = ListType.Numbered;
paragraph.ListFormat.NumberStyle = NumberedListStyle.ArabicPeriod;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
//Saves the Presentation to the file system.
pptxDoc.Save("MultiLevelList.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

st.pptx", "application/vnd.openxmlformats-
officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("MultiLevelList.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

The above code example generates a multi-level list in Presentation as follows.

1. Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company.
 - a. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets.
 - i. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams are located throughout their market base.
2. These subcomponents are shipped to the Bothell location for final product assembly

Working with Shapes

Adding shapes to a slide

In every slide, there is a shape collection that can contain any form of graphical objects such as AutoShape, chart, text, or picture. You can add any shape element to this collection. The IShape is the base type for the shape elements.

The following code example demonstrates how to add an AutoShape and image to the shape collection of a slide.

C#

```
//Creates an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds normal shape to slide
slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Creates an instance for image as stream
Stream imageStream = File.Open("Image.jpg", FileMode.Open);
//Add picture to the shape collection

Iterating through shapes

You can iterate through the shapes in a PowerPoint slide. The following code example demonstrates how to iterate through the shapes present in a slide for modifying its properties.

C#

```
//Opens an existing Presentation from the file system
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Iterates through shapes in a slide and sets title
foreach (IShape shape in pptxDoc.Slides[0].Shapes)
{
    if (shape is IPicture)
        shape.Title = "Picture";
    else if (shape is IShape)
        shape.Title = "AutoShape";
}
//Saves the Presentation
```

```
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation from the file system
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Iterates through shapes in a slide and sets title
For Each shape As IShape In pptxDoc.Slides(0).Shapes
If TypeOf shape Is IPicture Then
shape.Title = "Picture"
ElseIf TypeOf shape Is IShape Then
shape.Title = "AutoShape"
End If
Next
'Saves the Presentation
pptxDoc.Save("Output.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Iterates through shapes in a slide and sets title
foreach(IShape shape in pptxDoc.Slides[0].Shapes)
{
if (shape is IPicture)
shape.Title = "Picture";
else if (shape is IShape)
shape.Title = "AutoShape";
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
```

```
//Iterates through shapes in a slide and sets title
foreach(ISHape shape in pptxDoc.Slides[0].Shapes)
{
    if (shape is IPicture)
        shape.Title = "Picture";
    else if (shape is IShape)
        shape.Title = "AutoShape";
}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation
pptxDoc.Close();
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream fileStream =

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Specifying shape properties

The shape properties can be used to format and modify the shapes in a slide. The following code example demonstrates how to apply formatting to a shape.

C#

```

//Creates instance for PowerPoint
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets the first slide of the Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets the shape of the slide
IShape shape = slide.Shapes[0] as IShape;
//Sets the shape name.
shape.ShapeName = "Shape1";
//Retrieves the line format of the shape.
ILineFormat lineFormat = shape.LineFormat;
//Sets the dash style of the line format.
lineFormat.DashStyle = LineDashStyle.DashDotDot;
//Sets the weight of the line format.
lineFormat.Weight = 3;
//Sets the pattern fill type to shape
shape.Fill.FillType = FillType.Pattern;
//Chooses the type of pattern
shape.Fill.PatternFill.Pattern = PatternFillType.DashedDownwardDiagonal;
//Sets the fore color
shape.Fill.PatternFill.ForeColor = ColorObject.AliceBlue;
//Sets the back color
shape.Fill.PatternFill.BackColor = ColorObject.DarkSalmon;
//Saves the Presentation
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Creates instance for PowerPoint
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Gets the first slide of the Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Gets the shape of the slide
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Sets the shape name.
shape.ShapeName = "Shape1"
'Retrieves the line format of the shape.
Dim lineFormat As ILineFormat = shape.LineFormat
'Sets the dash style of the line format.
lineFormat.DashStyle = LineDashStyle.DashDotDot
'Sets the weight of the line format.
lineFormat.Weight = 3
'Sets the pattern fill type to shape
shape.Fill.FillType = FillType.Pattern
'Chooses the type of pattern
shape.Fill.PatternFill.Pattern = PatternFillType.DashedDownwardDiagonal
'Sets the fore color
shape.Fill.PatternFill.ForeColor = ColorObject.AliceBlue
'Sets the back color
shape.Fill.PatternFill.BackColor = ColorObject.DarkSalmon
'Saves the Presentation
pptxDoc.Save("Output.pptx")
'Closes the Presentation

```

```
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Gets the first slide of the Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets the shape of the slide
IShape shape = slide.Shapes[0] as IShape;
//Sets the shape name.
shape.ShapeName = "Shape1";
//Retrieves the line format of the shape.
ILineFormat lineFormat = shape.LineFormat;
//Sets the dash style of the line format.
lineFormat.DashStyle = LineDashStyle.DashDotDot;
//Sets the weight of the line format.
lineFormat.Weight = 3;

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Removing the shapes

The shapes can be removed from a slide by its instance or by its index position in the shape collection. The following code example demonstrates how to remove the shapes from a slide.

C#

```
//Opens an existing Presentation from file system
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Removes the shape from the shape collection.
slide.Shapes.Remove(shape);
//Saves the Presentation to the file system.
pptxDoc.Save("Result.pptx");
//Closes the Presentation.
pptxDoc.Close();
```

VB.NET

```
'Opens an existing Presentation from file system
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first shape.
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Removes the shape from the shape collection.
slide.Shapes.Remove(shape)
'Saves the Presentation to the file system.
pptxDoc.Save("Result.pptx")
'Closes the Presentation.
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
```

```

//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Removes the shape from the shape collection.
slide.Shapes.Remove(shape);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Result";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Removes the shape from the shape collection.
slide.Shapes.Remove(shape);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation.
pptxDoc.Close();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream fileStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape.
IShape shape = slide.Shapes[0] as IShape;
//Removes the shape from the shape collection.
slide.Shapes.Remove(shape);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation

```

```
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Working with GroupShape

Creating a GroupShape

The shapes in a slide can be grouped into a single shape. The following code snippet demonstrates how to group different slide items into a single GroupShape.

C#

```
//Creates an instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a group shape to the slide
IGroupShape groupShape = slide.GroupShapes.AddGroupShape(20, 20, 450, 300);
//Adds a TextBox to the group shape
groupShape.Shapes.AddTextBox(30, 25, 100, 100).TextBody.AddParagraph("My
TextBox");
//Gets the image stream
Stream pictureStream = File.Open("Image.png", FileMode.Open);
//Adds a picture to the group shape
groupShape.Shapes.AddPicture(pictureStream, 40, 100, 100, 100);
//Adds a shape to the group shape
groupShape.Shapes.AddShape(AutoShapeType.Rectangle, 200, 200, 90, 30);
//Save the presentation
pptxDoc.Save("Output.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Creates an instance for PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a blank slide to presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds a group shape to the slide
Dim groupShape As IGroupShape = slide.GroupShapes.AddGroupShape(20, 20, 450,
300)
'Adds a TextBox to the group shape
groupShape.Shapes.AddTextBox(30, 25, 100, 100).TextBody.AddParagraph("My
TextBox")
'Gets the image stream
```

```

Dim pictureStream As Stream = File.Open("Image.png", FileMode.Open)
'Adds a picture to the group shape
groupShape.Shapes.AddPicture(pictureStream, 40, 100, 100, 100)
'Adds a shape to the group shape
groupShape.Shapes.AddShape(AutoShapeType.Rectangle, 200, 200, 90, 30)
'Saves the presentation
pptxDoc.Save("Output.pptx")
'Closes the presentation
pptxDoc.Close()

```

UWP

```

//Creates an instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a group shape to the slide
IGroupShape groupShape = slide.GroupShapes.AddGroupShape(20, 20, 450, 300);
//Adds a TextBox to the group shape
groupShape.Shapes.AddTextBox(30, 25, 100, 100).TextBody.AddParagraph("My
TextBox");
//Gets the image stream
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream pictureStream =
assembly.GetManifestResourceStream("UWP.Data.Image.png");
//Adds a picture to the group shape
groupShape.Shapes.AddPicture(pictureStream, 40, 100, 100, 100);
//Adds a shape to the group shape
groupShape.Shapes.AddShape(AutoShapeType.Rectangle, 200, 200, 90, 30);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Creates an instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();

//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Iterating and modifying a particular GroupShape

You can iterate through the shape collection of a GroupShape. Below code snippet demonstrates how to iterate through the shapes of a GroupShape to modify it by removing a specific shape.

C#

```
//Opens a PowerPoint presentation with group shapes
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide
```

```

ISlide slide = pptxDoc.Slides[0];
//Retrieves the first group shape of the slide
IGroupShape groupShape = slide.GroupShapes[0];
//Creates an instance to hold shape collection
IShapes shapes = groupShape.Shapes;
//Iterates the shape collection to remove the picture in a group shape
foreach (IShape shape in shapes)
{
    if (shape.SlideItemType == SlideItemType.Picture)
    {
        shapes.Remove(shape);
        break;
    }
}
//Saves the presentation
pptxDoc.Save("Output.pptx");
//Closes the presentation
pptxDoc.Close();

```

VB.NET

```

'Opens a PowerPoint presentation with group shapes
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first group shape of the slide
Dim groupShape As IGroupShape = slide.GroupShapes(0)
'Creates an instance to hold shape collection
Dim shapes As IShapes = groupShape.Shapes
'Iterates shape collection to remove the picture in a group shape
For Each shape As IShape In shapes

Removing a GroupShape

GroupShape can be removed from a slide using its instance or by its index position in the GroupShape collection of the slide. Below code snippet explains how to remove a GroupShape from a slide.

C#

```

//Opens a PowerPoint presentation with group shapes
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first group shape of the slide
IGroupShape groupShape = slide.GroupShapes[0];
//Removes the group shape from group shape collection
slide.GroupShapes.Remove(groupShape);
//Saves the presentation
pptxDoc.Save("Output.pptx");
//Closes the presentation
pptxDoc.Close();

```

VB.NET

```

'Opens a PowerPoint presentation with group shapes
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first group shape of the slide
Dim groupShape As IGroupShape = slide.GroupShapes(0)
'Removes the group shape from group shape collection
slide.GroupShapes.Remove(groupShape)
'Saves the presentation
pptxDoc.Save("Output.pptx")
'Closes the presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first group shape of the slide
IGroupShape groupShape = slide.GroupShapes[0];
//Removes the group shape from group shape collection
slide.GroupShapes.Remove(groupShape);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation

else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Note: The Presentation library do not have support for converting the auto-shapes with modified adjustment values in PowerPoint presentation to image or PDF conversion. To know more about adjustment values in PowerPoint shapes please click [here](#).

Working with images**Adding Images**

Essential Presentation library facilitates adding or modifying the images in a PowerPoint Presentation. The following code example demonstrates how to add a new image to the presentation.

C#

```

// Creates a instance of Presentation
IPresentation pptxDoc = Presentation.Create();
// Adds a blank slide.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
// Gets a picture as stream.
Stream pictureStream = File.Open("Image.png", FileMode.Open);
// Adds the picture to a slide by specifying its size and position.
IPicture picture = slide.Pictures.AddPicture(pictureStream, 0, 0, 250, 250);

```

```
//Saves the Presentation to the file system.
pptxDoc.Save("Sample.pptx");
//Dispose the image stream
pictureStream.Dispose();
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Creates a instance of Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a blank slide.
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Gets a picture as stream.
Dim pictureStream As Stream = File.Open("Image.png", FileMode.Open)
'Adds the picture to a slide by specifying its size and position.
Dim picture As IPicture = slide.Pictures.AddPicture(pictureStream, 0, 0,
250, 250)
'Saves the Presentation to the file system.
pptxDoc.Save("Sample.pptx")
'Dispose the image stream
pictureStream.Dispose()
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Creates a instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Gets a picture as stream.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream pictureStream =
assembly.GetManifestResourceStream("UWP.Data.Image.png");
//Adds the picture to a slide by specifying its size and position.
IPicture picture = slide.Pictures.AddPicture(pictureStream, 0, 0, 250, 250);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Creates a instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Gets a picture as stream.
```

```

FileStream pictureStream = new FileStream("Image.png", FileMode.Open);
//Adds the picture to a slide by specifying its size and position.
IPicture picture = slide.Pictures.AddPicture(pictureStream, 0, 0, 250, 250);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Dispose the image stream
pictureStream.Dispose();
//Closes the Presentation
pptxDoc.Close();

```

XAMARIN

```

//Creates a instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets a picture as stream.
Stream pictureStream = assembly.GetManifestResourceStream("Image.png");
//Adds the picture to a slide by specifying its size and position.
IPicture picture = slide.Pictures.AddPicture(pictureStream, 0, 0, 250, 250);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Replacing Images

The following code example demonstrates how to replace an existing image in a slide.

C#

```

//Opens an existing Presentation.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first picture from the slide.
IPicture picture = slide.Pictures[0];
//Gets the new picture as stream.
Stream pictureStream = File.Open("Image.png", FileMode.Open);

```

```

//Creates instance for memory stream
MemoryStream memoryStream = new MemoryStream();
//Copies stream to memoryStream.
pictureStream.CopyTo(memoryStream);
//Replaces the existing image with new image.
picture.ImageData = memoryStream.ToArray();
//Saves the Presentation to the file system.
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Opens an existing Presentation.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide from the Presentation.
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first picture from the slide.
Dim picture As IPicture = slide.Pictures(0)
'Gets the new picture as stream.
Dim pictureStream As Stream = File.Open("Image.png", FileMode.Open)
'Creates instance for memory stream
Dim memoryStream As New MemoryStream()
'Copies stream to memoryStream.
pictureStream.CopyTo(memoryStream)
'Replaces the existing image with new image.
picture.ImageData = memoryStream.ToArray()
'Saves the Presentation to the file system.
pptxDoc.Save("Output.pptx")
'Closes the Presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first picture from the slide.
IPicture picture = slide.Pictures[0];
//Gets the new picture as stream.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets the new picture as stream.
Stream pictureStream =
assembly.GetManifestResourceStream("UWP.Data.Image.png");
//Creates instance for memory stream
MemoryStream memoryStream = new MemoryStream();
//Copies stream to memoryStream.
pictureStream.CopyTo(memoryStream);
//Replaces the existing image with new image.

```

```

picture.ImageData = memoryStream.ToArray();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {

Removing Images

The following code example demonstrates how to remove an existing image in a PowerPoint slide.

C#

```

//Opens an existing Presentation from file system.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Iterates through the pictures collection and remove the picture named
"Image".
foreach (IPicture picture in slide.Pictures)
{
//Removes the picture from the slide.
slide.Pictures.Remove(picture);
break;
}
//Saves the Presentation to the file system.
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Opens an existing Presentation from file system.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Iterates through the pictures collection and removes the picture named
"Image".
For Each picture As IPicture In slide.Pictures
'Removes the picture from the slide.
slide.Pictures.Remove(picture)
Exit For

```

Next

```
'Saves the Presentation to the file system.
pptxDoc.Save("Output.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Iterates through the pictures collection and remove the picture named

stream);
```

Working with PowerPoint Tables

Create a table by adding rows

Essential Presentation supports creating and editing tables in PowerPoint slides by adding rows. Refer to the following code example.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells
```

```

int rowIndex = 0, colIndex;
//Iterate row-wise cells and add text to it
foreach (IRow rows in table.Rows)
{
    colIndex = 0;
    foreach (ICell cell in rows.Cells)
    {
        cell.TextBody.AddParagraph("(" + rowIndex.ToString() + " , " +
        colIndex.ToString() + ")");
        colIndex++;
    }
    rowIndex++;
}
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();

```

VB.NET

```

'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a table to the slide
Dim table As ITable = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200)
'Initialize index values to add text to table cells
Dim rowIndex As Integer = 0, colIndex As Integer
'Iterate row-wise cells and add text to it
For Each rows As IRow In table.Rows
    colIndex = 0
    For Each cell As ICell In rows.Cells
        cell.TextBody.AddParagraph("(" + rowIndex.ToString() + " , " +
        colIndex.ToString() + ")")
        colIndex += 1
    Next
    rowIndex += 1
Next
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells
int rowIndex = 0, colIndex;
//Iterate row-wise cells and add text to it
foreach (IRow rows in table.Rows)
{

```

```

colIndex = 0;
foreach (ICell cell in rows.Cells)
{
    cell.TextBody.AddParagraph("(" + rowIndex.ToString() + " , " +
    colIndex.ToString() + ")");
    colIndex++;
}
rowIndex++;
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells

//Iterate row-wise cells and add text to it
foreach (IRow rows in table.Rows)
{
    colIndex = 0;
    foreach (ICell cell in rows.Cells)
    {
        cell.TextBody.AddParagraph("(" + rowIndex.ToString() + " , " +
        colIndex.ToString() + ")");
        colIndex++;
    }
    rowIndex++;
}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();

```

XAMARIN

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);

```

```

//Initialize index values to add text to table cells
int rowIndex = 0, colIndex;
//Iterate row-wise cells and add text to it
foreach (IRow rows in table.Rows)
{
    colIndex = 0;
    foreach (ICell cell in rows.Cells)
    {
        cell.TextBody.AddParagraph("(" + rowIndex.ToString() + " , " +
            colIndex.ToString() + ")");
        colIndex++;
    }
    rowIndex++;
}
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);

```

Create a table by adding columns

The following code example demonstrates how to create a simple table in a PowerPoint slide by adding columns.

C#

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells
int row = 0, col;
//Iterate row-wise cells and add text to it
foreach (IColumn columns in table.Columns)
{
    col = 0;
    foreach (ICell cell in columns.Cells)
    {
        cell.TextBody.AddParagraph("(" + row.ToString() + " , " + col.ToString() +
            ")");
    }
}

```

```
col++;
}
row++;
}
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a table to the slide
Dim table As ITable = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200)
'Initialize index values to add text to the table cells
Dim row As Integer = 0, col As Integer
'Iterate row-wise cells and add text to it
For Each columns As IColumn In table.Columns
col = 0
For Each cell As ICell In columns.Cells
cell.TextBody.AddParagraph("(" + row.ToString() + " , " + col.ToString() +
")")
col += 1
Next
row += 1
Next
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()
```

UWP

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells
int row = 0, col;
//Iterate row-wise cells and add text to it
foreach (IColumn columns in table.Columns)
{
col = 0;
foreach (ICell cell in columns.Cells)
{
cell.TextBody.AddParagraph("(" + row.ToString() + " , " + col.ToString() +
")");
col++;
}
row++;
}
```

```
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells
int row = 0, col;
//Iterate row-wise cells and add text to it
foreach (IColumn columns in table.Columns)
{
    col = 0;
    foreach (ICell cell in columns.Cells)
    {
        cell.TextBody.AddParagraph("(" + row.ToString() + " , " + col.ToString() +
            ")");
        col++;
    }
    row++;
}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Initialize index values to add text to table cells
int row = 0, col;
//Iterate row-wise cells and add text to it
foreach (IColumn columns in table.Columns)
{
    col = 0;
    foreach (ICell cell in columns.Cells)
    {
```

```

cell.TextBody.AddParagraph("(" + row.ToString() + " , " + col.ToString() +
")");
col++;
}
row++;
}
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Append a new row at the end of table

You can append new rows at the end of an existing PowerPoint table. Refer to the following code sample.

C#

```

//Open an existing PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Table.pptx");
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Add or append a new row at the end of table
IRow row = table.Rows.Add();
//Iterate row-wise cells and add text to it
foreach (ICell cell in row.Cells)
{
cell.TextBody.AddParagraph(table.Rows.IndexOf(row).ToString());
}
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();

```

VB.NET

```

'Open an existing PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Table.pptx")
'Get a table in the slide
Dim table As ITable = TryCast(pptxDoc.Slides(0).Shapes(0), ITable)
'Add a new row at the end of table

```

```

Dim row As IRow = table.Rows.Add()
'Iterate row-wise cells and add text to it
For Each cell As ICell In row.Cells
cell.TextBody.AddParagraph(table.Rows.IndexOf(row).ToString())
Next
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Add or append a new row at the end of table
IRow row = table.Rows.Add();
//Iterate row-wise cells and add text to it
foreach (ICell cell in row.Cells)
{
cell.TextBody.AddParagraph(table.Rows.IndexOf(row).ToString());
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Add or append a new row at the end of table
IRow row = table.Rows.Add();
//Iterate row-wise cells and add text to it
foreach (ICell cell in row.Cells)
{
cell.TextBody.AddParagraph(table.Rows.IndexOf(row).ToString());
}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Table.pptx", FileMode.Create);

```

```
pptxDoc.Save(outputStream);
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Add or append a new row at the end of table
IRow row = table.Rows.Add();
//Iterate row-wise cells and add text to it
foreach (ICell cell in row.Cells)
{
    cell.TextBody.AddParagraph(table.Rows.IndexOf(row).ToString());
}
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Table.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Copy an existing row to the end of table

You can copy an existing row to the end of a table. Refer to the following code example.

C#

```
//Open an existing PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Table.pptx");
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Copy the first row to the end of table
table.Rows.Add(table.Rows[0].Clone());
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```

'Open an existing PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Table.pptx")
'Get the table in the slide
Dim table As ITable = TryCast(pptxDoc.Slides(0).Shapes(0), ITable)
'Copy the first row to the end of table
table.Rows.Add(table.Rows(0).Clone())
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Copy the first row to the end of table
table.Rows.Add(table.Rows[0].Clone());
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Insert a row in table

You can insert a row at the specified index position of a table. Refer to the following code example.

C#

```

//Open an existing PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Table.pptx");
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Insert a row at the specified index. Here, the existing first row at index
0 is copied and inserted at row index 1
table.Rows.Insert(1, table.Rows[0].Clone());
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();

```

VB.NET

```

'Open an existing PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Table.pptx")
'Get a table in the slide
Dim table As ITable = TryCast(pptxDoc.Slides(0).Shapes(0), ITable)
'Insert a row at the specified index. Here, the existing first row at index
0 is copied and inserted at row index 1.
table.Rows.Insert(1, table.Rows(0).Clone())
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Insert a row at the specified index. Here, the existing first row at index 0 is copied and inserted at row index 1
table.Rows.Insert(1, table.Rows[0].Clone());
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation

stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Table.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Get the actual height of the table

The table height expands with the content added to it. The Essential Presentation library allows you to get this actual height or rendered height of the table. This property is a calculated value based on the content added to the table cells.

The following code example demonstrates how to get the actual height of a PowerPoint table.

C#

```
//Opens existing PowerPoint file
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Opens slide in the presentation
ISlide slide = pptxDoc.Slides[0];
//Open Table in the slide to make changes
ITable table = slide.Shapes[0] as ITable;
//Changing the paragraph content in the table
table.Rows[0].Cells[0].TextBody.AddParagraph("Hello World");
//Get the dynamic height of the table
float height=table.GetActualHeight();
//Save the presentation
pptxDoc.Save("Table.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Open an existing PowerPoint file
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Get the table from the slide
Dim table As ITable = TryCast(pptxDoc.Slides(0).Shapes(0), ITable)
'Changing the paragraph content in the table
table.Rows[0].Cells[0].TextBody.AddParagraph("Hello World");
'Get the dynamic height of table
Dim height As float = table.GetActualHeight()
'Save the presentation
pptxDoc.Save("Table.pptx")
'Close the presentation
pptxDoc.Close()
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
```

```

FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Initialize Presentation renderer
pptxDoc.PresentationRenderer = new PresentationRenderer();
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Changing the paragraph content in the table
table.Rows[0].Cells[0].TextBody.AddParagraph("Hello World");
//Get the dynamic height of the table
float height=table.GetActualHeight();
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Table.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Initialize Presentation renderer
pptxDoc.PresentationRenderer = new PresentationRenderer();
//Get a table in the slide
ITable table = pptxDoc.Slides[0].Shapes[0] as ITable;
//Changing the paragraph content in the table
table.Rows[0].Cells[0].TextBody.AddParagraph("Hello World");
//Get the dynamic height of the table
float height=table.GetActualHeight();
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Table.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Table.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Note: Getting the actual height of the table is not supported in UWP platform.

Applying table formatting

You can format a table to change its appearance by customizing the table border, cell background, cell margins etc. The following code example demonstrates how to apply the custom table formatting.

C#

```

//Creates instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Retrieves each cell and fills text content to the cell.
ICell cell = table[0, 0];
//Sets the column width for a cell; this sets the width for entire column
cell.ColumnWidth = 400;
//Sets the margin for the cell.
cell.TextBody.MarginBottom = 0;
cell.TextBody.MarginLeft = 58;
cell.TextBody.MarginRight = 29;
cell.TextBody.MarginTop = 65;
//Sets the back color for the cell.
cell.Fill.SolidFill.Color.SystemColor = Color.Orange;
cell.TextBody.AddParagraph("First Row and First Column");
cell = table[0, 1];
//Sets the margin for the cell.
cell.TextBody.MarginLeft = 58;
cell.TextBody.MarginRight = 29;
cell.TextBody.MarginTop = 65;
//Sets the back color for the cell.
cell.Fill.SolidFill.Color.SystemColor = Color.BlueViolet;
cell.TextBody.AddParagraph("First Row and Second Column");
cell = table[1, 0];
//Sets the margin for the cell.
cell.TextBody.MarginLeft = 58;
cell.TextBody.MarginRight = 29;
cell.TextBody.MarginTop = 65;
//Sets the back color for the cell.
cell.Fill.SolidFill.Color.SystemColor = Color.SandyBrown;
cell.TextBody.AddParagraph("Second Row and First Column");
cell = table[1, 1];
//Sets the margin for the cell.
cell.TextBody.MarginLeft = 58;
cell.TextBody.MarginRight = 29;
cell.TextBody.MarginTop = 65;
//Sets the back color for the cell.
cell.Fill.SolidFill.Color.SystemColor = Color.Silver;
cell.TextBody.AddParagraph("Second Row and Second Column");
//Saves the Presentation
pptxDoc.Save("Table.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Creates instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds table to the slide

```

```

Dim table As ITable = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200)
'Retrieves each cell and fills text content to the cell.
Dim cell As ICell = table(0, 0)
'Sets the column width for a cell; this sets the width for entire column
cell.ColumnWidth = 400
'Sets the margin for the cell.
cell.TextBody.MarginBottom = 0
cell.TextBody.MarginLeft = 58
cell.TextBody.MarginRight = 29
cell.TextBody.MarginTop = 65
'Sets the back color for the cell.
cell.Fill.SolidFill.Color.SystemColor = Color.Orange
cell.TextBody.AddParagraph("First Row and First Column")
cell = table(0, 1)
'Sets the margin for the cell.
cell.TextBody.MarginLeft = 58
cell.TextBody.MarginRight = 29
cell.TextBody.MarginTop = 65
'Sets the back color for the cell.
cell.Fill.SolidFill.Color.SystemColor = Color.BlueViolet
cell.TextBody.AddParagraph("First Row and Second Column")
cell = table(1, 0)
'Sets the margin for the cell.
cell.TextBody.MarginLeft = 58

Applying table styles

You can format a table by applying pre-defined table styles. The following code example demonstrates how to apply predefined styles to a table.

C#

```

//Creates instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds table to the slide
ITable table = slide.Shapes.AddTable(3, 3, 100, 120, 300, 200);
table.BuiltInStyle = BuiltInTableStyle.ThemedStyle2Accent4;
table.HasBandedRows = false;
table.HasHeaderRow = false;
table.HasBandedColumns = true;

```

```

table.HasFirstColumn = true;
table.HasLastColumn = true;
table.HasTotalRow = true;
//Retrieves each cell and fills text content to the cell.
ICell cell = table[0, 0];
cell.TextBody.AddParagraph("First Row and First Column");
cell = table[0, 1];
cell.TextBody.AddParagraph("First Row and Second Column");
cell = table[0, 2];
cell.TextBody.AddParagraph("First Row and Third Column");
cell = table[1, 0];
cell.TextBody.AddParagraph("Second Row and First Column");
cell = table[1, 1];
cell.TextBody.AddParagraph("Second Row and Second Column");
cell = table[1, 2];
cell.TextBody.AddParagraph("Second Row and Third Column");
cell = table[2, 0];
cell.TextBody.AddParagraph("Third Row and First Column");
cell = table[2, 1];
cell.TextBody.AddParagraph("Third Row and Second Column");
cell = table[2, 2];
cell.TextBody.AddParagraph("Third Row and Third Column");
//Adds description to table shape
table.Description = "Table arrangement";
//Saves the Presentation
pptxDoc.Save("Table.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Creates instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds table to the slide
Dim table As ITable = slide.Shapes.AddTable(3, 3, 100, 120, 300, 200)
table.BuiltInStyle = BuiltInTableStyle.ThemedStyle2Accent4
table.HasBandedRows = False
table.HasHeaderRow = False
table.HasBandedColumns = True
table.HasFirstColumn = True
table.HasLastColumn = True
table.HasTotalRow = True
'Retrieves each cell and fills text content to the cell.
Dim cell As ICell = table(0, 0)
cell.TextBody.AddParagraph("First Row and First Column")
cell = table(0, 1)
cell.TextBody.AddParagraph("First Row and Second Column")
cell = table(0, 2)
cell.TextBody.AddParagraph("First Row and Third Column")
cell = table(1, 0)
cell.TextBody.AddParagraph("Second Row and First Column")
cell = table(1, 1)
cell.TextBody.AddParagraph("Second Row and Second Column")
cell = table(1, 2)

```

```

cell.TextBody.AddParagraph("Second Row and Third Column")
cell = table(2, 0)
cell.TextBody.AddParagraph("Third Row and First Column")
cell = table(2, 1)
cell.TextBody.AddParagraph("Third Row and Second Column")
cell = table(2, 2)
cell.TextBody.AddParagraph("Third Row and Third Column")
'Adds description to table shape
table.Description = "Table arrangement"
'Saves the Presentation
pptxDoc.Save("Table.pptx")
'Closes the Presentation
pptxDoc.Close()

```

stream);

```

Modifying the table

The following code example demonstrates how to modify the table in existing PowerPoint Presentation

C#

```

//Creates instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Table.pptx");
//Gets slide from the Presentation
ISlide slide = pptxDoc.Slides[0];

```

```

//Gets table from slide
ITable table = slide.Shapes[0] as ITable;
//Modifies the table width
table.Width = 450;
//Changes the built in style of the table
table.BuiltInStyle = BuiltInTableStyle.DarkStyle1Accent2;
//Sets text content to the cell
table.Rows[0].Cells[0].TextBody.AddParagraph("Row1 Cell1");
//Saves the Presentation
pptxDoc.Save("TableModified.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Creates instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Table.pptx")
'Gets slide from the Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Gets table from slide
Dim table As ITable = TryCast(slide.Shapes(0), ITable)
'Modifies the table width
table.Width = 450
'Changes the built in style of the table
table.BuiltInStyle = BuiltInTableStyle.DarkStyle1Accent2
'Sets text content to the cell
table.Rows(0).Cells(0).TextBody.AddParagraph("Row1 Cell1")
'Saves the Presentation
pptxDoc.Save("TableModified.pptx")
'Closes the Presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Gets slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets table from slide
ITable table = slide.Shapes[0] as ITable;
//Modifies the table width
table.Width = 450;
//Changes the built in style of the table
table.BuiltInStyle = BuiltInTableStyle.DarkStyle1Accent2;
//Sets text content to the cell
table.Rows[0].Cells[0].TextBody.AddParagraph("Row1 Cell1");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "TableModified";

```

```

savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker

Merging the cells

The following code example shows how to merge cells in a table.

C#

```

//Creates instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Retrieves first cell.
ICell cell = table[0, 0];
//Sets the column span value to merge the cell.
cell.ColumnSpan = 2;
//Retrieves each cell and fills text content to the cell.
cell.TextBody.AddParagraph("First Row and First Column");
cell = table[0, 1];
cell.TextBody.AddParagraph("First Row and Second Column");
cell = table[1, 0];
cell.TextBody.AddParagraph("Second Row and First Column");
cell = table[1, 1];
cell.TextBody.AddParagraph("Second Row and Second Column");
//Gives simple description to table shape
table.Description = "Table arrangement";
//Saves the Presentation
pptxDoc.Save("Table.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Creates instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds table to the slide
Dim table As ITable = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200)
'Retrieves first cell.
Dim cell As ICell = table(0, 0)
'Sets the column span value to merge the cell.
cell.ColumnSpan = 2
'Retrieves each cell and fills text content to the cell.
cell.TextBody.AddParagraph("First Row and First Column")
cell = table(0, 1)
cell.TextBody.AddParagraph("First Row and Second Column")

```

```

cell = table(1, 0)
cell.TextBody.AddParagraph("Second Row and First Column")
cell = table(1, 1)
cell.TextBody.AddParagraph("Second Row and Second Column")
'Gives simple description to table shape
table.Description = "Table arrangement"
'Saves the Presentation
pptxDoc.Save("Table.pptx")
'Closes the Presentation
pptxDoc.Close()

```

UWP

```

//Creates instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds table to the slide
ITable table = slide.Shapes.AddTable(2, 2, 100, 120, 300, 200);
//Retrieves first cell.

"application/vnd.openxmlformats-officedocument.presentationml.presentation",  
stream);
```

Removing the table

You can remove a table from a slide by its instance or by its index position in the shape collection. The following code example demonstrates removing a table in a slide.

C#

```
//Creates instance of PowerPoint Presentation  
IPresentation pptxDoc = Presentation.Open("Table.pptx");  
//Gets slide from the Presentation  
ISlide slide = pptxDoc.Slides[0];  
//Gets the table from slide  
ITable table = slide.Shapes[0] as ITable;  
//Removes table from shape collection  
slide.Shapes.Remove(table);  
//Saves the Presentation  
pptxDoc.Save("TableRemoved.pptx");  
//Closes the Presentation  
pptxDoc.Close();
```

VB.NET

```
'Creates instance of PowerPoint Presentation  
Dim pptxDoc As IPresentation = Presentation.Open("Table.pptx")  
'Gets slide from the Presentation  
Dim slide As ISlide = pptxDoc.Slides(0)  
'Gets the table from slide  
Dim table As ITable = TryCast(slide.Shapes(0), ITable)  
'Removes table from shape collection  
slide.Shapes.Remove(table)  
'Saves the Presentation  
pptxDoc.Save("TableRemoved.pptx")  
'Closes the Presentation  
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker  
FileOpenPicker openPicker = new FileOpenPicker();  
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;  
openPicker.FileTypeFilter.Add(".pptx");  
//Creates a storage file from FileOpenPicker  
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);  
//Gets slide from the Presentation  
ISlide slide = pptxDoc.Slides[0];  
//Gets the table from slide  
ITable table = slide.Shapes[0] as ITable;  
//Removes table from shape collection  
slide.Shapes.Remove(table);  
//Initializes FileSavePicker
```

```

FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "TableRemoved";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets the table from slide
ITable table = slide.Shapes[0] as ITable;
//Removes table from shape collection
slide.Shapes.Remove(table);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("TableModified.pptx",
FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets the table from slide
ITable table = slide.Shapes[0] as ITable;
//Removes table from shape collection
slide.Shapes.Remove(table);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Table.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else

```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("Table.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Working with Charts

Creating a Chart from scratch

An instance of **IOfficeChart** can be used to create or modify the charts in PowerPoint Presentation. The following code example demonstrates how to create a simple chart by adding data from scratch.

C#

```
//Creates a Presentation instance
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds chart to the slide with position and size
IPresentationChart chart = slide.Charts.AddChart(100, 10, 700, 500);
//Specifies the chart title
chart.ChartTitle = "Sales Analysis";
//Sets chart data - Row1
chart.ChartData.SetValue(1, 2, "Jan");
chart.ChartData.SetValue(1, 3, "Feb");
chart.ChartData.SetValue(1, 4, "March");
//Sets chart data - Row2
chart.ChartData.SetValue(2, 1, 2010);
chart.ChartData.SetValue(2, 2, 60);
chart.ChartData.SetValue(2, 3, 70);
chart.ChartData.SetValue(2, 4, 80);
//Sets chart data - Row3
chart.ChartData.SetValue(3, 1, 2011);
chart.ChartData.SetValue(3, 2, 80);
chart.ChartData.SetValue(3, 3, 70);
chart.ChartData.SetValue(3, 4, 60);
//Sets chart data - Row4
chart.ChartData.SetValue(4, 1, 2012);
chart.ChartData.SetValue(4, 2, 60);
chart.ChartData.SetValue(4, 3, 70);
chart.ChartData.SetValue(4, 4, 80);
//Creates a new chart series with the name
IOfficeChartSerie seriesJan = chart.Series.Add("Jan");
//Sets the data range of chart series - start row, start column, end row,
end column
seriesJan.Values = chart.ChartData[2, 2, 4, 2];
//Creates a new chart series with the name
IOfficeChartSerie seriesFeb = chart.Series.Add("Feb");
//Sets the data range of chart series - start row, start column, end row,
end column
seriesFeb.Values = chart.ChartData[2, 3, 4, 3];
//Creates a new chart series with the name
IOfficeChartSerie seriesMarch = chart.Series.Add("March");
//Sets the data range of chart series - start row, start column, end row,
end column
seriesMarch.Values = chart.ChartData[2, 4, 4, 4];
//Sets the data range of the category axis
chart.PrimaryCategoryAxis.CategoryLabels = chart.ChartData[2, 1, 4, 1];
```

```
//Specifies the chart type
chart.ChartType = OfficeChartType.Column_Clustered;
//Adds the third slide into the Presentation
pptxDoc.Save("sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Creates a Presentation instance
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a blank slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds chart to the slide with position and size
Dim chart As IPresentationChart = slide.Charts.AddChart(100, 10, 700, 500)
'Specifies the chart title
chart.ChartTitle = "Sales Analysis"
'Sets chart data - Row1
chart.ChartData.SetValue(1, 2, "Jan")
chart.ChartData.SetValue(1, 3, "Feb")

chart.ChartData.SetValue(2, 2, 60);
chart.ChartData.SetValue(2, 3, 70);
chart.ChartData.SetValue(2, 4, 80);
//Sets chart data - Row3
chart.ChartData.SetValue(3, 1, 2011);
chart.ChartData.SetValue(3, 2, 80);
chart.ChartData.SetValue(3, 3, 70);
chart.ChartData.SetValue(3, 4, 60);
//Sets chart data - Row4
chart.ChartData.SetValue(4, 1, 2012);
chart.ChartData.SetValue(4, 2, 60);
chart.ChartData.SetValue(4, 3, 70);
chart.ChartData.SetValue(4, 4, 80);
//Creates a new chart series with the name
IOfficeChartSerie seriesJan = chart.Series.Add("Jan");
//Sets the data range of chart series - start row, start column, end row,
end column
seriesJan.Values = chart.ChartData[2, 2, 4, 2];
//Creates a new chart series with the name
IOfficeChartSerie seriesFeb = chart.Series.Add("Feb");
//Sets the data range of chart series - start row, start column, end row,
end column
seriesFeb.Values = chart.ChartData[2, 3, 4, 3];
//Creates a new chart series with the name
IOfficeChartSerie seriesMarch = chart.Series.Add("March");
//Sets the data range of chart series - start row, start column, end row,
end column
seriesMarch.Values = chart.ChartData[2, 4, 4, 4];
//Sets the data range of the category axis
chart.PrimaryCategoryAxis.CategoryLabels = chart.ChartData[2, 1, 4, 1];
//Specifies the chart type
chart.ChartType = OfficeChartType.Column_Clustered;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.

```

```
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Creating charts from excel sheet

You can also create a chart with the data from an existing excel worksheet. The following code example demonstrates the same.

C#

```
//Creates a Presentation instance
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Gets the excel file as stream
MemoryStream excelStream = new
MemoryStream(File.ReadAllBytes("Book1.xlsx"));
//Adds a chart to the slide with a data range from excel worksheet - excel
workbook, worksheet number, Data range, position, and size.
IPresentationChart chart = slide.Charts.AddChart(excelStream, 1, "A1:D4",
new RectangleF(100, 10, 700, 500));
//Saves the Presentation
pptxDoc.Save("output.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Creates a Presentation instance
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a blank slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Gets the excel file as stream
Dim excelStream As New MemoryStream(File.ReadAllBytes("Book1.xlsx"))
'Adds a chart to the slide with a data range from excel worksheet - excel
workbook, worksheet number, Data range, position, and size.
Dim chart As IPresentationChart = slide.Charts.AddChart(excelStream, 1,
"A1:D4", New RectangleF(100, 10, 700, 500))
'Saves the Presentation
pptxDoc.Save("output.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```

//Creates a Presentation instance
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Gets the excel file as stream
MemoryStream excelStream = new
MemoryStream(File.ReadAllBytes("Book1.xlsx"));
//Adds a chart to the slide with a data range from excel worksheet - excel
workbook, worksheet number, Data range, position, and size.
IPresentationChart chart = slide.Charts.AddChart(excelStream, 1, "A1:D4",
new RectangleF(100, 10, 700, 500));
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Creates a Presentation instance
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Gets the excel file as stream
FileStream excelStream = new FileStream("Book1.xlsx", FileMode.Open);
//Adds a chart to the slide with a data range from excel worksheet - excel
workbook, worksheet number, Data range, position, and size.
IPresentationChart chart = slide.Charts.AddChart(excelStream, 1, "A1:D4",
new RectangleF(100, 10, 700, 500));
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation
pptxDoc.Close();

```

XAMARIN

```

//Creates a Presentation instance
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets the excel file as stream
Stream excelStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Book1.xlsx");

```

```

//Adds a chart to the slide with a data range from excel worksheet - excel
workbook, worksheet number, Data range, position, and size.
IPresentationChart chart = slide.Charts.AddChart(excelStream, 1, "A1:D4",
new RectangleF(100, 10, 700, 500));
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Creating Custom Charts

Essential Presentation facilitates you to create custom charts by adding different charts series for a single chart.

For example, you can use a Bar- clustered chart for the first data series and a scatter- line- marker chart for the second series. As a result, you can have a Bar-clustered chart combined with a scatter-line-marker chart.

The following code example demonstrates how to create custom charts.

C#

```

//Creates an instance of the IPresentation
IPresentation pptxDoc = Presentation.Create();
//Creates a new slide
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a new chart in the slide by specifying its position and size as
parameters.
IPresentationChart chart = slide.Charts.AddChart(100, 80, 500, 350);
chart.ChartTitle = "Sales comparison";
chart.ChartTitleArea.Bold = true;
//Sets the data for chart- RowIndex, columnIndex and data
chart.ChartData.SetValue(1, 1, "Month");
chart.ChartData.SetValue(2, 1, "July");
chart.ChartData.SetValue(3, 1, "August");
chart.ChartData.SetValue(4, 1, "September");
chart.ChartData.SetValue(5, 1, "October");
chart.ChartData.SetValue(6, 1, "November");
chart.ChartData.SetValue(7, 1, "December");
chart.ChartData.SetValue(1, 2, "2013");
chart.ChartData.SetValue(2, 2, 35);
chart.ChartData.SetValue(3, 2, 47);

```

```

chart.ChartData.SetValue(4, 2, 30);
chart.ChartData.SetValue(5, 2, 29);
chart.ChartData.SetValue(6, 2, 25);
chart.ChartData.SetValue(7, 2, 30);
chart.ChartData.SetValue(1, 3, "2014");
chart.ChartData.SetValue(2, 3, 30);
chart.ChartData.SetValue(3, 3, 25);
chart.ChartData.SetValue(4, 3, 29);
chart.ChartData.SetValue(5, 3, 35);
chart.ChartData.SetValue(6, 3, 38);
chart.ChartData.SetValue(7, 3, 32);
chart.ChartData.SetValue(1, 4, "2015");
chart.ChartData.SetValue(2, 4, 35);
chart.ChartData.SetValue(3, 4, 37);
chart.ChartData.SetValue(4, 4, 30);
chart.ChartData.SetValue(5, 4, 29);
chart.ChartData.SetValue(6, 4, 25);
chart.ChartData.SetValue(7, 4, 30);
//Creates a new ChartSerie with the name
IOfficeChartSerie serie2013 = chart.Series.Add("2013");
//Sets the data range of chart series start row, start column, end row, end column
serie2013.Values = chart.ChartData[2, 2, 7, 2];
serie2013.SeriesType = OfficeChartType.Bar_Clustered;
IOfficeChartSerie serie2014 = chart.Series.Add("2014");
serie2014.Values = chart.ChartData[2, 3, 7, 3];
serie2014.SeriesType = OfficeChartType.Scatter_Line_Markers;
//Saves the Presentation
pptxDoc.Save("Output_1.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Creates an instance of the IPresentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Creates a new slide
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds a new chart in the slide by specifying its position and size as parameters.
Dim chart As IPresentationChart = slide.Charts.AddChart(100, 80, 500, 350)
chart.ChartTitle = "Sales comparison"
chart.ChartTitleArea.Bold = True
'Sets the data for chart- RowIndex, columnIndex, and data

stream);

```

The above code example creates a chart in the following screenshot.

Refreshing the chart

Sometimes, the charts do not represent the actual data. In those cases, the charts in PowerPoint Presentation should be refreshed.

The following code example demonstrates how to refresh the charts in PowerPoint Presentation.

C#

```
//Opens the Presentation
IPresentation pptxDoc = Presentation.Open("Chart.pptx");
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Refreshes the chart
chart.Refresh();
//Saves the Presentation
pptxDoc.Save("output.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Opens the Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Chart.pptx")
'Gets the first slide
Dim slide As ISlide = pptxDoc.Slides(0)
'Gets the chart in slide
Dim chart As IPresentationChart = TryCast(slide.Shapes(0),
IPresentationChart)
'Refreshes the chart
chart.Refresh()
```

```
'Saves the Presentation
pptxDoc.Save("output.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Opens the Presentation
IPresentation pptxDoc = Presentation.Open("Chart.pptx");
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Refreshes the chart
chart.Refresh();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Refreshes the chart
chart.Refresh();
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the Presentation
pptxDoc.Close();
```

XAMARIN

```
/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
```

```

IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Refreshes the chart
chart.Refresh();
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Editing the Chart Data

You can change the data for an existing chart. The code example demonstrates how to modify the chart in a slide.

C#

```

//Opens a Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Adds a slide to the Presentation
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Modifies chart data - Row1
chart.ChartData.SetValue(1, 2, "Jan");
chart.ChartData.SetValue(1, 3, "Feb");
chart.ChartData.SetValue(1, 4, "March");
//Modifies chart data - Row2
chart.ChartData.SetValue(2, 1, 2010);
chart.ChartData.SetValue(2, 2, 60);
chart.ChartData.SetValue(2, 3, 70);
chart.ChartData.SetValue(2, 4, 80);
//Refreshes the chart
chart.Refresh();
//Saves the Presentation
pptxDoc.Save("output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Opens a Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")

```

```

'Adds a slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Gets the chart in slide
Dim chart As IPresentationChart = TryCast(slide.Shapes(0),
IPresentationChart)
'Modifies chart data - Row1

Customizing the chart

Chart Basics

A chart is composed of various elements such as legends, axes, series, etc. Each chart element corresponds to an object. The following image illustrates the basic elements of a chart.

1. The chart area of the chart.
2. The plot area of the chart.
3. The data points of the data series that are plotted in the chart.
4. The horizontal (category) and vertical (value) axis along where the data is plotted in the chart.
5. The legend of the chart.
6. A chart and axis title that you can use in the chart.
7. A data label that you can use to identify the details of a data point in a data series.

Modifying the Chart Appearance

The appearance of a chart can be modified according to the convenience and usage. The following code example demonstrates modifying the chart element styles.

C#

```

//Opens the Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide

```

```

IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Modifies the chart height
chart.Height = 500;
//Modifies the chart width
chart.Width = 700;
//Changes the title
chart.ChartTitle = "New title";
//Changes the series name of first chart series
chart.Series[0].Name = "Modified series name";
//Hides the category labels
chart.CategoryLabelLevel =
OfficeCategoriesLabelLevel.CategoriesLabelLevelNone;
//Shows Data Table.
chart.HasDataTable = true;
//Formats Chart Area.
IOfficeChartFrameFormat chartArea = chart.ChartArea;
//Chart Area Border Settings
//Style
chartArea.Border.LinePattern = OfficeChartLinePattern.Solid;
//Color
chartArea.Border.LineColor = Color.Blue;
//Weight
chartArea.Border.LineWeight = OfficeChartLineWeight.Hairline;
//Chart Area Settings
//Fill Effects
chartArea.Fill.FillType = OfficeFillType.Gradient;
//Two Color
chartArea.Fill.GradientColorType = OfficeGradientColor.TwoColor;
//Sets two colors.
chartArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartArea.Fill.ForeColor = Color.White;
//Plot Area
IOfficeChartFrameFormat chartPlotArea = chart.PlotArea;
//Plots Area Border Settings
//Style
chartPlotArea.Border.LinePattern = OfficeChartLinePattern.Solid;
//Color
chartPlotArea.Border.LineColor = Color.Blue;
//Weight
chartPlotArea.Border.LineWeight = OfficeChartLineWeight.Hairline;
//Fill Effects
chartPlotArea.Fill.FillType = OfficeFillType.Gradient;
//Two Color
chartPlotArea.Fill.GradientColorType = OfficeGradientColor.TwoColor;
//Sets two colors.
chartPlotArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartPlotArea.Fill.ForeColor = Color.White;
//Saves the Presentation
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Opens the Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")

```

```

```

Modifying the Plot and Legends of chart

The following code example demonstrates how to modify the legend and plot areas of a chart.

C#

```

//Opens a Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets the chart from the first slide
IPresentationChart chart = pptxDoc.Slides[0].Charts[0] as
IPresentationChart;
//Sets border settings
chart.PlotArea.Border.AutoFormat = false;
//Sets the auto line color
chart.PlotArea.Border.IsAutoLineColor = false;
//Sets the border line color
chart.PlotArea.Border.LineColor = Color.Blue;
//Sets the border line pattern
chart.PlotArea.Border.LinePattern = OfficeChartLinePattern.DashDot;
//Sets the border line weight
chart.PlotArea.Border.LineWeight = OfficeChartLineWeight.Wide;
//Sets the border transparency
chart.PlotArea.Border.Transparency = 0.6;

```

```
//Sets the plot area's fill type
chart.PlotArea.Fill.FillType = OfficeFillType.SolidColor;
//Sets the plot area's fill color
chart.PlotArea.Fill.ForeColor = Color.LightPink;
//Sets the plot area shadow presence
chart.PlotArea.Shadow.ShadowInnerPresets =
Office2007ChartPresetsInner.InsideDiagonalTopLeft;
//Sets the legend position
chart.Legend.Position = OfficeLegendPosition.Left;
//Sets the layout inclusion
chart.Legend.IncludeInLayout = true;
//Sets the legend border format
chart.Legend.FrameFormat.Border.AutoFormat = false;
//Sets the legend border auto line color
chart.Legend.FrameFormat.Border.IsAutoLineColor = false;
//Sets the border line color
chart.Legend.FrameFormat.Border.LineColor = Color.Blue;
//Sets the border line pattern
chart.Legend.FrameFormat.Border.LinePattern =
OfficeChartLinePattern.DashDot;
//Sets the legend border line weight
chart.Legend.FrameFormat.Border.LineWeight = OfficeChartLineWeight.Wide;
//Sets the font weight for legend text
chart.Legend.TextArea.Bold = true;
//Sets the fore color to legend text
chart.Legend.TextArea.Color = OfficeKnownColors.Bright_green;
//Sets the font name for legend text
chart.Legend.TextArea.FontName = "Times New Roman";
//Sets the font size for legend text
chart.Legend.TextArea.Size = 20;
//Sets the legend text area' strike through
chart.Legend.TextArea.Strikethrough = true;
//Modifies the legend entry
chart.Legend.LegendEntries[0].IsDeleted = true;
//Modifies the legend layout height
chart.Legend.Layout.Height = 200;
//Modifies the legend layout height mode
chart.Legend.Layout.HeightMode = LayoutModes.factor;
//Modifies the legend layout left position
chart.Legend.Layout.Left = 100;
//Modifies the legend layout left mode
chart.Legend.Layout.LeftMode = LayoutModes.factor;
//Modifies the legend layout top position

Positioning Chart Elements

The following code examples illustrate how to position the different chart elements.

C#

```

IPresentation pptxDoc = Presentation.Create();
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds chart to slide
IPresentationChart chart = slide.Shapes.AddChart(100, 120, 500, 300);
//Sets the data range of chart
chart.DataRange = chart.ChartData[1, 2, 4, 3];
//Sets data to the chart- RowIndex, columnIndex and data
chart.ChartData.SetValue(1, 2, "2012");
chart.ChartData.SetValue(2, 2, 330);
chart.ChartData.SetValue(3, 2, 490);
chart.ChartData.SetValue(4, 2, 700);

```

```

chart.ChartType = OfficeChartType.Area;
//Edge: Specifies the width or Height to be interpreted as right or bottom
of the chart element.
//Factor: Specifies the width or Height to be interpreted as the width or
height of the chart element.
chart.PlotArea.Layout.LeftMode = LayoutModes.auto;
chart.PlotArea.Layout.TopMode = LayoutModes.factor;
//Value in points should not be negative value when LayoutMode is Edge
//It can be a negative value, when the LayoutMode is Factor.
chart.ChartTitleArea.Layout.Left = 10;
chart.ChartTitleArea.Layout.Top = 100;
//Manually positions chart plot area
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.outer;
chart.PlotArea.Layout.LeftMode = LayoutModes.edge;
chart.PlotArea.Layout.TopMode = LayoutModes.edge;
//Manually positions chart legend
chart.Legend.Layout.LeftMode = LayoutModes.factor;
chart.Legend.Layout.TopMode = LayoutModes.factor;
//Saves the Presentation
pptxDoc.Save("Output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

Applying 3D Formats

Essential Presentation allows you to modify side wall, back wall, and floor settings of a 3-D chart. The following code example explains how to apply these settings to a 3-D chart.

C#

```

//Opens the Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Changes the chart type to 3D
chart.ChartType = OfficeChartType.Bar_Clustered_3D;
//Sets the rotation
chart.Rotation = 80;
//Sets the shadow angle
chart.SideWall.Shadow.Angle = 60;
//Sets the back wall border weight
chart.BackWall.Border.LineWeight = OfficeChartLineWeight.Narrow;
//Saves the Presentation
pptxDoc.Save("output.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Opens the Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Gets the first slide
Dim slide As ISlide = pptxDoc.Slides(0)
'Gets the chart in slide
Dim chart As IPresentationChart = TryCast(slide.Shapes(0),
IPresentationChart)

```

```

'Changes the chart type to 3D
chart.ChartType = OfficeChartType.Bar_Clustered_3D
'Sets the rotation
chart.Rotation = 80
'Sets the shadow angle
chart.SideWall.Shadow.Angle = 60
'Sets the back wall border weight
chart.BackWall.Border.LineWeight = OfficeChartLineWeight.Narrow
'Saves the Presentation
pptxDoc.Save("output.pptx")
'Closes the Presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Changes the chart type to 3D
chart.ChartType = OfficeChartType.Bar_Clustered_3D;
//Sets the rotation
chart.Rotation = 80;
//Sets the shadow angle
chart.SideWall.Shadow.Angle = 60;
//Sets the back wall border weight
chart.BackWall.Border.LineWeight = OfficeChartLineWeight.Narrow;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker

Chart to Image conversion

The following code example demonstrates how to convert the charts in a Presentation slide to image.

Tips: You can specify the quality of the converted charts by setting the scaling mode. For more details on how to set the scaling mode, see [Converting PowerPoint presentation to Images](#)

C#

```
//Opens the Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Initializes the ChartToImageConverter class; this is mandatory
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Sets the scaling mode for quality
pptxDoc.ChartToImageConverter.ScalingMode =
Syncfusion.OfficeChart.ScalingMode.Best;
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Creates a stream instance to store the image
MemoryStream stream = new MemoryStream();
//Saves the image to stream
chart.SaveAsImage(stream);
//Saves the stream to a file
using (FileStream fileStream = File.Create("ChartImage.png",
(int)stream.Length))
fileStream.Write(stream.ToArray(), 0, stream.ToArray().Length);
//Closes the stream
stream.Close();
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Opens the Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Initializes the ChartToImageConverter class; this is mandatory
pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Sets the scaling mode for quality
pptxDoc.ChartToImageConverter.ScalingMode =
Syncfusion.OfficeChart.ScalingMode.Best
'Gets the first slide
Dim slide As ISlide = pptxDoc.Slides(0)
'Gets the chart in slide
Dim chart As IPresentationChart = TryCast(slide.Shapes(0),
IPresentationChart)
'Creates a stream instance to store the image
Dim stream As New MemoryStream()
'Saves the image to stream
chart.SaveAsImage(stream)
'Saves the stream to a file
Using fileStream As FileStream = File.Create("ChartImage.png",
CInt(stream.Length))
fileStream.Write(stream.ToArray(), 0, stream.ToArray().Length)
End Using
'Closes the stream
```

```
stream.Close()  
'Closes the Presentation  
pptxDoc.Close()
```

Removing the chart from slide

The following code example demonstrates removing a chart from a slide.

C#

```
//Opens the Presentation  
IPresentation pptxDoc = Presentation.Open("Sample.pptx");  
//Gets the first slide  
ISlide slide = pptxDoc.Slides[0];  
//Gets the chart in slide  
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;  
//Removes the chart from slide  
slide.Shapes.Remove(chart as IShape);  
//Saves the Presentation  
pptxDoc.Save("output.pptx");  
//Closes the presentation  
pptxDoc.Close();
```

VB.NET

```
'Opens the Presentation  
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")  
'Gets the first slide  
Dim slide As ISlide = pptxDoc.Slides(0)  
'Gets the chart in slide  
Dim chart As IPresentationChart = TryCast(slide.Shapes(0),  
IPresentationChart)  
'Removes the chart from slide  
slide.Shapes.Remove(TryCast(chart, IShape))  
'Saves the Presentation  
pptxDoc.Save("output.pptx")  
'Closes the Presentation  
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker  
FileOpenPicker openPicker = new FileOpenPicker();  
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;  
openPicker.FileTypeFilter.Add(".pptx");  
//Creates a storage file from FileOpenPicker  
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();  
//Loads or open an PowerPoint Presentation  
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);  
//Gets the first slide  
ISlide slide = pptxDoc.Slides[0];  
//Gets the chart in slide  
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;  
//Removes the chart from slide  
slide.Shapes.Remove(chart as IShape);  
//Initializes FileSavePicker
```

```

FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets the first slide
ISlide slide = pptxDoc.Slides[0];
//Gets the chart in slide
IPresentationChart chart = slide.Shapes[0] as IPresentationChart;
//Removes the chart from slide
slide.Shapes.Remove(chart as IShape);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the presentation
pptxDoc.Close();

```

XAMARIN

Creating a Scatter chart

The following code example demonstrates creating a Scatter chart.

C#

```
//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds chart to the slide with position and size
IPresentationChart chart = slide.Charts.AddChart(100, 10, 700, 500);
//Set the chart type as Scatter_Markers
chart.ChartType = OfficeChartType.Scatter_Markers;
//Assign data
chart.DataRange = chart.ChartData[1, 1, 4, 2];
chart.IsSeriesInRows = false;
//Set data to the chart RowIndex, columnIndex, and data
chart.ChartData.SetValue(1, 1, "X-Axis");
chart.ChartData.SetValue(1, 2, "Y-Axis");
chart.ChartData.SetValue(2, 1, 1);
chart.ChartData.SetValue(3, 1, 5);
chart.ChartData.SetValue(4, 1, 10);
chart.ChartData.SetValue(2, 2, 10);
chart.ChartData.SetValue(3, 2, 5);
chart.ChartData.SetValue(4, 2, 1);
//Apply chart elements
//Set chart title

PowerPoint 2016 Charts

Essential Presentation supports creating and manipulating new and modern chart types such as waterfall, histogram, pareto, box and whisker, tree map, and sunburst, which are introduced in Microsoft PowerPoint 2016.

Funnel

[Funnel](#) charts show values across multiple stages in a process. Refer to the following code example to create a Funnel chart.

C#

```

using (IPresentation pptxDoc = Presentation.Create())
{
    ISlide slidel1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Create a chart
    IPresentationChart chart = slidel1.Charts.AddChart(30, 50, 600, 300);
    //Set chart type as Funnel
    chart.ChartType = OfficeChartType.Funnel;
    //Set the chart title
    chart.ChartTitle = "Funnel";
    //Assign data
    chart.DataRange = chart.ChartData[1, 1, 6, 2];
    chart.IsSeriesInRows = false;
    //Set data
    chart.ChartData.SetValue(1, 1, "Web sales");
    chart.ChartData.SetValue(1, 2, "Users count");
    chart.ChartData.SetValue(2, 1, "Website Visits");
    chart.ChartData.SetValue(2, 2, "15600");
    chart.ChartData.SetValue(3, 1, "Downloads");
    chart.ChartData.SetValue(3, 2, "8000");
    chart.ChartData.SetValue(4, 1, "Requested price list");
    chart.ChartData.SetValue(4, 2, "6000");
    chart.ChartData.SetValue(5, 1, "Invoice sent");
    chart.ChartData.SetValue(5, 2, "2000");
    chart.ChartData.SetValue(6, 1, "Finalized");
    chart.ChartData.SetValue(6, 2, "1000");
    //Formatting the legend and data label option
    chart.HasLegend = false;
    IOfficeChartSerie serie = chart.Series[0];
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.Size = 8;
    //Save and close the presentation
    pptxDoc.Save("FunnelChart.pptx");
    pptxDoc.Close();
}

```

VB.NET

```

The following screenshot shows the output of previous code.

Box and Whisker

[Box and Whisker](#) chart shows distribution of data into quartiles, highlighting the mean and outliers. Box and Whisker charts are most commonly used in statistical analysis. Refer to the following code example to create the Box and Whisker chart.

C#

```
private static void TestBox_Whisker()
{
    using (IPresentation pptxDoc = Presentation.Create())
    {
        ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
        IPresentationChart chart = slide1.Charts.AddChart(50, 50, 600, 400);
        chart.ChartTitle = "Test Scores";
        chart.ChartType = OfficeChartType.BoxAndWhisker;
        //Assign data
        chart.DataRange = chart.ChartData[1, 1, 16, 4];
        chart.IsSeriesInRows = false;
        //Set data to the chart RowIndex, columnIndex, and data
        SetChartData(chart);
        //Box and Whisker settings on first series
        IOfficeChartSeries seriesA = chart.Series[0];
        seriesA.SeriesFormat.ShowInnerPoints = false;
        seriesA.SeriesFormat.ShowOutlierPoints = true;
        seriesA.SeriesFormat.ShowMeanMarkers = true;
        seriesA.SeriesFormat.ShowMeanLine = false;
        seriesA.SeriesFormat.QuartileCalculationType =
            QuartileCalculation.ExclusiveMedian;

The following screenshot shows the output of previous code.

Waterfall

Waterfall chart helps understand the finances of business owners by viewing profit and loss statements. You can quickly illustrate the line items in your financial data and get a clear picture of how each item is impacting your bottom line using a Waterfall chart. Refer to the following code to create a Waterfall chart.

C#

```

using (IPresentation pptxDoc = Presentation.Create())
{
    ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Create a chart
    IPresentationChart chart = slide1.Charts.AddChart(50, 50, 700, 400);
    //Set chart type as Waterfall
    chart.ChartType = OfficeChartType.WaterFall;
    //Set data range
    chart.DataRange = chart.ChartData[1, 1, 8, 2];
    chart.IsSeriesInRows = false;
    chart.ChartData.SetValue(2, 1, "Start");
    chart.ChartData.SetValue(2, 2, 120000);
    chart.ChartData.SetValue(3, 1, "Product Revenue");
    chart.ChartData.SetValue(3, 2, 570000);
    chart.ChartData.SetValue(4, 1, "Service Revenue");
    chart.ChartData.SetValue(4, 2, 230000);
    chart.ChartData.SetValue(5, 1, "Positive Balance");
}

```

```

chart.ChartData.SetValue(5, 2, 920000);
chart.ChartData.SetValue(6, 1, "Fixed Costs");
chart.ChartData.SetValue(6, 2, -345000);
chart.ChartData.SetValue(7, 1, "Variable Costs");
chart.ChartData.SetValue(7, 2, -230000);
chart.ChartData.SetValue(8, 1, "Total");
chart.ChartData.SetValue(8, 2, 345000);
//Data point settings as total in chart
IOfficeChartSerie series = chart.Series[0];
chart.Series[0].DataPoints[2].SetAsTotal = true;
chart.Series[0].DataPoints[5].SetAsTotal = true;
//Showing the connector lines between data points
chart.Series[0].SerieFormat.ShowConnectorLines = true;
//Set the chart title
chart.ChartTitle = "Company Profit (in USD)";
//Formatting data label and legend option
chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.Size = 8;
chart.Legend.Position = OfficeLegendPosition.Right;
//Save and close the presentation
pptxDoc.Save("WaterFall.pptx");
pptxDoc.Close();
}

```

The following screenshot shows the output of previous code.

Histogram

[Histogram](#) shows the frequencies within a distribution. Each column of the chart is called a bin, which can be changed further to analyze the data. Refer to the following code example to create a Histogram.

C#

```
using (IPresentation pptxDoc = Presentation.Create())
{
    ISlide slide1 = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    IPresentationChart chart = slide1.Charts.AddChart(50, 50, 500, 400);
    chart.ChartType = OfficeChartType.Histogram;
    chart.DataRange = chart.ChartData[2, 1, 15, 1];
    chart.ChartData.SetValue(1, 1, "Student Heights");
    chart.ChartData.SetValue(2, 1, 130);
    chart.ChartData.SetValue(3, 1, 132);
    chart.ChartData.SetValue(4, 1, 159);
    chart.ChartData.SetValue(5, 1, 163);
    chart.ChartData.SetValue(6, 1, 140);
    chart.ChartData.SetValue(7, 1, 155);
    chart.ChartData.SetValue(8, 1, 139);
    chart.ChartData.SetValue(9, 1, 143);
    chart.ChartData.SetValue(10, 1, 153);
    chart.ChartData.SetValue(11, 1, 165);
    chart.ChartData.SetValue(12, 1, 153);
    chart.ChartData.SetValue(13, 1, 149);
    chart.ChartData.SetValue(14, 1, 154);
    chart.ChartData.SetValue(15, 1, 162);

Working with Animations

Animations are visual effects for the objects in PowerPoint presentation and animation helps to make a PowerPoint presentation more dynamic. Animation effects can be grouped into four categories.,

1. Entrance
2. Emphasis
3. Exit
4. Motion paths

Entrance effects can be set to enter the objects with animations during slide show. Emphasis effects animate the objects on the spot. Exit effects allow objects to leave the slide show with animations. Motion Paths allow objects to move around the slide show. Each effect contains variables such as start (On click, with previous and after previous), delay, speed, repeat, and trigger. This makes animations more flexible and interactive.

Syncfusion Presentation library allows you to animate the text, pictures, shapes, tables, SmartArt graphics, and charts in PowerPoint presentation.

Adding animation effect to shapes

Animation effects can be added to shapes, images, tables, charts and SmartArt diagrams. The following code example demonstrates how to add an animation effect to a shape.

C#

```
//Create an instance for PowerPoint
using (IPresentation pptxDoc = Presentation.Create())
{
    //Add a blank slide to Presentation
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Add normal shape to slide
    IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
    //Access the animation sequence to create effects
    ISequence sequence = slide.Timeline.MainSequence;
    //Add bounce effect to the shape
    IEffect bounceEffect = sequence.AddEffect(cubeShape, EffectType.Bounce, EffectSubtype.None, EffectTriggerType.OnClick);
    //Save the Presentation
    pptxDoc.Save("Sample.pptx");
}
```

VB.NET

```
'Create an instance for PowerPoint
Using pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add normal shape to slide
```

```

Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Access the animation sequence to create effects
Dim sequence As ISequence = slide.Timeline.MainSequence
'Add bounce effect to the shape
Dim bounceEffect As IEffect = sequence.AddEffect(cubeShape,
EffectType.Bounce, EffectSubtype.None, EffectTriggerType.OnClick)
'Save the Presentation
pptxDoc.Save("Sample.pptx")
End Using

```

UWP

```

//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add bounce effect to the shape
IEffect bounceEffect = sequence.AddEffect(cubeShape, EffectType.Bounce,
EffectSubtype.None, EffectTriggerType.OnClick);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add bounce effect to the shape
IEffect bounceEffect = sequence.AddEffect(cubeShape, EffectType.Bounce,
EffectSubtype.None, EffectTriggerType.OnClick);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add bounce effect to the shape
IEffect bounceEffect = sequence.AddEffect(cubeShape, EffectType.Bounce,
EffectSubtype.None, EffectTriggerType.OnClick);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Adding interactive animation

Animations can be interactive when it depends on another slide element., for example, an animation associated with a rectangle is triggered when user clicks an oval shape in the slide. The following code example demonstrates how to set an interactive animation.

C#

```

//Create an instance for PowerPoint
using (IPresentation pptxDoc= Presentation.Create())
{
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Add a shape to act as button
IShape buttonShape = slide.Shapes.AddShape(AutoShapeType.Oval,
100,100,50,50);
//Create the interactive sequence to make the animation effects interactive
by triggering with button click
ISequence interactiveSequence =
slide.Timeline.InteractiveSequences.Add(buttonShape);
//Add Fly effect with top subtype to animate the shape as fly from top

```

```
IEffect bounceEffect = interactiveSequence.AddEffect(cubeShape,
EffectType.Fly, EffectSubtype.Top, EffectTriggerType.OnClick);
//Save the Presentation
pptxDoc.Save("Sample.pptx");
}
```

VB.NET

```
'Create an instance for PowerPoint
Using pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add normal shape to slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Add a shape to act as button
Dim buttonShape As IShape = slide.Shapes.AddShape(AutoShapeType.Oval, 100,
100, 50, 50)
'Create the interactive sequence to make the animation effects interactive
by triggering with button click
Dim interactiveSequence As ISequence =
slide.Timeline.InteractiveSequences.Add(buttonShape)
'Add Fly effect with top subtype to animate the shape as fly from top
Dim bounceEffect As IEffect = interactiveSequence.AddEffect(cubeShape,
EffectType.Fly, EffectSubtype.Top, EffectTriggerType.OnClick)
'Save the Presentation
pptxDoc.Save("Sample.pptx")
End Using
```

UWP

```
//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Add a shape to act as button
IShape buttonShape = slide.Shapes.AddShape(AutoShapeType.Oval,
100,100,50,50);
//Create the interactive sequence to make the animation effects interactive
by triggering with button click
ISequence interactiveSequence =
slide.Timeline.InteractiveSequences.Add(buttonShape);
//Add Fly effect with top subtype to animate the shape as fly from top
IEffect bounceEffect = interactiveSequence.AddEffect(cubeShape,
EffectType.Fly, EffectSubtype.Top, EffectTriggerType.OnClick);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
```

```
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Add a shape to act as button
IShape buttonShape = slide.Shapes.AddShape(AutoShapeType.Oval,
100,100,50,50);
//Create the interactive sequence to make the animation effects interactive
by triggering with button click
ISequence interactiveSequence =
slide.Timeline.InteractiveSequences.Add(buttonShape);
//Add Fly effect with top subtype to animate the shape as fly from top
IEffect bounceEffect = interactiveSequence.AddEffect(cubeShape,
EffectType.Fly, EffectSubtype.Top, EffectTriggerType.OnClick);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Add a shape to act as button
IShape buttonShape = slide.Shapes.AddShape(AutoShapeType.Oval,
100,100,50,50);
//Create the interactive sequence to make the animation effects interactive
by triggering with button click
ISequence interactiveSequence =
slide.Timeline.InteractiveSequences.Add(buttonShape);
//Add Fly effect with top subtype to animate the shape as fly from top
IEffect bounceEffect = interactiveSequence.AddEffect(cubeShape,
EffectType.Fly, EffectSubtype.Top, EffectTriggerType.OnClick);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Adding animation to text

Animation effects can be applied to text. The following code example demonstrated how to set an animation effect to a text.

C#

```

//Open an existing Presentation from file system
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
//Retrieve the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add swivel effect with vertical subtype to the shape, build type is used
to represent the animate level of the paragraph
IEffect bounceEffect = sequence.AddEffect(shape, EffectType.Swivel,
EffectSubtype.Vertical, EffectTriggerType.OnClick,
BuildType.ByLevelParagraphs1);
//Save the Presentation to the file system
pptxDoc.Save("Result.pptx");
}

```

VB.NET

```

'Opens an existing Presentation from file system
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieve the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieve the first shape
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Access the animation sequence to create effects
Dim sequence As ISequence = slide.Timeline.MainSequence
'Add swivel effect with vertical subtype to the shape, build type is used to
represent the animate level of the paragraph
Dim bounceEffect As IEffect = sequence.AddEffect(shape, EffectType.Swivel,
EffectSubtype.Vertical, EffectTriggerType.OnClick,
BuildType.ByLevelParagraphs1)
'Save the Presentation to the file system
pptxDoc.Save("Result.pptx")
End Using

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieve the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add swivel effect with vertical subtype to the shape, build type is used to represent the animate level of the paragraph
IEffect bounceEffect = sequence.AddEffect(shape, EffectType.Swivel, EffectSubtype.Vertical, EffectTriggerType.OnClick, BuildType.ByLevelParagraphs1);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() { ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieve the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add swivel effect with vertical subtype to the shape, build type is used to represent the animate level of the paragraph
IEffect bounceEffect = sequence.AddEffect(shape, EffectType.Swivel, EffectSubtype.Vertical, EffectTriggerType.OnClick, BuildType.ByLevelParagraphs1);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Result.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;

```

```

Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieve the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add swivel effect with vertical subtype to the shape, build type is used
to represent the animate level of the paragraph
IEffect bounceEffect = sequence.AddEffect(shape, EffectType.Swivel,
EffectSubtype.Vertical, EffectTriggerType.OnClick,
BuildType.ByLevelParagraphs1);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Result.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Adding exit animation effect

When you add common animation effects for both entrance and exit types, animation is applied with entrance effect by default. The following code example demonstrates how to set exist type animation for a shape.

C#

```

//Create an instance for PowerPoint
using (IPresentation pptxDoc = Presentation.Create())
{
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add random bars effect to the shape
IEffect effect = sequence.AddEffect(cubeShape, EffectType.RandomBars,
EffectSubtype.None, EffectTriggerType.OnClick);

```

```
//Change the preset class type of the effect from default entrance to exit
effect.PresetClassType = EffectPresetClassType.Exit;
//Save the Presentation
pptxDoc.Save("Sample.pptx");
}
```

VB.NET

```
'Create an instance for PowerPoint
Using pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add normal shape to slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Access the animation sequence to create effects
Dim sequence As ISequence = slide.Timeline.MainSequence
'Add random bars effect to the shape
Dim effect As IEfffect = sequence.AddEffect(cubeShape, EffectType.RandomBars,
EffectSubtype.None, EffectTriggerType.OnClick)
'Change the preset class type of the effect from default entrance to exit
effect.PresetClassType = EffectPresetClassType.[Exit]
'Save the Presentation
pptxDoc.Save("Sample.pptx")
End Using
```

UWP

```
//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add random bars effect to the shape
IEfffect effect = sequence.AddEffect(cubeShape, EffectType.RandomBars,
EffectSubtype.None, EffectTriggerType.OnClick);
//Change the preset class type of the effect from default entrance to exit
effect.PresetClassType = EffectPresetClassType.Exit;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add random bars effect to the shape
IEffect effect = sequence.AddEffect(cubeShape, EffectType.RandomBars, EffectSubtype.None, EffectTriggerType.OnClick);
//Change the preset class type of the effect from default entrance to exit
effect.PresetClassType = EffectPresetClassType.Exit;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
//Create an instance for PowerPoint
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add normal shape to slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Access the animation sequence to create effects
ISequence sequence = slide.Timeline.MainSequence;
//Add random bars effect to the shape
IEffect effect = sequence.AddEffect(cubeShape, EffectType.RandomBars, EffectSubtype.None, EffectTriggerType.OnClick);
//Change the preset class type of the effect from default entrance to exit
effect.PresetClassType = EffectPresetClassType.Exit;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
```

Edit existing animation effect

The Presentation library allows you to edit the animations in existing presentations. The following example demonstrates how to modify an existing animation applied to a shape.

C#

```
//Open an existing Presentation from file system
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
    //Retrieve the first slide from Presentation
    ISlide slide = pptxDoc.Slides[0];
    //Retrieve the first shape
    IShape shape = slide.Shapes[0] as IShape;
    //Access the animation main sequence to modify the effects
    ISequence sequence = slide.Timeline.MainSequence;
    //Get the animation effects of the particular shape
    IEffect[] animationEffects = sequence.GetEffectsByShape(shape);
    //Iterate the animation effect to make the change
    IEffect animationEffect = animationEffects[0];
    //Change the animation effect type from swivel to GrowAndTurn
    animationEffect.Type = EffectType.GrowAndTurn;
    //Save the Presentation to the file system
    pptxDoc.Save("Animation.pptx");
}
```

VB.NET

```
'Open an existing Presentation from file system
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieve the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieve the first shape.
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Access the animation main sequence to modify the effects
Dim sequence As ISequence = slide.Timeline.MainSequence
'Get the animation effects of the particular shape
Dim animationEffects As IEffect() = sequence.GetEffectsByShape(shape)
'Iterate the animation effect to make the change
Dim animationEffect As IEffect = animationEffects(0)
'Change the animation effect type from swivel to GrowAndTurn
animationEffect.Type = EffectType.GrowAndTurn
'Save the Presentation to the file system
pptxDoc.Save("Animation.pptx")
End Using
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieve the first slide from Presentation
```

```

ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation main sequence to modify the effects
ISequence sequence = slide.Timeline.MainSequence;
//Get the animation effects of the particular shape
IEffect[] animationEffects = sequence.GetEffectsByShape(shape);
//Iterate the animation effect to make the change
IEffect animationEffect = animationEffects[0];
//Change the animation effect type from swivel to GrowAndTurn
animationEffect.Type = EffectType.GrowAndTurn;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieve the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation main sequence to modify the effects
ISequence sequence = slide.Timeline.MainSequence;
//Get the animation effects of the particular shape
IEffect[] animationEffects = sequence.GetEffectsByShape(shape);
//Iterate the animation effect to make the change
IEffect animationEffect = animationEffects[0];
//Change the animation effect type from swivel to GrowAndTurn
animationEffect.Type = EffectType.GrowAndTurn;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Animation.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieve the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieve the first shape
IShape shape = slide.Shapes[0] as IShape;

```

```

//Access the animation main sequence to modify the effects
ISequence sequence = slide.Timeline.MainSequence;
//Get the animation effects of the particular shape
IEffect[] animationEffects = sequence.GetEffectsByShape(shape);
//Iterate the animation effect to make the change

```

Modifying animation effect sub type

Presentation library allows you to edit the sub type of animations effects in existing presentations. The following example demonstrates how to modify a sub type applied to the existing animation.

C#

```

//Opens an existing Presentation from file system
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation main sequence to modify the effects
ISequence sequence = slide.Timeline.MainSequence;
//Get the required animation effect from the slide
IEffect wheelEffect = sequence[0] as IEffect;
//Change the wheel animation effect sub type from 2 spoke to 4 spoke
wheelEffect.Subtype = EffectSubtype.Wheel4;
//Saves the Presentation to the file system
pptxDoc.Save("Result.pptx");
}

```

VB.NET

```

'Opens an existing Presentation from file system
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")

```

```

'Retrieves the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first shape
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Access the animation main sequence to modify the effects
Dim sequence As ISequence = slide.Timeline.MainSequence
'Get the required animation effect from the slide
Dim wheelEffect As IEffect = TryCast(sequence(0), IEffect)
'Change the wheel animation effect sub type from 2 spoke to 4 spoke
wheelEffect.Subtype = EffectSubtype.Wheel4
'Saves the Presentation to the file system
pptxDoc.Save("Result.pptx")
End Using

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieves the first slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape
IShape shape = slide.Shapes[0] as IShape;
//Access the animation main sequence to modify the effects
ISequence sequence = slide.Timeline.MainSequence;
//Get the required animation effect from the slide
IEffect wheelEffect = sequence[0] as IEffect;
//Change the wheel animation effect sub type from 2 spoke to 4 spoke
wheelEffect.Subtype = EffectSubtype.Wheel4;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;

Modifying timing of animation effect

Presentation library allows you to edit the animation timing in the existing presentations. The following example demonstrates how to modify an existing animation timing applied to a shape.

C#

```
//Open an existing Presentation from file system
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
```

```

{
    //Retrieves the first slide from Presentation
    ISlide slide = pptxDoc.Slides[0];
    //Retrieves the first shape
    IShape shape = slide.Shapes[0] as IShape;
    //Access the animation main sequence to modify the effects
    ISequence sequence = slide.Timeline.MainSequence;
    //Get the required animation effect from the slide
    IEffect pathEffect = sequence[0] as IEffect;
    //Increase the duration of the animation effect
    pathEffect.Behaviors[0].Timing.Duration = 5;
    //Saves the Presentation to the file system
    pptxDoc.Save("Result.pptx");
}

```

VB.NET

```

'Open an existing Presentation from file system
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieves the first slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first shape
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Access the animation main sequence to modify the effects
Dim sequence As ISequence = slide.Timeline.MainSequence
'Get the required animation effect from the slide
Dim pathEffect As IEffect = TryCast(sequence(0), IEffect)
'Increase the duration of the animation effect
pathEffect.Behaviors(0).Timing.Duration = 5
'Save the Presentation to the file system.
pptxDoc.Save("Result.pptx")
End Using

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker

Reordering the animation effects

Presentation library allows you to reorder the animation effects in existing presentations. The following example demonstrates how to modify an existing animation order applied to a shape.

C#

```

//Open the existing presentation
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
    //Iterate the slide
    ISlide slide = pptxDoc.Slides[0];
    //Iterate the shape
    IShape shape = slide.Shapes[0] as IShape;
    //Iterate the sequence
    ISequence sequence = slide.Timeline.MainSequence;
    //Get the animation effects of the shape
    IEffect[] shapeAnimationEffects = sequence.GetEffectsByShape(shape);
    //Get the second animation effect of the shape
    IEffect effect = shapeAnimationEffects[1];
    //Remove the animation effect from the sequence
    sequence.Remove(effect);
    //Insert the removed animation effect as first
    sequence.Insert(0, effect);
    //Save the created presentation
    pptxDoc.Save("Output.pptx");
}

```

VB.NET

```

'Open the existing presentation
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
    'Iterate the slide
    Dim slide As ISlide = pptxDoc.Slides(0)
    'Iterate the shape
    Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
    'Iterate the sequence
    Dim sequence As ISequence = slide.Timeline.MainSequence
    'Get the animation effects of the shape
    Dim shapeAnimationEffects As IEffect() = sequence.GetEffectsByShape(shape)
    'Get the second animation effect of the shape
    Dim effect As IEffect = shapeAnimationEffects(1)
    'Remove the animation effect from the sequence
    sequence.Remove(effect)
    'Insert the removed animation effect as first
    sequence.Insert(0, effect)

```

```
'Save the created presentation
pptxDoc.Save("Output.pptx")
End Using
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation

Creating custom path animation effect

Presentation library allows you to create and modify the custom animations in presentations. The following example demonstrates how to apply a custom animation to a shape.

C#

```

//Creates an instance for PowerPoint
using (IPresentation pptxDoc = Presentation.Create())
{
    //Adds a blank slide to Presentation
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Adds normal shape to slide
    IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 200, 0, 300,
    300);
    //Access the animation sequence to create effects
    ISequence sequence = slide.Timeline.MainSequence;
    //Add user path effect to the shape
    IEfffect bounceEffect = sequence.AddEffect(cubeShape, EffectType.PathUser,
    EffectSubtype.None, EffectTriggerType.OnClick);
    //Add commands to the empty path for moving
    IMotionEffect motionBehavior = ((IMotionEffect)bounceEffect.Behaviors[0]);
    PointF[] points = new PointF[1];
    //Add the move command to move the position of the shape
    points[0] = new PointF(0, 0);
    motionBehavior.Path.Add(MotionCommandPathType.MoveTo, points,
    MotionPathPointsType.Auto, false);
    //Add the line command to move the shape in straight line
    points[0] = new PointF(0, 0.25f);
    motionBehavior.Path.Add(MotionCommandPathType.LineTo, points,
    MotionPathPointsType.Auto, false);
    //Add the end command to finish the path animation
    motionBehavior.Path.Add(MotionCommandPathType.End, null,
    MotionPathPointsType.Auto, false);
    //Saves the Presentation
    pptxDoc.Save("Sample.pptx");
}

```

VB.NET

```

'Creates an instance for PowerPoint
Using pptxDoc As IPresentation = Presentation.Create()
'Adds a blank slide to Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds normal shape to slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 200, 0,
300, 300)
'Access the animation sequence to create effects
Dim sequence As ISequence = slide.Timeline.MainSequence

```

Removing animation effect

Presentation library allows you to remove the animation effects from a shape. The following example demonstrates how to remove an animation effect from a shape.

C#

```
//Open the existing presentation
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
//Iterate the slide
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape
IShape shape = slide.Shapes[0] as IShape;
//Iterate the sequence
ISequence sequence = slide.Timeline.MainSequence;
//To Remove the animation effects from the shape
//Get the animation effects of the particular shape
IEffect[] animationEffects = sequence.GetEffectsByShape(shape);
//Remove the animation effect from the main sequence
foreach (IEffect effect in animationEffects)
{
sequence.Remove(effect);
}
//Save the created presentation
pptxDoc.Save("Result.pptx");
}
```

VB.NET

```
'Open the existing presentation
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Iterate the slide
Dim slide As ISlide = pptxDoc.Slides(0)
'Retrieves the first shape
Dim shape As IShape = TryCast(slide.Shapes(0), IShape)
'Iterate the sequence
Dim sequence As ISequence = slide.Timeline.MainSequence
'To Remove the animation effects from the shape
```

```

'Get the animation effects of the particular shape
Dim animationEffects As IEffekt() = sequence.GetEffectsByShape(shape)
'Remove the animation effect from the main sequence
For Each effect As IEffekt In animationEffects
sequence.Remove(effect)
Next
'Save the created presentation
pptxDoc.Save("Result.pptx")
End Using

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Iterate the slide
ISlide slide = pptxDoc.Slides[0];
//Retrieves the first shape
IShape shape = slide.Shapes[0] as IShape;
//Iterate the sequence
ISequence sequence = slide.Timeline.MainSequence;
//To Remove the animation effects from the shape
//Get the animation effects of the particular shape
IEffekt[] animationEffects = sequence.GetEffectsByShape(shape);
//Remove the animation effect from the main sequence
foreach (IEffekt effect in animationEffects)
{
sequence.Remove(effect);
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";

Add and edit transitions in PowerPoint slides

Slide transitions are the motion effects that occur when you move from one slide to the next during a slide show presentation. A transition can be simple as push type that pushes to the next slide or an airplane type that displays the next slide like an eye-catching effect. You can control the speed, add sound, and customize the properties of transition effects. Transition effects can be grouped into three categories.

1. Subtle
2. Exciting
3. Dynamic Content

Transition effect contains the following properties. This makes slide transition more flexible and interactive.

1. Start (after a click or after certain time)
2. Duration
3. Speed

Set a transition effect to a PowerPoint slide

The following code example demonstrates how to set a transition effect to a PowerPoint slide.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Set the transition effect options
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Across;
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```

'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a shape to the slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard
'Set the transition effect option
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Across
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Set the transition effect options
slide.SlideTransition.TransitionEffectOption =
TransitionEffectOption.Across;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;

```

```
//Set the transition effect options
slide.SlideTransition.TransitionEffectOption =
TransitionEffectOption.Across;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputFileName, FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Set the transition effect options
slide.SlideTransition.TransitionEffectOption =
TransitionEffectOption.Across;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Modify a transition effect applied to a PowerPoint slide

You can edit the transition effects that already applied to the PowerPoint slides. Refer to the following code example.

C#

```
//Open an existing PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Retrieve the first slide from the presentation
ISlide slide = pptxDoc.Slides[0];
//Modify the transition effect applied to the slide
slide.SlideTransition.TransitionEffect = TransitionEffect.Cover;
```

```
//Set the transition subtype
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Right;
//Save the presentation
pptxDoc.Save("Transition.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Open an existing PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Retrieve the first slide from the presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Modify the transition effect applied to the slide
slide.SlideTransition.TransitionEffect = TransitionEffect.Cover
'Set the transition subtype
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Right
'Save the presentation
pptxDoc.Save("Transition.pptx")
'Close the presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Retrieve the first slide from the presentation
ISlide slide = pptxDoc.Slides[0];
//Modify the transition effect applied to the slide
slide.SlideTransition.TransitionEffect = TransitionEffect.Cover;
//Set the transition subtype
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Right;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Transition";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieve the first slide from the presentation
```

```
ISlide slide = pptxDoc.Slides[0];
//Modify the transition effect applied to the slide
slide.SlideTransition.TransitionEffect = TransitionEffect.Cover;
//Set the transition subtype
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Right;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Transition.pptx",
    FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Retrieve the first slide from the presentation
ISlide slide = pptxDoc.Slides[0];
//Modify the transition effect applied to the slide
slide.SlideTransition.TransitionEffect = TransitionEffect.Cover;
//Set the transition subtype
slide.SlideTransition.TransitionEffectOption = TransitionEffectOption.Right;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Transition.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Transition.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
```

Set the transition duration

You can set the transition duration value up to 59 seconds. This specifies the length of the slide transition to happen. Refer to the following code example.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
```

```
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
// Set the duration in seconds for the transition effect. Maximum duration
value is 59 seconds
slide.SlideTransition.Duration = 40;
//Save the presentation
pptxDoc.Save("Transition.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a shape to the slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Add a shape to the slide
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard
'Set the duration value(sec) for the transition effect. Max duration value
is 59 seconds
slide.SlideTransition.Duration = 40
'Save the presentation
pptxDoc.Save("Transition.pptx")
'Close the presentation
pptxDoc.Close()
```

UWP

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
// Set the duration in seconds for the transition effect. Maximum duration
value is 59 seconds
slide.SlideTransition.Duration = 40;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Transition";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
// Set the duration in seconds for the transition effect. Maximum duration value is 59 seconds
slide.SlideTransition.Duration = 40;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Transition.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
// Set the duration in seconds for the transition effect. Maximum duration value is 59 seconds
slide.SlideTransition.Duration = 40;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Transition.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Transition.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
```

Set the transition delay

You can set the transition delay in seconds. This delays the next transactions to happen for a certain number of seconds. The following example demonstrates how to apply the time delay.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Enable the transition time delay
slide.SlideTransition.TriggerOnTimeDelay = true;
//Assign the value for the advance time delay in seconds
slide.SlideTransition.TimeDelay = 5;
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a shape to the slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300)
'Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard
'Enable the transition time delay
slide.SlideTransition.TriggerOnTimeDelay = True
'Assign the value for the advance time delay in seconds
slide.SlideTransition.TimeDelay = 5
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()
```

UWP

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300, 300);
//Set the transition effect type
```

```

slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Enable the transition time delay
slide.SlideTransition.TriggerOnTimeDelay = true;
//Assign the value for the advance time delay in seconds
slide.SlideTransition.TimeDelay = 5;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Enable the transition time delay
slide.SlideTransition.TriggerOnTimeDelay = true;
//Assign the value for the advance time delay in seconds
slide.SlideTransition.TimeDelay = 5;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();

```

XAMARIN

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Enable the transition time delay
slide.SlideTransition.TriggerOnTimeDelay = true;
//Assign the value for the advance time delay in seconds
slide.SlideTransition.TimeDelay = 5;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);

```

```
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Set the trigger mode for the transition

The next slide transition can be triggered by the following two ways:

1. Mouse clicks - Brings the next slide to the view.
2. Setting a time - Brings the next slide after that specified time without any interactions.

Syncfusion PowerPoint library allows you to set both the previously given trigger modes while using PowerPoint slide transitions. Refer to the following code example.

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Set transition advance on click to true. This will enable the next
transition after a click
slide.SlideTransition.TriggerOnClick = true;
//Save the presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a shape to the slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Set the transition effect type
```

```

slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard
'Set transition advance on click to true. This will enable the next
transition after a click
slide.SlideTransition.TriggerOnClick = True
'Save the presentation
pptxDoc.Save("Sample.pptx")
'Close the presentation
pptxDoc.Close()

```

UWP

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Set transition advance on click to true. This will enable the next
transition after a click
slide.SlideTransition.TriggerOnClick = true;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide

//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Set the speed for transition effect

The speed is the customized property provided by Syncfusion PowerPoint library to set the transition duration mentioned [above](#) (in this page) to a customized enumeration values. By default, each transition will happen for 2 seconds. You can change the following enumeration values to change the duration of a slide transition:

1. Default - 2 seconds
2. Fast - 0.5 seconds
3. Slow - 1.0 seconds
4. Medium - 0.75 seconds

C#

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
```

```
//Set the transition effect speed enumeration. This will reduce the
transition duration to 0.75 seconds from the default 2 second
slide.SlideTransition.Speed = TransitionSpeed.Medium;
//Save the presentation
pptxDoc.Save("Sample.pptx");
```

VB.NET

```
'Create a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a shape to the slide
Dim cubeShape As IShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200,
300, 300)
'Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard
'Set the transition effect speed enumeration. This will reduce the
transition duration to 0.75 seconds from the default 2 seconds
slide.SlideTransition.Speed = TransitionSpeed.Medium
'Save the presentation
pptxDoc.Save("Sample.pptx")
```

UWP

```
//Create a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a shape to the slide
IShape cubeShape = slide.Shapes.AddShape(AutoShapeType.Cube, 50, 200, 300,
300);
//Set the transition effect type
slide.SlideTransition.TransitionEffect = TransitionEffect.Checkerboard;
//Set the transition effect speed enumeration. This will reduce the
transition duration to 0.75 seconds from the default 2 second
slide.SlideTransition.Speed = TransitionSpeed.Medium;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

56	Zoom	<ul style="list-style-type: none"> • In • Out

Adding connectors in PowerPoint slides

Essential Presentation library supports adding, editing, and removing the connectors in a PowerPoint file. The following code example demonstrates how to add a connector between two shapes.

The following code example demonstrates how to add a connector in PowerPoint slide.

C#

```
//Create a new PowerPoint file
using (IPresentation pptxDoc = Presentation.Create())
{
```

```
//Add a slide to the PowerPoint file
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a rectangle shape on the slide
IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 200, 300,
100, 100);
//Add an oval shape on the slide
IShape oval = slide.Shapes.AddShape(AutoShapeType.Oval, 400, 10, 100, 100);
//Add elbow connector on the slide and connect the end points of connector
with specified port positions 0 and 4 of the beginning and end shapes
IConnector connector = slide.Shapes.AddConnector(ConnectorType.Elbow,
rectangle, 0, oval, 4);
//Save the PowerPoint file
pptxDoc.Save("Sample.pptx");
}
```

VB.NET

```
'Create a new PowerPoint file
Using pptxDoc As IPresentation = Presentation.Create
'Add a slide to the PowerPoint file
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a rectangle shape on the slide
Dim rectangle As IShape = slide.Shapes.AddShape(AutoShapeType.Rectangle,
200, 300, 100, 100)
'Add an oval shape on the slide
Dim oval As IShape = slide.Shapes.AddShape(AutoShapeType.Oval, 400, 10, 100,
100)
'Add elbow connector on the slide and connect the end points of connector
with specified port positions 0 and 4 of the beginning and end shapes
Dim connector As IConnector = slide.Shapes.AddConnector(ConnectorType.Elbow,
rectangle, 0, oval, 4)
'Save the PowerPoint file
pptxDoc.Save("Sample.pptx")
End Using
```

UWP

```
//Create a new PowerPoint file
using (IPresentation pptxDoc = Presentation.Create())
{
//Add a slide to the PowerPoint file
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a rectangle shape on the slide
IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 200, 300,
100, 100);
//Add an oval shape on the slide
IShape oval = slide.Shapes.AddShape(AutoShapeType.Oval, 400, 10, 100, 100);
//Add elbow connector on the slide and connect the end points of connector
with specified port positions 0 and 4 of the beginning and end shapes
IConnector connector = slide.Shapes.AddConnector(ConnectorType.Elbow,
rectangle, 0, oval, 4);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
}
```

```

savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
}

```

ASP.NET CORE

```

using (IPresentation pptxDoc = Presentation.Create())
{
    //Add a slide to the PowerPoint file
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Add a rectangle shape on the slide
    IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 200, 300,
    100, 100);
    //Add an oval shape on the slide
    IShape oval = slide.Shapes.AddShape(AutoShapeType.Oval, 400, 10, 100, 100);
    //Add elbow connector on the slide and connect the end points of connector
    with specified port positions 0 and 4 of the beginning and end shapes
    IConnector connector = slide.Shapes.AddConnector(ConnectorType.Elbow,
    rectangle, 0, oval, 4);
    //Save the PowerPoint Presentation as stream
    FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
    pptxDoc.Save(outputStream);
}

```

XAMARIN

```

//Create a new PowerPoint file
using (IPresentation pptxDoc = Presentation.Create())
{
    //Add a slide to the PowerPoint file
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Add a rectangle shape on the slide
    IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 200, 300,
    100, 100);
    //Add an oval shape on the slide
    IShape oval = slide.Shapes.AddShape(AutoShapeType.Oval, 400, 10, 100, 100);
    //Add elbow connector on the slide and connect the end points of connector
    with specified port positions 0 and 4 of the beginning and end shapes
    IConnector connector = slide.Shapes.AddConnector(ConnectorType.Elbow,
    rectangle, 0, oval, 4);
    //Create new memory stream to save Presentation.
    MemoryStream stream = new MemoryStream();
    //Save Presentation in stream format.
    pptxDoc.Save(stream);
    stream.Position = 0;
    //The operation in Save under Xamarin varies between Windows Phone, Android
    and iOS platforms. Please refer presentation/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)

```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
}
```

Adding a single point connector

You can also add a connector to a source shape without any destination shapes. The following code example demonstrates how to add a connector with single point connection.

C#

```
//Create a new PowerPoint file
using (IPresentation pptxDoc = Presentation.Create())
{
    // Add a slide to the PowerPoint file.
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Add a rectangle shape on the slide
    IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 420, 250,
100, 100);
    //Add connector with specified bounds
    IConnector connector = slide.Shapes.AddConnector(ConnectorType.Straight, 0,
0, 470, 150);
    //Connect the beginning point of the connector with rectangle shape
    connector.BeginConnect(rectangle, 0);
    //Set the beginning cap of the connector as arrow
    connector.LineFormat.BeginArrowheadStyle = ArrowheadStyle.Arrow;
    //Change the connector color
    //Set the connector fill type as solid
    connector.LineFormat.Fill.FillType = FillType.Solid;
    //Set the connector solid fill as black
    connector.LineFormat.Fill.SolidFill.Color = ColorObject.Black;
    //Save the PowerPoint file
    pptxDoc.Save("Sample.pptx");
}
```

VB.NET

```
'Create a new PowerPoint file
Using pptxDoc As IPresentation = Presentation.Create
'Add a slide to the PowerPoint file
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a rectangle shape on the slide
Dim rectangle As IShape = slide.Shapes.AddShape(AutoShapeType.Rectangle,
420, 250, 100, 100)
'Add connector with specified bounds
Dim connector As IConnector =
slide.Shapes.AddConnector(ConnectorType.Straight, 0, 0, 470, 150)
'Connect the beginning point of the connector with rectangle shape
connector.BeginConnect(rectangle, 0)
'Set the beginning cap of the connector as arrow
connector.LineFormat.BeginArrowheadStyle = ArrowheadStyle.Arrow
```

```

'Change the connector color
'Set the connector fill type as solid
connector.LineFormat.Fill.FillType = FillType.Solid
'Set the connector solid fill as black
connector.LineFormat.Fill.SolidFill.Color = ColorObject.Black
'Save the PowerPoint file
pptxDoc.Save("Sample.pptx")
End Using

```

UWP

```

//Create a new PowerPoint file
using (IPresentation pptxDoc = Presentation.Create())
{
    // Add a slide to the PowerPoint file.
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Add a rectangle shape on the slide
    IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 420, 250,
    100, 100);
    //Add connector with specified bounds
    IConnector connector = slide.Shapes.AddConnector(ConnectorType.Straight, 0,
    0, 470, 150);
    //Connect the beginning point of the connector with rectangle shape
    connector.BeginConnect(rectangle, 0);
    //Set the beginning cap of the connector as arrow
    connector.LineFormat.BeginArrowheadStyle = ArrowheadStyle.Arrow;
    //Change the connector color
    //Set the connector fill type as solid
    connector.LineFormat.Fill.FillType = FillType.Solid;
    //Set the connector solid fill as black
    connector.LineFormat.Fill.SolidFill.Color = ColorObject.Black;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Sample";
    savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await pptxDoc.SaveAsync(storageFile);
}

```

ASP.NET CORE

```

//Create a new PowerPoint file
using (IPresentation pptxDoc = Presentation.Create())
{
    // Add a slide to the PowerPoint file.
    ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
    //Add a rectangle shape on the slide
    IShape rectangle = slide.Shapes.AddShape(AutoShapeType.Rectangle, 420, 250,
    100, 100);
    //Add connector with specified bounds
    IConnector connector = slide.Shapes.AddConnector(ConnectorType.Straight, 0,
    0, 470, 150);

```

```
//Connect the beginning point of the connector with rectangle shape

Editing a connector in PowerPoint slide

The following code example demonstrates how to edit an existing connector in a PowerPoint slide.

C#

```
//Open an existing PowerPoint file
```

```

using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
    //Get the first slide of a PowerPoint file
    ISlide slide = pptxDoc.Slides[0];
    //Get the connector from a slide
    IConnector connector = slide.Shapes[2] as IConnector;
    //Set the begin cap for the connector
    connector.LineFormat.BeginArrowheadStyle = ArrowheadStyle.ArrowOpen;
    //Set the line format for the connector
    connector.LineFormat.DashStyle = LineDashStyle.DashDotDot;
    //Disconnect the end connection of the connector if end point get connected
    if (connector.EndConnectedShape != null)
        connector.EndDisconnect();
    //Insert a triangle shape into slide
    IShape triangle = slide.Shapes.AddShape(AutoShapeType.IsoscelesTriangle,
    600, 500, 150, 150);
    //Declare the end connection site index
    int connectionSiteIndex = 4;
    //Reconnect the end point of connector with triangle shape if its connection
    site count is greater than 4
    if (connectionSiteIndex < triangle.ConnectionSiteCount)
        connector.EndConnect(triangle, connectionSiteIndex);
    //Save the PowerPoint file
    pptxDoc.Save("Connector.pptx");
}

```

VB.NET

```

' Open an existing PowerPoint file.
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Get the first slide of a PowerPoint file
Dim slide As ISlide = pptxDoc.Slides(2)

Updating the positions of the connector in PowerPoint slide

The following code example demonstrates how to update a connector's position when a source shape position is changed.

C#

```
//Open an existing PowerPoint file
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
    //Get the first slide of a PowerPoint file
    ISlide slide = pptxDoc.Slides[0];
    //Get the rectangle shape from a slide
    IShape rectangle = slide.Shapes[0] as IShape;
    //Get the connector from a slide
    IConnector connector = slide.Shapes[2] as IConnector;
    //Change the X and Y position of the rectangle
    rectangle.Left = 600;
    rectangle.Top = 200;
    //Update the connector to connect with previously updated shape
    connector.Update();
    //Save the PowerPoint file
    pptxDoc.Save("Connector.pptx");
}
```

VB.NET

```
'Open an existing PowerPoint file
Using pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Get the first slide of a PowerPoint file
Dim slide As ISlide = pptxDoc.Slides(0)
'Get the rectangle shape from a slide
Dim rectangle As IShape = CType(slide.Shapes(0), IShape)
'Get the connector from a slide
Dim connector As IConnector = CType(slide.Shapes(2), IConnector)
'Change the X and Y position of the rectangle
rectangle.Left = 600
rectangle.Top = 200
'Update the connector to connect with previously updated shape
connector.Update()
'Save the PowerPoint file
pptxDoc.Save("Connector.pptx")
End Using
```

UWP

```
//Instantiates the File Picker
```

```

FileOpenPicker openPicker = new FileOpenPicker();

Working with Headers and Footers

Add Headers and Footers in PowerPoint

Add Footer to a Slide in PowerPoint

Essential Presentation library facilitates adding Footer in a slide of the PowerPoint Presentation. Footers are useful in providing quick information about your document or data.

The following code example demonstrates how to add a footer to the presentation.

C#

```
//Creates an instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Sets the visibility of Footer content in the slide
slide.HeadersFooters.Footer.Visible = true;
//Sets the text to be added to the Footer
slide.HeadersFooters.Footer.Text = "Footer content";
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
```

```
//Adds a TextPart to the paragraph
ITextPart textPart = paragraph.AddTextPart();
//Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base.";
//Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Creates an instance of Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a blank slide
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Sets the visibility of Footer content in the slide
slide.HeadersFooters.Footer.Visible = True
'Sets the text to be added to the Footer
slide.HeadersFooters.Footer.Text = "Footer content"
'Adds textbox to the slide
Dim textboxShape As IShape = slide.AddTextBox(0, 0, 500, 500)
'Adds paragraph to the textbody of textbox
Dim paragraph As IParagraph = textboxShape.TextBody.AddParagraph()
'Adds a TextPart to the paragraph
Dim textPart As ITextPart = paragraph.AddTextPart()
'Adds text to the TextPart
textPart.Text = "AdventureWorks Cycles, the fictitious company on which the
AdventureWorks sample databases are based, is a large, multinational
manufacturing company. The company manufactures and sells metal and
composite bicycles to North American, European and Asian commercial markets.
While its base operation is located in Washington with 290 employees,
several regional sales teams are located throughout their market base."
'Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```
//Creates an instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Sets the visibility of Footer content in the slide
slide.HeadersFooters.Footer.Visible = true;
//Sets the text to be added to the Footer
slide.HeadersFooters.Footer.Text = "Footer content";
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
```

stream);
```

By executing the program, you will get the PowerPoint slide as follows.

Add Date and Time in PowerPoint Slide

Essential Presentation library facilitates adding Date and Time to a slide of the PowerPoint Presentation. Date and Time comes with formatting options for date stamp as either it can be updated automatically using computer's clock or stay fixed until you change it.

The following code example demonstrates how to add Date and Time to a slide of the presentation.

C#

```
//Creates an instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a blank slide.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Sets the visibility of Date and Time in the slide
slide.HeadersFooters.DateAndTime.Visible = true;
//Sets the format of the Date and Time to the Footer
slide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTimehhmmssAMPM;
//Adds textbox to the slide
IShape textboxShape = slide.AddTextBox(0, 0, 500, 500);
//Adds paragraph to the textbody of textbox
IParagraph paragraph = textboxShape.TextBody.AddParagraph();
//Adds a TextPart to the paragraph
ITextPart textPart = paragraph.AddTextPart();
//Adds text to the TextPart

By executing the program, you will get the PowerPoint slide as follows.

Add Footer to Master and Layout slides

Essential Presentation library facilitates adding Footers to both master and layout slides of the PowerPoint Presentation. If you want to use a different format for the Footers, then a great way to apply the format to all the slides (existing and new slides) is using the Slide Master and Slide layout. Under Slide Master and Slide layout, you can control the styles for footer options and this way you can apply different styles to the slides, or re-locate the Footer shape to any other position based on your requirement

The following code example demonstrates how to add a Footers to the master and layout slides of the presentation.

C#

```
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Footer.pptx");
//Access the first master slide in PowerPoint file
IMasterSlide masterSlide = pptxDoc.Masters[0];
//Sets the visibility of Footer content in the Master slide
masterSlide.HeadersFooters.Footer.Visible = true;
//Sets the text to be added to the Footer of the Master slide
masterSlide.HeadersFooters.Footer.Text = "Master Slide Footer";
//Sets the visibility of DateTime Footer in the Master slide
masterSlide.HeadersFooters.DateAndTime.Visible = true;
//Sets the format of the DateTime Footer in the Master slide
masterSlide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTimehhmmssAMPM;
//Iterate each layout slide in the Master slide
foreach(ILayoutSlide layoutSlide in masterSlide.LayoutSlides)
{
    //Sets the visibility of Footer content in the Layout slide
    layoutSlide.HeadersFooters.Footer.Visible = true;
    //Sets the text to be added to the Footer of the Layout slide
    layoutSlide.HeadersFooters.Footer.Text = "Layout slide Footer";
    //Sets the visibility of DateTime Footer in Layout slide
    layoutSlide.HeadersFooters.DateAndTime.Visible = true;
    //Sets the format of the DateTime Footer in Layout slide
```

```

layoutSlide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTimeMMddyyhmmAMPM;
}
//Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Load or open an PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Footer.pptx")

By executing the program, you will get the PowerPoint Master slide as follows.

By executing the program, you will get the PowerPoint Layout slide as follows.

Add Headers and Footers into Notes slide

Essential Presentation library facilitates adding Headers and Footers to the Notes slide of the PowerPoint Presentation.

Note: 1. As per Microsoft PowerPoint behavior, you can add Header only in Notes slide of the PowerPoint using our Essential Presentation Library.

2. Header added in Notes slide will be visible only in the Notes page of the PowerPoint viewer.

The following code example demonstrates how to add a Headers and Footers to the Notes slide of the presentation.

C#

```
//Creates an instance of Presentation
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide
INotesSlide notesSlide = slide.AddNotesSlide();
//Sets the visibility of Header in the Notes slide
notesSlide.HeadersFooters.Header.Visible = true;
//Sets the text to be added to the Header of the Notes slide
notesSlide.HeadersFooters.Header.Text = "Header is added to Notes slide";
//Sets the visibility of DateTime Footer in the Notes slide
notesSlide.HeadersFooters.DateAndTime.Visible = true;
//Sets the format of the DateTime Footer in the Notes slide
notesSlide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTimeMMMy;
//Sets the visibility of Footer content in the Notes slide
notesSlide.HeadersFooters.Footer.Visible = true;
//Sets the text to be added to the Footer of the Notes slide
notesSlide.HeadersFooters.Footer.Text = "Notes slide Footer";
//Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Creates an instance of Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds new slide with blank slide layout type
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds new notes slide in the specified slide
Dim notesSlide As INotesSlide = slide.AddNotesSlide()
'Sets the visibility of Header in the Notes slide
notesSlide.HeadersFooters.Header.Visible = True
'Sets the text to be added to the Header of the Notes slide
notesSlide.HeadersFooters.Header.Text = "Header is added to Notes slide"
'Sets the visibility of DateTime Footer in the Notes slide
notesSlide.HeadersFooters.DateAndTime.Visible = True
'Sets the format of the DateTime Footer in the Notes slide
notesSlide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTimeMMMy
'Sets the visibility of Footer content in the Notes slide
notesSlide.HeadersFooters.Footer.Visible = True
'Sets the text to be added to the Footer of the Notes slide
notesSlide.HeadersFooters.Footer.Text = "Notes slide Footer"
'Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx")
```

```
'Closes the Presentation
pptxDoc.Close()
```

UWP

notesSlide.HeadersFooters.Footer.Visible = true;
//Sets the text to be added to the Footer of the Notes slide
notesSlide.HeadersFooters.Footer.Text = "Notes slide Footer";
//Create new memory stream to save Presentation
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the Presentation/Xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

By executing the program, you will get the PowerPoint Notes slide as follows.

Modify Headers and Footers in PowerPoint

Edit Footer text of an existing Slide

Essential Presentation library facilitates editing the Footer text of an existing slide in the PowerPoint Presentation.

The following code example demonstrates how to edit Footer text of an existing slide in the presentation.

C#

```
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Footer.pptx");
//Gets the first slide from the cloned PowerPoint presentation
ISlide slide = pptxDoc.Slides[0];
//Modify the Footer text
slide.HeadersFooters.Footer.Text = "Footer content modified";
//Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Load or open an PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Footer.pptx")
'Gets the first slide from the PowerPoint presentation
ISlide slide = pptxDoc.Slides[0]
'Modify the Footer text
slide.HeadersFooters.Footer.Text = "Footer content modified"
'Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx")
'Closes the Presentation
pptxDoc.Close()
```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Load or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Modify the Footer text.
slide.HeadersFooters.Footer.Text = "Footer content modified";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Load or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets the first slide from the cloned PowerPoint presentation
ISlide slide = pptxDoc.Slides[0];
//Modify the Footer text
slide.HeadersFooters.Footer.Text = "Footer content modified";
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Dispose the image stream
pictureStream.Dispose();
//Closes the Presentation
pptxDoc.Close();

```

XAMARIN

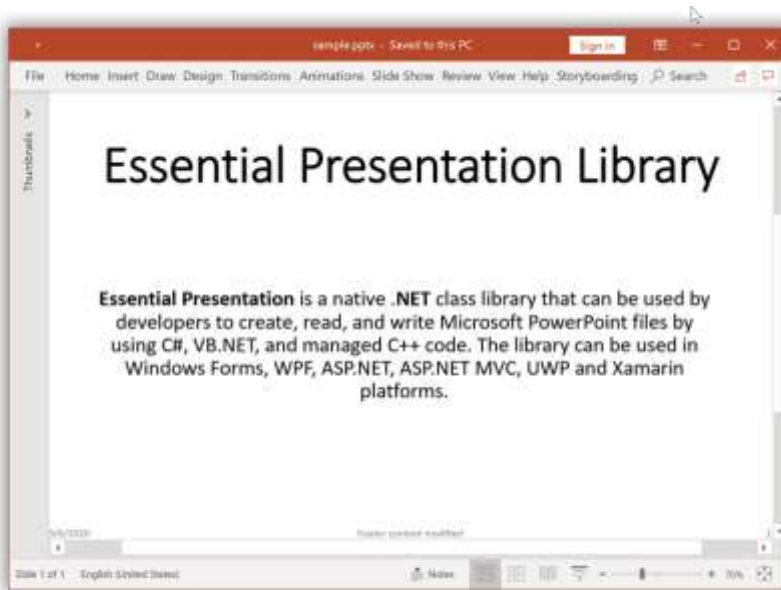

```

//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Modify the Footer text
slide.HeadersFooters.Footer.Text = "Footer content modified";
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;

```

```
//The operation in Save under Xamarin varies between Windows Phone, Android,
//and iOS platforms. Refer to the Presentation/Xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

By executing the program, you will get the PowerPoint slide as follows.

Modify Date and Time format of an existing Slide

Essential Presentation library facilitates modifying the Date and Time of an existing slide in the PowerPoint Presentation.

The following code example demonstrates how to modify Date and Time of an existing slide in the presentation.

C#

```
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Footer.pptx");
//Gets the first slide from the cloned PowerPoint presentation
ISlide slide = pptxDoc.Slides[0];
//Modify Date and Time format of the Footer
slide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTImeddddMMMMdyyyyy;
//Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Load or open an PowerPoint Presentation  
Dim pptxDoc As IPresentation = Presentation.Open("Footer.pptx")  
'Gets the first slide from the PowerPoint presentation  
ISlide slide = pptxDoc.Slides[0]  
'Modify Date and Time format of the Footer  
slide.HeadersFooters.DateAndTime.Format =  
DateTimeFormatType.DateTimeddddMMMMdyyyyy  
'Saves the Presentation to the file system  
pptxDoc.Save("Sample.pptx")  
'Closes the Presentation  
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker  
FileOpenPicker openPicker = new FileOpenPicker();  
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;  
openPicker.FileTypeFilter.Add(".pptx");  
//Creates a storage file from FileOpenPicker  
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();  
//Load or open an PowerPoint Presentation  
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);  
//Modify Date and Time format of the Footer  
slide.HeadersFooters.DateAndTime.Format =  
DateTimeFormatType.DateTimeddddMMMMdyyyyy;  
//Initializes FileSavePicker  
FileSavePicker savePicker = new FileSavePicker();  
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;  
savePicker.SuggestedFileName = "Output";  
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {  
    ".pptx" });  
//Creates a storage file from FileSavePicker  
StorageFile storageFile = await savePicker.PickSaveFileAsync();  
//Saves changes to the specified storage file  
await pptxDoc.SaveAsync(storageFile);
```

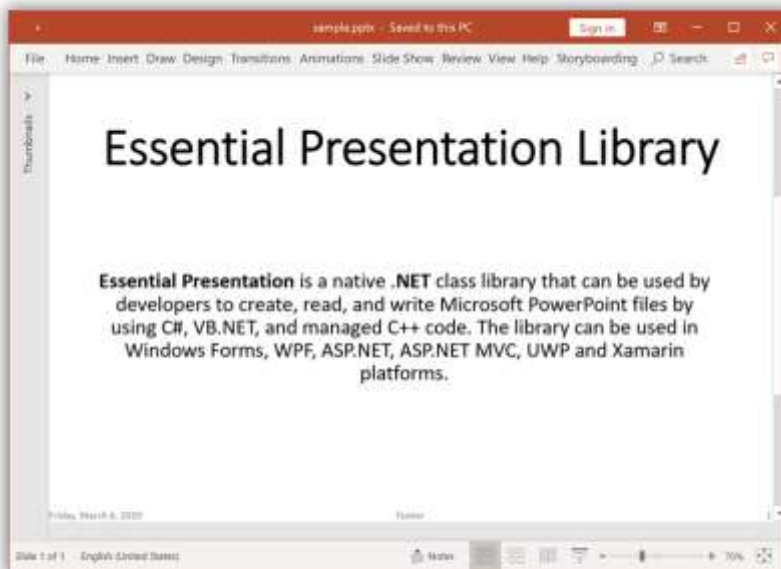

ASP.NET CORE

```
//Load or open an PowerPoint Presentation  
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);  
IPresentation pptxDoc = Presentation.Open(inputStream);  
//Gets the first slide from the cloned PowerPoint presentation  
ISlide slide = pptxDoc.Slides[0];  
//Modify Date and Time format of the Footer  
slide.HeadersFooters.DateAndTime.Format =  
DateTimeFormatType.DateTimeddddMMMMdyyyyy;  
//Save the PowerPoint Presentation as stream  
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);  
pptxDoc.Save(outputStream);  
//Dispose the image stream  
pictureStream.Dispose();  
//Closes the Presentation  
pptxDoc.Close();
```

XAMARIN

```
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Modify Date and Time format of the Footer
slide.HeadersFooters.DateAndTime.Format =
DateTimeFormatType.DateTimeddddMMMMddyyyy;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android,
and iOS platforms. Refer to the Presentation/Xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

        shape.TextBody.Paragraphs[0].Font.FontName = "Verdana";
        ///Change the font size for the Footer content
        shape.TextBody.Paragraphs[0].Font.FontSize = 18;
    }
}
///Create new memory stream to save Presentation
MemoryStream stream = new MemoryStream();
///Save Presentation in stream format
pptxDoc.Save(stream);
///Close the presentation
pptxDoc.Close();
stream.Position = 0;
///The operation in Save under Xamarin varies between Windows Phone, Android, and iOS platforms. Refer to the Presentation/Xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
        "application/vnd.openxmlformats-officedocument.presentationml.presentation",
        stream);
```

By executing the program, you will get the PowerPoint slide as follows.

Remove Headers and Footers from Title Slides

Essential Presentation library facilitates removing Footers from all the Title slides in the PowerPoint Presentation.

The following code example demonstrates how to remove Footers from all the Title slides in the presentation.

C#

```
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Footer.pptx");
//Iterate each slide in the Presentation
foreach(ISlide slide in pptxDoc.Slides)
{
    //Checks whether the LayoutType of Layout slide is Title
    if (slide.LayoutSlide.LayoutType == SlideLayoutType.Title)
    {
        //Sets the visibility of DateAndTime in the Title slide
        slide.HeadersFooters.DateAndTime.Visible = false;
        //Sets the visibility of Footer in the Title slide
        slide.HeadersFooters.Footer.Visible = false;
        //Sets the visibility of SlideNumber in the Title slide
        slide.HeadersFooters.SlideNumber.Visible = false;
    }
}
//Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();
```

VB.NET

```
'Load or open an PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Footer.pptx")
'Iterate each slide in the Presentation
For Each slide As ISlide In pptxDoc.Slides
```

```

'Checks whether the LayoutType of Layout slide is Title
If slide.LayoutSlide.LayoutType = SlideLayoutType.Title Then
'Sets the visibility of DateAndTime in the Title slide
slide.HeadersFooters.DateAndTime.Visible = False
'Sets the visibility of Footer in the Title slide
slide.HeadersFooters.Footer.Visible = False
'Sets the visibility of SlideNumber in the Title slide
slide.HeadersFooters.SlideNumber.Visible = False
End If
Next
'Saves the Presentation to the file system
pptxDoc.Save("Sample.pptx")
'Closes the Presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Load or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Iterate each slide in the Presentation
foreach(ISlide slide in pptxDoc.Slides)
{
    //Checks whether the LayoutType of Layout slide is Title
    if (slide.LayoutSlide.LayoutType == SlideLayoutType.Title)
    {
        //Sets the visibility of DateAndTime in the Title slide
        slide.HeadersFooters.DateAndTime.Visible = false;
        //Sets the visibility of Footer in the Title slide
        slide.HeadersFooters.Footer.Visible = false;
        //Sets the visibility of SlideNumber in the Title slide
        slide.HeadersFooters.SlideNumber.Visible = false;
    }
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Load or open an PowerPoint Presentation
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Iterate each slide in the Presentation

```

```

foreach(ISlide slide in pptxDoc.Slides)
{
    //Checks whether the LayoutType of Layout slide is Title
    if (slide.LayoutSlide.LayoutType == SlideLayoutType.Title)
    {
        //Sets the visibility of DateAndTime in the Title slide
        slide.HeadersFooters.DateAndTime.Visible = false;
        //Sets the visibility of Footer in the Title slide
        slide.HeadersFooters.Footer.Visible = false;
        //Sets the visibility of SlideNumber in the Title slide
        slide.HeadersFooters.SlideNumber.Visible = false;
    }
}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sample.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Dispose the image stream
pictureStream.Dispose();
//Closes the Presentation
pptxDoc.Close();

```

XAMARIN

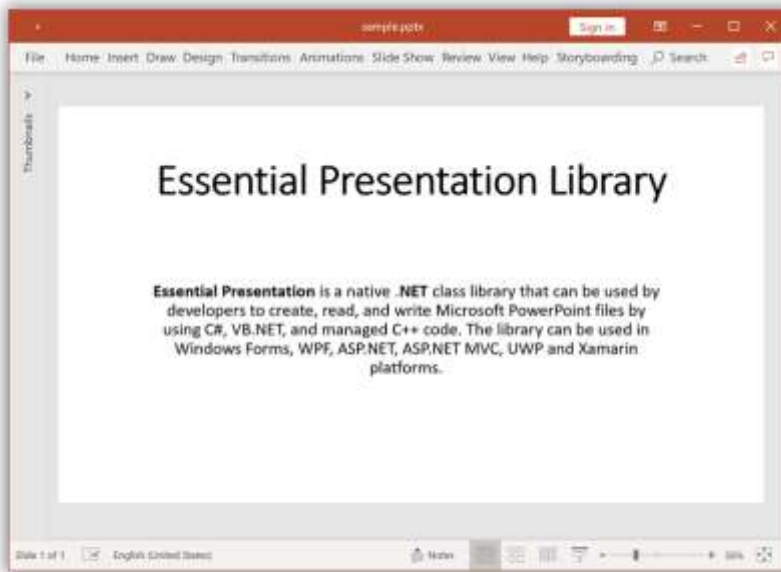

```

/"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(resourcePath);
//Load or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Iterate each slide in the Presentation
foreach(ISlide slide in pptxDoc.Slides)
{
    //Checks whether the LayoutType of Layout slide is Title
    if (slide.LayoutSlide.LayoutType == SlideLayoutType.Title)
    {
        //Sets the visibility of DateAndTime in the Title slide
        slide.HeadersFooters.DateAndTime.Visible = false;
        //Sets the visibility of Footer in the Title slide
        slide.HeadersFooters.Footer.Visible = false;
        //Sets the visibility of SlideNumber in the Title slide
        slide.HeadersFooters.SlideNumber.Visible = false;
    }
}
//Create new memory stream to save Presentation
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android, and iOS platforms. Refer to the Presentation/Xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)

```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

By executing the program, you will get the PowerPoint slide as follows.

Working with Notes

Notes are the contents associated with each slide and are visible only to the presenter when monitors are shared in “Presenter View”. It shows hint for the speaker, so it is often called as “Speaker Notes”. The presenter can optionally add key points to notes. You can add and modify the notes in your slide using Essential Presentation library.

Adding Notes to a Slide

The below code example demonstrates how to create a Notes in a PowerPoint Slide.

C#

```
//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
//Adds text content into the Notes Slide.
notesSlide.NotesTextBody.AddParagraph("Notes content");
//Saves Presentation with specified file name with extension.
pptxDoc.Save("PresentationWithNotesSlide.pptx");
```

VB.NET

```
'Creates a Presentation without slides.
```

```

Dim pptxDoc As IPresentation = Presentation.Create()
'Adds new slide with blank slide layout type.
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds new notes slide in the specified slide.
Dim notesSlide As INotesSlide = slide.AddNotesSlide()
'Adds text content into the Notes Slide.
notesSlide.NotesTextBody.AddParagraph("Notes content")
'Saves Presentation with specified file name with extension.
pptxDoc.Save("PresentationWithNotesSlide.pptx")

```

UWP

```

//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
//Adds text content into the Notes Slide.
notesSlide.NotesTextBody.AddParagraph("Notes content");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "PresentationWithNotesSlide";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
//Adds text content into the Notes Slide.
notesSlide.NotesTextBody.AddParagraph("Notes content");
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream(OutputStreamName, FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
//Adds text content into the Notes Slide.
notesSlide.NotesTextBody.AddParagraph("Notes content");

```

```

//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sample.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Adding Text into the Notes

The following code example demonstrates how to add a text in a Notes.

C#

```

//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
//Adds Paragraph into the text body.
IParagraph paragraph = notesSlide.NotesTextBody.AddParagraph();
//Adds text part into the Paragraph.
ITextPart textPart = paragraph.AddTextPart();
textPart.Text = "The notes slide represents the contents and key notes of
the corresponding slide. It is more useful when we use Presenter View while
presenting the seminars through SlideShow.";
//Sets Bold format for text content.
textPart.Font.Bold=true;
// Sets font style using font name.
textPart.Font.FontName = "Times New Roman";
// Sets text content size using FontSize property.
textPart.Font.FontSize = 20;
//Saves Presentation with specified file name with extension.
pptxDoc.Save("PresentationWithNotesSlide.pptx");

```

VB.NET

```

'Creates a Presentation without slides.
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds new slide with blank slide layout type.
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds new notes slide in the specified slide.
Dim notesSlide As INotesSlide = slide.AddNotesSlide()
'Adds Paragraph into the text body.

```

```

Dim paragraph As IParagraph = notesSlide.NotesTextBody.AddParagraph()
'Adds text part into the Paragraph.
Dim textPart As ITextPart = paragraph.AddTextPart()
textPart.Text = "The notes slide represents the contents and key notes of
the corresponding slide. It is more useful when we use Presenter View while
presenting the seminars through SlideShow."
'Sets Bold format for text content.
textPart.Font.Bold = True
'Sets font style using font name.
textPart.Font.FontName = "Times New Roman"
'Sets text content size using FontSize property.
textPart.Font.FontSize = 20
'Saves Presentation with specified file name with extension.
pptxDoc.Save("PresentationWithNotesSlide.pptx")

```

UWP

```

//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
//Adds Paragraph into the text body.
IParagraph paragraph = notesSlide.NotesTextBody.AddParagraph();
//Adds text part into the Paragraph.
ITextPart textPart = paragraph.AddTextPart();
textPart.Text = "The notes slide represents the contents and key notes of
the corresponding slide. It is more useful when we use Presenter View while
presenting the seminars through SlideShow.";
//Sets Bold format for text content.
textPart.Font.Bold=true;
//Sets font style using font name.

Adding a numbered list to Notes

The following code example demonstrates how to create simple numbered list as Notes.

C#

```
//Creates a Presentation without slides.
IPresentation pptxDoc = Presentation.Create();
//Adds new slide with blank slide layout type.
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds new notes slide in the specified slide.
INotesSlide notesSlide = slide.AddNotesSlide();
// Adds a new paragraph with the text in the left hand side textbox.
IParagraph paragraph = notesSlide.NotesTextBody.AddParagraph("The Northwind
sample database (Northwind.mdb) is included with all versions of Access.");
//Sets the list type as Numbered
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as Arabic number following by
period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.ArabicPeriod;
//Sets the starting value as 1
paragraph.ListFormat.StartValue = 1;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
// Sets the bullet character size. Here, 100 means 100% of its text.
Possible values can range from 25 to 400.
paragraph.ListFormat.Size = 100;
// Adds another paragraph with the text in the left hand side textbox.
paragraph = notesSlide.NotesTextBody.AddParagraph("It provides data you can
experiment with and database objects that demonstrate features you might
want to implement in your own databases.");
//Sets the list type as bulleted
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as Arabic number following by
period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.ArabicPeriod;
//Sets the list level as 1
paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
// Sets the bullet character size. Here, 100 means 100% of its text.
Possible values can range from 25 to 400.
paragraph.ListFormat.Size = 100;
// Adds another paragraph with the text in the left hand side textbox.
paragraph = notesSlide.NotesTextBody.AddParagraph("Using Northwind, you can
become familiar with how a relational database is structured and how the
database objects work together to help you enter, store, manipulate, and
print your data.");
//Sets the list type as bulleted
paragraph.ListFormat.Type = ListType.Numbered;
//Sets the numbered style (list numbering) as Arabic number following by
period.
paragraph.ListFormat.NumberStyle = NumberedListStyle.ArabicPeriod;
//Sets the list level as 1
```

```

paragraph.IndentLevelNumber = 1;
// Sets the hanging value
paragraph.FirstLineIndent = -20;
// Sets the bullet character size. Here, 100 means 100% of its text.
Possible values can range from 25 to 400.
paragraph.ListFormat.Size = 100;
//Saves the Presentation to the file system.
pptxDoc.Save("Sample.pptx");
//Closes the Presentation
pptxDoc.Close();

```

Removing Notes from a Slide

The below code example demonstrates how to remove a Notes from a PowerPoint Slide.

C#

```
//Opens an existing PowerPoint presentation.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets instance of the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0] as ISlide;
//Removes Notes Slide from a corresponding slide.
slide.RemoveNotesSlide();
//Saves Presentation with specified file name with extension.
pptxDoc.Save("PresentationWithNotesSlide.pptx");
```

VB.NET

```
'Opens an existing PowerPoint presentation.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Gets instance of the first slide from the Presentation.
Dim slide As ISlide = TryCast(pptxDoc.Slides(0), ISlide)
'Removes Notes Slide from a corresponding slide.
slide.RemoveNotesSlide()
'Saves Presentation with specified file name with extension.
pptxDoc.Save("PresentationWithNotesSlide.pptx")
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Gets instance of the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0] as ISlide;
//Removes Notes Slide from a corresponding slide.
slide.RemoveNotesSlide();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "PresentationWithNotesSlide";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation

```

Working with SmartArt

A SmartArt diagram is a visual representation of your information, to effectively communicate your ideas in presentations. You can add and modify the SmartArt diagrams in PowerPoint presentations using Essential Presentation library.

Adding SmartArt to a Slide

You can add any of the predefined SmartArt diagrams to PowerPoint Presentation. The following code example demonstrates adding a SmartArt to a Slide.

C#

```
// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a BasicBlockList SmartArt to the slide at the specified size and
position.
ISmartArt smartArt = slide.Shapes.AddSmartArt(SmartArtType.BasicBlockList,
0, 0, 640, 426);
//Save the Presentation
pptxDoc.Save("SmartArt.pptx");
//Close the Presentation
pptxDoc.Close();
```

VB.NET

```
'Create an instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a BasicBlockList SmartArt to the slide at the specified size and
position.
Dim smartArt As ISmartArt =
slide.Shapes.AddSmartArt(SmartArtType.BasicBlockList, 0, 0, 640, 426)
'Save the Presentation
pptxDoc.Save("SmartArt.pptx")
'Close the Presentation
pptxDoc.Close()
```

UWP

```
//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a BasicBlockList SmartArt to the slide at the specified size and
position.
ISmartArt smartArt = slide.Shapes.AddSmartArt(SmartArtType.BasicBlockList,
0, 0, 640, 426);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
```

```
//Add a BasicBlockList SmartArt to the slide at the specified size and
position.
ISmartArt smartArt = slide.Shapes.AddSmartArt(SmartArtType.BasicBlockList,
0, 0, 640, 426);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("SmartArt.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation
pptxDoc.Close();
```

XAMARIN

```
// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a BasicBlockList SmartArt to the slide at the specified size and
position.
ISmartArt smartArt = slide.Shapes.AddSmartArt(SmartArtType.BasicBlockList,
0, 0, 640, 426);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Adding a node to the SmartArt

You can add a new node to the SmartArt diagram. The following code example demonstrates the same.

C#

```
// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426);
// Add a new node to the SmartArt.
ISmartArtNode newNode = smartArt.Nodes.Add();
// Set the text to the newly added node.
newNode.TextBody.AddParagraph("New main node added.");
```

```
//Save the Presentation.
pptxDoc.Save("SmartArt.pptx");
//Close the Presentation.
pptxDoc.Close();
```

VB.NET

```
'Create an instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a SmartArt to the slide at the specified size and position
Dim smartArt As ISmartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426)
'Add a new node to the SmartArt.
Dim newNode As ISmartArtNode = smartArt.Nodes.Add()
'Set the text to the newly added node.
newNode.TextBody.AddParagraph("New main node added.")
'Save the Presentation.
pptxDoc.Save("SmartArt.pptx")
'Close the Presentation.
pptxDoc.Close()
```

UWP

```
//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426);
// Add a new node to the SmartArt.
ISmartArtNode newNode = smartArt.Nodes.Add();
// Set the text to the newly added node.
newNode.TextBody.AddParagraph("New main node added.");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position
```

```

ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426);
// Add a new node to the SmartArt.
ISmartArtNode newNode = smartArt.Nodes.Add();
// Set the text to the newly added node.
newNode.TextBody.AddParagraph("New main node added.");
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("SmartArt.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation.
pptxDoc.Close();

```

XAMARIN

```

// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426);
// Add a new node to the SmartArt.
ISmartArtNode newNode = smartArt.Nodes.Add();
// Set the text to the newly added node.

stream);

```

In SmartArt diagrams, you can also add nodes to several nested levels. The maximum limit of nested levels may vary based on SmartArt types. The following code example demonstrates adding nested level nodes in a SmartArt.

C#

```

// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);

```

```
//Add a SmartArt to the slide at the specified size and position.
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426);
// Add a new node to the SmartArt.
ISmartArtNode newNode = smartArt.Nodes.Add();
// Add a child node to the SmartArt node
ISmartArtNode childNode = newNode.ChildNodes.Add();
// Set a text to newly added child node.
childNode.TextBody.AddParagraph("Child node of the existing node.");
//Save the Presentation.
pptxDoc.Save("SmartArt.pptx");
//Close the Presentation.
pptxDoc.Close();
```

VB.NET

```
'Create an instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a SmartArt to the slide at the specified size and position.
Dim smartArt As ISmartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426)
'Add a new node to the SmartArt.
Dim newNode As ISmartArtNode = smartArt.Nodes.Add()
'Add a child node to the SmartArt node
Dim childNode As ISmartArtNode = newNode.ChildNodes.Add()
'Set a text to newly added child node.
childNode.TextBody.AddParagraph("Child node of the existing node.")
'Save the Presentation.
pptxDoc.Save("SmartArt.pptx")
'Close the Presentation.
pptxDoc.Close()
```

UWP

```
//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position.
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.AlternatingHexagons, 0, 0, 640, 426);
// Add a new node to the SmartArt.
ISmartArtNode newNode = smartArt.Nodes.Add();
// Add a child node to the SmartArt node
ISmartArtNode childNode = newNode.ChildNodes.Add();
// Set a text to newly added child node.
childNode.TextBody.AddParagraph("Child node of the existing node.");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker

pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
```

```
Xamarin.Forms.DependencyService.Get<ISave>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Modifying SmartArt appearance

You can modify the SmartArt appearance by modifying the fill type, color, transparency etc. The below code example demonstrates modifying the appearance of SmartArt nodes.

C#

```
//Open a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("SampleDocument.pptx");
//Get the Slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from Slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Get the first node
ISmartArtNode firstNode = smartArt.Nodes[0];
// Set the text content of node.
firstNode.TextBody.AddParagraph("First Node");
//Set the fill type of node.
firstNode.Shapes[0].Fill.FillType = FillType.Solid;
// Set the fill color of node.
firstNode.Shapes[0].Fill.SolidFill.Color = ColorObject.GreenYellow;
//Set transparency value of fill
firstNode.Shapes[0].Fill.SolidFill.Transparency = 30;
//Save the Presentation.
pptxDoc.Save("SmartArt.pptx");
//Close the Presentation.
pptxDoc.Close();
```

VB.NET

```
'Open a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("SampleDocument.pptx")
'Get the Slide from Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Get the SmartArt from Slide.
Dim smartArt As ISmartArt = TryCast(slide.Shapes(0), ISmartArt)
'Get the first node
Dim firstNode As ISmartArtNode = smartArt.Nodes(0)
' Set the text content of node.
firstNode.TextBody.AddParagraph("First Node")
'Set the fill type of node.
firstNode.Shapes(0).Fill.FillType = FillType.Solid
' Set the fill color of node.
firstNode.Shapes(0).Fill.SolidFill.Color = ColorObject.GreenYellow
'Set transparency value of fill
firstNode.Shapes(0).Fill.SolidFill.Transparency = 30
'Save the Presentation.
pptxDoc.Save("SmartArt.pptx")
'Close the Presentation.
pptxDoc.Close()
```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get the Slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from Slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Get the first node
ISmartArtNode firstNode = smartArt.Nodes[0];
// Set the text content of node.
firstNode.TextBody.AddParagraph("First Node");
//Set the fill type of node.
firstNode.Shapes[0].Fill.FillType = FillType.Solid;
// Set the fill color of node.
firstNode.Shapes[0].Fill.SolidFill.Color = ColorObject.GreenYellow;
//Set transparency value of fill
firstNode.Shapes[0].Fill.SolidFill.Transparency = 30;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the Slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from Slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Get the first node
ISmartArtNode firstNode = smartArt.Nodes[0];
// Set the text content of node.
firstNode.TextBody.AddParagraph("First Node");
//Set the fill type of node.
firstNode.Shapes[0].Fill.FillType = FillType.Solid;
// Set the fill color of node.
firstNode.Shapes[0].Fill.SolidFill.Color = ColorObject.GreenYellow;
//Set transparency value of fill
firstNode.Shapes[0].Fill.SolidFill.Transparency = 30;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("SmartArt.pptx", FileMode.Create);

```

```
pptxDoc.Save(outputStream);
//Close the Presentation.
pptxDoc.Close();
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the Slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from Slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Get the first node
ISmartArtNode firstNode = smartArt.Nodes[0];
// Set the text content of node.
firstNode.TextBody.AddParagraph("First Node");
//Set the fill type of node.
firstNode.Shapes[0].Fill.FillType = FillType.Solid;
// Set the fill color of node.
firstNode.Shapes[0].Fill.SolidFill.Color = ColorObject.GreenYellow;
//Set transparency value of fill
firstNode.Shapes[0].Fill.SolidFill.Transparency = 30;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Iterating through child nodes of an existing SmartArt

You can iterate through the child nodes and access the properties of each node in a SmartArt. The following code example demonstrates accessing and modifying the text content of node.

C#

```
//Open a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("SampleDocument.pptx");
```

```

//Traverse through shape in the first slide.
foreach (IShape shape in pptxDoc.Slides[0].Shapes)
{
    if (shape is ISmartArt)
    {
        //Traverse through all nodes inside SmartArt
        foreach (ISmartArtNode mainNode in (shape as ISmartArt).Nodes)
        {
            if (mainNode.TextBody.Text == "Old Content")
            //Change the node content
            mainNode.TextBody.Paragraphs[0].TextParts[0].Text = "New Content";
        }
    }
}
//Save the Presentation.
pptxDoc.Save("SmartArt.pptx");
//Close the Presentation.
pptxDoc.Close();

```

VB.NET

```

'Open a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("SampleDocument.pptx")
'Traverse through shape in the first slide.
For Each shape As IShape In pptxDoc.Slides(0).Shapes
    If TypeOf shape Is ISmartArt Then
        'Traverse through all nodes inside SmartArt
        For Each mainNode As ISmartArtNode In TryCast(shape, ISmartArt).Nodes
            If mainNode.TextBody.Text = "Old Content" Then
                'Change the node content
                mainNode.TextBody.Paragraphs(0).TextParts(0).Text = "New Content"
            End If
        Next
    End If
Next
'Save the Presentation.
pptxDoc.Save("SmartArt.pptx")
'Close the Presentation.
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Traverse through shape in the first slide.
foreach (IShape shape in pptxDoc.Slides[0].Shapes)
{
    if (shape is ISmartArt)
    {
        //Traverse through all nodes inside SmartArt

```

```

foreach (ISmartArtNode mainNode in (shape as ISmartArt).Nodes)
{
    if (mainNode.TextBody.Text == "Old Content")
    //Change the node content
    mainNode.TextBody.Paragraphs[0].TextParts[0].Text = "New Content";
}
}
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Traverse through shape in the first slide.
foreach (IShape shape in pptxDoc.Slides[0].Shapes)
{
    if (shape is ISmartArt)
    {
        //Traverse through all nodes inside SmartArt
        foreach (ISmartArtNode mainNode in (shape as ISmartArt).Nodes)
        {
            if (mainNode.TextBody.Text == "Old Content")
            //Change the node content
            mainNode.TextBody.Paragraphs[0].TextParts[0].Text = "New Content";
        }
    }
}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("SmartArt.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation.
pptxDoc.Close();

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Traverse through shape in the first slide.
foreach (IShape shape in pptxDoc.Slides[0].Shapes)
{

```

```

if (shape is ISmartArt)
{
    //Traverse through all nodes inside SmartArt
    foreach (ISmartArtNode mainNode in (shape as ISmartArt).Nodes)
    {
        if (mainNode.TextBody.Text == "Old Content")
        //Change the node content
        mainNode.TextBody.Paragraphs[0].TextParts[0].Text = "New Content";
    }
}

//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Removing node from an existing SmartArt

You can remove a node from the SmartArt diagram. The following code example demonstrates the same.

C#

```

//Open a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("SampleDocument.pptx");
//Get the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Remove a node at the specified index.
smartArt.Nodes.RemoveAt(4);
//Save the Presentation.
pptxDoc.Save("SmartArt.pptx");
//Close the Presentation.
pptxDoc.Close();

```

VB.NET

```

'Open a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("SampleDocument.pptx")
'Get the first slide from the Presentation.

```

```

Dim slide As ISlide = pptxDoc.Slides(0)
'Get the SmartArt from slide.
Dim smartArt As ISmartArt = TryCast(slide.Shapes(0), ISmartArt)
'Remove a node at the specified index.
smartArt.Nodes.RemoveAt(4)
'Save the Presentation.
pptxDoc.Save("SmartArt.pptx")
'Close the Presentation.
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get the Slide from Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Remove a node at the specified index.
smartArt.Nodes.RemoveAt(4);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0];
//Get the SmartArt from slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
//Remove a node at the specified index.
smartArt.Nodes.RemoveAt(4);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("SmartArt.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation.
pptxDoc.Close();

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
// Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
// Get the first slide from the Presentation.
ISlide slide = pptxDoc.Slides[0];
// Get the SmartArt from slide.
ISmartArt smartArt = slide.Shapes[0] as ISmartArt;
// Remove a node at the specified index.
smartArt.Nodes.RemoveAt(4);
// Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
// Save Presentation in stream format.
pptxDoc.Save(stream);
// Close the presentation
pptxDoc.Close();
stream.Position = 0;
// The operation in Save under Xamarin varies between Windows Phone, Android
// and iOS platforms. Please refer presentation/xamarin section for respective
// code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("SmartArt.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Assistant nodes in SmartArt

You can check whether a node is an assistant or not. Also you can change a node as assistant node or revert an assistant node to normal node. The following code example demonstrates making an assistant node as normal node.

C#

```

// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
// Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
// Add a SmartArt to the slide at the specified size and position
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.OrganizationChart, 0, 0, 640, 426.96);
// Traverse through all nodes of the SmartArt.
foreach (ISmartArtNode node in smartArt.Nodes)
{
// Check if the node is assistant or not.
if (node.IsAssistant)
// Set the assistant node to false.
node.IsAssistant = false;
}
// Save the Presentation.

```

```
pptxDoc.Save("Sample.pptx");
//Close the Presentation.
pptxDoc.Close();
```

VB.NET

```
'Create an instance of PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a blank slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a SmartArt to the slide at the specified size and position
Dim smartArt As ISmartArt =
slide.Shapes.AddSmartArt(SmartArtType.OrganizationChart, 0, 0, 640, 426.96)
'Traverse through all nodes of the SmartArt.
For Each node As ISmartArtNode In smartArt.Nodes
'Check if the node is assistant or not.
If node.IsAssistant Then
'Set the assistant node to false.
node.IsAssistant = False
End If
Next
'Save the Presentation.
pptxDoc.Save("Sample.pptx")
'Close the Presentation.
pptxDoc.Close()
```

UWP

```
//Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.OrganizationChart, 0, 0, 640, 426.96);
//Traverse through all nodes of the SmartArt.
foreach (ISmartArtNode node in smartArt.Nodes)
{
//Check if the node is assistant or not.
if (node.IsAssistant)
//Set the assistant node to false.
node.IsAssistant = false;
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "SmartArt";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
// Create an instance of PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a blank slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a SmartArt to the slide at the specified size and position
ISmartArt smartArt =
slide.Shapes.AddSmartArt(SmartArtType.OrganizationChart, 0, 0, 640, 426.96);
//Traverse through all nodes of the SmartArt.
foreach (ISmartArtNode node in smartArt.Nodes)

stream);
```

Limitations

The modifications in a SmartArt (like add/remove nodes, modify position and size of nodes etc., which involve SmartArt layout changes) done by Essential Presentation will not be reflected in Image and PDF conversion. Whereas layout changes will be reflected properly in the generated PPTX file when opened using Microsoft PowerPoint.

Supported SmartArt layout types

1. Basic Block List
2. Alternating Hexagons
3. Picture Caption List
4. Lined List
5. Vertical Bullet List
6. Vertical Box List
7. Horizontal Bullet List
8. Square Accent List
9. Picture Accent List
10. Bending Picture Accent List
11. Stacked List
12. Increasing Circle Process
13. Pie Process
14. Detailed Process
15. Grouped List
16. Horizontal Picture List
17. Continuous Picture List
18. Picture Strips
19. Vertical Picture List
20. Alternating Picture Blocks
21. Vertical Picture Accent List
22. Titled Picture Accent List
23. Vertical Block List
24. Vertical Chevron List
25. Vertical Accent List
26. Vertical Arrow List
27. Trapezoid List
28. Descending Block List
29. Table List
30. Segmented Process
31. Vertical Curved List
32. Pyramid List
33. Target List
34. Vertical Circle List
35. Table Hierarchy
36. Basic Process

37. Step Up Process
38. Step Down Process
39. Accent Process
40. Alternating Flow
41. Continuous Block Process
42. Increasing Arrows Process
43. Continuous Arrow Process
44. Process Arrows
45. Circle Accent Time Line
46. Basic Time Line
47. Basic Chevron Process
48. Closed Chevron Process
49. Chevron List
50. Sub-Step Process
51. Phased Process
52. Random to Result Process
53. Staggered Process
54. Process List
55. Circle Arrow Process
56. Basic Bending Process
57. Vertical Bending Process
58. Ascending Picture Accent Process
59. Upward Arrow
60. Descending Process
61. Circular Bending Process
62. Equation
63. Vertical Equation
64. Funnel
65. Gear
66. Arrow Ribbon
67. Opposing Arrows
68. Converging Arrows
69. Diverging Arrows
70. Basic Cycle
71. Text Cycle
72. Block Cycle
73. Non directional Cycle
74. Continuous Cycle
75. Multi Directional Cycle
76. Segmented Cycle
77. Basic Pie
78. Radial Cycle
79. Basic Radial
80. Diverging Radial
81. Radial Venn
82. Radial Cluster
83. Organization Chart
84. Name and Title Organization Chart

85. Half Circle Organization Chart
86. Circle Picture hierarchy
87. Hierarchy
88. Labeled Hierarchy
89. Horizontal Organization Chart
90. Horizontal Multi-Level Hierarchy
91. Horizontal Hierarchy
92. Horizontal Labeled Hierarchy
93. Balance
94. Circle Relationship
95. Hexagon Cluster
96. Opposing Ideas
97. Plus and Minus
98. Reverse List
99. Counter Balance Arrows
100. Segmented Pyramid
101. Nested Target
102. Converging Radial
103. Radial List
104. Basic Target
105. Basic Matrix
106. Titled Matrix
107. Grid Matrix
108. Cycle Matrix
109. Accent Picture
110. Circular Picture Callout
111. Snapshot Picture List
112. Spiral Picture
113. Captioned Pictures
114. Bending Picture Caption
115. Bending Picture-Semi Transparent Text
116. Bending Picture Blocks
117. Bending Picture Caption List
118. Titled Picture Blocks
119. Picture Grid
120. Picture Accent Blocks
121. Alternating Picture Circles
122. Title Picture Lineup
123. Picture Lineup
124. Framed Text Picture
125. Bubble Picture List
126. Basic Pyramid
127. Inverted Pyramid
128. Basic Venn
129. Linear Venn
130. Stacked Venn
131. Hierarchy List
132. Picture Accent Process

- 133. Repeating Bending Process
- 134. Vertical Process

Working with Comments

A comment is a text note attached to a location on a slide. Each comment contains an unformatted text string, information about its author and the time it was added. In a PowerPoint slide, the comments and the reply comments are sequentially maintained in a single collection. The top most comment will have the index position 0 and the other comments and replies in that slide will have the incremental index positions.

Adding a comment

The following code example demonstrates how to add a comment in a slide.

C#

```
//Create a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a comment to the slide
slide.Comments.Add(10, 10, "Author1", "A1", "Can we change the font size to 20?", DateTime.Now);
//Save the Presentation
pptxDoc.Save("Comment.pptx");
//Close the Presentation
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Add a slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add a comment to the slide
slide.Comments.Add(10, 10, "Author1", "A1", "Can we change the font size to 20?", DateTime.Now)
'Save the Presentation
pptxDoc.Save("Comment.pptx")
'Close the Presentation
pptxDoc.Close()
```

UWP

```
//Create a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a comment to the slide
slide.Comments.Add(10, 10, "Author1", "A1", "Can we change the font size to 20?", DateTime.Now);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Comment";
```

```
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a comment to the slide
slide.Comments.Add(10, 10, "Author1", "A1", "Can we change the font size to 20?", DateTime.Now);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Comment.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation
pptxDoc.Close();
```

XAMARIN

```
//Create a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Create();
//Add a slide to the Presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add a comment to the slide
slide.Comments.Add(10, 10, "Author1", "A1", "Can we change the font size to 20?", DateTime.Now);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Comment.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Comment.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
```

Replying to a comment

The following code example demonstrates how to reply to an existing comment in a slide.

C#

```

//Create a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Get the slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment in the slide
IComment comment = slide.Comments[0] as IComment;
//Add reply to the comment
slide.Comments.Add("Author2", "A2", "Yes, we can we change the font size to
20", DateTime.Now, comment);
//Save the presentation
pptxDoc.Save("ReplyComment.pptx");
//Close the Presentation
pptxDoc.Close();

```

VB.NET

```

'Create a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Get the slide from the Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Get the comment in the slide
Dim comment As IComment = TryCast(slide.Comments(0), IComment)
'Add reply to the comment
slide.Comments.Add("Author2", "A2", "Yes, we can we change the font size to
20", DateTime.Now, comment)
'Save the presentation
pptxDoc.Save("ReplyComment.pptx")
'Close the Presentation
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get the slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment in the slide
IComment comment = slide.Comments[0] as IComment;
//Add reply to the comment
slide.Comments.Add("Author2", "A2", "Yes, we can we change the font size to
20", DateTime.Now, comment);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "ReplyComment";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file

```

```
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment in the slide
IComment comment = slide.Comments[0] as IComment;
//Add reply to the comment
slide.Comments.Add("Author2", "A2", "Yes, we can we change the font size to 20", DateTime.Now, comment);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("ReplyComment.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation
pptxDoc.Close();
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment in the slide
IComment comment = slide.Comments[0] as IComment;
//Add reply to the comment
slide.Comments.Add("Author2", "A2", "Yes, we can we change the font size to 20", DateTime.Now, comment);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();

else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("ReplyComment.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
```

Modifying the comment

The following code example demonstrates how to modify the content of a comment.

C#

```
//Create a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Open a slide to the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment from the slide
IComment comment = slide.Comments[0] as IComment;
//Modify the comment text
comment.Text = "The comment text content is changed";
//Save the presentation
pptxDoc.Save("ModifyCommentText.pptx");
//Close the Presentation
pptxDoc.Close();
```

VB.NET

```
'Create a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Open a slide to the Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Get the comment from the slide
Dim comment As IComment = TryCast(slide.Comments(0), IComment)
'Modify the comment text
comment.Text = "The comment text content is changed"
'Save the presentation
pptxDoc.Save("ModifyCommentText.pptx")
'Close the Presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = await Presentation.OpenAsync(inputStorageFile);
//Get the slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment in the slide
IComment comment = slide.Comments[0] as IComment;
//Modify the comment text
comment.Text = "The comment text content is changed";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "ModifyCommentText";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
```

```
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Open a slide to the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment from the slide
IComment comment = slide.Comments[0] as IComment;
//Modify the comment text
comment.Text = "The comment text content is changed";
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("ModifyCommentText.pptx",
FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("Sample.pptx");
//Loads or open an PowerPoint Presentation

```

Deleting the comment

Deleting a comment will remove all its replies from the PowerPoint slide. You can also delete a particular reply comment from a slide. You can delete a comment by specifying its reference or by specifying its position.

The following code example demonstrates how to delete a comment from a slide.

C#

```
//Open a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Get the first slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get a comment from the slide
IComment comment = slide.Comments[0];
//Remove the comment from the slide
slide.Comments.Remove(comment);
//Save the presentation
pptxDoc.Save("DeleteComment.pptx");
//Close the Presentation
pptxDoc.Close();
```

VB.NET

```
'Open a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Get the first slide from the Presentation
Dim slide As ISlide = pptxDoc.Slides(0)
'Get a comment from the slide
Dim comment As IComment = slide.Comments(0)
'Remove the comment from the slide
slide.Comments.Remove(comment)
'Save the presentation
pptxDoc.Save("DeleteComment.pptx")
'Close the Presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Get the slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get the comment in the slide
IComment comment = slide.Comments[0] as IComment;
//Remove the comment from the slide
slide.Comments.Remove(comment);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
```

```

savePicker.SuggestedFileName = "DeleteComment";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the first slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get a comment from the slide
IComment comment = slide.Comments[0];
//Remove the comment from the slide
slide.Comments.Remove(comment);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("DeleteComment.pptx",
    FileMode.Create);
pptxDoc.Save(outputStream);
//Close the Presentation
pptxDoc.Close();

```

XAMARIN

```

/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Get the first slide from the Presentation
ISlide slide = pptxDoc.Slides[0];
//Get a comment from the slide

```

Working with Sections

Sections helps to manage the slides of a PowerPoint presentation. If a presentation has many slides, you can organize the slides using sections to make the navigation easier.

Creating a section

Adding a new slide to a section

The following code example demonstrates how to add a blank slide to a section.

C#

```
//Creates a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a section to the PowerPoint presentation
ISection section = pptxDoc.Sections.Add();
//Sets a name to the created section
section.Name = "SectionDemo";
//Adds a slide to the created section
ISlide slide = section.AddSlide(SlideLayoutType.Blank);
//Adds a text box to the slide
slide.AddTextBox(10, 10, 100, 100).TextBody.AddParagraph("Slide in
SectionDemo");
//Saves the PowerPoint presentation
pptxDoc.Save("Section.pptx");
```

VB.NET

```
'Creates a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Create()
'Adds a section to the PowerPoint presentation
Dim section As ISection = pptxDoc.Sections.Add()
'Sets a name to the created section
section.Name = "SectionDemo"
'Adds a slide to the created section
Dim slide As ISlide = section.AddSlide(SlideLayoutType.Blank)
'Adds a text box to the slide
slide.AddTextBox(10, 10, 100, 100).TextBody.AddParagraph("Slide in
SectionDemo")
'Saves the PowerPoint presentation
pptxDoc.Save("Section.PPTX")
```

UWP

```
//Creates a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a section to the PowerPoint presentation
ISection section = pptxDoc.Sections.Add();
//Sets a name to the created section
section.Name = "SectionDemo";
//Adds a slide to the created section
ISlide slide = section.AddSlide(SlideLayoutType.Blank);
//Adds a text box to the slide
slide.AddTextBox(10, 10, 100, 100).TextBody.AddParagraph("Slide in
SectionDemo");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Section";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
```

```
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Creates a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a section to the PowerPoint presentation
ISection section = pptxDoc.Sections.Add();
//Sets a name to the created section
section.Name = "SectionDemo";
//Adds a slide to the created section
ISlide slide = section.AddSlide(SlideLayoutType.Blank);
//Adds a text box to the slide
slide.AddTextBox(10, 10, 100, 100).TextBody.AddParagraph("Slide in SectionDemo");
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
//Creates a PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Adds a section to the PowerPoint presentation
ISection section = pptxDoc.Sections.Add();
//Sets a name to the created section
section.Name = "SectionDemo";
//Adds a slide to the created section
ISlide slide = section.AddSlide(SlideLayoutType.Blank);
//Adds a text box to the slide
slide.AddTextBox(10, 10, 100, 100).TextBody.AddParagraph("Slide in SectionDemo");
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Adding an existing slide to a section

The following code example demonstrates how to add an existing slide to a section.

C#

```
//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithoutSection.PPTX");
//Creates a new section in the PowerPoint presentation
pptxDoc.Sections.Add();
//Moves the first slide to the created section
pptxDoc.Slides[0].MoveToSection(0);
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");
```

VB.NET

```
'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithoutSection.PPTX")
'Creates a new section in the PowerPoint presentation
pptxDoc.Sections.Add()
'Moves the first slide to the created section
pptxDoc.Slides(0).MoveToSection(0)
'Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Creates a new section in the PowerPoint presentation
pptxDoc.Sections.Add();
//Moves the first slide to the created section
pptxDoc.Slides[0].MoveToSection(0);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
```

```

IPresentation pptxDoc = Presentation.Open(inputStream);
//Creates a new section in the PowerPoint presentation
pptxDoc.Sections.Add();
//Moves the first slide to the created section
pptxDoc.Slides[0].MoveToSection(0);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Creates a new section in the PowerPoint presentation
pptxDoc.Sections.Add();
//Moves the first slide to the created section
pptxDoc.Slides[0].MoveToSection(0);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx",
, "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Inserting a section

The following code example demonstrates how to insert a section in a template PowerPoint presentation that contains sections

C#

```

//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithSections.PPTX");
//Creates a new section
ISection section = pptxDoc.Sections.Add();
//Names the created section
section.Name = "InsertedSection";
//Inserts the section at second position.

```

```
pptxDoc.Sections.Insert(1, section);
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");
```

VB.NET

```
'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithSections.PPTX")
'Creates a new section
Dim section As ISection = pptxDoc.Sections.Add()
'Names the created section
section.Name = "InsertedSection"
'Inserts the section at second position.
pptxDoc.Sections.Insert(1, section)
'Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
/Creates a new section
ISection section = pptxDoc.Sections.Add();
//Names the created section
section.Name = "InsertedSection";
//Inserts the section at second position.
pptxDoc.Sections.Insert(1, section);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Creates a new section
ISection section = pptxDoc.Sections.Add();
//Names the created section
section.Name = "InsertedSection";
//Inserts the section at second position.
```

```
pptxDoc.Sections.Insert(1, section);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Creates a new section
ISection section = pptxDoc.Sections.Add();
//Names the created section
section.Name = "InsertedSection";
//Inserts the section at second position.
pptxDoc.Sections.Insert(1, section);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
```

Moving the sections within a PowerPoint presentation

You can move the sections within a PowerPoint presentation. The following code example demonstrates how to move a section to a specific position in the navigation pane.

C#

```
//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithSections.PPTX");
//Moves the second section to third position within the PowerPoint presentation.
pptxDoc.Sections[2].Move(3);
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");
```

VB.NET

```
'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithSections.PPTX")
'Moves the second section to third position within the PowerPoint presentation.
pptxDoc.Sections(2).Move(3)
'Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Moves the second section to third position within the PowerPoint presentation.
pptxDoc.Sections[2].Move(3);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Moves the second section to third position within the PowerPoint presentation.
pptxDoc.Sections[2].Move(3);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
/"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
```

```

IPresentation pptxDoc = Presentation.Open(inputStream);
//Moves the second section to third position within the PowerPoint
presentation.
pptxDoc.Sections[2].Move(3);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Moving a slide within sections

The following code example demonstrates how to move a slide from one section to another.

C#

```

//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithSections.PPTX");
//Gets the first slide of second section in the PowerPoint presentation
ISlide slide = pptxDoc.Sections[1].Slides[0];
//Moves the slide to first section
slide.MoveToSection(0);
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");

```

VB.NET

```

'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithSections.PPTX")
'Gets the first slide of second section in the PowerPoint presentation
Dim slide As ISlide = pptxDoc.Sections(1).Slides(0)
'Moves the slide to first section
slide.MoveToSection(0)
'Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");

```

```

//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Gets the first slide of second section in the PowerPoint presentation
ISlide slide = pptxDoc.Sections[1].Slides[0];
//Moves the slide to first section
slide.MoveToSection(0);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets the first slide of second section in the PowerPoint presentation
ISlide slide = pptxDoc.Sections[1].Slides[0];
//Moves the slide to first section
slide.MoveToSection(0);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets the first slide of second section in the PowerPoint presentation
ISlide slide = pptxDoc.Sections[1].Slides[0];
//Moves the slide to first section
slide.MoveToSection(0);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx"
, "application/vnd.openxmlformats-
officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Cloning and merging the slides in a section

The following code example demonstrates how to clone the slide collection of a section and add those slides to a destination presentation.

C#

```

//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithSections.PPTX");
//Clones the slides in 3rd section
ISlides slides = pptxDoc.Sections[2].Clone();
//Creates a destination PowerPoint presentation instance. Existing
presentations can also be used here.
pptxDoc = Presentation.Create();
//Iterates the cloned slides and adds the slides to the destination
presentation
foreach (ISlide slide in slides)
pptxDoc.Slides.Add(slide);
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");

```

VB.NET

```

'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithSections.PPTX")
'Clones the slides in 3rd section
Dim slides As ISlides = pptxDoc.Sections(2).Clone()
'Creates a destination PowerPoint presentation instance. Existing
presentations can also be used here.
pptxDoc = Presentation.Create()
'Iterates the cloned slides and adds the slides to the destination
presentation
For Each slide As ISlide In slides
pptxDoc.Slides.Add(slide)
Next
'Save the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();

```

```

//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Clones the slides in 3rd section
ISlides slides = pptxDoc.Sections[2].Clone();
//Creates a destination PowerPoint presentation instance. Existing presentations can also be used here.
pptxDoc = Presentation.Create();
//Iterates the cloned slides and adds the slides to the destination presentation
foreach (ISlide slide in slides)
pptxDoc.Slides.Add(slide);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Clones the slides in 3rd section
ISlides slides = pptxDoc.Sections[2].Clone();
//Creates a destination PowerPoint presentation instance. Existing presentations can also be used here.
pptxDoc = Presentation.Create();
//Iterates the cloned slides and adds the slides to the destination presentation
foreach (ISlide slide in slides)
pptxDoc.Slides.Add(slide);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Clones the slides in 3rd section
ISlides slides = pptxDoc.Sections[2].Clone();
//Creates a destination PowerPoint presentation instance. Existing presentations can also be used here.
pptxDoc = Presentation.Create();

```

```

//Iterates the cloned slides and adds the slides to the destination presentation
foreach (ISlide slide in slides)
    pptxDoc.Slides.Add(slide);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
    Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);

```

Removing a section

The following code example demonstrates how to create remove a particular section from the sections collection of a presentation.

C#

```

//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithSections.PPTX");
//Removes the second section from the PowerPoint presentation
pptxDoc.Sections.Remove(pptxDoc.Sections[1]);
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");

```

VB.NET

```

'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithSections.PPTX")
'Removes the second section from the PowerPoint presentation
pptxDoc.Sections.Remove(pptxDoc.Sections(1))
'Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation

```

```

IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Removes the second section from the PowerPoint presentation
pptxDoc.Sections.Remove(pptxDoc.Sections[1]);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Removes the second section from the PowerPoint presentation
pptxDoc.Sections.Remove(pptxDoc.Sections[1]);
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Section.pptx", FileMode.Create);
pptxDoc.Save(outputStream);

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Removes the second section from the PowerPoint presentation
pptxDoc.Sections.Remove(pptxDoc.Sections[1]);
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Section.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Remove all sections

The following code example demonstrates how to remove section collection from an existing PowerPoint presentation.

C#

```
//Loads a PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("PPTXWithSections.PPTX");
//Removes the sections
pptxDoc.Sections.Clear();
//Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX");
```

VB.NET

```
'Loads a PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("PPTXWithSections.PPTX")
'Removes the sections
pptxDoc.Sections.Clear()
'Saves the PowerPoint presentation
pptxDoc.Save("Sections.PPTX")
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Removes the sections
pptxDoc.Sections.Clear();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sections";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Loads or open an PowerPoint Presentation
FileStream inputStream = new
FileStream("PPTXWithSections.PPTX", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Removes the sections
pptxDoc.Sections.Clear();
```

```
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Sections.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
```

XAMARIN

```
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Removes the sections
pptxDoc.Sections.Clear();
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android and iOS platforms. Please refer presentation/xamarin section for respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Sections.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Sections.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
```

Working with Macros

A macro is a series of commands that can be grouped together as a single command to automate a frequently used tasks. Macros can be created for Microsoft PowerPoint using Visual Basic for Applications (VBA). Please refer [Create Macros in PowerPoint](#) for more details

Macros enabled PowerPoint presentations of file types - .PPTM and .POTM can only be preserved using Essential Presentation.

Loading and Saving Macro enabled Presentation

The following code illustrates how to load and save a macro enabled presentation.

C#

```
//Opens an existing macro enabled PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.PPTM");
//Adds a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a text box to the slide
IParagraph paragraph = slide.Shapes.AddTextBox(100, 100, 300, 80).TextBody.AddParagraph("Preserve Macros");
```

```
//Saves the presentation
pptxDoc.Save("Output.PPTM");
//Closes the presentation
pptxDoc.Close();
```

VB.NET

```
'Opens an existing macro enabled PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.PPTM")
'Adds a blank slide to the presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Adds a text box to the slide
Dim paragraph As IParagraph = slide.Shapes.AddTextBox(100, 100, 300,
80).TextBody.AddParagraph("Preserve Macros")
'Saves the presentation
pptxDoc.Save("Output.PPTM")
'Closes the presentation
pptxDoc.Close()
```

UWP

```
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".PPTM");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Adds a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a text box to the slide
IParagraph paragraph = slide.Shapes.AddTextBox(100, 100, 300,
80).TextBody.AddParagraph("Preserve Macros");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".PPTM" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Opens an existing macro enabled PowerPoint presentation
FileStream inputStream = new FileStream("Sample.PPTM", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Adds a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a text box to the slide
IParagraph paragraph = slide.Shapes.AddTextBox(100, 100, 300,
80).TextBody.AddParagraph("Preserve Macros");
```

```
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.PPTM", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the presentation
pptxDoc.Close();
```

XAMARIN

```
//Opens an existing macro enabled PowerPoint presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Adds a blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Adds a text box to the slide
IParagraph paragraph = slide.Shapes.AddTextBox(100, 100, 300,
80).TextBody.AddParagraph("Preserve Macros");
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.PPTM",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.PPTM",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Removing Macros from Macro enabled Presentation

The following code example illustrates how to remove the macros present in the presentation,

C#

```
//Opens an existing macro enabled PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.PPTM");
//Checks whether the presentation has macros and then removes them
if (pptxDoc.HasMacros)
pptxDoc.RemoveMacros();
//Saves the presentation
pptxDoc.Save("Output.pptx");
//Closes the presentation
pptxDoc.Close();
```

VB.NET

```
'Opens an existing macro enabled PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.PPTM")
'Checks whether the presentation has macros and then removes them
```

```

If pptxDoc.HasMacros Then
pptxDoc.RemoveMacros ()
End If
'Saves the presentation
pptxDoc.Save ("Output.pptx")
'Closes the presentation
pptxDoc.Close ()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker ();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add (".PPTM");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync ();
//Loads or open an Macro enabled PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync (inputStorageFile);
//Checks whether the presentation has macros and then removes them
if (pptxDoc.HasMacros)
pptxDoc.RemoveMacros ();
//Saves the presentation
pptxDoc.Save ("Output.pptx");
//Closes the presentation
pptxDoc.Close ();

```

ASP.NET CORE

```

//Opens an existing macro enabled PowerPoint presentation
FileStream inputStream = new FileStream ("Sample.PPTM", FileMode.Open);
IPresentation pptxDoc = Presentation.Open (inputStream);
//Checks whether the presentation has macros and then removes them
if (pptxDoc.HasMacros)
pptxDoc.RemoveMacros ();
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream ("Output.pptx", FileMode.Create);
pptxDoc.Save (outputStream);
//Closes the presentation
pptxDoc.Close ();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof (App).GetTypeInfo ().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream ("SampleBrowser.Presentation.Samples.Template.Sample.PPTM");
//Opens an existing macro enabled PowerPoint presentation
IPresentation pptxDoc = Presentation.Open (inputStream);
//Checks whether the presentation has macros and then removes them
if (pptxDoc.HasMacros)
pptxDoc.RemoveMacros ();
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream ();
//Save Presentation in stream format.

```

```
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
```

Security

Encrypting with password

You can protect a PowerPoint Presentation by encrypting the document by using a password. This prevents unauthorized users to access or make changes in the Presentation.

The following code example demonstrates how to encrypt a PowerPoint Presentation with password.

C#

```
//Creates an instance for Presentation
IPresentation presentation = Presentation.Create();
//Adds slide to Presentation
ISlide slide = presentation.Slides.Add(SlideLayoutType.Blank);
//Adds textbox to slide
IShape shape = slide.Shapes.AddTextBox(100, 30, 200, 300);
//Adds a paragraph with text content.
IParagraph paragraph = shape.TextBody.AddParagraph("Password Protected.");
//Protects the file with password
presentation.Encrypt("PASSWORD!@1#$");
//Saves the Presentation
presentation.Save("Sample.pptx");
//Closes the Presentation
presentation.Close();
```

VB.NET

```
'Creates an instance for Presentation
Dim presentationDocument As IPresentation = Presentation.Create()
'Adds slide to Presentation
Dim slide As ISlide = presentationDocument.Slides.Add(SlideLayoutType.Blank)
'Adds textbox to slide
Dim shape As IShape = slide.Shapes.AddTextBox(100, 30, 200, 300)
'Adds a paragraph with text content.
Dim paragraph As IParagraph = shape.TextBody.AddParagraph("Password
Protected.")
'Protects the file with password
presentationDocument.Encrypt("PASSWORD!@1#$")
'Saves the Presentation
```

```
presentationDocument.Save("Sample.pptx")  
'Closes the Presentation  
presentationDocument.Close()
```

Note: PowerPoint Presentation doesn't support encryption in ASP.NET Core, Blazor and Xamarin.

Decrypting the PowerPoint Presentation

Essential Presentation provides ability to remove the encryption from the PowerPoint Presentation. You can decrypt a PowerPoint Presentation by opening it with the password.

Opening the Encrypted PowerPoint Presentation

The following code example demonstrates opening the encrypted PowerPoint Presentation.

C#

```
//Opens an existing Presentation from file system and it can be decrypted by  
using the provided password.  
IPresentation presentation = Presentation.Open("Sample.pptx",  
"PASSWORD!@1#$");  
//Saves the Presentation  
presentation.Save("Output.pptx");  
//Closes the Presentation  
presentation.Close();
```

VB.NET

```
'Opens an existing Presentation from file system and it can be decrypted by  
using the provided password.  
Dim presentationDocument As IPresentation = Presentation.Open("Sample.pptx",  
"PASSWORD!@1#$")  
'Saves the Presentation  
presentationDocument.Save("Output.pptx")  
'Closes the Presentation  
presentationDocument.Close()
```

Removing the encryption from Presentation

The following code example demonstrates removing the encryption from a PowerPoint Presentation.

C#

```
//Opens an existing Presentation from file system and it can be decrypted by  
using the provided password.  
IPresentation presentation = Presentation.Open("Sample.pptx",  
"PASSWORD!@1#$");  
//Decrypts the document  
presentation.RemoveEncryption();  
//Saves the presentation  
presentation.Save("Output.pptx");  
//Closes the Presentation  
presentation.Close();
```

VB.NET

```
'Opens an existing Presentation from file system and it can be decrypted by
using the provided password.
Dim presentationDocument As IPresentation = Presentation.Open("Sample.pptx",
"PASSWORD!@1#$")
'Decrypts the document
presentationDocument.RemoveEncryption()
'Saves the Presentation
presentationDocument.Save("Output.pptx")
'Closes the Presentation
presentationDocument.Close()
```

Write Protection

You can set write protection for a PowerPoint Presentation and remove protection from the write protected PowerPoint presentation.

Protect PowerPoint Presentation

You can protect a PowerPoint Presentation with password to restrict unauthorized editing.

The following code example shows how to set write protection for a PowerPoint Presentation.

C#

```
//Create a new instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add the blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add the shape to the slide
IShape shape = slide.Shapes.AddShape(AutoShapeType.BlockArc, 0, 0, 200,
200);
//Add the paragraph to the shape.
IParagraph paragraph = shape.TextBody.AddParagraph("welcome");
//Sets the author name
pptxDoc.BuiltInDocumentProperties.Author = "Syncfusion";
//Set the write protection for presentation instance
pptxDoc.SetWriteProtection("MYPASSWORD");
//Saves the modified cloned PowerPoint presentation
pptxDoc.Save("Sample.pptx");
//Close the presentation instance
pptxDoc.Close();
```

VB.NET

```
'Create a new instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create()
'Add the blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Add the shape to the slide
IShape shape = slide.Shapes.AddShape(AutoShapeType.BlockArc, 0, 0, 200, 200)
'Add the paragraph to the shape.
IParagraph paragraph = shape.TextBody.AddParagraph("welcome")
'Sets the author name
pptxDoc.BuiltInDocumentProperties.Author = "Syncfusion"
'Set the write protection for presentation instance
pptxDoc.SetWriteProtection("MYPASSWORD")
'Saves the modified cloned PowerPoint presentation
pptxDoc.Save("Sample.pptx")
```

```
'Close the presentation instance
pptxDoc.Close()
```

UWP

```
//Create a new instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add the blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add the shape to the slide
IShape shape = slide.Shapes.AddShape(AutoShapeType.BlockArc, 0, 0, 200,
200);
//Add the paragraph to the shape.
IParagraph paragraph = shape.TextBody.AddParagraph("welcome");
//Sets the author name
pptxDoc.BuiltInDocumentProperties.Author = "Syncfusion";
//Set the write protection for presentation instance
pptxDoc.SetWriteProtection("MYPASSWORD");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create a new instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add the blank slide to the presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add the shape to the slide
IShape shape = slide.Shapes.AddShape(AutoShapeType.BlockArc, 0, 0, 200,
200);
//Add the paragraph to the shape.
IParagraph paragraph = shape.TextBody.AddParagraph("welcome");
//Sets the author name
pptxDoc.BuiltInDocumentProperties.Author = "Syncfusion";
//Set the write protection for presentation instance
pptxDoc.SetWriteProtection("MYPASSWORD");
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the presentation
pptxDoc.Close();
```

XAMARIN

```
//Create a new instance for PowerPoint presentation
IPresentation pptxDoc = Presentation.Create();
//Add the blank slide to the presentation
```

```

ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Add the shape to the slide
IShape shape = slide.Shapes.AddShape(AutoShapeType.BlockArc, 0, 0, 200,
200);
//Add the paragraph to the shape.
IParagraph paragraph = shape.TextBody.AddParagraph("welcome");
//Sets the author name
pptxDoc.BuiltInDocumentProperties.Author = "Syncfusion";
//Set the write protection for presentation instance
pptxDoc.SetWriteProtection("MYPASSWORD");
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Remove Protection

You can check whether a PowerPoint Presentation is write protected and remove protection from the write protected PowerPoint Presentation.

The following code example shows how to remove restriction protection from the write protected PowerPoint Presentation

C#

```

//Open the PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Gets whether the presentation is write Protected. Read - only.
bool writeProtected = pptxDoc.IsWriteProtected;
//Checks whether the presentation is write protected
if (writeProtected)
{
//Removes the write protection for presentation instance.
pptxDoc.RemoveWriteProtection();
}
//Saves the modified cloned PowerPoint presentation
pptxDoc.Save("Output.pptx");
//Close the presentation instance
pptxDoc.Close();

```

VB.NET

```

'Open the PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
'Gets whether the presentation is write Protected. Read - only.
bool writeProtected = pptxDoc.IsWriteProtected;
'Checks whether the presentation is write protected
if (writeProtected)
{
    'Removes the write protection for presentation instance.
    pptxDoc.RemoveWriteProtection();
}
'Saves the modified cloned PowerPoint presentation
pptxDoc.Save("Output.pptx")
'Close the presentation instance
pptxDoc.Close()

```

UWP

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".pptx");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc= await Presentation.OpenAsync(inputStorageFile);
//Gets whether the presentation is write Protected. Read - only.
bool writeProtected = pptxDoc.IsWriteProtected;
//Checks whether the presentation is write protected
if (writeProtected)
{
    //Removes the write protection for presentation instance.
    pptxDoc.RemoveWriteProtection();
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
    ".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);

```

ASP.NET CORE

```

//Loads or open an PowerPoint Presentation
FileStream inputStream = new FileStream("Sample.pptx", FileMode.Open);
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets whether the presentation is write Protected. Read - only.
bool writeProtected = pptxDoc.IsWriteProtected;
//Checks whether the presentation is write protected
if (writeProtected)
{
    //Removes the write protection for presentation instance.
    pptxDoc.RemoveWriteProtection();
}

```

```

}
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("Output.pptx", FileMode.Create);
pptxDoc.Save(outputStream);
//Closes the presentation
pptxDoc.Close();

```

XAMARIN

```

//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.Presentation.Samples.Template.Sample.pptx");
//Loads or open an PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open(inputStream);
//Gets whether the presentation is write Protected. Read - only.
bool writeProtected = pptxDoc.IsWriteProtected;
//Checks whether the presentation is write protected
if (writeProtected)
{
//Removes the write protection for presentation instance.
pptxDoc.RemoveWriteProtection();
}
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("Output.pptx",
"application/vnd.openxmlformats-officedocument.presentationml.presentation",
stream);

```

Note: 1. In Xamarin application, this feature is supported from the target framework .NET Standard 2.0 version onwards.

2. For ASP.NET Core, this feature is supported from .NET Core 2.0 version onwards.

Working with OLE Objects

The OLE Object enables sharing of application objects written in different file formats. In PowerPoint presentation the application data can be inserted into a PowerPoint slide using the [programmatic identifier](#) of each file format.

Inserting OLE Object to a Slide

The below code snippet demonstrates how to add an Excel worksheet into a slide.

C#

```
//Create new instance of PowerPoint presentation. [Equivalent to launching
MS PowerPoint with no slides].
IPresentation pptxDoc = Presentation.Create();
//Add slide with blank layout to presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Get the excel file as stream
Stream excelStream = File.Open("OleTemplate.xlsx", FileMode.Open);
//Image to be displayed, This can be any image
Stream imageStream = File.Open("OlePicture.png", FileMode.Open);
//Add an OLE object to the slide
IOleObject oleObject = slide.Shapes.AddOleObject(imageStream,
"Excel.Sheet.12", excelStream);
//Set size and position of the OLE object
oleObject.Left = 10;
oleObject.Top = 10;
oleObject.Width = 400;
oleObject.Height = 300;
//Save the presentation
pptxDoc.Save("OleObjectSample.pptx");
//Close the presentation
pptxDoc.Close();
```

VB.NET

```
'Create new instance of PowerPoint presentation. [Equivalent to launching MS
PowerPoint with no slides].
Dim pptxDoc As IPresentation = Presentation.Create()
'Add slide with blank layout to presentation
Dim slide As ISlide = pptxDoc.Slides.Add(SlideLayoutType.Blank)
'Get the excel file as stream
Dim excelStream As Stream = File.Open("OleTemplate.xlsx", FileMode.Open)
'Image to be displayed, This can be any image
Dim imageStream As Stream = File.Open("OlePicture.png", FileMode.Open)
'Add an OLE object to the slide
Dim oleObject As IOleObject = slide.Shapes.AddOleObject(imageStream,
"Excel.Sheet.12", excelStream)
'Set size and position of the OLE object
oleObject.Left = 10
oleObject.Top = 10
oleObject.Width = 400
oleObject.Height = 300
'Save the presentation
pptxDoc.Save("OleObjectSample.pptx")
'Close the presentation
pptxDoc.Close()
```

UWP

```
//Create new instance of PowerPoint presentation. [Equivalent to launching
MS PowerPoint with no slides].
IPresentation pptxDoc = Presentation.Create();
```

```
//Add slide with blank layout to presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Get the excel file as stream
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream excelStream =
assembly.GetManifestResourceStream("UWP.Data.OleTemplate.xlsx");
//Image to be displayed, This can be any image
Stream imageStream =
assembly.GetManifestResourceStream("UWP.Data.OlePicture.png");
//Add an OLE object to the slide
IOleObject oleObject = slide.Shapes.AddOleObject(imageStream,
"Excel.Sheet.12", excelStream);
//Set size and position of the OLE object
oleObject.Left = 10;
oleObject.Top = 10;
oleObject.Width = 400;
oleObject.Height = 300;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "OleObjectSample";
savePicker.FileTypeChoices.Add("PowerPoint Files", new List<string>() {
".pptx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await pptxDoc.SaveAsync(storageFile);
```

ASP.NET CORE

```
//Create new instance of PowerPoint presentation.
IPresentation pptxDoc = Presentation.Create();
//Add slide with blank layout to presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//Get the excel file as stream
FileStream excelStream = new FileStream("OleTemplate.xlsx", FileMode.Open);
//Image to be displayed, This can be any image
FileStream excelStream = new FileStream("OlePicture.png", FileMode.Open);
//Add an OLE object to the slide
IOleObject oleObject = slide.Shapes.AddOleObject(imageStream,
"Excel.Sheet.12", excelStream);
//Set size and position of the OLE object
oleObject.Left = 10;
oleObject.Top = 10;
oleObject.Width = 400;
oleObject.Height = 300;
//Save the PowerPoint Presentation as stream
FileStream outputStream = new FileStream("OleObjectSample.pptx",
FileMode.Create);
pptxDoc.Save(outputStream);
//Close the presentation
pptxDoc.Close();
```

XAMARIN

```
//Create new instance of PowerPoint presentation.
```

```

IPresentation pptxDoc = Presentation.Create();
//Add slide with blank layout to presentation
ISlide slide = pptxDoc.Slides.Add(SlideLayoutType.Blank);
//"App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Get the excel file as stream
Stream excelStream = assembly.GetManifestResourceStream("OleTemplate.xlsx");
//Image to be displayed, This can be any image
Stream imageStream = assembly.GetManifestResourceStream("OlePicture.png");
//Add an OLE object to the slide
IOleObject oleObject = slide.Shapes.AddOleObject(imageStream,
"Excel.Sheet.12", excelStream);
//Set size and position of the OLE object
oleObject.Left = 10;
oleObject.Top = 10;
oleObject.Width = 400;
oleObject.Height = 300;
//Create new memory stream to save Presentation.
MemoryStream stream = new MemoryStream();
//Save Presentation in stream format.
pptxDoc.Save(stream);
//Close the presentation
pptxDoc.Close();
stream.Position = 0;
//The operation in Save under Xamarin varies between Windows Phone, Android
and iOS platforms. Please refer presentation/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().Save("OleObjectSample.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);
else
Xamarin.Forms.DependencyService.Get<ISave>().Save("OleObjectSample.pptx", "application/vnd.openxmlformats-officedocument.presentationml.presentation", stream);

```

Presentation to image conversion

.NET Framework

This section covers converting an entire Presentation or a single slide to image in Windows Forms, WPF, ASP.NET and ASP.NET MVC platforms. The supported image formats are listed as follows.

- BMP
- EMF
- JPG
- JPEG
- PNG

Assemblies Required

Refer to the following links for assemblies required based on platforms to convert the worksheet to image.

- [Assemblies Information](#)
- [NuGet Information](#)

Tips: When converting a slide to image, use 'Metafile' format for good image resolution.

The following code example demonstrates how to convert a slide to image.

C#

```
//Namespaces to perform PPTX to Image conversion
using Syncfusion.Presentation;
using Syncfusion.OfficeChartToImageConverter;
using System.IO;
using Syncfusion.Drawing;
//Opens a PowerPoint Presentation file
IPresentation pptxDoc = Presentation.Open(fileName);
//Creates an instance of ChartToImageConverter
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Sets the scaling mode as best
pptxDoc.ChartToImageConverter.ScalingMode =
Syncfusion.OfficeChart.ScalingMode.Best;
//Converts the first slide into image
Image image =
pptxDoc.Slides[0].ConvertToImage(Syncfusion.Drawing.ImageType.Metafile);
//Saves the image as file
image.Save("slide1.png");
//Disposes the image
image.Dispose();
//Closes the Presentation instance
pptxDoc.Close();
```

VB.NET

```
'Namespaces to perform PPTX to Image conversion
Imports Syncfusion.Presentation
Imports Syncfusion.OfficeChartToImageConverter
Imports Syncfusion.Drawing
Imports System.IO
'Opens a PowerPoint Presentation file
Dim pptxDoc As IPresentation = Presentation.Open(fileName)
'Creates an instance of ChartToImageConverter
pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Sets the scaling mode as best
pptxDoc.ChartToImageConverter.ScalingMode =
Syncfusion.OfficeChart.ScalingMode.Best
'Converts the first slide into image
Dim image As Image =
pptxDoc.Slides(0).ConvertToImage(Syncfusion.Drawing.ImageType.Metafile)
'Saves the image as file
image.Save("slide1.png")
'Disposes the image
image.Dispose()
'Closes the Presentation instance
Presentation 1.Close()
```

ASP.NET CORE

```
//Namespaces to perform PPTX to Image conversion
using Syncfusion.Presentation;
using Syncfusion.PresentationRenderer;
using System.IO;
//Open the existing PowerPoint presentation with stream.
using (IPresentation pptxDoc = Presentation.Open(fileStreamInput))
{
    //Initialize the PresentationRenderer to perform image conversion.
    pptxDoc.PresentationRenderer = new PresentationRenderer();
    //Convert PowerPoint slide to image as stream.
    using (Stream stream =
        pptxDoc.Slides[0].ConvertToImage(ExportImageFormat.Jpeg))
    {
        //Reset the stream position
        stream.Position = 0;
        //Create the output image file stream
        using (FileStream fileStreamOutput = File.Create("Output.jpg"))
        {
            //Copy the converted image stream into created output stream
            stream.CopyTo(fileStreamOutput);
        }
    }
}
```

XAMARIN

```
//Namespaces to perform PPTX to Image conversion
using Syncfusion.Presentation;
using Syncfusion.PresentationRenderer;
using System.IO;
//Open the existing PowerPoint presentation with stream.
using (IPresentation pptxDoc = Presentation.Open(fileStreamInput))
{
    //Initialize the PresentationRenderer to perform image conversion.
    pptxDoc.PresentationRenderer = new PresentationRenderer();
    //Convert PowerPoint slide to image as stream.
    using (Stream stream =
        pptxDoc.Slides[0].ConvertToImage(ExportImageFormat.Jpeg))
    {
        //Reset the stream position
        stream.Position = 0;
        //Create the output image file stream
        using (FileStream fileStreamOutput = File.Create("Output.jpg"))
        {
            //Copy the converted image stream into created output stream
            stream.CopyTo(fileStreamOutput);
        }
    }
}
```

The following code example demonstrates the conversion of an entire Presentation to images:

C#

```

//Loads the PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Creates instance of ChartToImageConverter
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Sets the scaling mode as best
pptxDoc.ChartToImageConverter.ScalingMode =
Syncfusion.OfficeChart.ScalingMode.Best;
//Converts entire Presentation to images
Image[] images =
pptxDoc.RenderAsImages(Syncfusion.Drawing.ImageType.Metafile);
//Saves the image to file system
foreach (Image image in images)
{
    image.Save("ImageOutput" + Guid.NewGuid().ToString() + ".png");
}

```

VB.NET

```

'Loads the PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Creates instance of ChartToImageConverter
pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Sets the scaling mode as best
pptxDoc.ChartToImageConverter.ScalingMode =
Syncfusion.OfficeChart.ScalingMode.Best
'Converts entire Presentation to images
Dim images As Image() =
pptxDoc.RenderAsImages(Syncfusion.Drawing.ImageType.Metafile)
'Saves the image to file system
For Each image As Image In images
    image.Save("ImageOutput" + Guid.NewGuid().ToString() + ".png")
Next

```

The following code snippet demonstrates how to convert a PowerPoint slide to image using custom image resolution,

C#

```

//Loads the PowerPoint presentation
IPresentation pptxDoc = Presentation.Open("Output.pptx");
//Declare variables to hold custom width and height
int customWidth = 1500;
int customHeight = 1000;
//Converts the slide as image and returns the image stream
Stream stream =
pptxDoc.Slides[0].ConvertToImage(Syncfusion.Drawing.ImageFormat.Emf);
//Creates a bitmap of specific width and height
Bitmap bitmap = new Bitmap(customWidth, customHeight,
PixelFormat.Format32bppArgb);
//Gets the graphics from image
Graphics graphics = Graphics.FromImage(bitmap);
//Sets the resolution
bitmap.SetResolution(graphics.DpiX, graphics.DpiY);
//Recreates the image in custom size
graphics.DrawImage(System.Drawing.Image.FromStream(stream), new Rectangle(0,
0, bitmap.Width, bitmap.Height));

```

```
//Saves the image as bitmap
bitmap.Save("ImageOutput" + Guid.NewGuid().ToString() + ".jpeg");
//Closes the presentation
pptxDoc.Close();
```

VB.NET

```
'Loads the PowerPoint presentation
Dim pptxDoc As IPresentation = Presentation.Open("Output.pptx")
'Declare variables to hold custom width and height
Dim customWidth As Integer = 1500
Dim customHeight As Integer = 1000
'Converts the slide as image and returns the image stream
Dim stream As Stream =
pptxDoc.Slides(0).ConvertToImage(Syncfusion.Drawing.ImageFormat.Emf)
'Creates a bitmap of specific width and height
Dim bitmap As New Bitmap(customWidth, customHeight,
PixelFormat.Format32bppPArgb)
'Gets the graphics from image
Dim imageGraphics As Graphics = Graphics.FromImage(bitmap)
'Sets the resolution
bitmap.SetResolution(imageGraphics.DpiX, imageGraphics.DpiY)
'Recreates the image in custom size
imageGraphics.DrawImage(System.Drawing.Image.FromStream(stream), New
Rectangle(0, 0, bitmap.Width, bitmap.Height))
'Saves the image as bitmap
bitmap.Save("ImageOutput" + Guid.NewGuid().ToString() + ".jpeg")
'Closes the presentation
pptxDoc.Close()
```

UWP

PowerPoint slides can be converted to images in UWP by using Essential Presentation library. The following assemblies are required in the UWP application to convert the slides as images.

Assembly Name	Short Description
Syncfusion.Presentation.UWP	This assembly contains the core features needed for creating, reading, manipulating a Presentation file.
Syncfusion.OfficeChart.UWP	This assembly contains the Office Chart Object model and core features needed for chart creation.
Syncfusion.OfficeChartToImageConverter.UWP	This assembly is used to convert Office Chart into Image.
Syncfusion.SfChart.UWP	Supporting assembly for Syncfusion.OfficeChartToImageConverter.UWP

The following code example demonstrates how to convert a slide to image in UWP.

C#

```
//Load the presentation file using open picker
FileOpenPicker openPicker = new FileOpenPicker();
```

```
openPicker.FileTypeFilter.Add(".pptx");
StorageFile inputFile = await openPicker.PickSingleFileAsync();
pptxDoc = await Presentation.OpenAsync(inputFile);
//Initialize the 'ChartToImageConverter' instance to convert the charts in
the slides
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Pick the folder to save the converted images.
FolderPicker folderPicker = new FolderPicker();
folderPicker.ViewMode = PickerViewMode.Thumbnail;
folderPicker.FileTypeFilter.Add("*");
StorageFolder storageFolder = await folderPicker.PickSingleFolderAsync();
StorageFile imageFile = await storageFolder.CreateFileAsync("Slide1.jpg",
CreationCollisionOption.ReplaceExisting);
//Convert the slide to image.
await slide.SaveAsImageAsync(imageFile);
//Closes the presentation instance
pptxDoc.Close();
```

The following code snippet demonstrates how to convert a PowerPoint slide to image using custom image resolution.

C#

```
//Load the presentation file using open picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.FileTypeFilter.Add(".pptx");
StorageFile inputFile = await openPicker.PickSingleFileAsync();
pptxDoc = await Presentation.OpenAsync(inputFile);
//Initialize the 'ChartToImageConverter' instance to convert the charts in
the slides.
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Pick the folder to save the converted images.
FolderPicker folderPicker = new FolderPicker();
folderPicker.ViewMode = PickerViewMode.Thumbnail;
folderPicker.FileTypeFilter.Add("*");
StorageFolder storageFolder = await folderPicker.PickSingleFolderAsync();
StorageFile imageFile = await storageFolder.CreateFileAsync("Slide1.jpg",
CreationCollisionOption.ReplaceExisting);
//Get the stream of the created image file.
StorageFile imageStream = await imageFile.OpenStreamForWriteAsync()
//Creates a new instance for the rendering options to customize the image
resolution.
RenderingOptions renderingOptions = new RenderingOptions();
//Sets the horizontal scaling value for the converted image. The default
value is 1.
renderingOptions.ScaleX = 10F;
//Sets the vertical scaling value for the converted image. The default value
is 1.
renderingOptions.ScaleY = 10F;
//Convert the slide to image with specified resolution.
await slide.SaveAsImageAsync(imageStream, renderingOptions);
//Closes the presentation instance
pptxDoc.Close();
```

The following code snippet demonstrates how to convert a PowerPoint slide to image by passing 'CancellationToken'.

C#

```
//Load the presentation file using open picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.FileTypeFilter.Add(".pptx");
StorageFile inputFile = await openPicker.PickSingleFileAsync();
pptxDoc = await Presentation.OpenAsync(inputFile);
//Initialize the ChartToImageConverter instance to convert the charts in the
slides.
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Pick the folder to save the converted images.
FolderPicker folderPicker = new FolderPicker();
folderPicker.ViewMode = PickerViewMode.Thumbnail;
folderPicker.FileTypeFilter.Add("*");
StorageFolder storageFolder = await folderPicker.PickSingleFolderAsync();
//Create a cancellation token to cancel the image rendering instantly.
CancellationTokensource cancellationToken = new CancellationTokensource();
//Convert the slide to image.
int slideNumber = 1;
foreach (ISlide slide in pptxDoc.Slides)
{
    StorageFile imageFile = await storageFolder.CreateFileAsync("Slide" +
slideNumber++ + ".jpg", CreationCollisionOption.ReplaceExisting);
    await slide.SaveAsImageAsync(imageFile, cancellationToken.Token);
}
//Close the Presentation instance
pptxDoc.Close();
```

Note: 1. PowerPoint Presentation to image conversion is supported in Blazor server-side application alone and is not supported in Blazor client-side application.

2. Instance of **ChartToImageConverter** class is mandatory to convert the charts present in the Presentation to image. Otherwise, the charts in the presentation are not exported to the converted image

3. **ChartToImageConverter** is supported from .NET Framework 4.0 onward

4. The assembly "Syncfusion.SfChart.WPF" is non compliance with FIPS(Federal Information Processing Standard) algorithm policy.

5. EMF images in the PowerPoint slides will not be converted in UWP due to platform limitation.

6. Radial gradient, rectangular gradient and path gradient brushes are not supported in UWP due to platform limitation. These brushes are rendered as linear gradient brush in our UWP slide to image conversion.

Font substitution for unavailable fonts

When a font used in a PowerPoint presentation is unavailable in the environment where it is converted to image, then the library substitutes the 'Microsoft Sans Serif' as a default font for text rendering. This leads to a difference in text layouts of PowerPoint presentation and the converted image. To avoid this, the Essential Presentation library allows you to set an alternate font for the missing font used in the PowerPoint presentation.

Note: Font substitution for Unavailable fonts is not supported in UWP platform.

The following code sample demonstrates how to set a substitute font for a missing font while converting a PowerPoint presentation to image.

C#

```
//Load the PowerPoint presentation and convert to image
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
    //Initialize 'ChartToImageConverter' to convert charts in the slides, and
    this is optional
    pptxDoc.ChartToImageConverter = new ChartToImageConverter();
    // Initializes the 'SubstituteFont' event to set the replacement font
    pptxDoc.FontSettings.SubstituteFont += FontSettings_SubstituteFont;
    //Converts the first slide into image
    Image image =
    pptxDoc.Slides[0].ConvertToImage(Syncfusion.Drawing.ImageType.Metafile);
    //Saves the image as file
    image.Save("slide1.png");
    //Disposes the image
    image.Dispose();
}
/// <summary>
/// Sets the alternate font when a specified font is unavailable in the
production environment
/// </summary>
/// <param name="sender">FontSettings type of the Presentation in which the
specified font is used but unavailable in production environment. </param>
/// <param name="args">Retrieves the unavailable font name and receives the
substitute font name for conversion. </param>
private static void FontSettings_SubstituteFont(object sender,
SubstituteFontEventArgs args)
{
    if (args.OriginalFontName == "Arial Unicode MS")
        args.AlternateFontName = "Arial";
    else
        args.AlternateFontName = "Times New Roman";
}
```

VB.NET

```
'Load the PowerPoint presentation and convert to image
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Initialize 'ChartToImageConverter' to convert charts in the slides, and
this is optional
pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Initializes the 'SubstituteFont' event to set the replacement font
AddHandler pptxDoc.FontSettings.SubstituteFont, AddressOf SubstituteFont
'Convert the PowerPoint presentation to image.
Dim image As Image =
pptxDoc.Slides(0).ConvertToImage(Syncfusion.Drawing.ImageType.Metafile)
'Save the image.
image.Save("slide1.png")
'Dispose the Presentation instance
pptxDoc.Dispose()
'Dispose the image
```

```

image.Dispose()
''' <summary>
''' Sets the alternate font when a specified font is unavailable in the
production environment
''' </summary>
''' <param name="sender">FontSettings type of the Presentation in which the
specified font is used but unavailable in production environment. </param>
''' <param name="args">Retrieves the unavailable font name and receives the
substitute font name for conversion. </param>
Private Sub SubstituteFont(ByVal sender As Object, ByVal args As
SubstituteFontEventArgs)
' Sets the alternate font when a specified font is not installed in the
production environment
If args.OriginalFontName = "Arial Unicode MS" Then
args.AlternateFontName = "Arial"
Else
args.AlternateFontName = "Times New Roman"
End If
End Sub

```

Presentation to PDF conversion

PowerPoint allows you to convert an entire Presentation or a single slide into PDF document. Refer to the following links for assemblies/nuget packages required based on platforms to convert PowerPoint document into PDF.

- [Assemblies Information](#)
- [NuGet Information](#)

PresentationToPdfConverter class is responsible for converting an entire Presentation or a slide into PDF. The following code example demonstrates how to convert a PowerPoint presentation to PDF.

C#

```

//Namespaces to perform PPTX to PDF conversion
using Syncfusion.OfficeChartToImageConverter;
using Syncfusion.Presentation;
using Syncfusion.PresentationToPdfConverter;
using Syncfusion.Pdf;
//Opens a PowerPoint Presentation
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Creates an instance of ChartToImageConverter and assigns it to
ChartToImageConverter property of Presentation
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Converts the PowerPoint Presentation into PDF document
PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc);
//Saves the PDF document
pdfDocument.Save("Sample.pdf");
//Closes the PDF document
pdfDocument.Close(true);
//Closes the Presentation
pptxDoc.Close();

```

VB.NET

```

'Namespaces to perform PPTX to PDF conversion
Imports Syncfusion.OfficeChartToImageConverter
Imports Syncfusion.Presentation
Imports Syncfusion.PresentationToPdfConverter
Imports Syncfusion.Pdf
'Opens a PowerPoint Presentation
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Creates an instance of ChartToImageConverter and assigns it to
ChartToImageConverter property of Presentation
pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Converts the PowerPoint Presentation into PDF document
Dim pdfDocument As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc)
'Saves the PDF document
pdfDocument.Save("Sample.pdf")
'Closes the PDF document
pdfDocument.Close(True)
'Closes the Presentation
pptxDoc.Close()

```

ASP.NET CORE

```

//Namespaces to perform PPTX to PDF conversion
using Syncfusion.Pdf;
using Syncfusion.Presentation;
using Syncfusion.PresentationToPdfConverter;
using System.IO;
//Load the PowerPoint presentation into stream.
using (FileStream fileStreamInput = new FileStream(@"Template.pptx",
FileMode.Open, FileAccess.Read))
{
//Open the existing PowerPoint presentation with loaded stream.
using (IPresentation pptxDoc = Presentation.Open(fileStreamInput))
{
//Create the MemoryStream to save the converted PDF.
using (MemoryStream pdfStream = new MemoryStream())
{
//Convert the PowerPoint document to PDF document.
using (PdfDocument pdfDocument =
PresentationToPdfConverter.Convert(pptxDoc))
{
//Save the converted PDF document to MemoryStream.
pdfDocument.Save(pdfStream);
pdfStream.Position = 0;
}
}
//Create the output PDF file stream
using (FileStream fileStreamOutput = File.Create("Output.pdf"))
{
//Copy the converted PDF stream into created output PDF stream
pdfStream.CopyTo(fileStreamOutput);
}
}
}
}

```

XAMARIN

```
//Namespaces to perform PPTX to PDF conversion
using Syncfusion.Pdf;
using Syncfusion.Presentation;
using Syncfusion.PresentationToPdfConverter;
using System.IO;
//Load the PowerPoint presentation into stream.
using (FileStream fileStreamInput = new FileStream(@"Template.pptx",
    FileMode.Open, FileAccess.Read))
{
    //Open the existing PowerPoint presentation with loaded stream.
    using (IPresentation pptxDoc = Presentation.Open(fileStreamInput))
    {
        //Create the MemoryStream to save the converted PDF.
        using (MemoryStream pdfStream = new MemoryStream())
        {
            //Convert the PowerPoint document to PDF document.
            using (PdfDocument pdfDocument =
                PresentationToPdfConverter.Convert(pptxDoc))
            {
                //Save the converted PDF document to MemoryStream.
                pdfDocument.Save(pdfStream);
                pdfStream.Position = 0;
            }
            //Create the output PDF file stream
            using (FileStream fileStreamOutput = File.Create("Output.pdf"))
            {
                //Copy the converted PDF stream into created output PDF stream
                pdfStream.CopyTo(fileStreamOutput);
            }
        }
    }
}
```

Note: 1. PowerPoint Presentation to PDF conversion is supported in Blazor server-side application alone and is not supported in Blazor client-side application.

2. Creating an instance of **ChartToImageConverter** class is mandatory to convert the charts present in the Presentation to PDF. Otherwise, the charts are not exported to the converted PDF

3. **ChartToImageConverter** is supported from .NET Framework 4.0 onwards

4. The assembly "Syncfusion.SfChart.WPF" is non compliance with FIPS(Federal Information Processing Standard) algorithm policy.

Customizing the PowerPoint Presentation to PDF conversion

Essential Presentation library provides you the ability to customize the Presentation to PDF conversion with the following options:

- Specify the number of slides per PDF page with 'Handouts' option.
- Convert slides with notes pages to PDF.
- Embed fonts in a PowerPoint file into the converted PDF document to avoid font-related issues across different machines and different platforms.
- Convert a PowerPoint document to PDF with the PDF-A1B conformance standards.
- Specify fallback fonts to be used in place of missing fonts.

- Skip or include hidden slides
- Set the quality of images in the PowerPoint slides to reduce the converted PDF document size.

Font substitution for unavailable fonts

When a font used in a PowerPoint presentation is unavailable in the environment where it is converted to PDF, then the library substitutes the 'Microsoft Sans Serif' as a default font for text rendering. This leads to a difference in text layouts of PowerPoint presentation and the converted PDF document. To avoid this, the Essential Presentation library allows you to set an alternate font for the missing font used in the PowerPoint presentation.

Set alternate font

The following code example demonstrates how to set alternate font name for a missing font while converting a PowerPoint presentation to PDF. The provided alternate font should be installed in the production environment.

C#

```
//Load the PowerPoint presentation and convert to PDF
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))
{
    //Initialize 'ChartToImageConverter' to convert charts in the slides, and
    //this is optional
    pptxDoc.ChartToImageConverter = new ChartToImageConverter();
    // Initializes the 'SubstituteFont' event to set the replacement font
    pptxDoc.FontSettings.SubstituteFont += FontSettings_SubstituteFont;
    //Convert the PowerPoint presentation to PDF file
    using (PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc))
    {
        //Save the PDF file
        pdfDoc.Save("Sample.pdf");
    }
}

/// <summary>
/// Sets the alternate font when a specified font is unavailable in the
/// production environment
/// </summary>
/// <param name="sender">FontSettings type of the Presentation in which the
/// specified font is used but unavailable in production environment. </param>
/// <param name="args">Retrieves the unavailable font name and receives the
/// substitute font name for conversion. </param>
private static void FontSettings_SubstituteFont(object sender,
SubstituteFontEventArgs args)
{
    if (args.OriginalFontName == "Arial Unicode MS")
        args.AlternateFontName = "Arial";
    else
        args.AlternateFontName = "Times New Roman";
}
```

VB.NET

```
'Load the PowerPoint presentation and convert to PDF
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Initialize 'ChartToImageConverter' to convert charts in the slides, and
this is optional
```

```

pptxDoc.ChartToImageConverter = New ChartToImageConverter()
'Initializes the 'SubstituteFont' event to set the replacement font
AddHandler pptxDoc.FontSettings.SubstituteFont, AddressOf SubstituteFont
'Convert the PowerPoint presentation to PDF file
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc)
'Save the PDF file.
pdfDoc.Save("Sample.pdf")
'Dispose the PowerPoint presentation instance
pptxDoc.Dispose()
'Dispose the PDF document instance
pdfDoc.Dispose()
''' <summary>
''' Sets the alternate font when a specified font is unavailable in the
production environment
''' </summary>
''' <param name="sender">FontSettings type of the Presentation in which the

args.AlternateFontName = "Times New Roman"
End If
End Sub

```

ASP.NET CORE

```

//Load the PowerPoint presentation as stream
using (FileStream fileStream = new FileStream("Sample.pptx",
FileMode.Create))
{
//Load the PowerPoint presentation from stream
using (IPresentation pptxDoc = Presentation.Open(fileStream))
{
// Initializes the 'SubstituteFont' event to set the replacement font
pptxDoc.FontSettings.SubstituteFont += SubstituteFont;
//Convert the PowerPoint presentation to PDF file
PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc);
//Create new instance of file stream
FileStream pdfStream = new FileStream("Output.pdf", FileMode.Create);
//Save the generated PDF to file stream
pdfDocument.Save(pdfStream);
//Release all resources
pdfStream.Dispose();
pdfDocument.Close(true);
}
}
/// <summary>
/// Sets the alternate font when a specified font is unavailable in the
production environment
/// </summary>

```

```

/// <param name="sender">FontSettings type of the Presentation in which the
specified font is used but unavailable in production environment. </param>
/// <param name="args">Retrieves the unavailable font name and receives the

private static void SubstituteFont(object sender, SubstituteFontEventArgs
args)
{
if (args.OriginalFontName == "Arial Unicode MS")
args.AlternateFontName = "Arial";
else
args.AlternateFontName = "Times New Roman";
}

```

XAMARIN

```

// "App" is the class of Portable project.
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
// Opens the PowerPoint presentation
using (IPresentation pptxDoc =
Presentation.Open(assembly.GetManifestResourceStream("GettingStarted.Assets.
Sample.pptx")))
{
// Initializes the 'SubstituteFont' event to set the replacement font
pptxDoc.FontSettings.SubstituteFont += SubstituteFont;
// Convert PowerPoint presentation to PDF
PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc);
// Create new instance of MemoryStream
MemoryStream stream = new MemoryStream();
// Save the Pdf to memory stream
pdfDocument.Save(stream);
stream.Position = 0;
// Save the stream as a file in the device and invoke it for viewing
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.pdf",
"application/pdf", stream);
}
/// <summary>
/// Sets the alternate font when a specified font is unavailable in the
production environment
/// </summary>
/// <param name="sender">FontSettings type of the Presentation in which the
specified font is used but unavailable in production environment. </param>
/// <param name="args">Retrieves the unavailable font name and receives the
substitute font name for conversion. </param>
private static void SubstituteFont(object sender, SubstituteFontEventArgs
args)
{
if (args.OriginalFontName == "Arial Unicode MS")
args.AlternateFontName = "Arial";
else
args.AlternateFontName = "Times New Roman";
}

```

Upload font stream

The following code example demonstrates how to upload a font stream for missing font while converting a PowerPoint presentation to PDF. The provided alternate font stream is not mandatory to be installed in the production environment.

C#

```
//Load the PowerPoint presentation and convert to PDF
using (IPresentation pptxDoc = Presentation.Open("Sample.pptx"))

Show Warning for unsupported elements

The Presentation library shows warning message about the unsupported elements such as Metafile images and charts (supported from .NET Standard 2.0) present in the input PowerPoint presentation, during PowerPoint to PDF conversion. It also allows you to cancel or continue the PowerPoint to PDF conversion, when any unsupported elements is present in the input PowerPoint presentation.

The following code example demonstrates how to cancel or continue the PowerPoint presentation to PDF conversion, when an unsupported elements (Metafile and Chart) are present in the input PowerPoint presentation.

C#

```

//Essential Presentation library supports Show warning for unsupported
elements feature in ASP.NET Core, Blazor server-side application and Xamarin
platforms alone.

```

VB.NET

```

//Essential Presentation supports library Show warning for unsupported
elements feature in ASP.NET Core, Blazor server-side application and Xamarin
platforms alone.

```

ASP.NET CORE

```

// Open the file as Stream
using (FileStream pptStream = new FileStream("Template.pptx", FileMode.Open,
FileAccess.Read))
{
//Open the existing PowerPoint presentation with loaded stream.
using (IPresentation pptxDoc = Presentation.Open(pptStream))
{
//Instantiation of PresentationToPdfConverterSettings
PresentationToPdfConverterSettings settings = new
PresentationToPdfConverterSettings();
//Gets all the warnings into the collection
settings.Warning = new DocumentWarning();
//Converts the PowerPoint Presentation into PDF document
using (PdfDocument pdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
settings))
{
//If the PowerPoint to Pdf conversion has been stopped, IsCanceled value
will be True, otherwise false
if (!PresentationToPdfConverter.IsCanceled)
{
//Saves the PDF file

```

```

using (FileStream outputStream = new FileStream("Output.pdf",
    FileMode.OpenOrCreate, FileAccess.ReadWrite))
{
    pdfDocument.Save(outputStream);
    outputStream.Position = 0;
}
}
else
{
    Console.WriteLine("PowerPoint to PDF conversion is stopped , please press
any key to exit the application");
    Console.ReadKey();
}
}
}
}

    }
}
return isContinueConversion;
}
}

```

Handouts

The Presentation library allows you to convert a PowerPoint presentation to PDF document with 'Handouts' option. Thus, the library allows selecting the number of slides to be included per PDF page. This helps converting multiple PowerPoint slides within a single PDF page.

The following code sample demonstrates how to convert a PowerPoint presentation to PDF document with 'Handouts' property.

C#

```

//Load the PowerPoint presentation to convert.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Enable the handouts and number of pages per slide options in converter
settings.
PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
pdfConverterSettings.PublishOptions = PublishOptions.Handouts;
pdfConverterSettings.SlidesPerPage = SlidesPerPage.Nine;
//Convert the documents by passing the PDF conversion settings as parameter.
PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings);
//Save the converted PDF document.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();

```

VB.NET

```

'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Enable the handouts and number of pages per slide options in converter
settings.

```

```

Dim pdfConverterSettings As PresentationToPdfConverterSettings = new
PresentationToPdfConverterSettings()
pdfConverterSettings.PublishOptions = PublishOptions.Handouts
pdfConverterSettings.SlidesPerPage = SlidesPerPage.Nine
'Convert the documents by passing the PDF conversion settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings)
'Save the converted PDF document.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance
pdfDoc.Close()

```

Notes pages

The Presentation library allows you to convert a PowerPoint presentation to PDF document with 'notes pages' option, which will includes the notes content while PDF conversion.

The following code sample demonstrates how to convert a PowerPoint presentation to PDF with 'notes pages'.

C#

```

//Load the PowerPoint presentation to convert.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Enable the include hidden slides option in converter settings.
PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
pdfConverterSettings.PublishOptions = PublishOptions.NotesPages;
//Convert the documents by passing the settings as parameter.
PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings);
//Save the converted PDF file.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();

```

VB.NET

```

'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Enable the include hidden slides option in converter settings.
Dim pdfConverterSettings As PresentationToPdfConverterSettings
pdfConverterSettings = new PresentationToPdfConverterSettings()
pdfConverterSettings.PublishOptions = PublishOptions.NotesPages
'Convert the documents by passing the settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings)
'Save the converted PDF file.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance

```

```
pdfDoc.Close()
```

Include hidden slides

The PowerPoint presentation supports hiding the slides in a presentation document. The hidden slides will not be included in the converted PDF document, by default. The Presentation library provides support to include or exclude the hidden slides while converting a PowerPoint presentation to PDF document.

The following code sample demonstrates how to include the hidden slides while converting a PowerPoint presentation to PDF document.

C#

```
//Load the PowerPoint presentation to convert.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Enable or disable including the hidden slides option in converter settings.
PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
pdfConverterSettings.ShowHiddenSlides = true;
//Convert the documents by passing the settings as parameter.
PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings);
//Save the converted PDF file.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();
```

VB.NET

```
'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Enable or disable including the hidden slides option in converter settings.
Dim pdfConverterSettings As PresentationToPdfConverterSettings = new
PresentationToPdfConverterSettings()
pdfConverterSettings.ShowHiddenSlides = true
'Convert the documents by passing the settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings)
'Save the converted PDF file.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance
pdfDoc.Close()
```

PDF Conformance

Essential Presentation currently supports following PDF conformances while converting a PowerPoint document to PDF.

- PDF/A-1b conformance

- PDF/X-1a conformance

Note: 1. To know more details about PDF/A standard refer

<https://en.wikipedia.org/wiki/PDF/A#Description>

2. To know more details about PDF/X standard refer <https://en.wikipedia.org/wiki/PDF/X>

The following code sample demonstrates how to set the PDF conformance level while PowerPoint presentation to PDF conversion.

C#

```
//Load the PowerPoint document
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Initialize the conversion settings
PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
//Set the Pdf conformance level to A1B
pdfConverterSettings.PdfConformanceLevel = PdfConformanceLevel.Pdf_A1B;
//Convert the PowerPoint document to PDF
PdfDocument pdfDoc =
PresentationToPdfConverter.Convert(pptxDoc,pdfConverterSettings);
//Save the converted PDF file.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();
```

VB.NET

```
'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Enable or disable including the hidden slides option in converter settings.
Dim pdfConverterSettings As PresentationToPdfConverterSettings = new
PresentationToPdfConverterSettings()
'Set the Pdf conformance level to A1B
pdfConverterSettings.PdfConformanceLevel = PdfConformanceLevel.Pdf_A1B
'Convert the documents by passing the settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings)
'Save the converted PDF file.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance
pdfDoc.Close()
```

Chart quality

The Presentation library provides an option to decide the quality of the charts to optimize the converted PDF document size.

Note: The default 'ScalingMode' for charts is 'ScalingMode.Normal'.

Setting the 'Best' scaling mode will improve the quality of the converted charts and increase the converted PDF document size.

The following code sample demonstrates how to set the quality of the charts while PowerPoint presentation to PDF conversion

C#

```
//Load the PowerPoint presentation to convert.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Create an instance of ChartToImageConverter and assigns it to
ChartToImageConverter property of Presentation
pptxDoc.ChartToImageConverter = new ChartToImageConverter();
//Sets the scaling mode of the chart to best.
pptxDoc.ChartToImageConverter.ScalingMode = ScalingMode.Best;
//Convert the documents by passing the PDF conversion settings as parameter.
PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc);
//Save the converted PDF document.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();
```

VB.NET

```
'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Create an instance of ChartToImageConverter and assigns it to
ChartToImageConverter property of Presentation
pptxDoc.ChartToImageConverter = new ChartToImageConverter()
'Sets the scaling mode of the chart to best.
pptxDoc.ChartToImageConverter.ScalingMode = ScalingMode.Best
'Convert the documents by passing the PDF conversion settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc)
'Save the converted PDF document.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance
pdfDoc.Close()
```

Optimizing the converted PDF document size

Optimizing the identical images

The presentation library allows you to optimize the memory usage for the duplicate images while converting the PowerPoint presentation to PDF document to reduce the document size.

The following code sample demonstrates how to optimize the duplicate images while converting a PowerPoint presentation to PDF document.

C#

```
//Load the PowerPoint presentation to convert.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Enable the include hidden slides option in converter settings.
```

```

PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
//Set the flag to optimize the identical images
pdfConverterSettings.OptimizeIdenticalImages = true;
//Convert the documents by passing the settings as parameter.
PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings);
//Save the converted PDF file.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();

```

VB.NET

```

'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Enable the include hidden slides option in converter settings.
Dim pdfConverterSettings As PresentationToPdfConverterSettings = new
PresentationToPdfConverterSettings()
'Set the flag to optimize the identical images
pdfConverterSettings.OptimizeIdenticalImages = true
'Convert the documents by passing the settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings)
Save the converted PDF file.
pdfDoc.Save("Sample.pdf")
Close the presentation instance
pptxDoc.Close()
Close the PDF instance
pdfDoc.Close()

```

Optimizing the image quality and resolution

You may have high resolution images in the PowerPoint slides which will impact the size of the converted PDF document. The Presentation library allows you to optimize the document size, by adjusting the quality and resolution of the images while converting the PowerPoint presentation to PDF document.

The following code sample demonstrates how to optimize the image quality and resolution while converting a PowerPoint presentation to PDF document.

C#

```

//Load the PowerPoint presentation to convert.
IPresentation pptxDoc = Presentation.Open("Sample.pptx");
//Enable the include hidden slides option in converter settings.
PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
//Set the image resolution
pdfConverterSettings.ImageResolution = 100;
//Set the image quality
pdfConverterSettings.ImageQuality = 100;
//Convert the documents by passing the settings as parameter.

```

```
PdfDocument pdfDoc = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings);
//Save the converted PDF file.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();
```

VB.NET

```
'Load the PowerPoint presentation to convert.
Dim pptxDoc As IPresentation = Presentation.Open("Sample.pptx")
'Enable the include hidden slides option in converter settings.
Dim pdfConverterSettings As PresentationToPdfConverterSettings = new
PresentationToPdfConverterSettings()
'Set the image resolution
pdfConverterSettings.ImageResolution = 100
'Set the image quality
pdfConverterSettings.ImageQuality = 100
'Convert the documents by passing the settings as parameter.
Dim pdfDoc As PdfDocument = PresentationToPdfConverter.Convert(pptxDoc,
pdfConverterSettings)
'Save the converted PDF file.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance
pdfDoc.Close()
```

PowerPoint to PDF conversion in Azure platform

The Syncfusion PowerPoint library supports converting the PowerPoint document to PDF in Azure platform. The following code sample demonstrates how to convert a PowerPoint presentation to PDF in Azure platform.

C#

```
//Load the PowerPoint document
IPresentation pptxDoc = Presentation.Open("Table.pptx");
//Initialize the conversion settings
PresentationToPdfConverterSettings pdfConverterSettings = new
PresentationToPdfConverterSettings();
//Enable the portable rendering.
pdfConverterSettings.EnablePortableRendering = true;
//Convert the PowerPoint document to PDF
PdfDocument pdfDoc =
PresentationToPdfConverter.Convert(pptxDoc, pdfConverterSettings);
//Save the converted PDF file.
pdfDoc.Save("Sample.pdf");
//Close the presentation instance
pptxDoc.Close();
//Close the PDF instance
pdfDoc.Close();
```

VB.NET

```

'Load the PowerPoint document
Dim pptxDoc As IPresentation = Presentation.Open("Table.pptx")
'Initialize the conversion settings
Dim pdfConverterSettings As PresentationToPdfConverterSettings = new
PresentationToPdfConverterSettings()
'Enable the portable rendering.
pdfConverterSettings.EnablePortableRendering = true
'Convert the PowerPoint document to PDF
Dim pdfDoc As PdfDocument =
PresentationToPdfConverter.Convert(pptxDoc,pdfConverterSettings)
'Save the converted PDF file.
pdfDoc.Save("Sample.pdf")
'Close the presentation instance
pptxDoc.Close()
'Close the PDF instance
pdfDoc.Close()

```

FAQ's

1. Why I get an exception when trying to load a PPT file?

The current version of Presentation library supports only .PPTX format - Microsoft Office 2007 and later version.

2. Is it possible to print the Presentation slides?

Yes, you can print the PowerPoint presentations by using its ability to convert the slides as images and by using the [PrintDocument](#) class. For more details, refer to [Printing](#)

3. Does adding audio and video to a Presentation is supported?

At present, there is no support to add audio and video to Presentation by using Essential Presentation library.

4. What measure does Essential Presentation use to add slide elements such as textbox, shape, picture and charts?

We use Points to add any slide elements in a Presentation.

5. Does Essential Presentation supports cloning a slide in the Presentation?

Yes, Essential Presentation library supports cloning as follows:

- Slide in the Presentation can be cloned from one Presentation to another or within a same Presentation.
 - An entire Presentation can also be cloned as an independent copy of the original.
- 6. Could not find Syncfusion.OfficeChartToImageConverter assembly in .NET 3.5 Framework, does it mean there is no support for chart conversion in this framework?**

Yes, OfficeChartToImageConverter assembly is not supported in .NET 3.5 Framework and it is available from .NET 4.0 Framework.

7. Can chart data be refreshed?

Yes, Essential Presentation supports refreshing the chart data. For more details, refer to [Working with charts](#)

8. Is it possible to convert 3D charts to PDF or image?

Current version of the Essential Presentation library does not provide support for converting 3D charts to PDF or image format.

9. How to improve the image quality while converting the Presentation slides to image?

You can improve the quality of converted images by specifying the image resolution. Refer – [Converting PowerPoint presentation to Images](#)

XlsIO

Overview

Essential XlsIO is a native **.NET** class library that can be used to create and modify **Microsoft Excel** files by using C#, VB.NET and managed C++ code. It is a non-UI component that provides a full-fledged object model that facilitates accessing & manipulating the spreadsheets without any dependency of Microsoft Office COM libraries & Microsoft Office.

The library can be used in Windows Forms, WPF, UWP, ASP.NET Web Forms, ASP.NET MVC, ASP.NET Core, Xamarin and Blazor applications.

Key Features

- Support to [create Excel documents](#) from scratch.
- Support to [modify](#) existing Excel documents.
- Support to [import and export](#) data.
- Supports Excel [formulas](#).
- Ability to create and manipulate [Conditional Formats](#) and [Data Validations](#).
- Create and manipulate [Charts](#) and [Sparklines](#).
- Supports creation and manipulation of [Tables](#), [Pivot Tables](#) and [Pivot Charts](#).
- Fill data using [Template Markers](#).
- [Clone and merge](#) Excel worksheets.
- [Encrypt and decrypt](#) Excel documents.
- Convert Excel [worksheets to images](#).
- Convert [chart in a worksheet to image](#).
- Supports [data filtering](#) and [data sorting](#).
- Support to insert [Images](#) and [AutoShapes](#).
- Support to add [Comments](#) and [Form Controls](#).
- Support to add [Ole objects](#) and [Group Shapes](#).
- Ability to convert Excel [workbook to PDF](#).
- Converts Excel [worksheet to HTML](#).
- Support to open and create [CSV](#) files.
- Support to open and create SpreadsheetML files.
- Access the [Custom document properties](#) of Excel file.
- Access the Built-in document properties.

Compatible Microsoft Excel Versions

- Microsoft Excel 97-2003
- Microsoft Excel 2007
- Microsoft Excel 2010
- Microsoft Excel 2013
- Microsoft Excel 2016
- Microsoft Excel 2019

Assemblies Required

The following assemblies need to be referenced in your application based on the platform.

Platform(s)	Assembly
-------------	----------

WPF, Windows Forms, ASP. NET and ASP.NET MVC	Syncfusion.XlsIO.Base Syncfusion.Compression.Base
Windows Forms and WPF (Client Profile)	Syncfusion.XlsIO.ClientProfile Syncfusion.Compression.Base
Universal Windows Platform	Syncfusion.XlsIO.UWP
.NET Core, Xamarin and Blazor	Syncfusion.XlsIO.Portable Syncfusion.Compression.Portable
WinRT (Windows Store applications)	Syncfusion.XlsIO.WinRT
Windows Phone 8	Syncfusion.XlsIO.WP8 Syncfusion.Compression.WP8
Windows Phone 8.1 Silverlight	Syncfusion.XlsIO.WPSilverlight Syncfusion.Compression.WPSilverlight
Windows Phone 8.1 WinRT	Syncfusion.XlsIO.WP Syncfusion.Compression.WP
Silverlight	Syncfusion.XlsIO.Silverlight Syncfusion.Compression.Silverlight
ASP.NET (Classic)	Syncfusion.XlsIO.Web Syncfusion.Compression.Base
ASP.NET MVC (Classic)	Syncfusion.XlsIO.MVC Syncfusion.Compression.Base
Universal (Classic)	Syncfusion.XlsIO.Universal

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to add "Syncfusion.Licensing" assembly reference and include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your applications to use our components.

Note: Syncfusion components are available in nuget.org

Converting Excel document to PDF

For converting an Excel document to PDF, the following assemblies need to be referenced in your application.

Platform(s)	Assembly
WPF, Windows Forms, ASP. NET and ASP.NET MVC	Syncfusion.XlsIO.Base Syncfusion.Compression.Base Syncfusion.Pdf.Base Syncfusion.ExcelToPDFConverter.Base
Windows Forms and WPF (Client Profile)	Syncfusion.XlsIO.ClientProfile Syncfusion.Compression.Base

	Syncfusion.Pdf.ClientProfile Syncfusion.ExcelToPDFConverter.ClientProfile
UWP, .NET Core, Xamarin and Blazor (Server-Side)	Syncfusion.Compression.Portable Syncfusion.XlsIO.Portable Syncfusion.Pdf.Portable Syncfusion.SkiaSharpHelper.Portable Syncfusion.XlsIORenderer.Portable

Note: Excel to PDF conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards.

Converting Excel Worksheet to Image

For converting an Excel worksheet to image, the following assemblies need to be referenced in your application.

Platform(s)	Assembly
Windows Forms, WPF, ASP.NET and ASP.NET MVC	Syncfusion.Compression.Base Syncfusion.XlsIO.Base
UWP, .NET Core, Xamarin and Blazor (Server-Side)	Syncfusion.Compression.Portable Syncfusion.XlsIO.Portable Syncfusion.SkiaSharpHelper.Portable Syncfusion.XlsIORenderer.Portable

Note: Worksheet to image conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards.

Converting Excel Chart to Image

For converting an Excel chart to image, the following assemblies need to be referenced in your application.

Platform(s)	Assembly
WPF, Windows Forms, ASP. NET and ASP.NET MVC	Syncfusion.Compression.Base Syncfusion.XlsIO.Base Syncfusion.ExcelChartToImageConverter.WPF Syncfusion.SfChart.WPF
UWP, .NET Core, Xamarin and Blazor (Server-Side)	Syncfusion.Compression.Portable Syncfusion.XlsIO.Portable Syncfusion.SkiaSharpHelper.Portable Syncfusion.XlsIORenderer.Portable

Note: Chart to image conversion is supported from .NET Framework 4.0 and .NET Standard 2.0 onwards.

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your applications to use our components.

NuGet Packages Required

To work with Excel documents, the following NuGet packages need to be installed in your application.

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.XlsIO.WinForms.nupkg
WPF	Syncfusion.XlsIO.Wpf.nupkg
.NET Framework 3.5 or 4.0 Client Profile	Syncfusion.XlsIO.ClientProfile.nupkg
ASP.NET Web Forms, ASP.NET Core (Targeting .NET Framework)	Syncfusion.XlsIO.AspNet.nupkg
ASP.NET MVC4	Syncfusion.XlsIO.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.XlsIO.AspNet.Mvc5.nupkg
UWP	Syncfusion.XlsIO.UWP.nupkg
ASP.NET Core (Targeting .NET Core), Console Application	[Syncfusion.XlsIO.Net.Core.nupkg](https://www.nuget.org/packages/Syncfusion.XlsIO.Net.Core/)

(Targeting .NET Core)	
Xamarin	Syncfusion.Xamarin.XlsIO.nupkg
Blazor	{{'Syncfusion.XlsIO.Net.Core.nupkg' Â markdownify }}

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to add "Syncfusion.Licensing" assembly reference and include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your applications to use our components.

Note: From the Essential Studio 2018 Volume 3 release(v16.3.0.21), Syncfusion has changed some of the NuGet package names to search and find the required Syncfusion NuGet packages in nuget.org easily based on the control and its platforms.

Converting Excel document into PDF

For converting Excel document into PDF, the following NuGet packages need to be installed in your application.

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.ExcelToPDFConverter.WinForms.nupkg
WPF	Syncfusion.ExcelToPDFConverter.Wpf.nupkg
.NET Framework 3.5 or 4.0 Client Profile	Syncfusion.ExcelToPdfConverter.ClientProfile.nupkg
ASP.NET Web Forms, ASP.NET Core (Targeting .NET Framework)	Syncfusion.ExcelToPDFConverter.AspNet.nupkg

ASP.NET MVC4	Syncfusion.ExcelToPDFConverter.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.ExcelToPDFConverter.AspNet.Mvc5.nupkg
UWP, ASP.NET Core (Targeting .NET Core), Console Application (Targeting .NET Core)	[Syncfusion.XlsIORenderer.Net.Core.nupkg](https://www.nuget.org/packages/Syncfusion.XlsIORenderer.Net.Core/)
Xamarin	Syncfusion.Xamarin.XlsIORenderer.nupkg
Blazor (Server-Side)	{{' Syncfusion.XlsIORenderer.Net.Core.nupkg ' markdownify }}

Note: Excel to PDF conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards.

Converting Excel Worksheet to Image

For converting an Excel worksheet to image, the following NuGet packages need to be installed in your application.

Platform(s)	NuGet Package
Windows Forms, Console Application (Targeting .NET Framework)	Syncfusion.XlsIO.WinForms.nupkg
WPF	Syncfusion.XlsIO.Wpf.nupkg
.NET Framework 3.5 or	Syncfusion.XlsIO.ClientProfile.nupkg

4.0 Client Profile	
ASP.NET Web Forms, ASP.NET Core (Targeting .NET Framework)	Syncfusion.XlsIO.AspNet.nupkg
ASP.NET MVC4	Syncfusion.XlsIO.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.XlsIO.AspNet.Mvc5.nupkg
UWP, ASP.NET Core (Targeting .NET Core), Console Application (Targeting .NET Core)	[Syncfusion.XlsIORenderer.Net.Core.nupkg](https://www.nuget.org/packages/Syncfusion.XlsIORenderer.Net.Core/)
Xamarin	Syncfusion.Xamarin.XlsIORenderer.nupkg
Blazor (Server-Side)	{{ Syncfusion.XlsIORenderer.Net.Core.nupkg markdownify }}

Note: Worksheet to image conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards.

Converting Charts in XlsIO

The below NuGet package need to be installed additionally to convert the charts present in Excel documents.

Platform(s)	NuGet Package
Windows Forms,	Syncfusion.ExcelChartToImageConverter.WinForms.nupkg

Console Application (Targeting .NET Framework)	
WPF	Syncfusion.ExcelChartToImageConverter.Wpf.nupkg
ASP.NET Web Forms, ASP.NET Core (Targeting .NET Framework)	Syncfusion.ExcelChartToImageConverter.AspNet.nupkg
ASP.NET MVC4	Syncfusion.ExcelChartToImageConverter.AspNet.Mvc4.nupkg
ASP.NET MVC5	Syncfusion.ExcelChartToImageConverter.AspNet.Mvc5.nupkg
UWP, ASP.NET Core (Targeting .NET Core), Console Application (Targeting .NET Core)	[Syncfusion.XlsIORenderer.Net.Core.nupkg](https://www.nuget.org/packages/Syncfusion.XlsIORenderer.Net.Core/)
Xamarin	Syncfusion.Xamarin.XlsIORenderer.nupkg
Blazor (Server-Side)	{{' Syncfusion.XlsIORenderer.Net.Core.nupkg ' markdownify }}

Note: 1. The "Syncfusion.ExcelChartToImageConverter.Wpf.nupkg" NuGet package is only supported from 4.0 .NET Framework onwards.

2. The "Syncfusion.Xamarin.XlsIORenderer.nupkg" or "Syncfusion.XlsIORenderer.Net.Core.nupkg" NuGet packages supports chart to image conversion only from .NET Standard 2.0 onwards.

NuGet Package Installation and Uninstallation

To use NuGet package in your project, please refer the NuGet Package [Installation](#) and [Uninstallation](#) sections.

XlsIO NuGet packages can be installed and uninstalled using Package Manager Console. In Visual Studio, select **Tools > NuGet Package Manager > Package Manager Console** and execute the below commands in respective platforms.

Note: Syncfusion components are available in nuget.org

Platform(s)	Install	UnInstall
Windows Forms	<i>Install-package Syncfusion.XlsIO.WinForms</i> Install-package Syncfusion.ExcelToPdfConverter.WinForms * Install-package Syncfusion.ExcelChartToImageConverter.WinForms	<i>Uninstall-package Syncfusion.XlsIO.WinForms -RemoveDependencies</i> Uninstall-package Syncfusion.ExcelToPdfConverter.WinForms - RemoveDependencies * Uninstall-package Syncfusion.ExcelChartToImageConverter.WinForms -RemoveDependencies
WPF	<i>Install-package Syncfusion.XlsIO.Wpf</i> Install-package Syncfusion.ExcelToPdfConverter.Wpf * Install-package Syncfusion.ExcelChartToImageConverter.Wpf	<i>Uninstall-package Syncfusion.XlsIO.Wpf -RemoveDependencies</i> Uninstall-package Syncfusion.ExcelToPdfConverter.Wpf - RemoveDependencies * Uninstall-package Syncfusion.ExcelChartToImageConverter.Wpf - RemoveDependencies
ASP.NET Web Forms	<i>Install-package Syncfusion.XlsIO.AspNet</i> Install-package Syncfusion.ExcelToPdfConverter.AspNet * Install-package Syncfusion.ExcelChartToImageConverter.AspNet	<i>Uninstall-package Syncfusion.XlsIO.AspNet -RemoveDependencies</i> Uninstall-package Syncfusion.ExcelToPdfConverter.AspNet - RemoveDependencies * Uninstall-package Syncfusion.ExcelChartToImageConverter.AspNet -RemoveDependencies
ASP.NET MVC4	<i>Install-package Syncfusion.XlsIO.AspNet.MVC4</i> Install-package Syncfusion.ExcelToPdfConverter.AspNet.MVC4	<i>Uninstall-package Syncfusion.XlsIO.AspNet.MVC4 -RemoveDependencies</i> Uninstall-package

Getting Started - Create Excel File in C# and VB.NET

This section explains how to create a simple Excel file in C# and VB.NET using XlsIO. The following assemblies must be referred in your application to create and manipulate the Excel document.

Assembly Name	Description
Syncfusion.XlsIO.Base	This assembly contains the core features for creating, reading, and manipulating an Excel file.

Assembly Name	Description
Syncfusion.Compression.Base	This assembly is used to package the Workbook contents.

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to add "Syncfusion.Licensing" assembly reference and include a license key in your projects. Please refer to this [link](#) to know about registering Syncfusion license key in your applications to use our components.

Note: Syncfusion components are available in nuget.org

Include the following namespaces in your .cs or .vb file as shown as follows.

C#

```
using Syncfusion.XlsIO;
```

VB.NET

```
Imports Syncfusion.XlsIO
```

UWP

```
using Syncfusion.XlsIO;
```

ASP.NET CORE

```
using Syncfusion.XlsIO;
```

XAMARIN

```
using Syncfusion.XlsIO;
```

Create a Hello World Excel File

The following code example explains how to create a hello world sample.

C#

```
using Syncfusion.XlsIO;
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the Excel application object
    IApplication application = excelEngine.Excel;
    //Assigns default application version
    application.DefaultVersion = ExcelVersion.Excel2013;
    //A new workbook is created equivalent to creating a new workbook in Excel
    //Create a workbook with 1 worksheet
    IWorkbook workbook = application.Workbooks.Create(1);
    //Access first worksheet from the workbook
```

```

IWorksheet worksheet = workbook.Worksheets[0];
//Adding text to a cell
worksheet.Range["A1"].Text = "Hello World";
//Saving the workbook to disk in XLSX format
workbook.SaveAs("Sample.xlsx");
}

```

VB.NET

```

Imports Syncfusion.XlsIO
'New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
'Instantiate the spreadsheet creation engine
Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the Excel application object
Dim application As IApplication = excelEngine.Excel
'Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013
'A new workbook is created equivalent to creating a new workbook in Excel
'Create a workbook with 1 worksheet
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Access first worksheet from workbook
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding text to a cell
worksheet.Range("A1").Text = "Hello World"
'Saving the workbook to disk in XLSX format
workbook.SaveAs("Sample.xlsx")
End Using

```

UWP

```

using Syncfusion.XlsIO;
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the Excel application object
IApplication application = excelEngine.Excel;
//Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013;
//A new workbook is created equivalent to creating a new workbook in Excel
//Create a workbook with 1 worksheet
IWorkbook workbook = application.Workbooks.Create(1);
//Access first worksheet from the workbook
IWorksheet worksheet = workbook.Worksheets[0];
//Adding text to a cell
worksheet.Range["A1"].Text = "Hello World";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
}

```

```
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

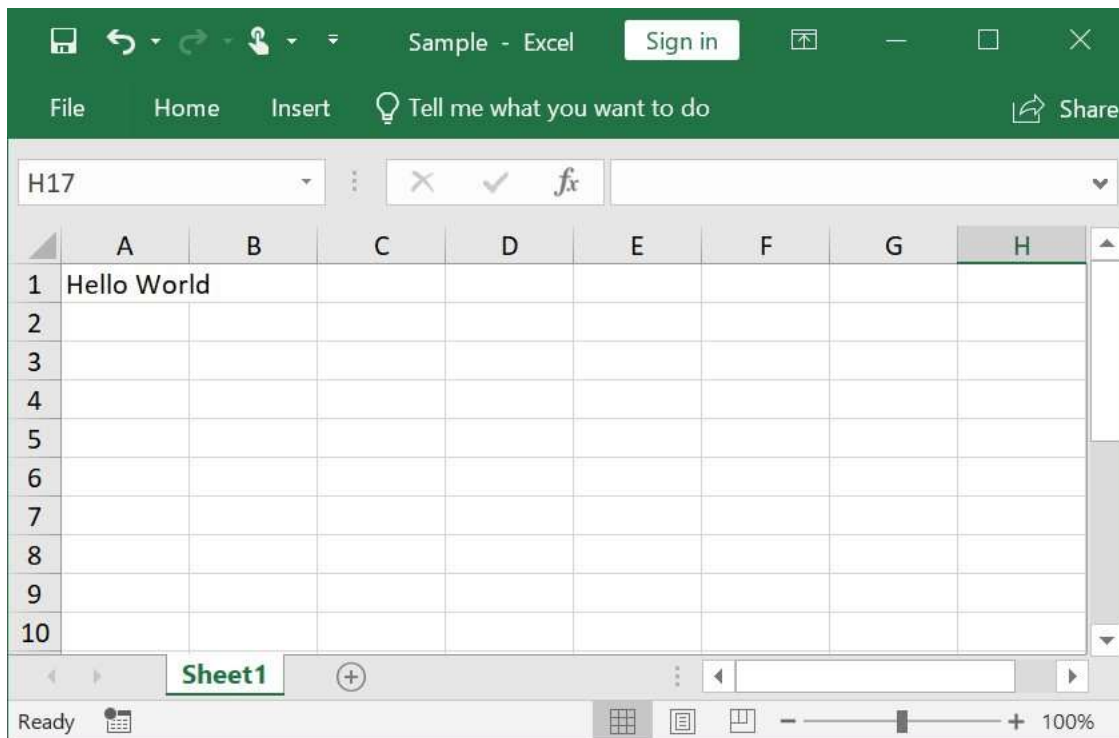

```
using Syncfusion.XlsIO;
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the Excel application object
    IApplication application = excelEngine.Excel;
    //Assigns default application version
    application.DefaultVersion = ExcelVersion.Excel2013;
    //A new workbook is created equivalent to creating a new workbook in Excel
    //Create a workbook with 1 worksheet
    IWorkbook workbook = application.Workbooks.Create(1);
    //Access first worksheet from the workbook
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding text to a cell
    worksheet.Range["A1"].Text = "Hello World";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Sample.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    //Dispose stream
    stream.Dispose();
}
```

XAMARIN

```
using Syncfusion.XlsIO;
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the Excel application object
    IApplication application = excelEngine.Excel;
    //Assigns default application version
    application.DefaultVersion = ExcelVersion.Excel2013;
    //A new workbook is created equivalent to creating a new workbook in Excel
    //Create a workbook with 1 worksheet
    IWorkbook workbook = application.Workbooks.Create(1);
    //Access first worksheet from the workbook
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding text to a cell
    worksheet.Range["A1"].Text = "Hello World";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
```

```
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Sample
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.xlsx",
"application/msexcel", stream);
}
}
```

The output screen-shot of the above code.

Create a Simple Excel File

An instance of the `ExcelEngine` gives access to create an application instance that is similar to launching Microsoft Excel application. The following code snippet shows how to initialize the application object for creating or manipulating Excel documents.

C#

```
//New instance of ExcelEngine is created equivalent to launching Microsoft
//Excel with no workbooks open
//Instantiate the spreadsheet creation engine
ExcelEngine excelEngine = new ExcelEngine();
//Instantiate the Excel application object
IApplication application = excelEngine.Excel;
```

VB.NET

```
'New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
'Instantiate the spreadsheet creation engine
Dim excelEngine As ExcelEngine = New ExcelEngine
'Instantiate the Excel application object
Dim application As IApplication = excelEngine.Excel
```

UWP

```
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
ExcelEngine excelEngine = new ExcelEngine();
//Instantiate the Excel application object
IApplication application = excelEngine.Excel;
```

ASP.NET CORE

```
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
ExcelEngine excelEngine = new ExcelEngine();
//Instantiate the Excel application object
IApplication application = excelEngine.Excel;
```

XAMARIN

```
//New instance of ExcelEngine is created equivalent to launching Microsoft
Excel with no workbooks open
//Instantiate the spreadsheet creation engine
ExcelEngine excelEngine = new ExcelEngine();
//Instantiate the Excel application object
IApplication application = excelEngine.Excel;
```

By default, the Excel version 97 to 2003 (*.xls) is associated with application object. XlsIO writes the excel files in the respective format depending on this excel version. You can modify the default Excel version to Excel 2013 as shown as follows.

C#

```
//Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013;
```

VB.NET

```
'Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013
```

UWP

```
//Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013;
```

ASP.NET CORE

```
//Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013;
```

XAMARIN

```
//Assigns default application version
application.DefaultVersion = ExcelVersion.Excel2013;
```

The workbook contains a collection of worksheets and various workbook-level properties. Each worksheet has cells, which can contain text, numbers, dates, formulas and more. The following code snippet illustrates how to create a workbook and access worksheet instance.

C#

```
//A new workbook is created equivalent to creating a new workbook in Excel
//Create a workbook with 1 worksheet
IWorkbook workbook = application.Workbooks.Create(1);
//Access a worksheet from workbook
IWorksheet worksheet = workbook.Worksheets[0];
```

VB.NET

```
'A new workbook is created equivalent to creating a new workbook in Excel
'Create a workbook with 1 worksheet
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Access a worksheet from workbook
Dim worksheet As IWorksheet = workbook.Worksheets(0)
```

UWP

```
//A new workbook is created equivalent to creating a new workbook in Excel
//Create a workbook with 1 worksheet
IWorkbook workbook = application.Workbooks.Create(1);
//Access a worksheet from workbook
IWorksheet worksheet = workbook.Worksheets[0];
```

ASP.NET CORE

```
//A new workbook is created equivalent to creating a new workbook in Excel
//Create a workbook with 1 worksheet
IWorkbook workbook = application.Workbooks.Create(1);
//Access a worksheet from workbook
IWorksheet worksheet = workbook.Worksheets[0];
```

XAMARIN

```
//A new workbook is created equivalent to creating a new workbook in Excel
//Create a workbook with 1 worksheet
```

```
IWorkbook workbook = application.Workbooks.Create(1);
//Access a worksheet from workbook
IWorksheet worksheet = workbook.Worksheets[0];
```

C#

```
//Adding text data
worksheet.Range["A1"].Text = "Month";
worksheet.Range["B1"].Text = "Sales";
worksheet.Range["A6"].Text = "Total";
//Adding DateTime data
worksheet.Range["A2"].DateTime = new DateTime(2015, 1, 10);
worksheet.Range["A3"].DateTime = new DateTime(2015, 2, 10);
worksheet.Range["A4"].DateTime = new DateTime(2015, 3, 10);
//Applying number format for date value cells A2 to A4
worksheet.Range["A2:A4"].NumberFormat = "mmmm, yyyy";
//Auto-size the first column to fit the content
worksheet.AutofitColumn(1);
//Adding numeric data
worksheet.Range["B2"].Number = 68878;
worksheet.Range["B3"].Number = 71550;
worksheet.Range["B4"].Number = 72808;
//Adding formula
worksheet.Range["B6"].Formula = "SUM(B2:B4)";
```

VB.NET

```
'Adding text data
worksheet.Range("A1").Text = "Month"
worksheet.Range("B1").Text = "Sales"
worksheet.Range("A6").Text = "Total"
'Adding DateTime data
worksheet.Range("A2").DateTime = new DateTime(2015, 1, 10)
worksheet.Range("A3").DateTime = new DateTime(2015, 2, 10)
worksheet.Range("A4").DateTime = new DateTime(2015, 3, 10)
'Applying number format for date value cells A2 to A4
worksheet.Range("A2:A4").NumberFormat = "mmmm, yyyy"
'Auto-size the first column to fit the content
worksheet.AutofitColumn(1)
'Adding numeric data
worksheet.Range("B2").Number = 68878
worksheet.Range("B3").Number = 71550
worksheet.Range("B4").Number = 72808
'Adding formula
worksheet.Range("B6").Formula = "SUM(B2:B4) "
```

UWP

```
//Adding text data
worksheet.Range["A1"].Text = "Month";
worksheet.Range["B1"].Text = "Sales";
worksheet.Range["A6"].Text = "Total";
//Adding DateTime data
worksheet.Range["A2"].DateTime = new DateTime(2015, 1, 10);
worksheet.Range["A3"].DateTime = new DateTime(2015, 2, 10);
```

```

worksheet.Range["A4"].DateTime = new DateTime(2015, 3, 10);
//Applying number format for date value cells A2 to A4
worksheet.Range["A2:A4"].NumberFormat = "mmmm, yyyy";
//Auto-size the first column to fit the content
worksheet.AutofitColumn(1);
//Adding numeric data
worksheet.Range["B2"].Number = 68878;
worksheet.Range["B3"].Number = 71550;
worksheet.Range["B4"].Number = 72808;
//Adding formula
worksheet.Range["B6"].Formula = "SUM(B2:B4)";

```

ASP.NET CORE

```

//Adding text data
worksheet.Range["A1"].Text = "Month";
worksheet.Range["B1"].Text = "Sales";
worksheet.Range["A6"].Text = "Total";
//Adding DateTime data
worksheet.Range["A2"].DateTime = new DateTime(2015, 1, 10);
worksheet.Range["A3"].DateTime = new DateTime(2015, 2, 10);
worksheet.Range["A4"].DateTime = new DateTime(2015, 3, 10);
//Applying number format for date value cells A2 to A4
worksheet.Range["A2:A4"].NumberFormat = "mmmm, yyyy";
//Auto-size the first column to fit the content
worksheet.AutofitColumn(1);
//Adding numeric data
worksheet.Range["B2"].Number = 68878;
worksheet.Range["B3"].Number = 71550;
worksheet.Range["B4"].Number = 72808;
//Adding formula
worksheet.Range["B6"].Formula = "SUM(B2:B4)";

```

XAMARIN

```

//Adding text data
worksheet.Range["A1"].Text = "Month";
worksheet.Range["B1"].Text = "Sales";
worksheet.Range["A6"].Text = "Total";
//Adding DateTime data
worksheet.Range["A2"].DateTime = new DateTime(2015, 1, 10);
worksheet.Range["A3"].DateTime = new DateTime(2015, 2, 10);
worksheet.Range["A4"].DateTime = new DateTime(2015, 3, 10);
//Applying number format for date value cells A2 to A4
worksheet.Range["A2:A4"].NumberFormat = "mmmm, yyyy";
//Auto-size the first column to fit the content
worksheet.AutofitColumn(1);
//Adding numeric data
worksheet.Range["B2"].Number = 68878;
worksheet.Range["B3"].Number = 71550;
worksheet.Range["B4"].Number = 72808;
//Adding formula
worksheet.Range["B6"].Formula = "SUM(B2:B4)";

```

The following code snippet shows how to add an image into the worksheet.

C#

```
//Inserting image  
worksheet.Pictures.AddPicture(10, 2, "image.jpg");
```

VB.NET

```
'Inserting image  
worksheet.Pictures.AddPicture(10, 2, "image.jpg")
```

UWP

```
//Inserting image  
//"App" is the class of Portable project  
Assembly assembly = typeof(App).GetTypeInfo().Assembly;  
Stream imageStream =  
assembly.GetManifestResourceStream("UWP.Data.image.jpg");  
worksheet.Pictures.AddPicture(10, 2, imageStream);
```

ASP.NET CORE

```
//Inserting image  
FileStream imageStream = new FileStream("image.jpg", FileMode.Open,  
FileAccess.Read);  
worksheet.Pictures.AddPicture(10, 2, imageStream);
```

XAMARIN

```
//Inserting image  
//"App" is the class of Portable project  
Assembly assembly = typeof(App).GetTypeInfo().Assembly;  
Stream imageStream =  
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.image.jpg");  
worksheet.Pictures.AddPicture(10, 2, imageStream);
```

Finally, save the document in file system and close/dispose the instance of IWorkbook and ExcelEngine.

C#

```
//Saving the workbook to disk in XLSX format  
workbook.SaveAs("Sample.xlsx");  
//Closing the workbook  
workbook.Close();  
//Dispose the Excel engine  
excelEngine.Dispose();
```

VB.NET

```
'Saving the workbook to disk in XLSX format  
workbook.SaveAs("Sample.xlsx")  
'Closing the workbook  
workbook.Close()  
'Dispose the Excel engine
```

```
excelEngine.Dispose()
```

UWP

```
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
//Closing the workbook
workbook.Close();
//Dispose the Excel engine
excelEngine.Dispose();
```

ASP.NET CORE

```
//Save the workbook as stream
FileStream stream = new FileStream("Sample.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
//Disposing the stream
stream.Dispose();
//Closing the workbook
workbook.Close();
//Dispose the Excel engine
excelEngine.Dispose();
```

XAMARIN

```
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
//Closing the workbook
workbook.Close();
//Dispose the Excel engine
excelEngine.Dispose();
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Sample
.xlsx", "application/msexcel", stream);
}
else
{
```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.xlsx",  
"application/msexcel", stream);  
}
```

The complete code to create a simple Excel document.

C#

```
using Syncfusion.XlsIO;  
namespace ExcelCreation  
{  
    class Program  
    {  
        static void Main(string[] args)  
        {  
            //New instance of ExcelEngine is created equivalent to launching Excel with  
            //no workbooks open  
            //Instantiate the spreadsheet creation engine  
            using (ExcelEngine excelEngine = new ExcelEngine())  
            {  
                //Instantiate the Excel application object  
                IApplication application = excelEngine.Excel;  
                //Assigns default application version  
                application.DefaultVersion = ExcelVersion.Excel2013;  
                //A new workbook is created equivalent to creating a new workbook in Excel  
                //Create a workbook with 1 worksheet  
                IWorkbook workbook = application.Workbooks.Create(1);  
                //Access a worksheet from workbook  
                IWorksheet worksheet = workbook.Worksheets[0];  
                //Adding text data  
                worksheet.Range["A1"].Text = "Month";

}  
}  
}
```

The output screen-shot of the above code.

Import Data to Excel Worksheets

XlsIO helps to import data from various data sources into a worksheet. The following data sources can be imported using XlsIO:

- Collection Objects
- Data Table
- Data Column
- Data View

- Array

The following code snippet shows how to import data from objects.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //GetCustomerAsObjects method returns list of customers
    IList<Employee> employees = GetEmployees();
    //Import data to worksheet
    worksheet.ImportData(employees, 2, 1, false);
    //Saving the workbook
    workbook.SaveAs("Spreadsheet.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'GetCustomerAsObjects method returns list of customers
Dim employees As IList(Of Employee) = GetEmployees()
'Import data to worksheet
worksheet.ImportData(employees, 2, 1, False)
'Saving the workbook
workbook.SaveAs("Spreadsheet.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //GetCustomerAsObjects method returns list of customers
    IList<Employee> employees = GetEmployees();
    //Import data to worksheet
    worksheet.ImportData(employees, 2, 1, false);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Spreadsheet";

You can refer various importing options in the “Importing Data to Worksheet” section.

Export Data from Excel Worksheets

The worksheet data can be exported to a data table using the **ExportDataTable()** method. This method provides various options that allows to export data through ExcelExportDataTableOptions.

The following code demonstrates how to export data from a worksheet to a data table with the **ColumnNames** and **DetectColumnTypes** options.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("WorkbookWithData.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Export data from worksheet used range to a DataTable
}

```

```

DataTable customersTable = sheet.ExportDataTable(sheet.UsedRange,
ExcelExportDataTableOptions.ColumnNames |
ExcelExportDataTableOptions.DetectColumnTypes);
//Saving the workbook
string fileName = "Output.xlsx";
workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook =
application.Workbooks.Open("WorkbookWithData.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
application.DefaultVersion = ExcelVersion.Excel2013
'Export data from worksheet used range to a DataTable
Dim customersTable As DataTable = sheet.ExportDataTable(sheet.UsedRange,
ExcelExportDataTableOptions.ColumnNames Or
ExcelExportDataTableOptions.DetectColumnTypes)
'Saving the workbook
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using

```

UWP

You can refer various exporting options in the “Exporting from Worksheet to Data Table” section.

Template based data filling using Template Markers

A template marker is a special marker symbol that allows to generate a document by filling data in an Excel template from data source. This marker automatically maps the column name in the data source and names of the marker fields in the Excel template document and fills the data (text or image).

This functionality supports the following data sources.

- Collection Objects
- DataTable
- Array

Each marker starts with a prefix "%", which is followed by a **MarkerVariable** and its **property**. The arguments are delimited by semicolon (;). The following syntax shows the usage of marker in input template document.

```
%<MarkerVariable>.<Property>
```

For example: %Reports.SalesPerson

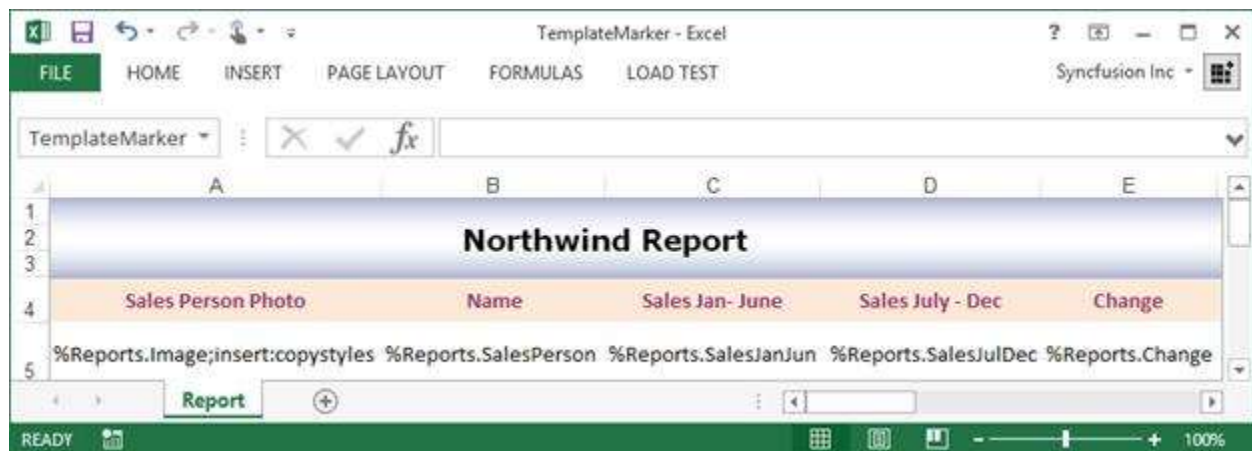

Use the following syntax to maintain row formats while filling data.

%<MarkerVariable>.<Property>;insert:copystyles

For example: %Reports.SalesPerson;insert:copystyles

Find more details in [Template marker section for arguments](#)

For example – let’s consider that you have a template document as shown below.

[Download input template](#)

The following code snippet shows how to use template markers with objects.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("TemplateMarker.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create template marker processor for the workbook
    ITemplateMarkersProcessor marker =
        workbook.CreateTemplateMarkersProcessor();
    //GetSalesReports method returns list of sales persons and their reports
    IList<Report> reports = GetSalesReports();
    //Adding reports collection to marker variables
    //Where the name should match with the input template
    marker.AddVariable("Reports", reports);
    //Applying Markers
    marker.ApplyMarkers();
    //Saving the workbook
    workbook.SaveAs("TemplateMarkerResult.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
```

```

Dim workbook As IWorkbook =
application.Workbooks.Open("TemplateMarker.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Create template marker processor for the workbook
Dim marker As ITemplateMarkersProcessor =
workbook.CreateTemplateMarkersProcessor()
'GetSalesReports method returns list of sales persons and their reports
Dim reports As IList(Of Report) = GetSalesReports()
'Adding reports collection to marker variables
'Where the name should match with the input template
marker.AddVariable("Reports", reports)
'Applying Markers

    Stream inputStream =
        assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.TemplateMarker.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    //Create template marker processor for the workbook
    ITemplateMarkersProcessor marker =
        workbook.CreateTemplateMarkersProcessor();
    //GetSalesReports method returns list of sales persons and their reports
    IList<Report> reports = GetSalesReports();
    //Adding reports collection to marker variables
    //Where the name should match with the input template
    marker.AddVariable("Reports", reports);
    //Applying Markers
    marker.ApplyMarkers();
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {

```

```

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("TemplateMarkerResult.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("TemplateMarkerResult.xlsx", "application/msexcel", stream);
}
}

```

The following code snippet provides supporting methods and classes for the previous code.

C#

```

//Gets a list of sales reports
private static List<Report> GetSalesReports()
{
List<Report> reports = new List<Report>();
reports.Add(new Report("Andy Bernard", "45000", "58000", 29, "Andy.jpg"));
reports.Add(new Report("Jim Halpert", "34000", "65000", 91, "Jim.png"));
reports.Add(new Report("Karen Fillippelli", "75000", "64000", -14,
"Karen.jpg"));
reports.Add(new Report("Phyllis Lapin", "56500", "33600", -40,
"Phyllis.png"));
reports.Add(new Report("Stanley Hudson", "46500", "52000", 12,
"Stanley.jpg"));
return reports;
}
//Sales report

    Change = change;
    Image = GetImage(imagePath);
}
private byte[] GetImage(string imagePath)
{
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream imageStream =
        assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template." +
        imagePath);
    using (BinaryReader reader = new BinaryReader(imageStream))
    {
        return reader.ReadBytes((int)imageStream.Length);
    }
}
}
}

```

The resultant document looks as follows:

Northwind Report				
Sales Person Photo	Name	Sales Jan- June	Sales July - Dec	Change
	Andy Bernard	45000	58000	29
	Jim Halpert	34000	65000	91
	Karen Fillippelli	75000	64000	-14
	Phyllis Lapin	56500	33600	-40
	Stanley Hudson	46500	52000	12

Document Object Model

When an existing document is opened or a new document is created, the XlsIO library creates a **Document Object Model** (DOM) of the document in main memory. This object model can be used to manipulate the document as needed.

Loading and Saving Workbook

Opening an existing workbook

You can open an existing workbook by using the Open method of IWorkbooks interface.

C#

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputFileName);
```

VB.NET

```
'Creates a new instance for ExcelEngine
Dim excelEngine As New ExcelEngine()
'Loads or open an existing workbook through Open method of IWorkbooks
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(inputFileName)
```

UWP

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an existing workbook
IWorkbook workbook = await
excelEngine.Excel.Workbooks.OpenAsync(inputStorageFile);
```

ASP.NET CORE

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
```

XAMARIN

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
```

Tips: Files parsing can be optimized by setting **IApplication.UseFastRecordParsing = false** or **true** (true – fast mode, but less error checks and false – slower but more reliable).

C#

```
IApplication application = excelEngine.Excel;
//Optimize parsing
```

```
application.UseFastRecordParsing = true;
```

VB.NET

```
Dim application As IApplication = excelEngine.Excel
'Optimize parsing
application.UseFastRecordParsing = True
```

UWP

```
IApplication application = excelEngine.Excel;
//Optimize parsing
application.UseFastRecordParsing = true;
```

ASP.NET CORE

```
IApplication application = excelEngine.Excel;
//Optimize parsing
application.UseFastRecordParsing = true;
```

XAMARIN

```
IApplication application = excelEngine.Excel;
//Optimize parsing
application.UseFastRecordParsing = true;
```

Opening an existing workbook from Stream

You can open an existing workbook from stream by using the overloads of Open methods of IWorkbooks interface.

C#

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Load the file into stream
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
```

VB.NET

```
'Creates a new instance for ExcelEngine
Dim excelEngine As New ExcelEngine()
'Load the file into stream
Dim inputStream As FileStream = New FileStream(inputFileName, FileMode.Open)
'Loads or open an existing workbook through Open method of IWorkbooks
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(inputStream)
```

UWP

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Load the file into stream
```

```
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
//Loads or open an existing workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
```

ASP.NET CORE

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Load the file into stream
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = application.Workbooks.Open(inputStream);
```

XAMARIN

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = application.Workbooks.Open(inputStream);
```

Saving a Excel workbook to file system

You can save the created or manipulated workbook to file system using Save method of IWorkbook interface. The workbook is saved in the XLS/XLSX format based on the application/workbook version specified, whereas saved in Excel 97-2003 (*.xls) format by default.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Loads or open an existing workbook through Open method of IWorkbooks
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputFileName);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Save the workbook in file system as XLSX format
    workbook.SaveAs(outputFileName);
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
'Loads or open an existing workbook through Open method of IWorkbooks
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(inputFileName)
'To-Do some manipulation
'To-Do some manipulation
'Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013
'Save the workbook in file system as XLSX format
workbook.SaveAs(outputFileName)
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    //Creates a storage file from FileOpenPicker
    StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
    //Loads or open an existing workbook
    IWorkbook workbook = await
    excelEngine.Excel.Workbooks.OpenAsync(inputStorageFile);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = OutputFileName;
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile outputStorageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(outputStorageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Loads or open an existing workbook
    FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Saving the workbook
    FileStream outputStream = new FileStream(outputFileName, FileMode.Create);
    workbook.SaveAs(outputStream);
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
    //Loads or open an existing workbook through Open method of IWorkbooks

```

```

IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
//Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013;
//Saving the workbook
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
outputStream.Position = 0;
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(outputF
ileName, "application/msexcel", outputStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(outputFileName,
"application/msexcel", outputStream);
}
}

```

Saving an Excel workbook to stream

You can also save the created or manipulated workbook to stream using overloads of Save methods

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputFileName);
//To-Do some manipulation
//To-Do some manipulation
//Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013;
//Save the workbook as stream
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
'Loads or open an existing workbook through Open method of IWorkbooks
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(inputFileName)
'To-Do some manipulation
'To-Do some manipulation
'Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013
'Save the workbook as stream
Dim outputStream As MemoryStream = New MemoryStream
workbook.SaveAs(outputStream)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    //Creates a storage file from FileOpenPicker
    StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
    //Loads or open an existing workbook
    IWorkbook workbook = await
    excelEngine.Excel.Workbooks.OpenAsync(inputStorageFile);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Saves changes to the specified storage file
    MemoryStream outputStream = new MemoryStream();
    await workbook.SaveAsAsync(outputStream);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Loads or open an existing workbook through Open method of IWorkbooks
    FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
    //Loads or open an existing workbook through Open method of IWorkbooks
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Save the workbook as stream
    MemoryStream outputStream = new MemoryStream();
}

```

```
workbook.SaveAs(outputStream);
}
```

Sending to a client browser

You can save & send the workbook to a client browser from a web site or web application by invoking the below shown overload of Save method. This method explicitly make use of an instance of [HttpResponse](#) as its parameter in order to stream the workbook to client browser. So this overload is suitable for web application which references System.Web assembly.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Loads or open an existing workbook through Open method of IWorkbooks
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputFileName);
    //To-Do some manipulation
    //To-Do some manipulation
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
    //Save the workbook in file system
    workbook.SaveAs(OutputFileName, Response, ExcelDownloadType.Open);
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
    'Loads or open an existing workbook through Open method of IWorkbooks
    Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(inputFileName)
    'To-Do some manipulation
    'To-Do some manipulation
    'Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013
    'Save the workbook in file system
    workbook.SaveAs(OutputFileName, Response, ExcelDownloadType.Open)
End Using
```

UWP

```
//Saving and sending the workbook to a client browser from a web site is
suitable for web applications alone.
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Loads or open an existing workbook through Open method of IWorkbooks
    FileStream inputStream = new FileStream(inputFilePath, FileMode.Open);
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
    //To-Do some manipulation
    //To-Do some manipulation
    //Initialize content type
    string ContentType = null;
    //Set the version of the workbook
    workbook.Version = ExcelVersion.Excel2013;
}
```

```

ContentType = "Application/msexcel";
//Save the workbook to stream
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
outputStream.Position = 0;
//Return the file with content type
return File(outputStream, ContentType, outputFileName);
}

```

XAMARIN

```

//Saving and sending the workbook to a client browser from a web site is
suitable for web applications alone.

```

Closing a workbook

Once after the workbook manipulation and save operation are completed, you should close the instance of IWorkbook and dispose the instance of ExcelEngine, in order to release all the memory consumed by XlsIO's DOM. The following code snippet illustrates how to close the instance of IWorkbook and dispose the instance of ExcelEngine.

Note: If the new instance for ExcelEngine is created in using statement, then there is no need to closing workbook and disposing excelEngine.

C#

```

//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputFileName);
//To-Do some manipulation
//To-Do some manipulation
//Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013;
//Save the workbook in file system
workbook.SaveAs(outputFileName);
//Close the instance of IWorkbook
workbook.Close();
//Dispose the instance of ExcelEngine
excelEngine.Dispose();

```

VB.NET

```

'Creates a new instance for ExcelEngine
Dim excelEngine As New ExcelEngine()
'Loads or open an existing workbook through Open method of IWorkbooks
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(inputFileName)
'To-Do some manipulation
'To-Do some manipulation
'Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013
'Save the workbook in file system
workbook.SaveAs(outputFileName)
'Close the instance of IWorkbook
workbook.Close()
'Dispose the instance of ExcelEngine

```

```
excelEngine.Dispose();
```

UWP

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
//Creates a storage file from FileOpenPicker
StorageFile inputStorageFile = await openPicker.PickSingleFileAsync();
//Loads or open an existing workbook
IWorkbook workbook =
excelEngine.Excel.Workbooks.OpenAsync(inputStorageFile);
//To-Do some manipulation
//To-Do some manipulation
//Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(outputStorageFile);
//Close the instance of IWorkbook
workbook.Close();
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
```

ASP.NET CORE

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
FileStream inputStream = new FileStream(inputFileName, FileMode.Open);
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
//Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013;
//Save the workbook as stream
FileStream outputStream = new FileStream("Output.xlsx", FileMode.Create);
workbook.SaveAs(outputStream);
//Close the instance of IWorkbook
workbook.Close();
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
```

XAMARIN

```

//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream(inputFilePath);
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(inputStream);
//To-Do some manipulation
//To-Do some manipulation
//Set the version of the workbook
workbook.Version = ExcelVersion.Excel2013;
//Save the workbook as stream
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
outputStream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", outputStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", outputStream);
}
//Close the instance of IWorkbook
workbook.Close();
//Dispose the instance of ExcelEngine
excelEngine.Dispose();

```

Tips: You can use `ThrowNotSavedOnDestroy` property of `ExcelEngine` object to prevent the data loss while unfortunately closing the workbook or disposing excel engine without saving contents. If it is set to true, then `ExcelWorkbookNotSavedException` will be thrown when you forgot to save the workbook before closing them. Following code illustrates how to set `ThrowNotSavedOnDestroy` property of `ExcelEngine` object.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
//No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = true;

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
'No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = True

```

UWP

```
ExcelEngine excelEngine = new ExcelEngine();
//No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = true;
```

ASP.NET CORE

```
ExcelEngine excelEngine = new ExcelEngine();
//No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = true;
```

XAMARIN

```
ExcelEngine excelEngine = new ExcelEngine();
//No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = true;
```

Working with Excel Worksheet

A Workbook contains a collection of worksheets where the actual contents resides and IWorksheet instance represents a worksheet. With XlsIO, You can add and manipulate worksheets.

Create a Worksheet

You can add a new worksheet into the Workbook through Create method of IWorkbook interface. You can also specify the required number of worksheets, if not specified, XlsIO will create three worksheets by default.

The following code snippet shows how to create worksheets within a workbook.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //The new workbook will have 5 worksheets
    IWorkbook workbook = application.Workbooks.Create(5);
    //Creating a Sheet
    IWorksheet sheet = workbook.Worksheets.Create();
    //Creating a Sheet with name "Sample"
    IWorksheet namedSheet = workbook.Worksheets.Create("Sample");
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'The new workbook will have 5 worksheets
Dim workbook As IWorkbook = application.Workbooks.Create(5)
'Creating a sheet
Dim sheet As IWorksheet = workbook.Worksheets.Create()
'Creating a Sheet with name "Sample"
Dim namedSheet As IWorksheet = workbook.Worksheets.Create("Sample")
workbook.SaveAs("Output.xlsx")
```

End Using**UWP**

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //The new workbook will have 5 worksheets.
    IWorkbook workbook = application.Workbooks.Create(5);
    //Creating a Sheet
    IWorksheet sheet = workbook.Worksheets.Create();
    //Creating a Sheet with name "Sample"
    IWorksheet namedSheet = workbook.Worksheets.Create("Sample");
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //The new workbook will have 5 worksheets
    IWorkbook workbook = application.Workbooks.Create(5);
    //Creating a Sheet
    IWorksheet sheet = workbook.Worksheets.Create();
    //Creating a Sheet with name "Sample"
    IWorksheet namedSheet = workbook.Worksheets.Create("Sample");
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //The new workbook will have 5 worksheets.
    IWorkbook workbook = application.Workbooks.Create(5);
    //Creating a Sheet.
    IWorksheet sheet = workbook.Worksheets.Create();
}

```

```

//Creating a Sheet with name "Sample"
IWorksheet namedSheet = workbook.Worksheets.Create("Sample");
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Access a Worksheet

Worksheets collection holds one or more worksheets present in a workbook. Accessing a particular worksheet can be done by the following ways.

1. Specifying the index
2. Specifying the sheet name.

The below codes illustrate how to access a worksheet from its worksheets collection.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
//Accessing via index
IWorksheet sheet = workbook.Worksheets[0];
//Accessing via sheet Name
IWorksheet NamedSheet = workbook.Worksheets["Sample"];
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(2)
'Accessing via index
Dim sheet As IWorksheet = workbook.Worksheets(0)

```

```
'Accessing via Sheet Name
Dim NamedSheet As IWorksheet = workbook.Worksheets("Sample")
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    //Accessing via index
    IWorksheet sheet = workbook.Worksheets[0];
    //Accessing via sheet Name
    IWorksheet NamedSheet = workbook.Worksheets["Sample"];
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    //Accessing via index
    IWorksheet sheet = workbook.Worksheets[0];
    //Accessing via sheet Name
    IWorksheet NamedSheet = workbook.Worksheets["Sample"];
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    //Accessing via index
    IWorksheet sheet = workbook.Worksheets[0];
```

```

//Accessing via sheet Name
IWorksheet NamedSheet = workbook.Worksheets["Sample"];
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Tips: If the workbook contains multiple worksheet, then the parsing of the workbook will consume time. You can use **ExcelParseOptions.ParseWorksheetsOnDemand** in **IWorkbooks.Open** method which parses the worksheet only when it is accessed. This option can be used in a scenario where workbook contains multiple worksheets but you are going to use few worksheets among them.

C#

```

IWorkbook workbook =
application.Workbooks.Open(fileName, ExcelParseOptions.ParseWorksheetsOnDemand);

```

VB.NET

```

Dim workbook As IWorkbook = application.Workbooks.Open(fileName,
ExcelParseOptions.ParseWorksheetsOnDemand)

```

UWP

```

IWorkbook workbook = await
application.Workbooks.OpenAsync(workbookStorageFile, ExcelOpenType.Automatic,
ExcelParseOptions.ParseWorksheetsOnDemand);

```

ASP.NET CORE

```

IWorkbook workbook =
application.Workbooks.Open(workbookStream, ExcelParseOptions.ParseWorksheetsOnDemand);

```

XAMARIN

```
IWorkbook workbook =
application.Workbooks.Open(workbookStream, ExcelParseOptions.ParseWorksheetsOnDemand);
```

Remove a Worksheet

Deletes the worksheets from the workbook collection by accessing the worksheet.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    //Removing the sheet
    workbook.Worksheets[0].Remove();
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(2)
'Removing the sheet
workbook.Worksheets(0).Remove()
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    //Removing the sheet
    workbook.Worksheets[0].Remove();
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
//Removing the sheet
workbook.Worksheets[0].Remove();
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    //Removing the sheet
    workbook.Worksheets[0].Remove();
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Move or Copy a Worksheet

Essential XlsIO allows to move or create a copy of a worksheet, and insert that worksheet before or after an existing worksheet in the workbook.

Copying Worksheets

You can copy a worksheet to one another workbook or within the same workbook.

The following code example illustrates how to copy a sheet with its entire contents to another workbook.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook sourceWorkbook =
application.Workbooks.Open("SourceWorkbookTemplate.xlsx");
IWorkbook destinationWorkbook =
application.Workbooks.Open("DestinationWorkbookTemplate.xlsx");
//Copy first worksheet from the Source workbook to the destination workbook
destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[0]);
destinationWorkbook.ActiveSheetIndex = 1;
destinationWorkbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim sourceWorkbook As IWorkbook =
application.Workbooks.Open("SourceWorkbookTemplate.xlsx")
Dim destinationWorkbook As IWorkbook =
application.Workbooks.Open("DestinationWorkbookTemplate.xlsx")
'Copy first worksheet from the Source workbook to the destination workbook
destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets(0))
destinationWorkbook.ActiveSheetIndex = 1
destinationWorkbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile sourceFile = await openPicker.PickSingleFileAsync();
StorageFile destinationFile = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook sourceWorkbook = await
application.Workbooks.OpenAsync(sourceFile);
IWorkbook destinationWorkbook = await
application.Workbooks.OpenAsync(destinationFile);
//Copy first worksheet from the Source workbook to the destination workbook
destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[0]);
destinationWorkbook.ActiveSheetIndex = 1;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();

```

```
//Saves changes to the specified storage file
await destinationWorkbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream sourceStream = new FileStream("SourceWorkbookTemplate.xlsx",
    FileMode.Open, FileAccess.Read);
    IWorkbook sourceWorkbook = application.Workbooks.Open(sourceStream);
    FileStream destinationStream = new
    FileStream("DestinationWorkbookTemplate.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook destinationWorkbook =
    application.Workbooks.Open(destinationStream);
    //Copy first worksheet from the Source workbook to the destination workbook
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[0]);
    destinationWorkbook.ActiveSheetIndex = 1;
    //Saving the workbook as stream
    FileStream copiedStream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    destinationWorkbook.SaveAs(copiedStream);
    copiedStream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    /"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream sourceStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sou
    rceWorkbookTemplate.xlsx");
    IWorkbook sourceWorkbook = application.Workbooks.Open(sourceStream);
    Stream destinationStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Des
    tinationWorkbookTemplate.xlsx");
    IWorkbook destinationWorkbook =
    application.Workbooks.Open(destinationStream);
    //Copy first worksheet from the Source workbook to the destination workbook
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[0]);
    destinationWorkbook.ActiveSheetIndex = 1;
    //Saving the workbook as stream
    MemoryStream copiedStream = new MemoryStream();
    destinationWorkbook.SaveAs(copiedStream);
    copiedStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
}
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", copiedStream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", copiedStream);
}
}

```

You can specify copy options while copying a worksheet, which helps to achieve customized copying by ignore the certain formatting. For more information about copy options, please refer **ExcelWorksheetCopyFlags** .

Moving a Worksheet

XlsIO allows moving worksheets from one position to another by using the **Move** method. The following code example illustrates how a worksheet is moved.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(3);
    IWorksheet sheet = workbook.Worksheets[0];
    //Move the Sheet
    sheet.Move(1);
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(3)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Move the sheet
sheet.Move(1)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(3);
    IWorksheet sheet = workbook.Worksheets[0];
    //Move the Sheet
}

```

```

sheet.Move(1);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(3);
    IWorksheet sheet = workbook.Worksheets[0];
    //Move the Sheet
    sheet.Move(1);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(3);
    IWorksheet sheet = workbook.Worksheets[0];
    //Move the Sheet
    sheet.Move(1);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {

```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}
```

Highlight Worksheet Tabs

You can highlight the worksheet tab of a particular sheet to denote its importance. You can set the tab color through the **TabColor** property, as given below.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Highlighting sheet tab
    sheet.TabColor = ExcelKnownColors.Red;
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Highlighting sheet tab
sheet.TabColor = ExcelKnownColors.Red
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Highlighting sheet tab
    sheet.TabColor = ExcelKnownColors.Red;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Highlighting sheet tab
    sheet.TabColor = ExcelKnownColors.Red;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Highlighting sheet tab
    sheet.TabColor = ExcelKnownColors.Red;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Freeze Panes

You can [freeze](#) a portion of the sheet to keep it visible while you scroll through the rest of the sheet. The following code snippet shows how to freeze panes through the FreezePanes method of **IRange**.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Applying Freeze Pane to the sheet by specifying a cell
    sheet.Range["B2"].FreezePanes();
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Applying Freeze Pane to the sheet by specifying a cell
sheet.Range("B2").FreezePanes()
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Applying Freeze Pane to the sheet by specifying a cell
    sheet.Range["B2"].FreezePanes();
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Applying Freeze Pane to the sheet by specifying a cell
    sheet.Range["B2"].FreezePanes();
}

```

```
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Applying Freeze Pane to the sheet by specifying a cell
    sheet.Range["B2"].FreezePanes();
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}
```

You can set first visible row and first visible column in non-frozen area, by setting the FirstVisibleRow and FirstVisibleColumn as shown below

Note: FirstVisibleColumn and FirstVisibleRow indexes are "zero-based".

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["B2"].FreezePanes();
    //Set first visible row in the bottom pane
    sheet.FirstVisibleRow = 2;
    //Set first visible column in the right pane
    sheet.FirstVisibleColumn = 2;
}
```

```
workbook.SaveAs ("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("B2").FreezePanes()
'Set first visible row in the bottom pane
sheet.FirstVisibleRow = 2
'Set first visible column in the right pane
sheet.FirstVisibleColumn = 2
workbook.SaveAs ("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["B2"].FreezePanes();
//Set first visible row in the bottom pane
sheet.FirstVisibleRow = 2;
//Set first visible column in the right pane
sheet.FirstVisibleColumn = 2;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["B2"].FreezePanes();
//Set first visible row in the bottom pane
sheet.FirstVisibleRow = 2;
//Set first visible column in the right pane
```

```

sheet.FirstVisibleColumn = 2;
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["B2"].FreezePanes();
    //Set first visible row in the bottom pane
    sheet.FirstVisibleRow = 2;
    //Set first visible column in the right pane
    sheet.FirstVisibleColumn = 2;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)

.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
    }
}

```

Unfreeze Panes

You can unfreeze panes in an Excel worksheet using the [RemovePanes](#) method of **IWorksheet** interface. Refer to the following complete code snippets.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unfreeze panes in the worksheet
}

```

```
worksheet.RemovePanes();
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Unfreeze panes in the worksheet
worksheet.RemovePanes()
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the file picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unfreeze panes in the worksheet
    worksheet.RemovePanes();
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
}
```

```
//Unfreeze panes in the worksheet
worksheet.RemovePanes();
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unfreeze panes in the worksheet
    worksheet.RemovePanes();
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
Android, and iOS platforms. Refer to the xlsio/xamarin section for
respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==

    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx", "application/msexcel", stream);
    }
}
```

Split Panes

You can divide the window into different [panes](#) that each scroll separately. The following code snippets illustrates how to split the window through the **HorizontalSplit** and **VerticalSplit** properties.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//split panes
sheet.FirstVisibleColumn = 5;
sheet.FirstVisibleRow = 11;
sheet.VerticalSplit = 1100;
sheet.HorizontalSplit = 1000;
sheet.ActivePane = 1;
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Split Panes
sheet.FirstVisibleColumn = 5
sheet.FirstVisibleRow = 11
sheet.VerticalSplit = 1100
sheet.HorizontalSplit = 1000
sheet.ActivePane = 1
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//split panes
sheet.FirstVisibleColumn = 5;
sheet.FirstVisibleRow = 11;
sheet.VerticalSplit = 1100;
sheet.HorizontalSplit = 1000;
sheet.ActivePane = 1;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //split panes
    sheet.FirstVisibleColumn = 5;
    sheet.FirstVisibleRow = 11;
    sheet.VerticalSplit = 1100;
    sheet.HorizontalSplit = 1000;
    sheet.ActivePane = 1;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Page Setup Settings

You can select the size, orientation of the paper, margins, page breaks, scaling, paper size, header/footer settings and background settings. The following code snippet shows how to set the page setup. To more about, please refer **Page setup**.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "PageBreak";
    //Set Horizontal Page Breaks
    sheet.HPageBreaks.Add(sheet.Range["A5"]);
    //Set Vertical Page Breaks
    sheet.VPageBreaks.Add(sheet.Range["B5"]);
    //Set print title
    sheet.PageSetup.PrintTitleColumns = "$B:$E";
    sheet.PageSetup.PrintTitleRows = "$2:$5";
    //Set Page Orientation as Portrait or Landscape
    sheet.PageSetup.Orientation = ExcelPageOrientation.Landscape;
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "PageBreak"
' Set Horizontal Page Breaks
sheet.HPageBreaks.Add(sheet.Range("A5"))
' Set Vertical Page Breaks
sheet.VPageBreaks.Add(sheet.Range("B5"))
' Set print titles
sheet.PageSetup.PrintTitleColumns = "$B:$E"
sheet.PageSetup.PrintTitleRows = "$2:$5"
' Set Page Orientation as Portrait or Landscape
sheet.PageSetup.Orientation = ExcelPageOrientation.Landscape
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Show or Hide Worksheet

The following code snippet shows how to hide the sheets using **Visibility** property.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "visibility";
//Set visibility
sheet.Visibility = WorksheetVisibility.Hidden;
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(2)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "Visibility"
'Set visibility
sheet.Visibility = WorksheetVisibility.Hidden

```

```
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "visibility";
    //Set visibility
    sheet.Visibility = WorksheetVisibility.Hidden;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "visibility";
    //Set visibility
    sheet.Visibility = WorksheetVisibility.Hidden;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "visibility";
    //Set visibility
    sheet.Visibility = WorksheetVisibility.Hidden;
```

```
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)

"application/msexcel", stream);
}
}
```

Activate a Worksheet

You can set a worksheet as active sheet in the workbook by using the **Activate** method.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Activate";
    //Activate the sheet
    sheet.Activate();
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(2)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "Activate"
'Activate the sheet
sheet.Activate()
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "Activate";
//Activate the sheet
sheet.Activate();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "Activate";
//Activate the sheet
sheet.Activate();
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "Activate";
//Activate the sheet
sheet.Activate();
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
}

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Show or Hide Worksheet Tabs

The following code snippet shows how to hide the worksheet tab using **DisplayWorkbookTabs** property.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(3);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "Tabs";
//Hide the tab
workbook.DisplayWorkbookTabs = false;
//set the display tab
workbook.DisplayedTab = 2;
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(3)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "Tabs"
'Hide the tab
workbook.DisplayWorkbookTabs = False
'set the display tab
workbook.DisplayedTab = 2
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(3);
IWorksheet sheet = workbook.Worksheets[0];

```

```

sheet.Range["A1:M20"].Text = "Tabs";
//Hide the tab
workbook.DisplayWorkbookTabs = false;
//set the display tab
workbook.DisplayedTab = 2;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(3);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Tabs";
    //Hide the tab
    workbook.DisplayWorkbookTabs = false;
    //set the display tab
    workbook.DisplayedTab = 2;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

View Settings

Show or Hide Row and Column Headers

You can show/hide row and column headings by using the **IsRowColumnHeadersVisible** property of **IWorksheet**.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "RowColumnHeader";
sheet.IsRowColumnHeadersVisible = false;
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "RowColumnHeader"
sheet.IsRowColumnHeadersVisible = False
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
```

```

sheet.Range["A1:M20"].Text = "RowColumnHeader";
sheet.IsRowColumnHeadersVisible = false;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "RowColumnHeader";
    sheet.IsRowColumnHeadersVisible = false;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())

Show or Hide Grid Lines

The following code snippet shows how to hide the grid lines using `IsGridLinesVisible` property.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Gridlines";
    //Hide grid line
    sheet.IsGridLinesVisible = false;
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "GridLines"
'Hide grid line
sheet.IsGridLinesVisible = False
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Gridlines";
    //Hide grid line
    sheet.IsGridLinesVisible = false;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
}
```

```
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

```

Open a CSV File

A CSV file has to be opened by specifying the delimiter set in it. Specifying the delimiter can be ignored, if it is Comma(,), as Syncfusion XlsIO considers the default delimiter as Comma(,).

The delimiters used in CSV file are Comma (,), Tab (\t), SemiColon (;), Colon (:), Space (), Equals Sign (=) etc..

The following complete code snippet explains how to open a Tab (\t) delimited CSV file using XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    //Open the Tab delimited CSV file
    IWorkbook workbook = application.Workbooks.Open("Sample.csv", "\t");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
'Open the Tab delimited CSV file
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.csv", "\t")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".csv");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Open the Tab delimited CSV file
    IWorkbook workbook = await application.Workbooks.OpenAsync(file, "\t");
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    FileStream inputStream = new FileStream("Sample.csv", FileMode.Open,
    FileAccess.Read);
    //Open the Tab delimited CSV file
    IWorkbook workbook = application.Workbooks.Open(inputStream, "\t");
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    // "App" is the class of Portable project
```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.csv");
//Open the Tab delimited CSV file
IWorkbook workbook = application.Workbooks.Open(inputStream, "\t");
}

```

Save Worksheet as CSV

The following code example illustrates how to save a worksheet as CSV file.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "document";
    //Save the sheet as CSV
    sheet.SaveAs("Sample.csv", ",");
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "document"
'Save the sheet as CSV
sheet.SaveAs("Sample.csv", ",")
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "document";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Sample";
    savePicker.FileTypeChoices.Add("CSV Files", new List<string>() { ".csv" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile1 = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
}

```

```

await sheet.SaveAsAsync(storageFile1, "");
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile2 = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile2);
}

```

ASP.NET CORE

Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Save worksheet as text (*.txt)

Essential XlsIO allows to save worksheet as a text file. This can be done by leaving the delimiter with a space as shown in the below codes.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Text document";
    //Save the sheet as text
    sheet.SaveAs("Sample.txt", " ");
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "Text document"
'Save the sheet as text
sheet.SaveAs("Sample.txt", " ")
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Text document";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
}

```

```

savePicker.SuggestedFileName = "Sample";
savePicker.FileTypeChoices.Add("Text Files", new List<string>() { ".txt" });
//Creates a storage file from FileSavePicker
StorageFile storageFile1 = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await sheet.SaveAsAsync(storageFile1, " ");
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile2 = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile2);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Text document";
    //Saving the sheet and workbook as streams
    FileStream sheetStream = new FileStream("Sample.txt", FileMode.Create,
    FileAccess.ReadWrite);
    sheet.SaveAs(sheetStream, " ");
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    sheetStream.Dispose();
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Text document";
    //Saving the sheet and workbook as streams
    MemoryStream sheetStream = new MemoryStream();
    sheet.SaveAs(sheetStream, " ");
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    sheetStream.Position = 0;
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,

code samples.
}

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Sample
.txt", "text/plain", sheetStream);
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Sample.txt",
"text/plain", sheetStream);
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Save Worksheet as HTML

XlsIO provides support to convert a worksheet or workbook to HTML with basic formatting preserved. The supporting formats in this conversion are:

1. Styles.
2. Hyperlinks.
3. Images.
4. 2D Charts.

The following code example illustrates on how to do this.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
sheet.Range["A1:M20"].Text = "Html Document";
//Save an Excel sheet as HTML file
sheet.SaveAsHtml("Sample.html");
//Save the workbook as HTML file
workbook.SaveAsHtml("Sample.html",
Syncfusion.XlsIO.Implementation.HtmlSaveOptions.Default);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.Range("A1:M20").Text = "Html Document"
' Save an Excel sheet as HTML file
sheet.SaveAsHtml("Sample.html")

```

```
'Save a workbook as HTML file
workbook.SaveAsHtml("Sample.html",
Syncfusion.XlsIO.Implementation.HtmlSaveOptions.Default)
End Using
```

UWP

```
//Worksheet To HTML conversion can be performed by referring .NET Standard
assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Html Document";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Sample";
    savePicker.FileTypeChoices.Add("HTML Files", new List<string>() {
        ".html", ".htm" });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Converts and save to stream
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    //Save an Excel sheet as HTML file
    sheet.SaveAsHtml(stream);
    //Save a workbook as HTML file
    workbook.SaveAsHtml(stream,
    Syncfusion.XlsIO.Implementation.HtmlSaveOptions.Default);
    await file.FlushAsync();
    stream.Dispose();
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Initialize excel engine and open workbook
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1:M20"].Text = "Html Document";
    //Create stream to store HTML file.
    Stream stream = new MemoryStream();
    //Save an Excel sheet as HTML file
    worksheet.SaveAsHtml(stream);
    //Save a workbook as HTML file
    workbook.SaveAsHtml(stream,
    Syncfusion.XlsIO.Implementation.HtmlSaveOptions.Default);
    stream.Dispose();
    workbook.Close();
}
```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.Range["A1:M20"].Text = "Html Document";
    //Creates memory stream.
    MemoryStream stream = new MemoryStream();
    //Save an Excel sheet as HTML file
    sheet.SaveAsHtml(stream);
    //Save a workbook as HTML file
    workbook.SaveAsHtml(stream,
        Syncfusion.XlsIO.Implementation.HtmlSaveOptions.Default);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
        DependencyService.Get<ISaveWindowsPhone>()
            .Save("Sample.html", "text/html", stream);
    else
        DependencyService.Get<ISave>().Save("Sample.html", "text/html", stream);
}

```

Save Options

XlsIO also provides options to save a worksheet with the displayed text or value in the cell to HTML file. The following code example illustrates this.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Create the instant for SaveOptions
    HtmlSaveOptions options = new HtmlSaveOptions();
    options.TextMode = HtmlSaveOptions.GetText.DisplayText;
    options.ImagePath = @"..\..\Images\";
    //Save the sheet as HTML
    sheet.SaveAsHtml("Sample.html", options);
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel

```

```

application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Create the instant for SaveOptions
Dim options As New HtmlSaveOptions()
options.TextMode = HtmlSaveOptions.GetText.DisplayText
options.ImagePath = "..\\..\\Images\\"
'Save the sheet as HTML
sheet.SaveAsHtml("Sample.html", options)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

//Worksheet To HTML conversion can be performed by referring .NET Standard
assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Sample";
    savePicker.FileTypeChoices.Add("HTML Files", new List<string>() {
        ".html", ".htm" });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Create the instant for SaveOptions
    HtmlSaveOptions saveOptions = new HtmlSaveOptions();
    saveOptions.TextMode = HtmlSaveOptions.GetText.DisplayText;
    //Converts and save to stream
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    sheet.SaveAsHtml(stream, saveOptions);
    await file.FlushAsync();
    stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Initialize excel engine and open workbook
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create stream to store HTML file.
    Stream stream = new MemoryStream();
    //Create the instant for SaveOptions
    HtmlSaveOptions saveOptions = new HtmlSaveOptions();
    saveOptions.TextMode = HtmlSaveOptions.GetText.DisplayText;
    //Save and Dispose
}

```

```
worksheet.SaveAsHtml(stream, saveOptions);
stream.Dispose();
workbook.Close();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Create the instant for SaveOptions
    HtmlSaveOptions saveOptions = new HtmlSaveOptions();
    saveOptions.TextMode = HtmlSaveOptions.GetText.DisplayText;
    //Converts and save to stream.
    MemoryStream stream = new MemoryStream();
    sheet.SaveAsHtml(stream, saveOptions);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
        DependencyService.Get<ISaveWindowsPhone>().
            Save("Sample.html", "text/html", stream);
    else
        DependencyService.Get<ISave>().Save("Sample.html", "text/html", stream);
}
```

Worksheet Rows and Columns Manipulation

The Essential XlsIO provides rows and columns manipulation options equivalent to Excel such as insertion, deletion, hiding, adjusting dimensions, grouping, sub-totaling and more through **IWorksheet** interface.

Insert Rows and Columns

The following code snippet illustrates how to insert rows and columns in a worksheet.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Insert a row
    worksheet.InsertRow(3, 1, ExcelInsertOptions.FormatAsBefore);
    //Inserting a column
    worksheet.InsertColumn(2, 1, ExcelInsertOptions.FormatAsAfter);
    workbook.SaveAs("Book1.xlsx");
}
```

```
}

```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Inserting a row
worksheet.InsertRow(3, 1, ExcelInsertOptions.FormatAsBefore)
'Inserting a column
worksheet.InsertColumn(2, 1, ExcelInsertOptions.FormatAsAfter)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Insert a row
    worksheet.InsertRow(3, 1, ExcelInsertOptions.FormatAsBefore);
    //Inserting a column
    worksheet.InsertColumn(2, 1, ExcelInsertOptions.FormatAsAfter);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
```

```

IWorkbook workbook = application.Workbooks.Open(fileStream);
IWorksheet worksheet = workbook.Worksheets[0];
//Insert a row
worksheet.InsertRow(3, 1, ExcelInsertOptions.FormatAsBefore);
//Inserting a column
worksheet.InsertColumn(2, 1, ExcelInsertOptions.FormatAsAfter);
//Saving the workbook as stream
FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Insert a row
    worksheet.InsertRow(3, 1, ExcelInsertOptions.FormatAsBefore);
    //Inserting a column
    worksheet.InsertColumn(2, 1, ExcelInsertOptions.FormatAsAfter);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
}

```

Note: Row and Column index of Insert methods are "one based".

To know more about insert rows and columns, refer to the **WorksheetImpl** in API section.

Delete Rows and Columns

The following code shows how to delete rows and columns.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Delete a row
    worksheet.DeleteRow(3);
    //Delete a column
    worksheet.DeleteColumn(2);
    workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Delete a row
worksheet.DeleteRow(3)
'Delete a column
worksheet.DeleteColumn(2)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Delete a row
    worksheet.DeleteRow(3);
    //Delete a column
    worksheet.DeleteColumn(2);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
}
```

```

savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Delete a row
    worksheet.DeleteRow(3);
    //Delete a column
    worksheet.DeleteColumn(2);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    /"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Delete a row
    worksheet.DeleteRow(3);
    //Delete a column
    worksheet.DeleteColumn(2);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)

```

```
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.
xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
"application/msexcel", stream);
}
}
```

Tips: To extract values little faster or to delete a larger number of rows and columns, use Un-Safe code option of **IApplication** interface as follows

C#

```
application.DataProviderType = ExcelDataProviderType.Unsafe;
```

VB.NET

```
application.DataProviderType = ExcelDataProviderType.Unsafe
```

UWP

```
application.DataProviderType = ExcelDataProviderType.Unsafe;
```

ASP.NET CORE

```
//XlsIO supports DataProviderType of IApplication in Windows Forms, WPF and
UWP platforms alone.
```

XAMARIN

```
//XlsIO supports DataProviderType of IApplication in Windows Forms, WPF and
UWP platforms alone.
```

In addition, cells can be deleted by shifting other cells in a row or column towards up/left by one step. This can be done by using the **Clear** method as shown in the following code.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Shifts cells towards Left after deletion
worksheet.Range["A1:E1"].Clear(ExcelMoveDirection.MoveLeft);
//Shifts cells toward Up after deletion
worksheet.Range["A1:A6"].Clear(ExcelMoveDirection.MoveUp);
workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Shifts cells towards Left after deletion
worksheet.Range("A1:E1").Clear(ExcelMoveDirection.MoveLeft)
'Shifts cells towards Up after deletion
worksheet.Range("A1:A6").Clear(ExcelMoveDirection.MoveUp)
workbook.SaveAs("Book1.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Shifts cells towards Left after deletion
    worksheet.Range["A1:E1"].Clear(ExcelMoveDirection.MoveLeft);
    //Shifts cells toward Up after deletion
    worksheet.Range["A1:A6"].Clear(ExcelMoveDirection.MoveUp);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Shifts cells towards Left after deletion

```

```

worksheet.Range["A1:E1"].Clear(ExcelMoveDirection.MoveLeft);
//Shifts cells toward Up after deletion
worksheet.Range["A1:A6"].Clear(ExcelMoveDirection.MoveUp);
//Saving the workbook as stream
FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Shifts cells towards Left after deletion
    worksheet.Range["A1:E1"].Clear(ExcelMoveDirection.MoveLeft);
    //Shifts cells toward Up after deletion
    worksheet.Range["A1:A6"].Clear(ExcelMoveDirection.MoveUp);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
}

```

Note: Deletion by using above method is more efficient than looping.

Row/Column index of these methods are "one based".

Show or Hide Rows and Columns

Visibility of rows and columns can be set by using the **ShowRow** and **ShowColumn** methods as shown as follows.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Hiding the first column and second row
    worksheet.ShowColumn(1, false);
    worksheet.ShowRow(2, false);
    workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Hiding the first column and second row
worksheet.ShowColumn(1, False)
worksheet.ShowRow(2, False)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Hiding the first column and second row
    worksheet.ShowColumn(1, false);
    worksheet.ShowRow(2, false);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Hiding the first column and second row
    worksheet.ShowColumn(1, false);
    worksheet.ShowRow(2, false);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Hiding the first column and second row
    worksheet.ShowColumn(1, false);
    worksheet.ShowRow(2, false);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
}
```

```
}
```

Show or Hide Specific Range

The Essential XlsIO allows to set visibility for a specific range. The following code snippet shows how to set the visibility of a range.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    IRange range = worksheet[1, 4];
    //Hiding the range 'D1'
    worksheet.ShowRange(range, false);
    IRange firstRange = worksheet[1, 1, 3, 3];
    IRange secondRange = worksheet[5, 5, 7, 7];
    RangesCollection rangeCollection = new RangesCollection(application,
    worksheet);
    rangeCollection.Add(firstRange);
    rangeCollection.Add(secondRange);
    //Hiding a collection of ranges
    worksheet.ShowRange(rangeCollection, false);
    workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim range As IRange = worksheet(1, 4)
'Hiding the range 'D1'
worksheet.ShowRange(range, False)
Dim firstRange As IRange = worksheet(1, 1, 3, 3)
Dim secondRange As IRange = worksheet(5, 5, 7, 7)
Dim rangeCollection As RangesCollection = New RangesCollection(application,
worksheet)
rangeCollection.Add(firstRange)
rangeCollection.Add(secondRange)
'Hiding a collection of ranges
worksheet.ShowRange(rangeCollection, False)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Hiding the first column and second row
worksheet.ShowColumn(1, false);
worksheet.ShowRow(2, false);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Book1";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    IRange range = worksheet[1, 4];
    //Hiding the range 'D1'
    worksheet.ShowRange(range, false);
    IRange firstRange = worksheet[1, 1, 3, 3];
    IRange secondRange = worksheet[5, 5, 7, 7];
    RangesCollection rangeCollection = new RangesCollection(application,
    worksheet);
    rangeCollection.Add(firstRange);
    rangeCollection.Add(secondRange);
    //Hiding a collection of ranges
    worksheet.ShowRange(rangeCollection, false);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;

```

```

IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
IRange range = worksheet[1, 4];
//Hiding the range 'D1'
worksheet.ShowRange(range, false);
IRange firstRange = worksheet[1, 1, 3, 3];
IRange secondRange = worksheet[5, 5, 7, 7];
RangesCollection rangeCollection = new RangesCollection(application,
worksheet);
rangeCollection.Add(firstRange);
rangeCollection.Add(secondRange);
//Hiding a collection of ranges
worksheet.ShowRange(rangeCollection, false);
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.
xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
"application/msexcel", stream);
}
}

```

Note: Resetting column width manually or through AutoFit, for the columns hidden using [ShowColumn](#)/[HideColumn](#) methods will make the hidden columns visible.

Resetting row height manually or through AutoFit, for the rows hidden using [ShowRow](#) /[HideRow](#) methods will make the hidden rows visible.

Adjust Row Height and Column Width

Rows and columns can be [resized](#) based on its contents. The XlsIO allows to resize rows and columns in the following ways:

- Resize a specific row or column
- Resize a range of rows or columns

Resize a specific row or column

A single row or column can be resized by the **SetRowHeight** and **SetColumnWidth** methods of **IWorksheet**. Similarly, the height and width of a single row or column can be accessed using the **GetRowHeight** or **GetColumnWidth** methods of **IWorksheet**.

The following code snippet shows how to resize a single row and column.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.SetRowHeight(2, 25);
    //Modifying the column width
    worksheet.SetColumnWidth(1, 20);
    workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Modifying the row height
worksheet.SetRowHeight(2, 25)
'Modifying the column width
worksheet.SetColumnWidth(1, 20)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.SetRowHeight(2, 25);
    //Modifying the column width
    worksheet.SetColumnWidth(1, 20);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.SetRowHeight(2, 25);
    //Modifying the column width
    worksheet.SetColumnWidth(1, 20);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.SetRowHeight(2, 25);
    //Modifying the column width
    worksheet.SetColumnWidth(1, 20);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.
        xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
        "application/msexcel", stream);
    }
}

```

Resize a range of rows or columns

Multiple rows or columns can be resized and accessed by using the **RowHeight** and **ColumnWidth** properties of **IRange**. The following code snippet shows how to resize multiple rows and columns.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.Range["A2:A6"].RowHeight = 25;
    //Modifying the column width
    worksheet.Range["A1:D1"].ColumnWidth = 20;
    workbook.SaveAs("Book1.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Modifying the row height
worksheet.Range("A2:A6").RowHeight = 25
'Modifying the column width
worksheet.Range("A1:D1").ColumnWidth = 20
workbook.SaveAs("Book1.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.Range["A2:A6"].RowHeight = 25;
    //Modifying the column width
    worksheet.Range["A1:D1"].ColumnWidth = 20;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Modifying the row height
worksheet.Range["A2:A6"].RowHeight = 25;
//Modifying the column width
worksheet.Range["A1:D1"].ColumnWidth = 20;
//Saving the workbook as stream
FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying the row height
    worksheet.Range["A2:A6"].RowHeight = 25;
    //Modifying the column width
    worksheet.Range["A1:D1"].ColumnWidth = 20;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.
        xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
        "application/msexcel", stream);
    }
}

```

Note: If a column width or a row height is 0, then the column or row is hidden.

Column width and row height can also be set in pixels, by using the `IWorksheet.SetColumnWidthInPixel` and `IWorksheet.SetRowHeightInPixel` methods respectively.

Auto-Fit Rows and Columns

The XlsIO allows to auto-size the width and height of a cell to fit its content. This section demonstrates various methods to auto-fit rows and columns of a worksheet.

Auto-Fit a Single Row or Column

The following code snippet shows how a row and a column is re-sized to its content.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1"].Text = "This is a long text";
    worksheet.Range["A1"].WrapText = true;
    //AutoFit applied to a single row
    worksheet.AutofitRow(1);
    worksheet.Range["A3"].Text = "This is a long text";
    //AutoFit applied to a single column
    worksheet.AutofitColumn(3);
    workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
worksheet.Range("A1").Text = "This is a long text"
worksheet.Range("A1").WrapText = True
'AutoFit applied to a single row
worksheet.AutofitRow(1)
worksheet.Range("A3").Text = "This is a long text"
'AutoFit applied to a single column
worksheet.AutofitColumn(3)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1"].Text = "This is a long text";
    worksheet.Range["A1"].WrapText = true;
    //AutoFit applied to a single row
    worksheet.AutofitRow(1);
    worksheet.Range["A3"].Text = "This is a long text";
    //AutoFit applied to a single column
}
```

```

worksheet.AutofitColumn(3);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Book1";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1"].Text = "This is a long text";
    worksheet.Range["A1"].WrapText = true;
    //AutoFit applied to a single row
    worksheet.AutofitRow(1);
    worksheet.Range["A3"].Text = "This is a long text";
    //AutoFit applied to a single column
    worksheet.AutofitColumn(3);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1"].Text = "This is a long text";
    worksheet.Range["A1"].WrapText = true;
    //AutoFit applied to a single row
    worksheet.AutofitRow(1);
    worksheet.Range["A3"].Text = "This is a long text";
    //AutoFit applied to a single column
    worksheet.AutofitColumn(3);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
}

```

```
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.
xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
"application/msexcel", stream);
}
}
```

Note: Row and Column indexes are "one based".

There is an alternative way to auto-fit row or column is by accessing the row or column, which is shown in the following code snippet.

C#

```
//AutoFit applied to first row
worksheet.Rows[0].AutofitRows();
//AutoFit applied to first column
worksheet.Columns[0].AutofitColumns();
```

VB.NET

```
'AutoFit applied to first row
worksheet.Rows(0).AutofitRows()
'AutoFit applied to first column
worksheet.Columns(0).AutofitColumns()
```

UWP

```
//AutoFit applied to first row
worksheet.Rows[0].AutofitRows();
//AutoFit applied to first column
worksheet.Columns[0].AutofitColumns();
```

ASP.NET CORE

```
//AutoFit applied to first row
worksheet.Rows[0].AutofitRows();
//AutoFit applied to first column
worksheet.Columns[0].AutofitColumns();
```

XAMARIN

```
//AutoFit applied to first row
worksheet.Rows[0].AutofitRows();
//AutoFit applied to first column
```

```
worksheet.Columns[0].AutofitColumns();
```

Note: Here column and row indexes are "zero based".

Auto-Fit Multiple Rows or Columns

Multiple rows or columns can be auto fitted based on the range specified. This is depicted in the following code.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assigning text to cells
    worksheet.Range["A1:D1"].Text = "This is the Long Text";
    worksheet.Range["A2:A5"].Text = "This is the Long Text using AutoFit Columns and Rows";
    worksheet.Range["A2:A5"].WrapText = true;
    //Auto-Fit the range
    worksheet.Range["A1:C1"].AutofitColumns();
    worksheet.Range["A2:A5"].AutofitRows();
    //Auto-fits all the columns used in the worksheet
    worksheet.UsedRange.AutofitColumns();
    workbook.SaveAs("Book1.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Assigning text to cells
worksheet.Range("A1:D1").Text = "This is the Long Text"
worksheet.Range("A2:A5").Text = "This is the Long Text using AutoFit Columns and Rows"
worksheet.Range("A2:A5").WrapText = True
'Auto-Fit the range
worksheet.Range("A1:C1").AutofitColumns()
worksheet.Range("A2:A5").AutofitRows()
'Auto-fits all the columns used in the worksheet
worksheet.UsedRange.AutofitColumns()
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Assigning text to cells
worksheet.Range["A1:D1"].Text = "This is the Long Text";
worksheet.Range["A2:A5"].Text = "This is the Long Text using AutoFit Columns
and Rows";
worksheet.Range["A2:A5"].WrapText = true;
//Auto-Fit the range
worksheet.Range["A1:C1"].AutofitColumns();
worksheet.Range["A2:A5"].AutofitRows();
//Auto-fits all the columns used in the worksheet
worksheet.UsedRange.AutofitColumns();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Book1";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assigning text to cells
    worksheet.Range["A1:D1"].Text = "This is the Long Text";
    worksheet.Range["A2:A5"].Text = "This is the Long Text using AutoFit Columns
and Rows";
    worksheet.Range["A2:A5"].WrapText = true;
    //Auto-Fit the range
    worksheet.Range["A1:C1"].AutofitColumns();
    worksheet.Range["A2:A5"].AutofitRows();
    //Auto-fits all the columns used in the worksheet
    worksheet.UsedRange.AutofitColumns();
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
}

```

```

IWorksheet worksheet = workbook.Worksheets[0];
//Assigning text to cells
worksheet.Range["A1:D1"].Text = "This is the Long Text";
worksheet.Range["A2:A5"].Text = "This is the Long Text using AutoFit Columns
and Rows";
worksheet.Range["A2:A5"].WrapText = true;
//Auto-Fit the range
worksheet.Range["A1:C1"].AutofitColumns();
worksheet.Range["A2:A5"].AutofitRows();
//Auto-fits all the columns used in the worksheet
worksheet.UsedRange.AutofitColumns();
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.
xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
"application/msexcel", stream);
}
}

```

Note: 1) If a Range is text wrapped, the AutofitColumn method will not be applied on it.

2) If a Range is merged, the Auto-Fit methods will not be applied on it. Note that this is the behavior of Excel as well.

3) Auto fitting is a time consuming process so, it might cause performance issues when used excessively.

Group or Ungroup Rows and Columns

Rows and columns can be grouped or ungrouped to summarize the data, which is given in the following code snippet.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Group Rows
worksheet.Range["A1:A3"].Group(ExcelGroupBy.ByRows, true);
worksheet.Range["A4:A6"].Group(ExcelGroupBy.ByRows);
//Group Columns
worksheet.Range["A1:B1"].Group(ExcelGroupBy.ByColumns, false);
}

```

```

worksheet.Range["C1:F1"].Group(ExcelGroupBy.ByColumns);
//Ungroup Rows
worksheet.Range["A1:A3"].Ungroup(ExcelGroupBy.ByRows);
//Ungroup Columns
worksheet.Range["C1:F1"].Ungroup(ExcelGroupBy.ByColumns);
workbook.SaveAs("Book1.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Group Rows
worksheet.Range("A1:A3").Group(ExcelGroupBy.ByRows, True)
worksheet.Range("A4:A6").Group(ExcelGroupBy.ByRows)
'Group Columns
worksheet.Range("A1:B1").Group(ExcelGroupBy.ByColumns, False)
worksheet.Range("C1:F1").Group(ExcelGroupBy.ByColumns)
'Ungroup Rows
worksheet.Range("A1:A3").Ungroup(ExcelGroupBy.ByRows)
'Ungroup Columns
worksheet.Range("C1:F1").Ungroup(ExcelGroupBy.ByColumns)
workbook.SaveAs("Book1.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Group Rows
worksheet.Range["A1:A3"].Group(ExcelGroupBy.ByRows, true);
worksheet.Range["A4:A6"].Group(ExcelGroupBy.ByRows);
//Group Columns
worksheet.Range["A1:B1"].Group(ExcelGroupBy.ByColumns, false);
worksheet.Range["C1:F1"].Group(ExcelGroupBy.ByColumns);
//Ungroup Rows
worksheet.Range["A1:A3"].Ungroup(ExcelGroupBy.ByRows);
//Ungroup Columns
worksheet.Range["C1:F1"].Ungroup(ExcelGroupBy.ByColumns);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;

```

```

savePicker.SuggestedFileName = "Book1";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Group Rows
    worksheet.Range["A1:A3"].Group(ExcelGroupBy.ByRows, true);
    worksheet.Range["A4:A6"].Group(ExcelGroupBy.ByRows);
    //Group Columns
    worksheet.Range["A1:B1"].Group(ExcelGroupBy.ByColumns, false);
    worksheet.Range["C1:F1"].Group(ExcelGroupBy.ByColumns);

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
"application/msexcel", stream);
}
}

```

Expand or Collapse Groups

Groups can be expanded and collapsed using the **ExpandGroups** and **CollapseGroups** methods of **IRange**, which is given in the following code snippet.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Expand group with flag set to expand parent
worksheet.Range["A5:A15"].ExpandGroup(ExcelGroupBy.ByRows,
ExpandCollapseFlags.ExpandParent);
//Collapse group
worksheet.Range["A5:A15"].CollapseGroup(ExcelGroupBy.ByRows);
workbook.SaveAs("Book1.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Expand group with flag set to expand parent
worksheet.Range("A5:A15").ExpandGroup(ExcelGroupBy.ByRows,
ExpandCollapseFlags.ExpandParent)
'Collapse group

```

```
worksheet.Range("A5:A15").CollapseGroup(ExcelGroupBy.ByRows)
workbook.SaveAs("Book1.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Expand group with flag set to expand parent
    worksheet.Range["A5:A15"].ExpandGroup(ExcelGroupBy.ByRows,
    ExpandCollapseFlags.ExpandParent);
    //Collapse group
    worksheet.Range["A5:A15"].CollapseGroup(ExcelGroupBy.ByRows);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Book1";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Expand group with flag set to expand parent
    worksheet.Range["A5:A15"].ExpandGroup(ExcelGroupBy.ByRows,
    ExpandCollapseFlags.ExpandParent);
    //Collapse group
    worksheet.Range["A5:A15"].CollapseGroup(ExcelGroupBy.ByRows);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

```
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())

    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
}
```

Subtotal

The XlsIO supports subtotalling a group to quickly calculate rows of related data by inserting subtotals and totals.

Various Subtotal options like **Summary below data**, **Replace current subtotals**, **Page break between groups** can be used to customize data.

The following code shows how to add subtotal for a given range.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Set the range for subtotaling
IRange range = worksheet.Range["C3:G12"];
//Perform subtotals for the range with every change in first column
//and subtotals to be included for specified list of columns
range.SubTotal(0, ConsolidationFunction.Sum, new int[] { 2, 3, 4 });
workbook.SaveAs("Book1.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Set the range for subtotaling
Dim range As IRange = worksheet("C3:G12")
'Perform subtotals for the range with every change in first column
'and subtotals to be included for specified list of columns
range.SubTotal(0, ConsolidationFunction.Sum, New Integer() {4})
workbook.SaveAs("Book1.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Set the range for subtotaling
IRange range = worksheet.Range["C3:G12"];
//Perform subtotals for the range with every change in first column
//and subtotals to be included for specified list of columns
range.SubTotal(0, ConsolidationFunction.Sum, new int[] { 2, 3, 4 });
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Book1";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Set the range for subtotaling
    IRange range = worksheet.Range["C3:G12"];
    //Perform subtotals for the range with every change in first column
    //and subtotals to be included for specified list of columns
    range.SubTotal(0, ConsolidationFunction.Sum, new int[] { 2, 3, 4 });
    //Saving the workbook as stream
    FileStream stream = new FileStream("Book1.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Set the range for subtotaling
    IRange range = worksheet.Range["C3:G12"];
    //Perform subtotals for the range with every change in first column
    //and subtotals to be included for specified list of columns
    range.SubTotal(0, ConsolidationFunction.Sum, new int[] { 2, 3, 4 });
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Book1.xlsx", "application/msexcel", stream);
    }
    else

```

```
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Book1.xlsx",
"application/msexcel", stream);
}
}
```

Note: Here column and row indexes are "zero based".

The screenshot of the output with SubTotal generated from the previous code.

Note: Summary of a group can be shown above the rows and left of the column using the `IsSummaryRowBelow` and `IsSummaryColumnRight` properties of `IPageSetup` interface. By default, these properties are set to `TRUE`.

Worksheet Cells Manipulation

The **IRange** interface represents a single cell or a group of cells in a worksheet. XlsIO has several useful methods for accessing, manipulating and formatting the content in the ranges.

Accessing a Cell or a Range

The following code shows the different ways of accessing a single cell or group of cells

Note: Here row and column indexes in the range are "one based".

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Access a range by specifying cell address
sheet.Range["A7"].Text = "Accessing a Range by specify cell address ";
//Access a range by specifying cell row and column index
sheet.Range[9, 1].Text = "Accessing a Range by specify cell row and column
index ";
//Access a Range by specifying using defined name
IName name = workbook.Names.Add("Name");
name.RefersToRange = sheet.Range["A11"];
sheet.Range["Name"].Text = "Accessing a Range by specifying using defined
name.";
//Accessing a Range of cells by specifying cells address
sheet.Range["A13:C13"].Text = "Accessing a Range of Cells (Method 1)";
//Accessing a Range of cells specifying cell row and column index
sheet.Range[15, 1, 15, 3].Text = "Accessing a Range of Cells (Method 2)";
workbook.SaveAs("Range.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Access a range by specify cell address
sheet.Range("A7").Text = "Accessing a Range by specify cell address "
'Access a range by specify cell row and column index
sheet.Range(9, 1).Text = "Accessing a Range by specify cell row and column
index "
'Access a Range by specifying using defined name
Dim name As IName = workbook.Names.Add("Name")
name.RefersToRange = sheet.Range("A11")
sheet.Range("Name").Text = "Accessing a Range by specifying using defined
name"
'Accessing a Range of cells by specify cells address
sheet.Range("A13:C13").Text = "Accessing a Range of Cells (Method 1)"
'Accessing a Range of cells specify cell row and column index
sheet.Range(15, 1, 15, 3).Text = "Accessing a Range of Cells (Method 2)"
workbook.SaveAs("Range.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Access a range by specifying cell address
sheet.Range["A7"].Text = "Accessing a Range by specify cell address ";
//Access a range by specifying cell row and column index

```

```

sheet.Range[9, 1].Text = "Accessing a Range by specify cell row and column
index ";
//Access a Range by specifying using defined name
IName name = workbook.Names.Add("Name");
name.RefersToRange = sheet.Range["A11"];
sheet.Range["Name"].Text = "Accessing a Range by specifying using defined
name";
//Accessing a Range of cells by specifying cells address
sheet.Range["A13:C13"].Text = "Accessing a Range of Cells (Method 1)";
//Accessing a Range of cells specifying cell row and column index
sheet.Range[15, 1, 15, 3].Text = "Accessing a Range of Cells (Method 2)";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Range";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Access a range by specifying cell address
    sheet.Range["A7"].Text = "Accessing a Range by specify cell address ";
    //Access a range by specifying cell row and column index
    sheet.Range[9, 1].Text = "Accessing a Range by specify cell row and column
index ";
    //Access a Range by specifying using defined name
    IName name = workbook.Names.Add("Name");
    name.RefersToRange = sheet.Range["A11"];
    sheet.Range["Name"].Text = "Accessing a Range by specifying using defined
name";
    //Accessing a Range of cells by specifying cells address
    sheet.Range["A13:C13"].Text = "Accessing a Range of Cells (Method 1)";
    //Accessing a Range of cells specifying cell row and column index
    sheet.Range[15, 1, 15, 3].Text = "Accessing a Range of Cells (Method 2)";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Range.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Access a range by specifying cell address
sheet.Range["A7"].Text = "Accessing a Range by specify cell address ";
//Access a range by specifying cell row and column index
sheet.Range[9, 1].Text = "Accessing a Range by specify cell row and column index ";
//Access a Range by specifying using defined name
IName name = workbook.Names.Add("Name");
name.RefersToRange = sheet.Range["A11"];
sheet.Range["Name"].Text = "Accessing a Range by specifying using defined name";
//Accessing a Range of cells by specifying cells address
sheet.Range["A13:C13"].Text = "Accessing a Range of Cells (Method 1)";
//Accessing a Range of cells specifying cell row and column index
sheet.Range[15, 1, 15, 3].Text = "Accessing a Range of Cells (Method 2)";
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Range.
xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Range.xlsx",
"application/msexcel", stream);
}
}

```

Tips: You can use of GetText, SetText, GetNumber and SetNumber methods from worksheet object that enable users to get/set values without range object.

Accessing Relative Range

By default, accessing a range by index will return the cell or range from worksheet level. To get a relative range for the indexes provided, it is recommended to set the **ExcelRangeIndexerMode** option. Here, the RowIndex and ColumnIndex arguments are relative offsets, where specifying a RowIndex of 1 returns cells in the first row of the range not the first row of the worksheet.

For example, if a range is mentioned as "B3:D5", then accessing a range with the index [1,1] will return the cell "A1" from worksheet. If the **ExcelRangeIndexerMode** is set to **Relative** then it returns "B3".

Following code example illustrates how to access the range relatively to the existing range object in XlsIO.

Note: Here row and column indexes in the range are "one-based".

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Setting range index mode to relative
    application.RangeIndexerMode = ExcelRangeIndexerMode.Relative;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating a range by specifying cells address
    IRange range1 = sheet.Range("B3:D5");
    //Accessing a range relatively to the existing range by specifying cell row
    and column index
    range1[2, 2].Text = "Returns C4 cell";
    range1[0, 0].Text = "Returns A2 cell";
    //Creating a Range of cells specifying cell row and column index
    IRange range2 = sheet.Range[5, 1, 10, 3];
    //Accessing a range relatively to the existing range of cells by specifying
    cell row and column index
    range2[2, 2, 3, 3].Text = "Returns range of cells B6 to C7";
    workbook.SaveAs("Range.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Setting range index mode to relative
application.RangeIndexerMode = ExcelRangeIndexerMode.Relative
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating a range by specifying cells address
Dim range1 As IRange = sheet.Range("B3:D5")
'Accessing a range relatively to the existing range by specifying cell row
and column index
range1(2, 2).Text = "Returns B4 cell"
range1(0, 0).Text = "Returns A2 cell"
Dim range2 As IRange = sheet.Range(5, 1, 10, 3)
'Accessing a range relatively to the existing range of cells by specifying
cell row and column index
range2(2, 2, 3, 3).Text = "Returns range of cells B6 to C7"
workbook.SaveAs("Range.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Setting range index mode to relative
    application.RangeIndexerMode = ExcelRangeIndexerMode.Relative;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
}
```

```

//Creating a range by specifying cells address
IRange range1 = sheet.Range["B3:D5"];
//Accessing a range relatively to the existing range by specifying cell row and column index
range1[2, 2].Text = "Returns C4 cell";
range1[0, 0].Text = "Returns A2 cell";
//Creating a Range of cells specifying cell row and column index
IRange range2 = sheet.Range[5, 1, 10, 3];
//Accessing a range relatively to the existing range of cells by specifying cell row and column index
range2[2, 2, 3, 3].Text = "Returns range of cells B6 to C7";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Range";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Setting range index mode to relative

workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Range.
xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Range.xlsx",
"application/msexcel", stream);
}
}

```

Accessing Discontinuous Ranges

You can access discontinuous ranges and add them to the **RangesCollection**. You can modify the contents or applying formatting of discontinuous range through RangeCollection instance.

Following code snippet illustrates how to access discontinuous range.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //range1 and range2 are discontinuous ranges
    IRange range1 = sheet.Range["A1:A2"];
    IRange range2 = sheet.Range["C1:C2"];
    IRanges ranges = sheet.CreateRangesCollection();
    //range1 and range2 are considered as a single range
}

```

```

ranges.Add(range1);
ranges.Add(range2);
ranges.Text = "Test";
workbook.SaveAs("Range.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'range1 and range2 are discontinuous ranges
Dim range1 As IRange = sheet.Range("A1:A2")
Dim range2 As IRange = sheet.Range("C1:C2")
Dim ranges As IRanges = sheet.CreateRangesCollection()
'range1 and range2 are considered as a single range
ranges.Add(range1)
ranges.Add(range2)
ranges.Text = "Test"
workbook.SaveAs("Range.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //range1 and range2 are discontinuous ranges
    IRange range1 = sheet.Range["A1:A2"];
    IRange range2 = sheet.Range["C1:C2"];
    IRanges ranges = sheet.CreateRangesCollection();
    //range1 and range2 are considered as a single range
    ranges.Add(range1);
    ranges.Add(range2);
    ranges.Text = "Test";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Range";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

```

```

{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //range1 and range2 are discontinuous ranges
    IRange range1 = sheet.Range["A1:A2"];
    IRange range2 = sheet.Range["C1:C2"];
    IRanges ranges = sheet.CreateRangesCollection();
    //range1 and range2 are considered as a single range
    ranges.Add(range1);
    ranges.Add(range2);
    ranges.Text = "Test";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Range.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //range1 and range2 are discontinuous ranges
    IRange range1 = sheet.Range["A1:A2"];
    IRange range2 = sheet.Range["C1:C2"];
    IRanges ranges = sheet.CreateRangesCollection();
    //range1 and range2 are considered as a single range
    ranges.Add(range1);
    ranges.Add(range2);
    ranges.Text = "Test";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Range.
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Range.xlsx",
        "application/msexcel", stream);
    }
}

```

Accessing a Cell or Range using IMigrantRange

The **IMigrantRange** interface can also be used to access a single cell or group of cells and manipulate it. You can prefer IMigrantRange instead of IRange while writing large amount of data which is an optimal way.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    IMigrantRange migrantRange = sheet.MigrantRange;
    //Writing Data
    for (int row = 1; row <= migrantRange.LastRow; row++)
    {
        for (int column = 1; column <= migrantRange.LastColumn; column++)
        {
            //Writing values
            migrantRange.ResetRowColumn(row, column);
            migrantRange.Text = "Test";
        }
    }
    workbook.SaveAs("Range.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim migrantRange As IMigrantRange = sheet.MigrantRange
'Writing Data
Dim row As Integer
For row = 1 To migrantRange.LastRow Step row + 1
Dim column As Integer
For column = 1 To migrantRange.LastColumn Step column + 1
'Writing values
migrantRange.ResetRowColumn(row, column)
migrantRange.Text = "Test"
Next
Next
workbook.SaveAs("Range.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
IMigrantRange migrantRange = sheet.MigrantRange;
//Writing Data
for (int row = 1; row <= migrantRange.LastRow; row++)
{
    for (int column = 1; column <= migrantRange.LastColumn; column++)
    {
        //Writing values
        migrantRange.ResetRowColumn(row, column);
        migrantRange.Text = "Test";
    }
}
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Range";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    IMigrantRange migrantRange = sheet.MigrantRange;
    //Writing Data
    for (int row = 1; row <= migrantRange.LastRow; row++)
    {
        for (int column = 1; column <= migrantRange.LastColumn; column++)
        {
            //Writing values
            migrantRange.ResetRowColumn(row, column);
            migrantRange.Text = "Test";
        }
    }
    //Saving the workbook as stream
    FileStream stream = new FileStream("Range.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;

```

```

application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
IMigrantRange migrantRange = sheet.MigrantRange;
//Writing Data
for (int row = 1; row <= migrantRange.LastRow; row++)
{
    for (int column = 1; column <= migrantRange.LastColumn; column++)
    {
        //Writing values
        migrantRange.ResetRowColumn(row, column);
        migrantRange.Text = "Test";
    }
}
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Range.
    xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Range.xlsx",
    "application/msexcel", stream);
}
}

```

Accessing used range of a Worksheet

The following code snippet shows how to get the range of cells used in a given sheet.

Note: By default, XlsIO considers a cell as used, even if there exists some formatting alone. You can disable this behavior, and make XlsIO consider a cell as used, only when there exists data, by using the `UsedRangeIncludesFormatting` property.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //UsedRange excludes the blank cell which has formatting
    sheet.UsedRangeIncludesFormatting = false;
    //Modifying the column width and row height of the used range
    sheet.UsedRange.ColumnWidth = 20;

Get Precedent and Dependent Cells or Range

Precedent cells are cells that are referred to by a formula in another cell. Dependent cells contain formulas that refer to other cells. XlsIO allows to trace the relationship between cells and formulas in Excel workbooks and returns the list of cells or range that are precedent and dependent.

Accessing list of precedent and dependent cells can be obtained:

from a worksheet from a workbook

Following code example illustrates how to get precedent cells from a worksheet and entire workbook.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("FormulaExcel.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Getting precedent cells from the worksheet
    IRange[] results1 = sheet["A1"].GetPrecedents();
    //Getting precedent cells from the workbook
    IRange[] results2 = sheet["A1"].GetPrecedents(true);
    string fileName = "Precedents.xlsx";
    workbook.SaveAs(fileName);
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("FormulaExcel.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Getting precedent cells from the worksheet
Dim results1() As IRange = sheet("A1").GetPrecedents()
'Getting precedent cells from the workbook
Dim results2() As IRange = sheet("A1").GetPrecedents(True)
Dim fileName As String = "Precedents.xlsx"
workbook.SaveAs(fileName)
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet sheet = workbook.Worksheets[0];
    //Getting precedent cells from the worksheet
    IRange[] results1 = sheet["A1"].GetPrecedents();
```

```

//Getting precedent cells from the workbook
IRange[] results2 = sheet["A1"].GetPrecedents(true);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Precedents";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

Get Direct Precedent and Dependent Cells

GetDirectDependents and **GetDirectPrecedents** methods are used to get direct dependent/precedent cells for source range excluding inner dependent/precedent cells.

Following code example illustrates how to get direct precedent cells from a worksheet and entire workbook.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("FormulaExcel.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Getting precedent cells from the worksheet
    IRange[] results1 = sheet["A1"].GetDirectPrecedents();
    //Getting precedent cells from the workbook
    IRange[] results2 = sheet["A1"].GetDirectPrecedents(true);
    string fileName = "DirectPrecedents.xlsx";
    workbook.SaveAs(fileName);
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("FormulaExcel.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Getting precedent cells from the worksheet
Dim results1() As IRange = sheet("A1").GetDirectPrecedents()
'Getting precedent cells from the workbook
Dim results2() As IRange = sheet("A1").GetDirectPrecedents(True)
```

```
Dim fileName As String = "DirectPrecedents.xlsx"
workbook.SaveAs(fileName)
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet sheet = workbook.Worksheets[0];
    //Getting precedent cells from the worksheet

Clearing a Cell Content

You can delete everything in the cell, or just remove the formatting, contents, comments. The following code example illustrates how to clear a range along with its formatting.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    ///Clearing a Range "A4" and its formatting
}

```

```
sheet.Range["A4"].Clear(true);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("ClearRange.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Clearing a Range "A4" and its formatting
sheet.Range("A4").Clear(True)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("ClearRange.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Clearing a Range "A4" and its formatting
    worksheet.Range["A4"].Clear(true);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "ClearRange";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Clearing a Range "A4" and its formatting
    worksheet.Range["A4"].Clear(true);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("ClearRange.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("ClearRange.xlsx", "application/msexcel", stream);
    }
}

```

Copy or Move a Range

You can copy a range of cells to another range using CopyTo method. You can also copy all the formats or only specific formats using **ExcelCopyRangeOptions** options.

Following code example illustrates how to copy a range of cells from the source to destination.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Copying a Range "A1" to "A5"
IRange source = sheet.Range["A1"];
IRange destination = sheet.Range["A5"];
source.CopyTo(destination, ExcelCopyRangeOptions.All);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("CopyRange.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Copying a Range "A1" to "A5"
Dim source As IRange = sheet.Range("A1")
Dim destination As IRange = sheet.Range("A5")
source.CopyTo(destination, ExcelCopyRangeOptions.All)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("CopyRange.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Copying a Range "A1" to "A5"
IRange source = worksheet.Range["A1"];
IRange destination = worksheet.Range["A5"];
source.CopyTo(destination, ExcelCopyRangeOptions.All);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "CopyRange";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Copying a Range "A1" to "A5"
    IRange source = worksheet.Range["A1"];
    IRange destination = worksheet.Range["A5"];
    source.CopyTo(destination, ExcelCopyRangeOptions.All);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "CopyRange";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    workbook.Version = ExcelVersion.Excel2013;
    await workbook.SaveAsAsync(storageFile);
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Copying a Range "A1" to "A5"
    IRange source = worksheet.Range["A1"];
    IRange destination = worksheet.Range["A5"];
    source.CopyTo(destination, ExcelCopyRangeOptions.All);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
}
```

```
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("CopyRange.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("CopyRange.xlsx", "application/msexcel", stream);
}
}
```

MoveTo method is used for moving a range of cells to another range as shown below.

Note: MoveTo method does not update formulas.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Moving a Range "A1" to "A5"
IRange source = sheet.Range["A1"];
IRange destination = sheet.Range["A5"];
source.MoveTo(destination);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("MoveRange.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Moving a Range "A1" to "A5"
Dim source As IRange = sheet.Range("A1")
Dim destination As IRange = sheet.Range("A5")
source.MoveTo(destination)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("MoveRange.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
```

```

openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Moving a Range "A1" to "A5"
IRange source = worksheet.Range["A1"];
IRange destination = worksheet.Range["A5"];
source.MoveTo(destination);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "MoveRange";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Moving a Range "A1" to "A5"
    IRange source = worksheet.Range["A1"];
    IRange destination = worksheet.Range["A5"];
    source.MoveTo(destination);
    //Saving the workbook as stream
    FileStream stream = new FileStream("MoveRange.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    ///"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sam
    ple.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
}

```

```

IWorksheet worksheet = workbook.Worksheets[0];
//Moving a Range "A1" to "A5"
IRange source = worksheet.Range["A1"];
IRange destination = worksheet.Range["A5"];
source.MoveTo(destination);
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("MoveRange.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("MoveRange.xlsx", "application/msexcel", stream);
}
}

```

Copy and Paste As Link

You can copy a range and paste the range as link to another range using a bool parameter in CopyTo method.

Following code example illustrates how to paste a range of cells as link.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Copy range as link from Range "A1" to "A5"
IRange source = sheet.Range["A1"];
IRange destination = sheet.Range["D5"];
source.CopyTo(destination, true);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("PasteLink.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Copy range as link from Range "A1" to "A5"
Dim source As IRange = sheet.Range("A1")

```

```

Dim destination As IRange = sheet.Range("A5")
source.CopyTo(destination, True)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("PasteLink.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Copy range as link from Range "A1" to "A5"
    IRange source = worksheet.Range["A1"];
    IRange destination = worksheet.Range["A5"];
    source.CopyTo(destination, true);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "PasteLink";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    workbook.Version = ExcelVersion.Excel2013;
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Copy range as link from Range "A1" to "A5"
    IRange source = worksheet.Range["A1"];
    IRange destination = worksheet.Range["A5"];
    source.CopyTo(destination, true);
    //Saving the workbook as stream
    FileStream stream = new FileStream("PasteLink.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

```
}

```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())

}
```

Skip Blanks While Copying

Blank cells can be skipped while copying from source to destination range by setting the parameter [skip blanks](#) to TRUE.

The following code illustrates how to skip blank cells while copying.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    ///Copy range as link from Range "A1" to "A5".
    IRange source = sheet.Range["A1:A7"];
    IRange destination = sheet.Range["C3"];
```

```
//Skip blanks while copying
source.CopyTo(destination, ExcelCopyRangeOptions.All, true);
//Save workbook
workbook.SaveAs("SkipBlank.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
' Copy range as link from Range "A1" to "A5".
Dim source As IRange = sheet.Range("A1:A7")
Dim destination As IRange = sheet.Range("C3")
' Skip blanks while copying
source.CopyTo(destination, ExcelCopyRangeOptions.All, true)
' Save workbook
workbook.SaveAs("SkipBlank.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker.
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile openFile = await openPicker.PickSingleFileAsync();
    //Opens the workbook.
    IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
    IWorksheet sheet = workbook.Worksheets[0];
    // Copy range as link from Range "A1" to "A5".
    IRange source = sheet.Range["A1:A7"];
    IRange destination = sheet.Range["C3"];
    //Skip blanks while copying
    source.CopyTo(destination, ExcelCopyRangeOptions.All, true);
    //Initializes FileSavePicker.
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "CreateSpreadsheet";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker.
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file.
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
```

```

{
    IApplication application = excelEngine.Excel;
    string basePath = _hostingEnvironment.WebRootPath + @"\"XlsIO\\Sample.xlsx";
    FileStream sampleFile = new FileStream(basePath, FileMode.Open);
    IWorkbook workbook = application.Workbooks.Open(sampleFile);
    IWorksheet sheet = workbook.Worksheets[0];
    // Copy range as link from Range "A1" to "A5".
    IRange source = sheet.Range["A1:A7"];
    IRange destination = sheet.Range["C3"];
    //Skip blanks while copying
    source.CopyTo(destination, ExcelCopyRangeOptions.All, true);
    //Saving the workbook to stream in XLSX format
    FileStream stream = new FileStream("SkipBlank.xlsx", FileMode.Create,

    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet sheet = workbook.Worksheets[0];
    // Copy range as link from Range "A1" to "A5".
    IRange source = sheet.Range["A1:A7"];
    IRange destination = sheet.Range["C3"];
    //Skip blanks while copying
    source.CopyTo(destination, ExcelCopyRangeOptions.All, true);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    workbook.Close();
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("SkipBl
        anks.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("SkipBlanks.xlsx",
        "application/msexcel", stream);
    }
}

```

Find and Replace

You can perform [find and replace](#) text and numbers in workbook or worksheet using XlsIO. Also, XlsIO provides the following options:

To search for data in formulas, values or comments. To search for case-sensitive data and to match entire cell contents of the cell.

To know more about these options, please refer the [ExcelFindType](#), [ExcelFindOptions](#) in the API documentation section.

You can find all the occurrences of a text in worksheet by using [FindAll](#) method. To know more about Find and Replace, please refer [IWorksheet](#) in the API documentation section.

The following code illustrates how to find all the occurrences of text in a worksheet with different find options.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Searches for the given string within the text of worksheet
    IRange[] result1 = sheet.FindAll("FindValue", ExcelFindType.Text);
    //Searches for the given string in formulas
    IRange[] result2 = sheet.FindAll("FindValue", ExcelFindType.Formula);
    //Searches for the given string in calculated value, number and text
    IRange[] result3 = sheet.FindAll("FindValue", ExcelFindType.Values);
    //Searches for the given string in comments
    IRange[] result4 = sheet.FindAll("FindValue", ExcelFindType.Comments);
    //Searches for the given string within the text of worksheet and case
    //matched
    IRange[] result5 = sheet.FindAll("FindValue", ExcelFindType.Text,
    ExcelFindOptions.MatchCase);
    //Searches for the given string within the text of worksheet and the entire
    //cell content matching to search text
    IRange[] result6 = sheet.FindAll("FindValue", ExcelFindType.Text,
    ExcelFindOptions.MatchEntireCellContent);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("Find.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()

```

You can replace a text with another text with the help of Replace method which searches for text you'd like to change. You can replace a string, with the data of various data types and data sources, such as data table, data column and array.

To know more about replace overloads, please refer [Replace](#) in the API documentation section.

The following code example illustrates how to replace all occurrences of given string with various data.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Replaces the given string with another string
sheet.Replace("FindValue", "NewValue");
//Replaces the given string with another string on match case
sheet.Replace("FindValue", "NewValue", ExcelFindOptions.MatchCase);
//Replaces the given string with another string matching entire cell content
to the search word
sheet.Replace("FindValue", "NewValue",
ExcelFindOptions.MatchEntireCellContent);
//Replaces the given string with DateTime value
sheet.Replace("DateValue", DateTime.Now);
//Replaces the given string with Array
sheet.Replace("ArrayValue", new string[] { "ArrayValue1", "ArrayValue2",
"ArrayValue3" }, true);
//Replaces the given string with DataTable

```

```

DataTable table = SampleDataTable();
sheet.Replace("DataTable", table, true);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Replace.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Replaces the given string with another string
sheet.Replace("FindValue", "NewValue")
'Replaces the given string with another string on match case
sheet.Replace("FindValue", "NewValue", ExcelFindOptions.MatchCase)
'Replaces the given string with another string matching entire cell content
to the search word
sheet.Replace("FindValue", "NewValue",
ExcelFindOptions.MatchEntireCellContent)
'Replaces the given string with DateTime value
sheet.Replace("DateValue", DateTime.Now)
'Replaces the given string with Array
sheet.Replace("ArrayValue", New String() {"ArrayValue1", "ArrayValue2",
"ArrayValue3"}, True)
'Replaces the given string with DataTable
Dim table As DataTable = SampleDataTable()
sheet.Replace("DataTable", table, True)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Replace.xlsx")
End Using

```

```

Data Sorting

You can sort a range of cells based on data in one or more columns. You can perform sorting based on the following:

- Based on Cell Values
- Based on Font Color
- Based on Cell Color

Note: Currently XlsIO don't support sorting based on cell icon, parsing and serialization of its sorting details.

Based on Cell Values

The following code snippet explains how to sort a range of cells by values

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
```

```

{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Creates the data sorter
    IDataSort sorter = workbook.CreateDataSorter();
    //Range to sort
    sorter.SortRange = sheet.Range["D3:D16"];
    //Adds the sort field with the column index, sort based on and order by attribute
    ISortField sortField = sorter.SortFields.Add(0, SortOn.Values,
    OrderBy.Ascending);
    //Adds another sort field
    ISortField sortField2 = sorter.SortFields.Add(1, SortOn.Values,
    OrderBy.Ascending);
    //Sort based on the sort Field attribute
    sorter.Sort();
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("Sort.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creates the Data sorter
Dim sorter As IDataSort = workbook.CreateDataSorter()
'Specifies the sort range
sorter.SortRange = sheet.Range("D3:D16")
'Adds the sort field with column index, sort based on and order by attribute
Dim sortField As ISortField = sorter.SortFields.Add(0, SortOn.Values,
OrderBy.Ascending)
'Adds the second sort field
Dim sortField2 As ISortField = sorter.SortFields.Add(1, SortOn.Values,
OrderBy.Ascending)
'Sorts the data with the sort field attribute
sorter.Sort()
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Sort.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
}

```

```
IWorksheet worksheet = workbook.Worksheets[0];
//Creates the data sorter
IDataSort sorter = workbook.CreateDataSorter();
//Range to sort
sorter.SortRange = worksheet.Range["D3:D16"];

Data Filtering

Using [AutoFilters](#), you can filter data to enable quick and easy way to find and work with a subset of data in a range of cells. When you filter data, entire rows are hidden if values in one or more columns don't meet the filtering criteria. The following are the types of filters that can be used in XlsIO.

- Custom Filter (Conditional)
- Combination Filter (Text and DateTime filter)
- Dynamic Filter
- Color Filter
- Icon Filter
- Advanced Filter

Applying Filter

The following code illustrates how to apply simple auto filters.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
    range.
    sheet.AutoFilters.FilterRange = sheet.Range["A1:K180"];
    //Column index to which AutoFilter must be applied
    IAutoFilter filter = sheet.AutoFilters[0];
    //To apply Top10Number filter, IsTop and IsTop10 must be enabled
    filter.IsTop = true;
    filter.IsTop10 = true;
    //Setting Top10 filter with number of cell to be filtered from top
    filter.Top10Number = 5;
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("Filter.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range.
sheet.AutoFilters.FilterRange = sheet.Range("A1:K180")
'Column index to which AutoFilter must be applied.
Dim filter As IAutoFilter = sheet.AutoFilters(0)
'To apply Top10Number filter, IsTop and IsTop10 must be enabled.
filter.IsTop = True
filter.IsTop10 = True
'Setting Top10 filter with number of cell to be filtered from top
filter.Top10Number = 5
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
}
```

```

IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range
worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied
IAutoFilter filter = worksheet.AutoFilters[0];
//To apply Top10Number filter, IsTop and IsTop10 must be enabled
filter.IsTop = true;
filter.IsTop10 = true;
//Setting Top10 filter with number of cell to be filtered from top
filter.Top10Number = 5;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Filter";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream);
IWorksheet worksheet = workbook.Worksheets[0];
//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range
worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied
IAutoFilter filter = worksheet.AutoFilters[0];
//To apply Top10Number filter, IsTop and IsTop10 must be enabled
filter.IsTop = true;
filter.IsTop10 = true;
//Setting Top10 filter with number of cell to be filtered from top
filter.Top10Number = 5;
//Saving the workbook as stream
FileStream stream = new FileStream("Filter.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
// "App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet worksheet = workbook.Worksheets[0];
// Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range
worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
// Column index to which AutoFilter must be applied
IAutoFilter filter = worksheet.AutoFilters[0];
// To apply Top10Number filter, IsTop and IsTop10 must be enabled
filter.IsTop = true;
filter.IsTop10 = true;
// Setting Top10 filter with number of cell to be filtered from top
filter.Top10Number = 5;
// Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs(stream);
stream.Position = 0;
// Save the document as file and view the saved document
// The operation in SaveAndView under Xamarin varies between Windows Phone,
// Android and iOS platforms. Please refer xlsio/xamarin section for respective
// code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Filter.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Filter.xlsx", "application/msexcel", stream);
}
}

```

Custom Filter

Following code snippets illustrates how to apply custom filter, based on first and second condition.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
// Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range
sheet.AutoFilters.FilterRange = sheet.Range["A1:B323"];
IAutoFilter filter = sheet.AutoFilters[1];
// Specifying first condition
IAutoFilterCondition firstCondition = filter.FirstCondition;

```

```

firstCondition.ConditionOperator = ExcelFilterCondition.Greater;
firstCondition.Double = 100;
//Specifying second condition
IAutoFilterCondition secondCondition = filter.SecondCondition;
secondCondition.ConditionOperator = ExcelFilterCondition.Less;
secondCondition.Double = 200;
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Filter.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
sheet.AutoFilters.FilterRange = sheet.Range("A1:B323")
Dim filter As IAutoFilter = sheet.AutoFilters(1)
'Specifying first condition.
Dim firstCondition As IAutoFilterCondition = filter.FirstCondition
firstCondition.ConditionOperator = ExcelFilterCondition.Greater
firstCondition.Double = 100
'Specifying second condition.
Dim secondCondition As IAutoFilterCondition = filter.SecondCondition
secondCondition.ConditionOperator = ExcelFilterCondition.Less
secondCondition.Double = 200
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet sheet = workbook.Worksheets[0];
//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range
sheet.AutoFilters.FilterRange = sheet.Range["A1:B323"];
IAutoFilter filter = sheet.AutoFilters[1];
//Specifying first condition
IAutoFilterCondition firstCondition = filter.FirstCondition;
firstCondition.ConditionOperator = ExcelFilterCondition.Greater;
firstCondition.Double = 100;
//Specifying second condition
IAutoFilterCondition secondCondition = filter.SecondCondition;

```

```

secondCondition.ConditionOperator = ExcelFilterCondition.Less;
secondCondition.Double = 200;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Filter";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

}
}

```

Combination Filter

This filter contains both Text filter and DateTime filter, it filters the data based on multiple criteria. Following code snippets illustrates how to apply combination filter with multiple of Text filter and DateTime filter.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range
    sheet.AutoFilters.FilterRange = sheet.Range["A1:K180"];
    //Column index to which AutoFilter must be applied
    IAutoFilter filter = sheet.AutoFilters[2];
    //Applying Text filter to filter multiple text to get filter
    filter.AddTextFilter(new string[] { "London", "Paris", "New York City" });
    //Applying DateTime filter to filter the date based on DateTimeGroupingType
    filter.AddDateFilter(new DateTime(2013, 1, 29, 0, 0, 0), DateTimeGroupingType.day);
}

```

```
filter.AddDateFilter(2014, 12, 2, 10, 30, 0, DateTimeGroupingType.minute);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Filter.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range
sheet.AutoFilters.FilterRange = sheet.Range("A1:K180")
'Column index to which AutoFilter must be applied
Dim filter As IAutoFilter = sheet.AutoFilters(2)
'Applying Text filter to filter multiple text to get filter
filter.AddTextFilter(New String() {"London", "Paris", "New York City"})
'Applying DateTime filter to filter the date based on DateTimeGroupingType
filter.AddDateFilter(New DateTime(2013, 1, 29, 0, 0, 0),
DateTimeGroupingType.day)
filter.AddDateFilter(2014, 12, 2, 10, 30, 0, DateTimeGroupingType.minute)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range.
worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied.
IAutoFilter filter = worksheet.AutoFilters[2];
//Applying Text filter to filter multiple text to get filter.
filter.AddTextFilter(new string[] { "London", "Paris", "New York City" });

Dynamic Filter

Dynamic filter is a relative date filter, which filters data based on DynamicFilterType enumeration. Following code snippets illustrates how to apply Dynamic filter.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range.
sheet.AutoFilters.FilterRange = sheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied.
IAutoFilter filter = sheet.AutoFilters[3];
//Applying dynamic filter to filter the date based on DynamicFilterType.
filter.AddDynamicFilter(DynamicFilterType.NextQuarter);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Filter.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
```

```

'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
sheet.AutoFilters.FilterRange = sheet.Range("A1:K180")
'Column index to which AutoFilter must be applied.
Dim filter As IAutoFilter = sheet.AutoFilters(3)
'Applying dynamic filter to filter the date based on DynamicFilterType.
filter.AddDynamicFilter(DynamicFilterType.NextQuarter)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
    worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
    //Column index to which AutoFilter must be applied.
    IAutoFilter filter = worksheet.AutoFilters[3];
    //Applying dynamic filter to filter the date based on DynamicFilterType.
    filter.AddDynamicFilter(DynamicFilterType.NextQuarter);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Filter";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    workbook.Version = ExcelVersion.Excel2013;
    await workbook.SaveAsAsync(storageFile);
}

```

Color Filter

Color Filter can be used to filter data based on the color applied to the cell or the color applied to the text in the cell. The following code snippets show how to apply Color Filter based on Cell Color (fill color applied to the cell).

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
    sheet.AutoFilters.FilterRange = sheet.Range["A1:K180"];
    //Column index to which AutoFilter must be applied.
    IAutoFilter filter = sheet.AutoFilters[3];
    //Applying color filter to filter based on Cell Color.
    filter.AddColorFilter(Color.Red, ExcelColorFilterType.CellColor);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("Filter.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
sheet.AutoFilters.FilterRange = sheet.Range("A1:K180")
'Column index to which AutoFilter must be applied.
Dim filter As IAutoFilter = sheet.AutoFilters(3)
'Applying color filter to filter based on Cell Color.
filter.AddColorFilter(Color.Red, ExcelColorFilterType.CellColor)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
}
```

```

worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied.
IAutoFilter filter = worksheet.AutoFilters[3];
//Applying color filter to filter based on Cell Color.
filter.AddColorFilter(Color.FromArgb(255, 255, 0, 0),
ExcelColorFilterType.CellColor);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Filter";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
    range.
    worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
    //Column index to which AutoFilter must be applied.
    IAutoFilter filter = worksheet.AutoFilters[3];
    //Applying color filter to filter based on Cell Color.
    filter.AddColorFilter(Color.Red, ExcelColorFilterType.CellColor);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Filter.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    // "App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sam
    ple.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
}

```

```

//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied.
IAutoFilter filter = worksheet.AutoFilters[0];
//Applying color filter to filter based on Cell Color.
filter.AddColorFilter(Syncfusion.Drawing.Color.Red,
ExcelColorFilterType.CellColor);
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,

"application/msexcel", stream);
}
}

```

To filter cells based on Font color of the text inside cells just change the ExcelColorFilterType to Font Color. The following snippets show how to filter the cells based on font color.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
sheet.AutoFilters.FilterRange = sheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied.
IAutoFilter filter = sheet.AutoFilters[3];
//Applying color filter to filter based on Cell Color.
filter.AddColorFilter(Color.Red, ExcelColorFilterType.FontColor);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Filter.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")

```

```

Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range.
sheet.AutoFilters.FilterRange = sheet.Range("A1:K180")
'Column index to which AutoFilter must be applied.
Dim filter As IAutoFilter = sheet.AutoFilters(3)
'Applying color filter to filter based on Cell Color.
filter.AddColorFilter(Color.Red, ExcelColorFilterType.FontColor)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);

    }
}
```

Icon Filter

Icon filter can be used to filter data that has conditional formatting with Icon Sets applied. Applying Icon Sets for numeric data adds icons to each cell based on the value present in that cell. Using Icon Filter, we can easily filter the data that has only a specific Icon in it.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
    range.
    sheet.AutoFilters.FilterRange = sheet.Range["A1:K180"];
    //Column index to which AutoFilter must be applied.
    IAutoFilter filter = sheet.AutoFilters[3];
    //Applying Icon filter to filter based on applied icon set.
    filter.AddIconFilter(ExcelIconSetType.ThreeFlags, 2);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("Filter.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating an AutoFilter in the first worksheet. Specifying the AutoFilter
range.
sheet.AutoFilters.FilterRange = sheet.Range("A1:K180")
'Column index to which AutoFilter must be applied.
Dim filter As IAutoFilter = sheet.AutoFilters(3)
'Applying Icon filter to filter based on applied icon set.
filter.AddIconFilter(ExcelIconSetType.ThreeFlags, 2)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Filter.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
}
```

```

//Creating an AutoFilter in the first worksheet. Specifying the AutoFilter range.
worksheet.AutoFilters.FilterRange = worksheet.Range["A1:K180"];
//Column index to which AutoFilter must be applied.
IAutoFilter filter = worksheet.AutoFilters[3];
//Applying Icon filter to filter based on applied icon set.
filter.AddIconFilter(ExcelIconSetType.ThreeFlags, 2);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;

}
}

```

Advanced Filter

Advanced Filter can be used to perform more complex filtering other than basic filters. You can filter a data with custom defined criteria range.

Advanced Filter support two types of filter action.

1. Filter In Place
2. Filter Copy

Filter In Place: Filter data in same location.

Filter Copy: Filter and copy data into new location within a worksheet.

Advanced Filter also provides an option to filter the unique records. This will remove the duplicate record from filtered data.

The following code illustrates how to apply Advanced Filter in worksheet.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("InputData.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
IRange filterRange = sheet.Range["A1:C6"];
IRange criteriaRange = sheet.Range["A10:C12"];
}

```

```

IRange copyToRange = sheet.Range["K5:N5"];
//Apply the Advanced Filter with enable of unique value and copy to another
place.
sheet.AdvancedFilter(ExcelFilterAction.FilterCopy, filterRange,
criteriaRange, copyToRange, true);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("AdvancedFilter.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("InputData.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim filterRange As IRange = sheet.Range("A1:C6")
Dim criteriaRange As IRange = sheet.Range("A10:C12")
Dim copyToRange As IRange = sheet.Range("K5:N5")
'Apply the Advanced filter with enable of unique value and copy to another
place.
sheet.AdvancedFilter(ExcelFilterAction.FilterCopy, filterRange,
criteriaRange, copyToRange, True)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("AdvancedFilter.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
IRange filterRange = worksheet.Range["A1:C6"];
IRange criteriaRange = worksheet.Range["A10:C12"];
IRange copyToRange = worksheet.Range["K5:N5"];
//Apply the Advanced Filter with enable of unique value and copy to another
place.
worksheet.AdvancedFilter(ExcelFilterAction.FilterCopy, filterRange,
criteriaRange, copyToRange, true);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "AdvancedFilter";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file

```

```
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    IRange filterRange = worksheet.Range["A1:C6"];
    IRange criteriaRange = worksheet.Range["A10:C12"];
    IRange copyToRange = worksheet.Range["K5:N5"];
    //Apply the Advanced Filter with enable of unique value and copy to another
    place.
    worksheet.AdvancedFilter(ExcelFilterAction.FilterCopy, filterRange,
    criteriaRange, copyToRange, true);
    //Saving the workbook as stream
    FileStream stream = new FileStream("AdvancedFilter.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sam
    ple.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    IRange filterRange = worksheet.Range["A1:C6"];
    IRange criteriaRange = worksheet.Range["A10:C12"];
    IRange copyToRange = worksheet.Range["K5:N5"];
    //Apply the Advanced Filter with enable of unique value and copy to another
    place.
    worksheet.AdvancedFilter(ExcelFilterAction.FilterCopy, filterRange,
    criteriaRange, copyToRange, true);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
}
```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Filter
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Filter.xlsx",
"application/msexcel", stream);
}
}

```

Accessing Filter

We can access the filter and its criteria, based on its column index. Following code snippets illustrates how to apply access different types of filters using XlsIO.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//selecting the filter by column index
IAutoFilter filter = worksheet.AutoFilters[0];
switch (filter.FilterType)
{
case ExcelFilterType.CombinationFilter:
CombinationFilter filterItems = (filter.FilteredItems as CombinationFilter);
for (int index = 0; index < filterItems.Count; index++)
{
if (filterItems[index].CombinationFilterType ==
ExcelCombinationFilterType.TextFilter)
{
string textValue = (filterItems[index] as TextFilter).Text;
}
else
{
DateTimeGroupingType groupType = (filterItems[index] as
DateTimeFilter).GroupingType;
}
}
break;
case ExcelFilterType.DynamicFilter:

Hyperlinks

You can create hyperlink in a workbook to provide quick access to web pages, places in your document and files. Hyperlink may target to any one of the following

- Worksheet range
- Web URL
- E-mail
- External files

The following code example illustrates how to insert various hyperlinks.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Creating a Hyperlink for a Website
IHyperLink hyperlink = sheet.HyperLinks.Add(sheet.Range["C5"]);
hyperlink.Type = ExcelHyperLinkType.Url;
hyperlink.Address = "http://www.syncfusion.com";
hyperlink.ScreenTip = "To know more about Syncfusion products, go through
this link.";
}

```

```

//Creating a Hyperlink for e-mail
IHyperLink hyperlink1 = sheet.HyperLinks.Add(sheet.Range["C7"]);
hyperlink1.Type = ExcelHyperLinkType.Url;
hyperlink1.Address = "mailto:Username@syncfusion.com";
hyperlink1.ScreenTip = "Send Mail";
//Creating a Hyperlink for Opening Files using type as File
IHyperLink hyperlink2 = sheet.HyperLinks.Add(sheet.Range["C9"]);
hyperlink2.Type = ExcelHyperLinkType.File;
hyperlink2.Address = @"C:\Program files";
hyperlink2.ScreenTip = "File path";
hyperlink2.TextToDisplay = "Hyperlink for files using File as type";
//Creating a Hyperlink for Opening Files using type as Unc
IHyperLink hyperlink3 = sheet.HyperLinks.Add(sheet.Range["C11"]);
hyperlink3.Type = ExcelHyperLinkType.Unc;
hyperlink3.Address = @"C:\Documents and Settings";
hyperlink3.ScreenTip = "Click here for files";
hyperlink3.TextToDisplay = "Hyperlink for files using Unc as type";
//Creating a Hyperlink to another cell using type as Workbook
IHyperLink hyperlink4 = sheet.HyperLinks.Add(sheet.Range["C13"]);
hyperlink4.Type = ExcelHyperLinkType.Workbook;
hyperlink4.Address = "Sheet1!A15";
hyperlink4.ScreenTip = "Click here";
hyperlink4.TextToDisplay = "Hyperlink to cell A15";
workbook.SaveAs("Hyperlink.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)

```

Modifying Existing Hyperlink

You can modify the properties of existing hyperlink by accessing the Hyperlinks collection of the IRange instance.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Modifying hyperlink's text to display
IHyperLink hyperlink = sheet.Range["C5"].Hyperlinks[0];
hyperlink.TextToDisplay = "Syncfusion";
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Hyperlink.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Modifying hyperlink's text to display
Dim hyperlink As IHyperLink = sheet.Range("C5").Hyperlinks(0)
hyperlink.TextToDisplay = "Syncfusion"
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Hyperlink.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Modifying hyperlink's text to display
IHyperLink hyperlink = worksheet.Range["C5"].Hyperlinks[0];
hyperlink.TextToDisplay = "Syncfusion";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Hyperlink";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
workbook.Version = ExcelVersion.Excel2013;
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying hyperlink's text to display
    IHyperLink hyperlink = worksheet.Range["C5"].Hyperlinks[0];
    hyperlink.TextToDisplay = "Syncfusion";

    }
}

```

Removing Hyperlink

You can remove a hyperlink from a range by accessing the Hyperlinks collection of the IRange instance.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Removing Hyperlink from Range "C7"
    sheet.Range["C7"].Hyperlinks.RemoveAt(0);
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("Hyperlink.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Removing Hyperlink from Range "C7"
sheet.Range("C7").Hyperlinks.RemoveAt(0)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Hyperlink.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Removing Hyperlink from Range "C7"
    worksheet.Range["C7"].Hyperlinks.RemoveAt(0);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Hyperlink";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    workbook.Version = ExcelVersion.Excel2013;
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);

    }
}

```

*Hyperlinks on Shapes***Adding Hyperlinks to Shapes**

Hyperlink can be added to the following shapes.

- Picture
- AutoShape
- TextBox

The following code example illustrates how to insert hyperlinks to shapes.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Adding hyperlink to TextBox
    IWorksheet sheet = workbook.Worksheets[0];
    ITextBox textBox = sheet.TextBoxes.AddTextBox(1, 1, 100, 100);
    IHyperLink hyperlink = sheet.HyperLinks.Add((textBox as IShape),
    ExcelHyperLinkType.Url, "http://www.Syncfusion.com", "click here");
    //Adding hyperlink to AutoShape
    sheet = workbook.Worksheets[1];
    IShape autoShape = sheet.Shapes.AddAutoShapes(AutoShapeType.Cloud, 1, 1,
    100, 100);
    hyperlink = sheet.HyperLinks.Add(autoShape, ExcelHyperLinkType.Url,
    "mailto:Username@syncfusion.com", "Send Mail");
    //Adding hyperlink to picture
    sheet = workbook.Worksheets[2];
    IPictureShape picture = sheet.Pictures.AddPicture(@"Image.png");
    hyperlink = sheet.HyperLinks.Add(picture);
    hyperlink.Type = ExcelHyperLinkType.Unc;
    hyperlink.Address = "C:\\Documents and Settings";
    hyperlink.ScreenTip = "Click here for files";
    workbook.SaveAs("Hyperlink.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Text box
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim textBox As ITextBox = sheet.TextBoxes.AddTextBox(1, 1, 100, 100)
Dim hyperlink As IHyperLink = sheet.HyperLinks.Add(TryCast(textBox, IShape),
ExcelHyperLinkType.Url, "http://www.Syncfusion.com", "click here")
'AutoShapes
sheet = workbook.Worksheets(1)
Dim autoShape As IShape = sheet.Shapes.AddAutoShapes(AutoShapeType.Cloud, 1,
1, 100, 100)
```

```

hyperlink = sheet.HyperLinks.Add(autoShape, ExcelHyperLinkType.Url,
"mailto:Username@syncfusion.com", "Send Mail")
'Pictures
sheet = workbook.Worksheets(2)
Dim picture As IPictureShape = sheet.Pictures.AddPicture("Image.png")
hyperlink = sheet.HyperLinks.Add(picture)
hyperlink.Type = ExcelHyperLinkType.Unc
hyperlink.Address = "C:\Documents and Settings"
hyperlink.ScreenTip = "Click here for files"
workbook.SaveAs("Hyperlink.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");

```

Modifying Hyperlinks on Shapes

Properties of existing hyperlink can be modified by accessing either the Hyperlinks collection of the IWorksheet instance or Hyperlink property in respective IShape instance.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet sheet = workbook.Worksheets[0];
//Modifying hyperlink's screen tip through IWorksheet instance
IHyperLink hyperlink = sheet.HyperLinks[0];
hyperlink.ScreenTip = "Syncfusion";
//Modifying hyperlink's screen tip through IShape instance
hyperlink = sheet.Shapes[0].Hyperlink;
hyperlink.ScreenTip = "Syncfusion";
workbook.SaveAs("Hyperlink.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)

```

```

'Modifying hyperlink's screen tip through IWorksheet instance
Dim hyperlink As IHyperLink = sheet.HyperLinks(0)
hyperlink.ScreenTip = "Syncfusion"
'Modifying hyperlink's screen tip through IShape instance
hyperlink = sheet.Shapes(0).Hyperlink
hyperlink.ScreenTip = "Syncfusion"
workbook.SaveAs("Hyperlink.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Modifying hyperlink's screen tip through IWorksheet instance
    IHyperLink hyperlink = worksheet.HyperLinks[0];
    hyperlink.ScreenTip = "Syncfusion";
    //Modifying hyperlink's screen tip through IShape instance
    hyperlink = worksheet.Shapes[0].Hyperlink;
    hyperlink.ScreenTip = "Syncfusion";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Hyperlink";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

Removing Hyperlinks from Shapes

Hyperlinks from shapes can be removed by accessing Hyperlinks collection of the worksheet instance.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())

```

```
{
  IApplication application = excelEngine.Excel;
  application.DefaultVersion = ExcelVersion.Excel2013;
  IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
  IWorksheet sheet = workbook.Worksheets[0];
  //Removing hyperlink from sheet with Index
  sheet.HyperLinks.RemoveAt(0);
  workbook.SaveAs("Hyperlink.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Removing Hyperlink from sheet with Index
sheet.HyperLinks.RemoveAt(0)
workbook.SaveAs("Hyperlink.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
  IApplication application = excelEngine.Excel;
  application.DefaultVersion = ExcelVersion.Excel2013;
  //Instantiates the File Picker
  FileOpenPicker openPicker = new FileOpenPicker();
  openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
  openPicker.FileTypeFilter.Add(".xlsx");
  openPicker.FileTypeFilter.Add(".xls");
  StorageFile file = await openPicker.PickSingleFileAsync();
  //Opens the workbook
  IWorkbook workbook = await application.Workbooks.OpenAsync(file);
  IWorksheet worksheet = workbook.Worksheets[0];
  //Removing hyperlink from sheet with Index
  worksheet.HyperLinks.RemoveAt(0);
  //Initializes FileSavePicker
  FileSavePicker savePicker = new FileSavePicker();
  savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
  savePicker.SuggestedFileName = "Hyperlink";
  savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
  //Creates a storage file from FileSavePicker
  StorageFile storageFile = await savePicker.PickSaveFileAsync();
  //Saves changes to the specified storage file
  await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing hyperlink from sheet with Index
worksheet.HyperLinks.RemoveAt(0);
//Saving the workbook as stream
FileStream stream = new FileStream("Hyperlink.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())

    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Hyperlink.xlsx", "application/msexcel", stream);
    }
}

```

Working with Cell or Range Formatting

This section covers the various formatting options in a cell or a range.

Create a Style

The following code shows how to create and apply cell style.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a new style with cell back color, fill pattern and font attribute
    IStyle style = workbook.Styles.Add("NewStyle");
    style.Color = Color.LightGreen;
    style.FillPattern = ExcelPattern.DarkUpwardDiagonal;
    style.Font.Bold = true;
    worksheet.Range["B2"].CellStyle = style;
    workbook.SaveAs("Style.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Creating a new style with cell back color, fill pattern and font attribute
Dim style As IStyle = workbook.Styles.Add("NewStyle")
style.Color = Color.LightGreen
style.FillPattern = ExcelPattern.DarkUpwardDiagonal
style.Font.Bold = True
worksheet.Range("B2").CellStyle = style
workbook.SaveAs("Style.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a new style with cell back color, fill pattern and font attribute
    IStyle style = workbook.Styles.Add("NewStyle");
    style.Color = Color.FromArgb(255, 144, 238, 144);
    style.FillPattern = ExcelPattern.DarkUpwardDiagonal;
    style.Font.Bold = true;
    worksheet.Range["B2"].CellStyle = style;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Style";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
```

```
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{

}
```

Set Default Style for row or column

It is the recommended and optimized approach to format entire row or column with same styles instead of formatting each and every cell individually. Use the following code to set default style.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Define new styles to apply in rows and columns
    IStyle rowStyle = workbook.Styles.Add("RowStyle");
    rowStyle.Color = Color.LightGreen;
    IStyle columnStyle = workbook.Styles.Add("ColumnStyle");
    columnStyle.Color = Color.Orange;
    //Set default row style for entire row
    worksheet.SetDefaultRowStyle(1, 2, rowStyle);
    //Set default column style for entire column
    worksheet.SetDefaultColumnStyle(1, 2, columnStyle);
    workbook.SaveAs("DefaultStyles.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Define new styles to apply in rows and columns
Dim rowStyle As IStyle = workbook.Styles.Add("RowStyle")
rowStyle.Color = Color.LightGreen
Dim columnStyle As IStyle = workbook.Styles.Add("ColumnStyle")
columnStyle.Color = Color.Orange
'Set default row style for entire row
worksheet.SetDefaultRowStyle(1, 2, rowStyle)
'Set default column style for entire column
worksheet.SetDefaultColumnStyle(1, 2, columnStyle)
workbook.SaveAs("DefaultStyles.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Define new styles to apply in rows and columns
IStyle rowStyle = workbook.Styles.Add("RowStyle");
rowStyle.Color = Color.FromArgb(255, 144, 238, 144);
IStyle columnStyle = workbook.Styles.Add("ColumnStyle");
columnStyle.Color = Color.FromArgb(255, 255, 165, 0);
//Set default row style for entire row
worksheet.SetDefaultRowStyle(1, 2, rowStyle);
//Set default column style for entire column
worksheet.SetDefaultColumnStyle(1, 2, columnStyle);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "DefaultStyles";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Define new styles to apply in rows and columns
    IStyle rowStyle = workbook.Styles.Add("RowStyle");
    rowStyle.Color = Color.LightGreen;
    IStyle columnStyle = workbook.Styles.Add("ColumnStyle");
    columnStyle.Color = Color.Orange;
    //Set default row style for entire row
    worksheet.SetDefaultRowStyle(1, 2, rowStyle);
    //Set default column style for entire column
    worksheet.SetDefaultColumnStyle(1, 2, columnStyle);
    //Saving the workbook as stream
    FileStream stream = new FileStream("DefaultStyles.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Define new styles to apply in rows and columns

```

```

IStyle rowStyle = workbook.Styles.Add("RowStyle");
rowStyle.Color = Syncfusion.Drawing.Color.LightGreen;
IStyle columnStyle = workbook.Styles.Add("ColumnStyle");
columnStyle.Color = Syncfusion.Drawing.Color.Orange;
//Set default row style for entire row
worksheet.SetDefaultRowStyle(1, 2, rowStyle);
//Set default column style for entire column
worksheet.SetDefaultColumnStyle(1, 2, columnStyle);
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Default
tStyles.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("DefaultStyles.xlsx
", "application/msexcel", stream);
}
}

```

Note: Applying custom styles will override original styles.

Tips: To apply styles for whole column instead of applying in each cell, use default styles.

Apply Global Style

The XlsIO adds styles globally that can be applied to one or more cells in a workbook. This is a recommended approach to apply single style in different rows and columns, which improves memory and performance considerably.

To learn more about performance, refer to the [Improving Performing section for better performance in XlsIO](#).

The following code snippet illustrates how to set header style and body style to the cells.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(2);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding values to a worksheet range
worksheet.Range["A1"].Text = "CustomerID";
worksheet.Range["B1"].Text = "CompanyName";
worksheet.Range["C1"].Text = "ContactName";
worksheet.Range["A2"].Text = "ALFKI";
worksheet.Range["A3"].Text = "ANATR";
}

```

```

worksheet.Range["A4"].Text = "BONAP";
worksheet.Range["A5"].Text = "BSBEV";
worksheet.Range["B2"].Text = "Alfred Futterkiste";
worksheet.Range["B3"].Text = "Ana Trujillo Emparedados y helados";
worksheet.Range["B4"].Text = "Bon App";
worksheet.Range["B5"].Text = "B's Beverages";
worksheet.Range["C2"].Text = "Maria Anders";
worksheet.Range["C3"].Text = "Ana Trujillo";
worksheet.Range["C4"].Text = "Laurence Lebihan";
worksheet.Range["C5"].Text = "Victoria Ashworth";
//Formatting
//Global styles should be used when the same style needs to be applied to
more than one cell. This usage of a global style reduces memory usage.
//Add custom colors to the palette
workbook.SetPaletteColor(8, Color.FromArgb(255, 174, 33));
//Defining header style
IStyle headerStyle = workbook.Styles.Add("HeaderStyle");
headerStyle.BeginUpdate();
headerStyle.Color = Color.FromArgb(255, 174, 33);
headerStyle.Font.Bold = true;
headerStyle.Borders[ExcelBordersIndex.EdgeLeft].LineStyle =
ExcelLineStyle.Thin;
headerStyle.Borders[ExcelBordersIndex.EdgeRight].LineStyle =
ExcelLineStyle.Thin;
headerStyle.Borders[ExcelBordersIndex.EdgeTop].LineStyle =
ExcelLineStyle.Thin;
headerStyle.Borders[ExcelBordersIndex.EdgeBottom].LineStyle =
ExcelLineStyle.Thin;
headerStyle.EndUpdate();
//Add custom colors to the palette
workbook.SetPaletteColor(9, Color.FromArgb(239, 243, 247));
//Defining body style
IStyle bodyStyle = workbook.Styles.Add("BodyStyle");
bodyStyle.BeginUpdate();
bodyStyle.Color = Color.FromArgb(239, 243, 247);
bodyStyle.Borders[ExcelBordersIndex.EdgeLeft].LineStyle =
ExcelLineStyle.Thin;
bodyStyle.Borders[ExcelBordersIndex.EdgeRight].LineStyle =
ExcelLineStyle.Thin;
bodyStyle.EndUpdate();
//Apply Header style
worksheet.Rows[0].CellStyle = headerStyle;
//Apply Body Style
worksheet.Range["A2:C5"].CellStyle = bodyStyle;
//Auto-fit the columns
worksheet.UsedRange.AutofitColumns();
workbook.SaveAs("GlobalStyles.xlsx");
}

```

Excel document with Global Styles

Apply Number Formats

Number Formats are codes that help to control the appearance of cell values especially numbers in an Excel document. Excel recognizes the numbers in various formats like:

- Number
- Currency
- Percentage
- DateTime
- Accounting
- Scientific
- Fraction and
- Text

This number format can be of maximum 4 parts, separated by semicolons. They are:

- Positive Numbers
- Negative Numbers
- Zeros
- Text

Each part is an individual number format. Default format is “General”, it means anything that will fit.

The following table shows various custom formatting codes:

Number Code	Description
General	General number format.
0 (zero)	Digit placeholder. This code pads the value with zeros to fill the format.

#	Digit placeholder. This code does not display extra zeros.
?	Digit placeholder. This code leaves a space for insignificant zeros but does not display them.
. (period)	Decimal placeholder. The decimal placeholder determines how many digits are displayed to the left and right of the decimal separator.
%	Percentage placeholder. Multiplies by 100 and adds the % character.
, (comma)	Thousands separator. A comma followed by a placeholder (0 or #) scales the number by a thousand.
E+ E- e+ e-	Scientific notation.
Text Code	Description
\$ - + / () : space	These characters are displayed in the number. To display any other character, enclose the character in quotation marks or precede it with a backslash.
\character	<p>This code displays the succeeding character you specify.</p> <p>Note Typing !, ^, &, ', ~, {, }, =, automatically places a backslash in front of the character.</p>
"text"	This code displays the text.
*	<p>This code repeats the next character in the format to fill the column width.</p> <p>Note: Only one asterisk per section of a format is allowed.</p>
_ (underscore)	This code skips the width of the next character. This code is commonly used as "_" (without the quotation marks) to leave space for a closing parenthesis in a positive number format when the negative number format includes parentheses.

	This allows the values to line up at the decimal point.
@	Text placeholder.
Date Code	Description
m	Month as a number without leading zeros (1-12).
mm	Month as a number with leading zeros (01-12).
mmm	Month as an abbreviation (Jan - Dec).
mmmm	Unabbreviated Month (January - December).
d	Day without leading zeros (1-31).
dd	Day with leading zeros (01-31).
ddd	Week day as an abbreviation (Sun - Sat).
dddd	Unabbreviated week day (Sunday - Saturday).
yy	Year as a two-digit number (for example, 96).
yyyy	Year as a four-digit number (for example, 1996).
Time Code	Description
h	Hours as a number without leading zeros (0-23).
hh	Hours as a number with leading zeros (00-23).
m	Minutes as a number without leading zeros (0-59).
mm	Minutes as a number with leading zeros (00-59).
s	Seconds as a number without leading zeros (0-59).
ss	Seconds as a number with leading zeros (00-59).
AM/PM am/pm	Time based on the twelve-hour clock.
Miscellaneous Code	Description

<p>[BLACK], [BLUE], [CYAN], [GREEN], [MAGENTA], [RED], [WHITE], [YELLOW], [COLOR n]</p>	<p>These codes display the characters in the specified colors.</p> <p>Note: n is a value from 1 to 56 and refers to the nth color in the color palette.</p>
<p>[Condition value]</p>	<p>Condition may be , =, >=, <=, <> and value may be any number.</p> <p>Note: A number format may contain up to two conditions.</p>

XlsIO provides support for reading and writing various built-in and custom number formats in a cell by using the **NumberFormat** property of **IRange** interface.

The following code snippet illustrates how to set different number formats in a worksheet range.

C#

[illegible]

```

worksheet.Range["A9"].Text = "1.20";
worksheet.Range["B9"].Text = "0.00E+00";
worksheet.Range["C9"].NumberFormat = "0.00E+00";
worksheet.Range["C9"].Number = 1.20;
//Applying percentage format
worksheet.Range["A10"].Text = "1.20";
worksheet.Range["B10"].Text = "0.00%";
worksheet.Range["C10"].NumberFormat = "0.00%";
worksheet.Range["C10"].Number = 1.20;
//Applying date format
worksheet.Range["A11"].Text = new DateTime(2005, 12, 25).ToString();
worksheet.Range["B11"].Text = "m/d/yyyy";
worksheet.Range["C11"].NumberFormat = "m/d/yyyy";
worksheet.Range["C11"].DateTime = new DateTime(2005, 12, 25);
//Applying currency format
worksheet.Range["A12"].Text = "1.20";
worksheet.Range["B12"].Text = "$#,##0.00";
worksheet.Range["C12"].NumberFormat = "$#,##0.00";
worksheet.Range["C12"].Number = 1.20;
//Applying accounting format
worksheet.Range["A12"].Text = "234";
worksheet.Range["B12"].Text = "_($* #,##0_)";
worksheet.Range["C12"].NumberFormat = "_($* #,##0_)";
worksheet.Range["C12"].Number = 234;
//Fit column width to data
worksheet.UsedRange.AutoFitColumns();
workbook.SaveAs("NumberFormats.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
worksheet.Range("A1").Text = "DATA"
worksheet.Range("B1").Text = "NUMBER FORMAT APPLIED"
worksheet.Range("C1").Text = "RESULT"
Dim headingStyle As IStyle = workbook.Styles.Add("HeadingStyle")
headingStyle.Font.Bold = True
headingStyle.HorizontalAlignment = ExcelHAlign.HAlignCenter
worksheet.Range("A1:C1").CellStyle = headingStyle
'Applying different number formats
worksheet.Range("A2").Text = "1000000.00075"
worksheet.Range("B2").Text = "0.00"
worksheet.Range("C2").NumberFormat = "0.00"
worksheet.Range("C2").Number = 1000000.00075
worksheet.Range("A3").Text = "1000000.500"
worksheet.Range("B3").Text = "###,##"
worksheet.Range("C3").NumberFormat = "###,##"
worksheet.Range("C3").Number = 1000000.5
worksheet.Range("A5").Text = "10000"
worksheet.Range("B5").Text = "0.00"
worksheet.Range("C5").NumberFormat = "0.00"
worksheet.Range("C5").Number = 10000

```

[illegible]

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1"].Text = "DATA";
    worksheet.Range["B1"].Text = "NUMBER FORMAT APPLIED";
    worksheet.Range["C1"].Text = "RESULT";
    IStyle headingStyle = workbook.Styles.Add("HeadingStyle");
    headingStyle.Font.Bold = true;
    headingStyle.HorizontalAlignment = ExcelHAlign.HAlignCenter;
    worksheet.Range["A1:C1"].CellStyle = headingStyle;
    //Applying different number formats
    worksheet.Range["A2"].Text = "1000000.00075";
    worksheet.Range["B2"].Text = "0.00";
    worksheet.Range["C2"].NumberFormat = "0.00";
    worksheet.Range["C2"].Number = 1000000.00075;
    worksheet.Range["A3"].Text = "1000000.500";
    worksheet.Range["B3"].Text = "###,##";
    worksheet.Range["C3"].NumberFormat = "###,##";
    worksheet.Range["C3"].Number = 1000000.500;
    worksheet.Range["A5"].Text = "10000";
    worksheet.Range["B5"].Text = "0.00";
    worksheet.Range["C5"].NumberFormat = "0.00";
    worksheet.Range["C5"].Number = 10000;
    worksheet.Range["A6"].Text = "-500";
    worksheet.Range["B6"].Text = "[Blue]#,##0";
    worksheet.Range["C6"].NumberFormat = "[Blue]#,##0";
    worksheet.Range["C6"].Number = -500;
    worksheet.Range["A7"].Text = "0.000000000000000000001234567890";
    worksheet.Range["B7"].Text = "0.00000000000000000000000000000000";
    worksheet.Range["C7"].NumberFormat = "0.00000000000000000000000000000000";
    worksheet.Range["C7"].Number = 0.000000000000000000001234567890;
    worksheet.Range["A9"].Text = "1.20";
    worksheet.Range["B9"].Text = "0.00E+00";
    worksheet.Range["C9"].NumberFormat = "0.00E+00";
    worksheet.Range["C9"].Number = 1.20;
    //Applying percentage format
    worksheet.Range["A10"].Text = "1.20";
    worksheet.Range["B10"].Text = "0.00%";
    worksheet.Range["C10"].NumberFormat = "0.00%";
    worksheet.Range["C10"].Number = 1.20;
    //Applying date format
    worksheet.Range["A11"].Text = new DateTime(2005, 12, 25).ToString();
    worksheet.Range["B11"].Text = "m/d/yyyy";
    worksheet.Range["C11"].NumberFormat = "m/d/yyyy";
    worksheet.Range["C11"].DateTime = new DateTime(2005, 12, 25);
    //Applying currency format
    worksheet.Range["A12"].Text = "1.20";
    worksheet.Range["B12"].Text = "$#,##0.00";
    worksheet.Range["C12"].NumberFormat = "$#,##0.00";
    worksheet.Range["C12"].Number = 1.20;
    //Applying accounting format
    worksheet.Range["A12"].Text = "234";
    worksheet.Range["B12"].Text = "_($* #,##0_)";
    worksheet.Range["C12"].NumberFormat = " ($* #,##0 )";
```

```
worksheet.Range["C12"].Number = 234;
//Fit column width to data
worksheet.UsedRange.AutoFitColumns();
//Saving the workbook as stream
FileStream stream = new FileStream("NumberFormats.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

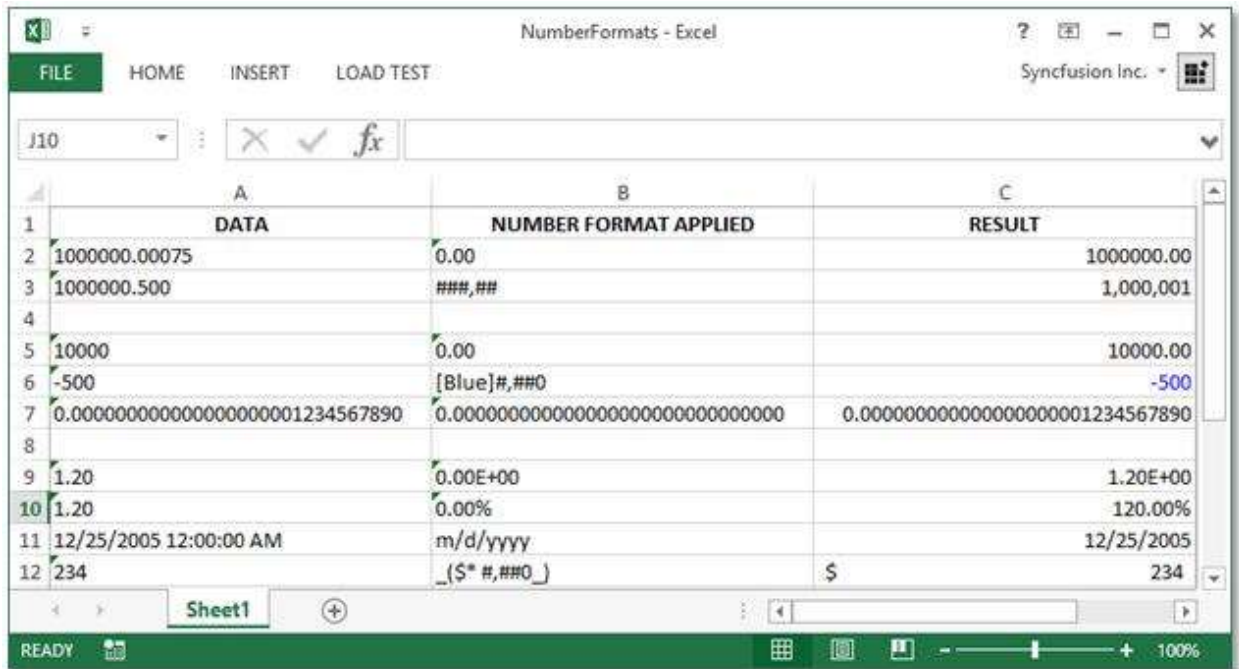

[illegible]

```

worksheet.Range["A11"].Text = new DateTime(2005, 12, 25).ToString();
worksheet.Range["B11"].Text = "m/d/yyyy";
worksheet.Range["C11"].NumberFormat = "m/d/yyyy";
worksheet.Range["C11"].DateTime = new DateTime(2005, 12, 25);
//Applying currency format

worksheet.Range["B12"].Text = "_(($* #,##0_)" ;
worksheet.Range["C12"].NumberFormat = "_(($* #,##0_)" ;
worksheet.Range["C12"].Number = 234;
//Fit column width to data
worksheet.UsedRange.AutofitColumns();
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Refer to the xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Number
Formats.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("NumberFormats.xlsx
", "application/msexcel", stream);
}
}

```

The screenshot of the previous code is shown as follows:

Access number format applied results at runtime

Cell values can be accessed as **Text**, **Number**, **DateTime** and **Formula** of **IRange** interface. In addition to this, there is an another property **DisplayText** in **IRange**, which returns a resultant value of a cell with its number format applied.

The following code example illustrates how to display the text of a cell.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    Application application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];

    //Set value to the cell
    worksheet.Range["C4"].Number = 1.20;

    //Set value to a cell
    worksheet.Range["B4"].Text = "$#,##0.00";

    //Get display text of the cell
    string text = worksheet.Range["B4"].DisplayText;

    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()  
Dim application As IApplication = excelEngine.Excel  
application.DefaultVersion = ExcelVersion.Excel2013  
Dim workbook As IWorkbook = application.Workbooks.Create(1)  
Dim worksheet As IWorksheet = workbook.Worksheets(0)  
'Set value to the cell  
worksheet.Range("C4").Number = 1.2
```

```

'Set value to a cell
worksheet.Range("B4").Text = "$#,##0.00"
'Get display text of the cell
Dim text As String = worksheet.Range("B4").DisplayText
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Set value to the cell
    worksheet.Range["C4"].Number = 1.20;
    //Set value to a cell
    worksheet.Range["B4"].Text = "$#,##0.00";
    //Get display text of the cell
    string text = worksheet.Range["B4"].DisplayText;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Set value to the cell
    worksheet.Range["C4"].Number = 1.20;
    //Set value to a cell
    worksheet.Range["B4"].Text = "$#,##0.00";
    //Get display text of the cell
    string text = worksheet.Range["B4"].DisplayText;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Set value to the cell
    worksheet.Range["C4"].Number = 1.20;
    //Set value to a cell
    worksheet.Range["B4"].Text = "$#,##0.00";
    //Get display text of the cell
    string text = worksheet.Range["B4"].DisplayText;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Refer to the xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

You can set **IWorkbook.DetectDateTimeInValue** property as 'false' with Value2 property, if you are sure that the given value is not of DateTime data type which improves time performance.

C#

```
workbook.DetectDateTimeInValue = false;
```

VB.NET

```
workbook.DetectDateTimeInValue = False
```

UWP

```
workbook.DetectDateTimeInValue = false;
```

ASP.NET CORE

```
workbook.DetectDateTimeInValue = false;
```

XAMARIN

```
workbook.DetectDateTimeInValue = false;
```

Hide Cell Content by setting Number Format

Essential XlsIO supports [hiding rows or columns](#) in a worksheet along with [hiding specific range](#). You can also hide a particular cell content by setting a specific number format to that cell.

Refer to the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assign values to a range of cells in the worksheet
    worksheet.Range["A1:A10"].Text = "Hide Cell Content";
    //Apply number format for the cell to hide its content
    worksheet.Range["A5"].NumberFormat = ";;;";
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Assign values to a range of cells in the worksheet
worksheet.Range("A1:A10").Text = "Hide Cell Content"
'Apply number format for the cell to hide its content
worksheet.Range("A5").NumberFormat = ";;;";
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assign values to a range of cells in the worksheet
    worksheet.Range["A1:A10"].Text = "Hide Cell Content";
    //Apply number format for the cell to hide its content
    worksheet.Range["A5"].NumberFormat = ";;;";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
```

```
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assign values to a range of cells in the worksheet
    worksheet.Range["A1:A10"].Text = "Hide Cell Content";
    //Apply number format for the cell to hide its content
    worksheet.Range["A5"].NumberFormat = ";;;";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assign values to a range of cells in the worksheet
    worksheet.Range["A1:A10"].Text = "Hide Cell Content";
    //Apply number format for the cell to hide its content
    worksheet.Range["A5"].NumberFormat = ";;;";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}
```

```
}
```

Apply Cell Text Alignment

The XlsIO supports the following alignment options:

- Horizontal Alignment
- Vertical Alignment
- Indentation
- Orientation
- Text Direction

Horizontal Alignment

This code snippet aligns the cell content horizontally.

C#

```
//Text Alignment Setting (Horizontal Alignment)  
worksheet.Range["A2"].CellStyle.HorizontalAlign =  
ExcelHAlign.HAlignCenter;
```

VB.NET

```
'Text Alignment Setting (Horizontal Alignment)  
worksheet.Range("A2").CellStyle.HorizontalAlign =  
ExcelHAlign.HAlignCenter
```

UWP

```
//Text Alignment Setting (Horizontal Alignment)  
worksheet.Range["A2"].CellStyle.HorizontalAlign =  
ExcelHAlign.HAlignCenter;
```

ASP.NET CORE

```
//Text Alignment Setting (Horizontal Alignment)  
worksheet.Range["A2"].CellStyle.HorizontalAlign =  
ExcelHAlign.HAlignCenter;
```

XAMARIN

```
//Text Alignment Setting (Horizontal Alignment)  
worksheet.Range["A2"].CellStyle.HorizontalAlign =  
ExcelHAlign.HAlignCenter;
```

Vertical Alignment

This code snippet aligns the cell content vertically.

C#

```
//Text Alignment Setting (Vertical Alignment)
```

```
worksheet.Range["B2"].CellStyle.VerticalAlignment =  
ExcelVAlign.VAlignBottom;
```

VB.NET

```
'Text Alignment Setting (Vertical Alignment)  
worksheet.Range("B2").CellStyle.VerticalAlignment = ExcelVAlign.VAlignBottom
```

UWP

```
//Text Alignment Setting (Vertical Alignment)  
worksheet.Range["B2"].CellStyle.VerticalAlignment =  
ExcelVAlign.VAlignBottom;
```

ASP.NET CORE

```
//Text Alignment Setting (Vertical Alignment)  
worksheet.Range["B2"].CellStyle.VerticalAlignment =  
ExcelVAlign.VAlignBottom;
```

XAMARIN

```
//Text Alignment Setting (Vertical Alignment)  
worksheet.Range["B2"].CellStyle.VerticalAlignment =  
ExcelVAlign.VAlignBottom;
```

Indentation

This allows to set the cell content either to move it closer to the cell border or to move it farther away from cell border.

C#

```
//Text Indent Setting  
worksheet.Range["C6"].CellStyle.IndentLevel = 6;
```

VB.NET

```
'Text Indent Setting  
worksheet.Range("C6").CellStyle.IndentLevel = 6
```

UWP

```
//Text Indent Setting  
worksheet.Range["C6"].CellStyle.IndentLevel = 6;
```

ASP.NET CORE

```
//Text Indent Setting  
worksheet.Range["C6"].CellStyle.IndentLevel = 6;
```

XAMARIN

```
//Text Indent Setting  
worksheet.Range["C6"].CellStyle.IndentLevel = 6;
```

Orientation

This helps to rotate the cell text diagonally or vertically. The text orientation can be set by using the **Rotation** property as shown as follows.

C#

```
//Text Orientation Settings  
worksheet.Range["C2"].CellStyle.Rotation = 60;
```

VB.NET

```
'Text Orientation Settings  
worksheet.Range("C2").CellStyle.Rotation = 60
```

UWP

```
//Text Orientation Settings  
worksheet.Range["C2"].CellStyle.Rotation = 60;
```

ASP.NET CORE

```
//Text Orientation Settings  
worksheet.Range["C2"].CellStyle.Rotation = 60;
```

XAMARIN

```
//Text Orientation Settings  
worksheet.Range["C2"].CellStyle.Rotation = 60;
```

Text Direction

You can specify the text direction by using the **ReadingOrder** property as shown as follows.

C#

```
//Text Direction Setting  
worksheet.Range["D2"].CellStyle.ReadingOrder =  
ExcelReadingOrderType.LeftToRight;
```

VB.NET

```
'Text Direction Setting  
worksheet.Range("D2").CellStyle.ReadingOrder =  
ExcelReadingOrderType.LeftToRight
```

UWP

```
//Text Direction Setting
```

```
worksheet.Range["D2"].CellStyle.ReadingOrder =
ExcelReadingOrderType.LeftToRight;
```

ASP.NET CORE

```
//Text Direction Setting
worksheet.Range["D2"].CellStyle.ReadingOrder =
ExcelReadingOrderType.LeftToRight;
```

XAMARIN

```
//Text Direction Setting
worksheet.Range["D2"].CellStyle.ReadingOrder =
ExcelReadingOrderType.LeftToRight;
```

The following is the complete code snippet illustrating the previous options.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A2"].Text = "HAlignCenter";
    worksheet.Range["A4"].Text = "HAlignFill";
    worksheet.Range["A6"].Text = "HAlignRight";
    worksheet.Range["A8"].Text = "HAlignCenterAcrossSelection";
    worksheet.Range["B2"].Text = "VAlignCenter";
    worksheet.Range["B4"].Text = "VAlignFill";
    worksheet.Range["B6"].Text = "VAlignTop";
    worksheet.Range["B8"].Text = "VAlignCenterAcrossSelection";
    worksheet.Range["C2"].Text = "Text Rotation to 60 degree";
    worksheet.Range["C4"].Text = "Text Rotation to 90 degree";
    worksheet.Range["C6"].Text = "Indent level is 6";
    worksheet.Range["D2"].Text = "Text Direction(LeftToRight)";
    worksheet.Range["D3"].Text = "Text Direction(RightToLeft)";
    worksheet.Range["D4"].Text = "Text Direction(Context)";
    //Text Alignment Setting (Horizontal Alignment)
    worksheet.Range["A2"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignCenter;
    worksheet.Range["A4"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignFill;
    worksheet.Range["A6"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignRight;
    worksheet.Range["A8"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignCenterAcrossSelection;
    //Text Alignment Setting (Vertical Alignment)
    worksheet.Range["B2"].CellStyle.VerticalAlignment =
ExcelVAlign.VAlignBottom;
    worksheet.Range["B4"].CellStyle.VerticalAlignment =
ExcelVAlign.VAlignCenter;
    worksheet.Range["B6"].CellStyle.VerticalAlignment = ExcelVAlign.VAlignTop;
```

```

worksheet.Range["B8"].CellStyle.VerticalAlignment =
ExcelVAlign.VAlignDistributed;
//Text Orientation Settings
worksheet.Range["C2"].CellStyle.Rotation = 60;
worksheet.Range["C4"].CellStyle.Rotation = 90;
//Text Indent Setting
worksheet.Range["C6"].CellStyle.IndentLevel = 6;
//Text Direction Setting
worksheet.Range["D2"].CellStyle.ReadingOrder =
ExcelReadingOrderType.LeftToRight;
worksheet.Range["D3"].CellStyle.ReadingOrder =
ExcelReadingOrderType.RightToLeft;
worksheet.Range["D4"].CellStyle.ReadingOrder =
ExcelReadingOrderType.Context;
worksheet.UsedRange.AutofitColumns();
worksheet.UsedRange.AutofitRows();
workbook.SaveAs("Book1.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)

}

```

The following screenshot is the output of previous code:

Merging and Un-Merging Cells

The cells can be merged using the **Merge()** method in **IRange** as shown as follows.

C#

```
//Merging Cells from A16 to C16
worksheet.Range["A16:C16"].Merge();
```

VB.NET

```
'Merging Cells from A16 to C16
worksheet.Range("A16:C16").Merge()
```

UWP

```
//Merging Cells from A16 to C16
worksheet.Range["A16:C16"].Merge();
```

ASP.NET CORE

```
//Merging Cells from A16 to C16  
worksheet.Range["A16:C16"].Merge();
```

XAMARIN

```
//Merging Cells from A16 to C16  
worksheet.Range["A16:C16"].Merge();
```

Merged cells can be unmerged using the **UnMerge()** method in **IRange** as shown below.

C#

```
//Un-Merging merged cells from A16 to C16  
worksheet.Range["A16:C16"].UnMerge();
```

VB.NET

```
'Un-Merging merged cells from A16 to C16  
worksheet.Range["A16:C16"].UnMerge();
```

UWP

```
//Un-Merging merged cells from A16 to C16  
worksheet.Range["A16:C16"].UnMerge();
```

ASP.NET CORE

```
//Un-Merging merged cells from A16 to C16  
worksheet.Range["A16:C16"].UnMerge();
```

XAMARIN

```
//Un-Merging merged cells from A16 to C16  
worksheet.Range["A16:C16"].UnMerge();
```

The below code shows merging and unmerging worksheet cells.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())  
{  
    IApplication application = excelEngine.Excel;  
    application.DefaultVersion = ExcelVersion.Excel2013;  
    IWorkbook workbook = application.Workbooks.Create(1);  
    IWorksheet worksheet = workbook.Worksheets[0];  
    //Merging cells  
    worksheet.Range["A16:C16"].Merge();  
    //Un-Merging merged cells  
    worksheet.Range["A16:C16"].UnMerge();  
    workbook.SaveAs("MergingUnMerging.xlsx");  
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create()
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Merging cells
worksheet.Range("A16:C16").Merge()
'Un-Merging merged cells
worksheet.Range("A16:C16").UnMerge()
workbook.SaveAs("MergingUnMerging.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())

    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("MergingUnMerging.xlsx", "application/msexcel", stream);
    }
}

```

Apply Wrap Text

If a cell content is too wide to fit a column and do not want to split over into adjacent cells, you can use the **WrapText** property. This will set the content within the cell border. The following code snippet illustrates this behavior.

Note: Applying wrap-text will not auto-fit the rows by default. It is recommended to [auto-fit](#) manually.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A2"].Text = "First Sentence is wrapped";
    worksheet.Range["B2"].Text = "Second Sentence is wrapped";
    worksheet.Range["C2"].Text = "Third Sentence is wrapped";
    //Applying Wrap-text
    worksheet.Range["A2:C2"].WrapText = true;
    workbook.SaveAs("WrapText.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
worksheet.Range("A2").Text = "First Sentence is wrapped"
worksheet.Range("B2").Text = "Second Sentence is wrapped"
worksheet.Range("C2").Text = "Third Sentence is wrapped"
'Applying wrap-text
worksheet.Range("A2:C2").WrapText = True
workbook.SaveAs("WrapText.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A2"].Text = "First Sentence is wrapped";
    worksheet.Range["B2"].Text = "Second Sentence is wrapped";
    worksheet.Range["C2"].Text = "Third Sentence is wrapped";
    //Applying Wrap-text
    worksheet.Range["A2:C2"].WrapText = true;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "WrapText";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("WrapText.xlsx", "application/msexcel", stream);
    }
}
```

Auto-Fit Rows or Columns

Cell dimensions can be auto-sized to its content dynamically to make its content visible.

The following code shows how to auto-size row height and column width to its cell content.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Auto-fit rows
    worksheet.Range["A2"].Text = "Fit the content to row";
    worksheet.Range["A2"].WrapText = true;
    worksheet.Range["A2"].AutofitRows();
    //Auto-fit columns
```

```
worksheet.Range["B4"].Text = "Fit the content to column";
worksheet.Range["B4"].AutofitColumns();
workbook.SaveAs("AutoFit.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Auto-fit rows
worksheet.Range("A2").Text = "Fit the content to row"
worksheet.Range("A2").WrapText = True
worksheet.Range("A2").AutofitRows()
'Auto-fit columns
worksheet.Range("B4").Text = "Fit the content to column"
worksheet.Range("B4").AutofitColumns()
workbook.SaveAs("AutoFit.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Auto-fit rows
    worksheet.Range["A2"].Text = "Fit the content to row";
    worksheet.Range["A2"].WrapText = true;
    worksheet.Range["A2"].AutofitRows();
    //Auto-fit columns
    worksheet.Range["B4"].Text = "Fit the content to column";
    worksheet.Range["B4"].AutofitColumns();
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "AutoFit";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

    }
}

```

The output of the previous code is shown as follows.

Apply Font Settings

The appearance of a text can be controlled by font settings of a cell. These settings can be done by using the **Font** property in **CellStyle**. Refer to the following code.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding text for a range
    worksheet.Range["A1:B6"].Text = "Hello World";
    //Setting Font Type
    worksheet.Range["A1"].CellStyle.Font.FontName = "Arial Black";
    worksheet.Range["A3"].CellStyle.Font.FontName = "Castellar";
    //Setting Font Styles
    worksheet.Range["A2"].CellStyle.Font.Bold = true;
    worksheet.Range["A4"].CellStyle.Font.Italic = true;
    //Setting Font Size
    worksheet.Range["A5"].CellStyle.Font.Size = 18;
    //Setting Font Effects
    worksheet.Range["A6"].CellStyle.Font.Strikethrough = true;
    worksheet.Range["B3"].CellStyle.Font.Subscript = true;
    worksheet.Range["B5"].CellStyle.Font.Superscript = true;
    //Setting UnderLine Types
    worksheet.Range["B1"].CellStyle.Font.Underline = ExcelUnderline.Double;
    worksheet.Range["B2"].CellStyle.Font.Underline = ExcelUnderline.Single;
    worksheet.Range["B4"].CellStyle.Font.Underline =
    ExcelUnderline.DoubleAccounting;
    worksheet.Range["B6"].CellStyle.Font.Underline =
    ExcelUnderline.SingleAccounting;
    //Setting Font Color
    worksheet.Range["B6"].CellStyle.Font.Color = ExcelKnownColors.Green;
    worksheet.UsedRange.AutofitColumns();
    worksheet.UsedRange.AutofitRows();
    workbook.SaveAs("FontSettings.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding text for a range
worksheet.Range("A1:B6").Text = "Hello World"

```

The output of the previous code is shown as follows.

	A	B
1	Hello World	Hello World
2	Hello World	Hello World
3	HELLO WORLD	Hello World
4	Hello World	Hello World
5	Hello World	Hello World
6	Hello World	Hello World
7		

Apply Color Settings

Colors give enhancement to cell values to highlight the data. These color settings in a cell are differentiated as BackColor, ForeColor, and PatternColor.

Back Color settings

Back color of a cell can be set using the **ColorIndex** property of **CellStyle** as shown as follows.

C#

```
//Apply cell back color
worksheet.Range["A1"].CellStyle.ColorIndex = ExcelKnownColors.Aqua;
```

VB.NET

```
'Apply cell back color
worksheet.Range("A1").CellStyle.ColorIndex = ExcelKnownColors.Aqua
```

UWP

```
//Apply cell back color
worksheet.Range["A1"].CellStyle.ColorIndex = ExcelKnownColors.Aqua;
```

ASP.NET CORE

```
//Apply cell back color
worksheet.Range["A1"].CellStyle.ColorIndex = ExcelKnownColors.Aqua;
```

XAMARIN

```
//Apply cell back color
worksheet.Range["A1"].CellStyle.ColorIndex = ExcelKnownColors.Aqua;
```

Fore Color Settings

Fore color of a cell can be set using the **PatternColorIndex** property of **CellStyle** as shown as follows.

C#

```
//Apply cell fore color
worksheet.Range["A2"].CellStyle.PatternColorIndex = ExcelKnownColors.Green;
```

VB.NET

```
'Apply cell fore color  
worksheet.Range("A2").CellStyle.PatternColorIndex = ExcelKnownColors.Green
```

UWP

```
//Apply cell fore color  
worksheet.Range["A2"].CellStyle.PatternColorIndex = ExcelKnownColors.Green;
```

ASP.NET CORE

```
//Apply cell fore color  
worksheet.Range["A2"].CellStyle.PatternColorIndex = ExcelKnownColors.Green;
```

XAMARIN

```
//Apply cell fore color  
worksheet.Range["A2"].CellStyle.PatternColorIndex = ExcelKnownColors.Green;
```

Pattern Settings

Excel provides various pattern styles for highlighting the cells. These patterns can be applied using the **FillPattern** property of **CellStyle** as shown as follows.

C#

```
//Apply cell pattern  
worksheet.Range["A2"].CellStyle.FillPattern = ExcelPattern.Angle;
```

VB.NET

```
'Apply cell pattern  
worksheet.Range("A2").CellStyle.FillPattern = ExcelPattern.Angle
```

UWP

```
//Apply cell pattern  
worksheet.Range["A2"].CellStyle.FillPattern = ExcelPattern.Angle;
```

ASP.NET CORE

```
//Apply cell pattern  
worksheet.Range["A2"].CellStyle.FillPattern = ExcelPattern.Angle;
```

XAMARIN

```
//Apply cell pattern  
worksheet.Range["A2"].CellStyle.FillPattern = ExcelPattern.Angle;
```

Apply Border Settings

The XlsIO applies cell borders and format it through **IBorder** interface as shown as follows.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Apply borders
    worksheet.Range["A2"].CellStyle.Borders.LineStyle = ExcelLineStyle.Medium;
    worksheet.Range["A4"].CellStyle.Borders.LineStyle = ExcelLineStyle.Double;
    worksheet.Range["A6"].CellStyle.Borders.LineStyle = ExcelLineStyle.Dash_dot;
    worksheet.Range["A8"].CellStyle.Borders.LineStyle = ExcelLineStyle.Thick;
    worksheet.Range["C2"].CellStyle.Borders.LineStyle =
    ExcelLineStyle.Slanted_dash_dot;
    worksheet.Range["C4"].CellStyle.Borders.LineStyle = ExcelLineStyle.Hair;
    worksheet.Range["C6"].CellStyle.Borders.LineStyle =
    ExcelLineStyle.Medium_dash_dot_dot;
    worksheet.Range["C8"].CellStyle.Borders.LineStyle = ExcelLineStyle.Thin;
    //Apply Border using Border Index
    //Top Border
    worksheet.Range["E2"].CellStyle.Borders[ExcelBordersIndex.EdgeTop].LineStyle
    = ExcelLineStyle.Medium;
    //Left Border
    worksheet.Range["E4"].CellStyle.Borders[ExcelBordersIndex.EdgeLeft].LineStyl
    e = ExcelLineStyle.Double;
    //Bottom Border
    worksheet.Range["E6"].CellStyle.Borders[ExcelBordersIndex.EdgeBottom].LineSt
    yle = ExcelLineStyle.Dashed;
    //Right Border
    worksheet.Range["E8"].CellStyle.Borders[ExcelBordersIndex.EdgeRight].LineSty
    le = ExcelLineStyle.Thick;
    //DiagonalUp Border
    worksheet.Range["E10"].CellStyle.Borders[ExcelBordersIndex.DiagonalUp].LineS
    tyle = ExcelLineStyle.Thin;
    //DiagonalDown Border
    worksheet.Range["E12"].CellStyle.Borders[ExcelBordersIndex.DiagonalDown].Lin
    eStyle = ExcelLineStyle.Dotted;
    //Apply border color
    worksheet.Range["A2"].CellStyle.Borders.Color = ExcelKnownColors.Blue;
    //Setting the Border as Range
    worksheet.Range["G2:I8"].BorderAround();
    worksheet.Range["G2:I8"].BorderInside(ExcelLineStyle.Dash_dot,
    ExcelKnownColors.Red);
    workbook.SaveAs("BorderSettings.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()

estyle = ExcelLineStyle.Dotted;
//Apply border color
worksheet.Range["A2"].CellStyle.Borders.Color = ExcelKnownColors.Blue;
//Setting the Border as Range
worksheet.Range["G2:I8"].BorderAround();
worksheet.Range["G2:I8"].BorderInside(ExcelLineStyle.Dash_dot,
ExcelKnownColors.Red);
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android, and iOS platforms. Refer to the xlsio/xamarin section for
respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Border
Settings.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("BorderSettings.xls
x", "application/msexcel", stream);
}
}
```

The output of the previous code is shown in the following screenshot:

HTML String Formatting

HTML string generates a string of characters with different formatting styles using different HTML tags for each character. This makes it easy to manipulate the text or value in the worksheet range as each character is independent and doesn't depend on hierarchical tag structure.

XlsIO supports adding HTML Rich-Text to a range of cells in worksheet.

Applying HTML String

The following code snippet illustrates how to read and write HTML Rich-Text using `HtmlString` property of `IRange`.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(3);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Add HTML string
    worksheet.Range["A1"].HtmlString = "<font style=\"color:red;font-family:Magneto;font-size:12px; \">Welcome Syncfusion</font>";
    //Assign HTML string as text to different range
    worksheet.Range["A2"].Text = worksheet.Range["A1"].HtmlString;
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(3)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Add HTML string
worksheet.Range("A1").HtmlString = "<font style=\"color:red;font-family:Magneto;font-size:12px; \">Welcome Syncfusion</font>"
'Assign HTML string as text to different range
```

```
worksheet.Range("A2").Text = worksheet.Range("A1").HtmlString
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
//XlsIO supports adding HTML string to worksheet range in Windows Forms,  
WPF, ASP.NET, ASP.NET MVC platforms alone.
```

ASP.NET CORE

```
//XlsIO supports adding HTML string to worksheet range in Windows Forms,  
WPF, ASP.NET, ASP.NET MVC platforms alone.
```

XAMARIN

```
//XlsIO supports adding HTML string to worksheet range in Windows Forms,  
WPF, ASP.NET, ASP.NET MVC platforms alone.
```

Supported Tags

The following are the list of tags supported in addition to HTML string.

- \
 - Defines a paragraph
- \ - Defines font, color and size of text
- \&.h6> - Defines HTML headings &.h6>
- \ - Defines a hyperlink
- \ - Defines italic text
- \ - Underlines the text
- \ - Defines bold text
- \ - Defines subscript
- \ - Defines superscript
- \
 - Inserts link break
- \ - Strikes out the text
- \ - Defines important text

These mentioned tags do support the following style attributes.

- Color
- Font-family
- Text-decoration
- Font-size
- Size
- Face

Rich-Text Formatting

You can format each character in a cell with different font styles. XlsIO reads and writes rich-text by using the **IRichTextString** interface.

Note: Currently XlsIO cannot process and write RTF codes to cells.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Add Text
    IRange range = worksheet.Range["A1"];
    range.Text = "RichText";
    IRichTextString richText = range.RichText;
    //Formatting first 4 characters
    IFont redFont = workbook.CreateFont();
    redFont.Bold = true;
    redFont.Italic = true;
    redFont.RGBColor = Color.Red;
    richText.SetFont(0, 3, redFont);
    //Formatting last 4 characters
    IFont blueFont = workbook.CreateFont();
    blueFont.Bold = true;
    blueFont.Italic = true;
    blueFont.RGBColor = Color.Blue;
    richText.SetFont(4, 7, blueFont);
    workbook.SaveAs("RichText.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Add Text
Dim range As IRange = worksheet.Range("A1")
range.Text = "RichText"
Dim richText As IRichTextString = range.RichText
'Formatting first 4 characters
Dim redFont As IFont = workbook.CreateFont()
redFont.Bold = True
redFont.Italic = True
redFont.RGBColor = Color.Red
richText.SetFont(0, 3, redFont)
'Formatting last 4 characters
Dim blueFont As IFont = workbook.CreateFont()
blueFont.Bold = True
blueFont.Italic = True
blueFont.RGBColor = Color.Blue
richText.SetFont(4, 7, blueFont)
```

```
workbook.SaveAs("RichText.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Add Text
    IRange range = worksheet.Range["A1"];
    range.Text = "RichText";
    IRichTextString richText = range.RichText;
    //Formatting first 4 characters.
    IFont redFont = workbook.CreateFont();
    redFont.Bold = true;
    redFont.Italic = true;
    redFont.RGBColor = Color.FromArgb(255, 255, 0, 0);
    richText.SetFont(0, 3, redFont);
    //Formatting last 4 characters.
    IFont blueFont = workbook.CreateFont();
    blueFont.Bold = true;
    blueFont.Italic = true;
    blueFont.RGBColor = Color.FromArgb(255, 0, 0, 255);
    richText.SetFont(4, 7, blueFont);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "RichText";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Add Text
    IRange range = worksheet.Range["A1"];
    range.Text = "RichText";
    IRichTextString richText = range.RichText;
    //Formatting first 4 characters.
    IFont redFont = workbook.CreateFont();
    redFont.Bold = true;
    redFont.Italic = true;
    redFont.RGBColor = Color.Red;
```

```

richText.SetFont(0, 3, redFont);
//Formatting last 4 characters.
IFont blueFont = workbook.CreateFont();
blueFont.Bold = true;
blueFont.Italic = true;
blueFont.RGBColor = Color.Blue;
richText.SetFont(4, 7, blueFont);
//Saving the workbook as stream
FileStream stream = new FileStream("RichText.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Add Text
    IRange range = worksheet.Range["A1"];
    range.Text = "RichText";
    IRichTextString richText = range.RichText;
    //Formatting first 4 characters.
    IFont redFont = workbook.CreateFont();
    redFont.Bold = true;
    redFont.Italic = true;
    redFont.RGBColor = Syncfusion.Drawing.Color.Red;
    richText.SetFont(0, 3, redFont);
    //Formatting last 4 characters.
    IFont blueFont = workbook.CreateFont();
    blueFont.Bold = true;
    blueFont.Italic = true;
    blueFont.RGBColor = Syncfusion.Drawing.Color.Blue;
    richText.SetFont(4, 7, blueFont);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Refer to the xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("RichText.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("RichText.xlsx", "application/msexcel", stream);
    }
}

```

```
}
}
```

The output of the previous code is shown as follows:

	A	B
1	<i>Rich Text</i>	
2		

Working with Data

Importing Data to Worksheets

XlsIO provides the ability to import data into a worksheet from the following data.

- Data Table
- Data Column
- Data View
- Collection Objects
- Nested Collection Objects
- Array

Import Data from DataTable

The following code snippet illustrates on how to import a DataTable into a worksheet using **ImportDataTable** method.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Initialize the DataTable
    DataTable table = SampleDataTable();
    //Import DataTable to the worksheet.
    worksheet.ImportDataTable(table, true, 1, 1);
    workbook.SaveAs("ImportFromDT.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Initialize the DataTable
Dim table As DataTable = sampleDataTable()
'Import DataTable to the worksheet
worksheet.ImportDataTable(table, True, 1, 1)
workbook.SaveAs("ImportFromDT.xlsx")
```

End Using**UWP**

//XlsIO supports importing of data from data table to worksheet in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms alone.

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Initialize the DataTable
    DataTable table = SampleDataTable();
    //Import DataTable to the worksheet
    worksheet.ImportDataTable(table, true, 1, 1);
    //Saving the workbook as stream
    FileStream stream = new FileStream("ImportFromDT.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

//XlsIO supports importing of data from data table to worksheet in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms alone.

Import Data from DataColumn

The following code snippet illustrates how to import DataColumn into a worksheet using **ImportDataColumn** method.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Initialize the DataTable
    DataTable table = SampleDataTable();
    //Import Data Column to the worksheet
    DataColumn column = table.Columns[0];
    worksheet.ImportDataColumn(column, true, 1, 1);
    workbook.SaveAs("ImportFromDT.xlsx");
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Initialize the DataTable
Dim table As DataTable = sampleDataTable()
'Import DataColumn to the worksheet
Dim column As DataColumn = table.Columns(0)
worksheet.ImportDataColumn(column, True, 1, 1)
workbook.SaveAs("ImportFromDT.xlsx")
End Using

```

UWP

//XlsIO supports importing data column to worksheet in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms alone.

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Initialize the DataTable
    DataTable table = SampleDataTable();
    //Import Data Column to the worksheet
    DataColumn column = table.Columns[0];
    worksheet.ImportDataColumn(column, true, 1, 1);
    //Saving the workbook as stream
    FileStream stream = new FileStream("ImportFromDT.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

//XlsIO supports importing data column to worksheet in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms alone.

Import Data from DataView

The following code snippet illustrates how to import DataView into a worksheet using **ImportDataView** method.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);

```

```

IWorksheet worksheet = workbook.Worksheets[0];
//Initialize the DataTable
DataTable table = SampleDataTable();
//Import DataView to the worksheet
DataView view = table.DefaultView;
worksheet.ImportDataView(view, true, 1, 1);
workbook.SaveAs("ImportFromDT.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Initialize the DataTable
Dim table As DataTable = sampleDataTable()
'Import DataView to the worksheet
Dim view As DataView = table.DefaultView
worksheet.ImportDataView(view, True, 1, 1)
workbook.SaveAs("ImportFromDT.xlsx")
End Using

```

UWP

//XlsIO supports importing data view to worksheet in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms alone.

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Initialize the DataTable
DataTable table = SampleDataTable();
//Import DataView to the worksheet
DataView view = table.DefaultView;
worksheet.ImportDataView(view, true, 1, 1);
//Saving the workbook as stream
FileStream stream = new FileStream("ImportFromDT.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

//XlsIO supports importing data view to worksheet in Windows Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms alone.

Import Data from Collection Objects

Essential XlsIO allows you to import data directly from Collection Objects as shown below.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet
    IList<Customer> reports = GetSalesReports();
    worksheet.ImportData(reports, 2, 1, false);
    workbook.SaveAs("ImportFromDT.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Import the data to worksheet
Dim reports As IList(Of Customer) = GetSalesReports()
worksheet.ImportData(reports, 2, 1, False)
workbook.SaveAs("ImportFromDT.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet
    IList<Customer> reports = GetSalesReports();
    worksheet.ImportData(reports, 2, 1, false);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "ImportFromDT";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet
    IList<Customer> reports = GetSalesReports();
    worksheet.ImportData(reports, 2, 1, false);
    //Saving the workbook as stream
    FileStream stream = new FileStream("ImportFromDT.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet
    IList<Customer> reports = GetSalesReports();
    worksheet.ImportData(reports, 2, 1, false);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Import
        FromDT.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("ImportFromDT.xlsx"
        , "application/msexcel", stream);
    }
}

```

The following code snippet provides supporting class for the above code. Here, the attributes `DisplayNameAttribute` and `Bindable` are used.

- [DisplayNameAttribute](#) - to customize the column header name while importing.
- [BindableAttribute](#) - to skip a property while importing.

C#

```

//Gets a list of sales reports
public static List<Customer> GetSalesReports()
{
    List<Customer> reports = new List<Customer>();
    reports.Add(new Customer("Andy Bernard", "45000", "58000"));
    reports.Add(new Customer("Jim Halpert", "34000", "65000"));
    reports.Add(new Customer("Karen Fillippelli", "75000", "64000"));
    reports.Add(new Customer("Phyllis Lapin", "56500", "33600"));
    reports.Add(new Customer("Stanley Hudson", "46500", "52000"));
    return reports;
}

//Customer details

        SalesJulDec = julToDec;
    }
}

```

Import Data Options

ExcelImportDataOptions is a support class for ImportData() method which contains various properties to import data with formatting.

ExcelImportDataOptions class contains the following properties:

FirstRow - Specifies first row from where the data should be imported.

FirstColumn - Specifies first column from where the data should be imported.

IncludeHeader - Specifies whether class properties names must be imported or not.

PreserveTypes - Indicates whether XlsIO should preserve column types from Data. By default, preserve type is TRUE. Setting it to True will import data based on column type, otherwise will import based on value type.

The following code snippet illustrates how to import collection objects into a worksheet using ImportData method with ExcelImportDataOptions class.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet with Import Data Options
    IList<Customer> reports = GetSalesReports();
    ExcelImportDataOptions importDataOptions = new ExcelImportDataOptions();
    importDataOptions.FirstRow = 2;
    importDataOptions.FirstColumn = 1;
    importDataOptions.IncludeHeader = false;
    importDataOptions.PreserveTypes = false;
    worksheet.ImportData(reports, importDataOptions);
    workbook.SaveAs("ImportData.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Import the data to worksheet with Import Data Options
Dim reports As IList(Of Customer) = GetSalesReports()
Dim importDataOptions As ExcelImportDataOptions = New
ExcelImportDataOptions()
importDataOptions.FirstRow = 2
importDataOptions.FirstColumn = 1
importDataOptions.IncludeHeader = False
importDataOptions.PreserveTypes = False
worksheet.ImportData(output, importDataOptions)
workbook.SaveAs("ImportData.xlsx")
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet with Import Data Options
    IList<Customer> reports = GetSalesReports();
    ExcelImportDataOptions importDataOptions = new ExcelImportDataOptions();
    importDataOptions.FirstRow = 2;
    importDataOptions.FirstColumn = 1;
    importDataOptions.IncludeHeader = false;
    importDataOptions.PreserveTypes = false;
    worksheet.ImportData(reports, importDataOptions);

Import Data from Nested Collection Objects

Import hierarchical data from nested collections to Excel worksheet helps the user to analyze data in its structure. XlsIO provides more flexible options to analyze such data by importing in different layouts and grouping the imported data.

Data import can be done with the layout options:

- **Default** - Parent records imported in the first row of its collection.
- **Merge** - Parent records imported in merged rows.
- **Repeat** - Parent records imported in all the rows.

Imported data can be grouped with the grouping options:

- **Expand** – Imported data will be grouped and expanded.
- **Collapse** – Imported data will be grouped and collapsed at first level, by default.

Let's see these options in detail along with code examples and screenshots.

Layout Options

Default layout option

This option adds the property value once per object for the corresponding records in the column while importing.

The following code snippet illustrates how to import data directly from nested collection objects with default layout option. The input XML file used in the code can be downloaded [here](#).

C#

```

using Syncfusion.XlsIO;
using System.Collections.Generic;
using System.ComponentModel;
using System.IO;

```

```

using System.Xml.Serialization;
namespace ImportFromNestedCollection
{
    class Program
    {
        static void Main(string[] args)
        {
            ImportData();
        }
        //Main method to import data from nested collection to Excel worksheet.
        private static void ImportData()
        {
            ExcelEngine excelEngine = new ExcelEngine();
            IApplication application = excelEngine.Excel;
            application.DefaultVersion = ExcelVersion.Excel2016;
            IWorkbook workbook = excelEngine.Excel.Workbooks.Create(1);
            IWorksheet worksheet = workbook.Worksheets[0];
            IList<Brand> vehicles = GetVehicleDetails();
            ExcelImportDataOptions importDataOptions = new ExcelImportDataOptions();
            //Imports from 4th row.
            importDataOptions.FirstRow = 4;
            //Imports column headers.
            importDataOptions.IncludeHeader = true;
            //Set layout options.
            importDataOptions.NestedDataLayoutOptions =
            ExcelNestedDataLayoutOptions.Default;
            //Import data from the nested collection.
            worksheet.ImportData(vehicles, importDataOptions);
            //Apply style to headers
            worksheet["A1:C2"].Merge();
            worksheet["A1"].Text = "Automobile Brands in the US";
            worksheet.UsedRange.AutofitColumns();
            workbook.SaveAs("ImportData.xlsx");
            workbook.Close();
            excelEngine.Dispose();

}

```

The following screenshot represents the output document with Default layout option.

	A	B	C
1	Automobile Brands in the US		
2			
3			
4	Brand	Vehicle Type	Model
5	Ford	Cars	Fusion
6			Fiesta
7			Mustang
8		SUVs & Crossovers	Eco Sport
9			Escape
10			Flex
11		Trucks & Vans	Fusion
12			Transit Connect
13			F-150

Merge layout option

This option merges the cells in the column for each object while importing.

The following code snippet helps to import data with merged cells.

C#

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Merge;
```

VB.NET

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Merge
```

UWP

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Merge;
```

ASP.NET CORE

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Merge;
```

XAMARIN

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Merge;
```

The following screenshot represents the output document with Merge layout option.

	A	B	C
1	Automobile Brands in the US		
2			
3			
4	Brand	Vehicle Type	Model
5	Ford	Cars	Fusion
6			Fiesta
7			Mustang
8		SUVs & Crossovers	Eco Sport
9			Escape
10			Flex
11		Trucks & Vans	Fusion
12			Transit Connect
13			F-150

[Repeat layout option](#)

This option repeats the parent records imported in all the rows.

The following code snippet helps to import data with repeated rows.

C#

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Repeat;
```

VB.NET

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Repeat
```

UWP

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Repeat;
```

ASP.NET CORE

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Repeat;
```

XAMARIN

```
importDataOptions.NestedDataLayoutOptions =
ExcelNestedDataLayoutOptions.Repeat;
```

The following screenshot represents the output document with Repeat layout option.

	A	B	C
1	Automobile Brands in the US		
2			
3			
4	Brand	Vehicle Type	Model
5	Ford	Cars	Fusion
6	Ford	Cars	Fiesta
7	Ford	Cars	Mustang
8	Ford	SUVs & Crossovers	Eco Sport
9	Ford	SUVs & Crossovers	Escape
10	Ford	SUVs & Crossovers	Flex
11	Ford	Trucks & Vans	Fusion
12	Ford	Trucks & Vans	Transit Connect
13	Ford	Trucks & Vans	F-150

Grouping Options**Import Data with Grouping option**

Hierarchical data imported into Excel worksheet must be shown its structure to analyze more flexible. In addition, if the data is grouped according to its level, it is easier to analyze. XlsIO supports to import hierarchical data from nested collection and group them while importing.

The following are the options that is supported to group on import.

- **Expand** – Imported data will be grouped and expanded.

- **Collapse** – Imported data will be grouped and collapsed at first level, by default.

In addition, `CollapseLevel` will group and collapse the mentioned level, upto the maximum of 8 levels.

The following code snippet illustrates how to import data directly from nested collection objects with collapse group option.

C#

```
using Syncfusion.XlsIO;
using System.Collections.Generic;
using System.ComponentModel;
using System.IO;
using System.Xml.Serialization;
namespace ImportFromNestedCollection
{
    class Program
    {
        static void Main(string[] args)
        {
            ImportData();
        }
        //Main method to import data from nested collection to Excel worksheet.
        private static void ImportData()
        {
            ExcelEngine excelEngine = new ExcelEngine();
            IApplication application = excelEngine.Excel;
            application.DefaultVersion = ExcelVersion.Excel2016;
            IWorkbook workbook = excelEngine.Excel.Workbooks.Create(1);
            IWorksheet worksheet = workbook.Worksheets[0];
            IList<Brand> vehicles = GetVehicleDetails();
            ExcelImportDataOptions importDataOptions = new ExcelImportDataOptions();
            //Imports from 4th row.
            importDataOptions.FirstRow = 4;
            //Imports column headers.
            importDataOptions.IncludeHeader = true;
            //Set layout options.
            importDataOptions.NestedDataLayoutOptions =
                ExcelNestedDataLayoutOptions.Default;
            //Set grouping option.
            importDataOptions.NestedDataGroupOptions =
                ExcelNestedDataGroupOptions.Collapse;
            //Set collapse level.
            //GroupingOption must set to 'Collapse' before applying 'CollapseLevel'.
            importDataOptions.CollapseLevel = 2;
            //Import data from the nested collection.
            worksheet.ImportData(vehicles, importDataOptions);
            //Apply style to headers
            worksheet["A1:C2"].Merge();
            worksheet["A1"].Text = "Automobile Brands in the US";

The following screenshot represents the output document of Grouped data imported from nested collection and collapsed at level 2.

1	2	3	A	B	C
	1		Automobile Brands in the US		
	2				
	3				
	4		Brand	Vehicle Type	Model
	5		Ford	Cars	Fusion
	8			SUVs & Crossovers	Eco Sport
	11			Trucks & Vans	Fusion
	14			Electrics	Fusion Hybrid SE
	17			Commercial Vehicles	Stripped Chassis
	20			Performance Vehicles	F-150 Raptor
	23		Chevrolet	Crossover and SUVs	Trax
	29			Cars	Spark
	34			Electrics	Volt
	36			Performance Vehicles	Camaro
	42			Trucks & Vans	Colorado
	45			Commercial Vehicles	Colorado

[Import Data from Collection Objects with hyperlink](#)

Essential XlsIO allows you to import images, data with URLs, and data with mail IDs as hyperlinks from various data sources binded in Collection Objects as shown below

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
}

```

```
//Import the data to worksheet
IList<Company> reports = GetCompanyDetails();
worksheet.ImportData(reports, 2, 1, false);
workbook.SaveAs("ImportFromBO.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Import the data to worksheet
Dim reports As IList(Of Company) = GetCompanyDetails()
worksheet.ImportData(reports, 2, 1, False)
workbook.SaveAs("ImportFromBO.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Import the data to worksheet
IList<Company> reports = GetCompanyDetails();
worksheet.ImportData(reports, 2, 1, false);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "ImportFromBO";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Import the data to worksheet
IList<Company> reports = GetCompanyDetails();
worksheet.ImportData(reports, 2, 1, false);
//Saving the workbook as stream
```

```

FileStream stream = new FileStream("ImportFromBO.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Import the data to worksheet
    IList<Company> reports = GetCompanyDetails();
    worksheet.ImportData(reports, 2, 1, false);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Import
        FromBO.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("ImportFromBO.xlsx"
        , "application/msexcel", stream);
    }
}

```

Import Data from Array

The following code snippet shows how to import array of data into a worksheet using **ImportArray** method.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
}

```

```
//Initialize the Object Array
object[] array = new object[4] { "Total Income", "Actual Expense", "Expected
Expenses", "Profit" };
//Import the Object Array to Sheet
worksheet.ImportArray(array, 1, 1, false);
workbook.SaveAs("ImportFromDT.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Initialize the Array Object
Dim array() As Object = New Object() {"Total Income", "Actual Expense",
"Expected Expenses", "Profit"}
'Import the Array Object to Sheet
worksheet.ImportArray(array, 1, 1, False)
workbook.SaveAs("ImportFromDT.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Initialize the Object Array
object[] array = new object[4] { "Total Income", "Actual Expense", "Expected
Expenses", "Profit" };
//Import the Object Array to Sheet
worksheet.ImportArray(array, 1, 1, false);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "ImportFromDT";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
```

```

IWorksheet worksheet = workbook.Worksheets[0];
//Initialize the Object Array
object[] array = new object[4] { "Total Income", "Actual Expense", "Expected Expenses", "Profit" };
//Import the Object Array to Sheet
worksheet.ImportArray(array, 1, 1, false);
//Saving the workbook as stream
FileStream stream = new FileStream("ImportFromDT.xlsx", FileMode.Create, FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Initialize the Object Array
    object[] array = new object[4] { "Total Income", "Actual Expense", "Expected Expenses", "Profit" };
    //Import the Object Array to Sheet
    worksheet.ImportArray(array, 1, 1, false);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone, Android, and iOS platforms. Refer to the xlsio/xamarin section for respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS == TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("ImportFromDT.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("ImportFromDT.xlsx", "application/msexcel", stream);
    }
}

```

Exporting from Worksheet to Data Table

XlsIO allows to export the sheet data to a **DataTable** by using the **ExportDataTable()** method. This method provides various options that allows to export data with specific requirement through **ExcelExportDataTableOptions**.

The following code snippet illustrates on how to export data from worksheet to Data grid using **DataTable**.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Export3.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Read data from the worksheet and Export to the DataTable
    DataTable customersTable = worksheet.ExportDataTable(worksheet.UsedRange,
        ExcelExportDataTableOptions.ColumnNames);
    //Binding exported DataTable to data grid, likewise it can binded to any
    //user interface control which supports binding
    DataGrid dataGrid = new DataGrid();
    dataGrid.DataSource = customersTable;
    workbook.SaveAs("ExportToGrid.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Read data from the worksheet and Export to the DataTable
Dim customersTable As DataTable = sheet.ExportDataTable(sheet.UsedRange,
    ExcelExportDataTableOptions.ColumnNames)
'Binding exported DataTable to data grid, likewise it can binded to any
'user interface control which supports binding
Dim dataGrid As DataGrid = New DataGrid
dataGrid.DataSource = customersTable
workbook.SaveAs("ExportToGrid.xlsx")
End Using

```

UWP

```

//XlsIO supports exporting of data from worksheet to data table in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms
alone.

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Read data from the worksheet and Export to the DataTable
    DataTable customersTable = worksheet.ExportDataTable(worksheet.UsedRange,
        ExcelExportDataTableOptions.ColumnNames);
    //Saving the workbook as stream
}

```

```

FileStream stream = new FileStream("ExportToDT.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
//XlsIO supports binding of exported data table to data grid in Windows
Forms, WPF, ASP.NET and ASP.NET MVC platforms alone.

```

XAMARIN

```

//XlsIO supports exporting of data from worksheet to data table in Windows
Forms, WPF, ASP.NET, ASP.NET MVC and ASP.NET Core (2.0 onwards) platforms
alone.

```

Exporting from Worksheet to Collection Objects

XlsIO allows to export the sheet data to a **Collection Objects** by using the **ExportData<T>()** method.

The following code snippet illustrates on how to export worksheet data into Collection Objects using **ExportData<T>**.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Export worksheet data into Collection Objects
    List<Report> collectionObjects = worksheet.ExportData<Report>(1, 1, 10, 3);
    workbook.SaveAs("CollectionObjects.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Export worksheet data into Collection Objects
Dim collectionObjects As List(Of Report) = worksheet.ExportData(Of
Report)(1, 1, 10, 3)
workbook.SaveAs("CollectionObjects.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
}

```

```

openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
//Export worksheet data into Collection Objects
List<Report> collectionObjects = worksheet.ExportData<Report>(1, 1, 10, 3);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "CollectionObjects";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Export worksheet data into Collection Objects
    List<Report> collectionObjects = worksheet.ExportData<Report>(1, 1, 10, 3);
    //Saving the workbook as stream
    FileStream stream = new FileStream("CollectionObjects.xlsx",
    FileMode.Create, FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sam
    ple.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Export worksheet data into Collection Objects
    List<Report> collectionObjects = worksheet.ExportData<Report>(1, 1, 10, 3);
    //Saving the workbook as stream

    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("CollectionObjects.xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("CollectionObjects.xlsx", "application/msexcel", stream);
}
}

```

The following code snippet provides supporting class for the above code. Here, the attributes `DisplayNameAttribute` and `Bindable` are used.

- [DisplayNameAttribute](#) - to match the column headers with set of properties while exporting.
- [BindableAttribute](#) - to skip a property while exporting.

C#

```

public class Report
{
    [DisplayNameAttribute("Sales Person Name")]
    public string SalesPerson { get; set; }
    [Bindable(false)]
    public string SalesJanJun { get; set; }
    public string SalesJulDec { get; set; }
    public Report()
    {
    }
}

```

VB.NET

```

Public Class Report
    Private m_SalesPerson As String
    Private m_SalesJanJun As String
    Private m_SalesJulDec As String
    <DisplayNameAttribute("Sales Person Name")>
    Public Property SalesPerson() As String
    Get
    Return m_SalesPerson
    End Get
    Set(value As String)
    m_SalesPerson = Value
    End Set
    End Property

```

```

<Bindable(False)>
Public Property SalesJanJun() As String
Get
Return m_SalesJanJun
End Get
Set(value As String)
m_SalesJanJun = Value
End Set
End Property
Public Property SalesJulDec() As String
Get
Return m_SalesJulDec
End Get
Set(value As String)
m_SalesJulDec = Value
End Set
End Property
End Class

```

UWP

```

public class Report
{
[DisplayNameAttribute("Sales Person Name")]
public string SalesPerson { get; set; }
[Bindable(false)]
public string SalesJanJun { get; set; }
public string SalesJulDec { get; set; }
public Report()
{
}
}

```

ASP.NET CORE

```

public class Report
{
[DisplayNameAttribute("Sales Person Name")]
public string SalesPerson { get; set; }
[Bindable(false)]
public string SalesJanJun { get; set; }
public string SalesJulDec { get; set; }
public Report()
{
}
}

```

XAMARIN

```

public class Report
{
[DisplayNameAttribute("Sales Person Name")]
public string SalesPerson { get; set; }
[Bindable(false)]
public string SalesJanJun { get; set; }

```

```
public string SalesJulDec { get; set; }
public Report()
{
}
}
```

Export data from Excel to Nested Class Objects

XlsIO allows to export worksheet data to nested class objects. A new overload to the existing `ExportData<T>()` method helps to achieve this requirement by mapping column headers with class properties.

Let's consider the input Excel document has the data as shown in the below screenshot.

	A	B	C	D	E
1	Customer ID	Customer Name	Customer Age	Order ID	Order Price
2	1324	Ashley Feathers	39	Z2340	\$ 450.00
3	1453	Abraham Wood	45	S2356	\$ 960.00
4	1239	Morris Jackson	35	A2345	\$ 320.00
5	1238	Robert Clay	40	B2345	\$ 550.00
6	1543	Victoria Sanders	45	A3423	\$ 600.00

The following code illustrates how to export data from Excel worksheet to nested class objects with column headers mapping collection.

C#

```
using Syncfusion.XlsIO;
using System.Collections.Generic;
namespace ImportFromNestedCollection
{
    class Program
    {
        static void Main(string[] args)
        {
            ExportData();
        }
        //Main method to Export data from worksheet to nested class objects.
        private static void ExportData()
        {
            using (ExcelEngine excelEngine = new ExcelEngine())
            {
                IApplication application = excelEngine.Excel;
                application.DefaultVersion = ExcelVersion.Excel2013;
                IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
                IWorksheet worksheet = workbook.Worksheets[0];
                //Map column headers in worksheet with class properties.
                Dictionary<string, string> mappingProperties = new Dictionary<string, string>();
                mappingProperties.Add("Customer ID", "CustId");
                mappingProperties.Add("Customer Name", "CustName");
                mappingProperties.Add("Customer Age", "CustAge");
                mappingProperties.Add("Order ID", "CustOrder.Order_Id");
                mappingProperties.Add("Order Price", "CustOrder.Price");
                //Export worksheet data into nested class Objects.
            }
        }
    }
}
```

```

List<Customer> nestedClassObjects = worksheet.ExportData<Customer>(1, 1, 10,
5, mappingProperties);
workbook.SaveAs("NestedClassObjects.xlsx");
}
}
}
//Customer details class
public partial class Customer
{
    public int CustId { get; set; }
    public string CustName { get; set; }
    public int CustAge { get; set; }
    public Order CustOrder { get; set; }
    public Customer()
    {
    }
}
//Order details class
public partial class Order
{
    public int Order_Id { get; set; }
    public double Price { get; set; }
    public Order()
    {
    }
}
}

```

VB.NET

```

Imports Syncfusion.XlsIO
Imports System.Collections.Generic

```

Importing Data from Microsoft Grid Controls to Worksheet

XlsIO provides support to import data from various Microsoft grid controls with its cell formatting. The supported grid controls are:

- DataGridView
- GridView
- DataGridView

DataGrid

Imports data from Microsoft DataGrid control with its header and cell formatting to Excel worksheet. The following code illustrates how to import data from Microsoft DataGrid control to worksheet.

Note: GetDataTable() method returns DataTable of applicable data to import.

C#

```
//Initialize DataGrid control
DataGrid dataGrid = new DataGrid();
dataGrid.DataSource = GetDataTable();
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create();
IWorksheet worksheet = workbook.Worksheets[0];
//Import data from DataGrid control
worksheet.ImportDataGrid(dataGrid, 1, 1, true, true);
workbook.SaveAs("Output.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
'Initialize DataGrid control
Dim dataGrid As DataGrid = New DataGrid()
dataGrid.DataSource = GetDataTable()
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create()
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Import data from DataGrid control
worksheet.ImportDataGrid(dataGrid, 1, 1, True, True)
workbook.SaveAs("Output.xlsx")
workbook.Close()
excelEngine.Dispose()
```

UWP

```
//XlsIO supports importing of data from data grid to worksheet in Windows Forms and WPF platforms alone.
```

ASP.NET CORE

```
//XlsIO supports importing of data from data grid to worksheet in Windows Forms and WPF platforms alone.
```

XAMARIN

```
//XlsIO supports importing of data from data grid to worksheet in Windows Forms and WPF platforms alone.
```

GridView

Imports data from Microsoft GridView control with its header and cell formatting to Excel worksheet. The following code illustrates how to import data from Microsoft GridView control to worksheet.

C#

```
//Initialize GridView control
GridView gridView = new GridView();
gridView.DataSource = GetDataTable();
gridView.DataBind();
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create();
IWorksheet worksheet = workbook.Worksheets[0];
//Import data from GridView control
worksheet.ImportGridView(gridView, 1, 1, true, true);
workbook.SaveAs("Output.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
'Initialize GridView control
Dim gridView As GridView = New GridView ()
gridView.DataSource = GetDataTable()
gridView.DataBind()
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create()
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Import data from GridView control
worksheet.ImportGridView(gridView, 1, 1, True, True)
workbook.SaveAs("Output.xlsx")
workbook.Close()
excelEngine.Dispose()
```

UWP

```
//XlsIO supports importing of data from data view to worksheet in Windows Forms and WPF platforms alone.
```

ASP.NET CORE

```
//XlsIO supports importing of data from data view to worksheet in Windows Forms and WPF platforms alone.
```

XAMARIN

```
//XlsIO supports importing of data from data view to worksheet in Windows Forms and WPF platforms alone.
```

DataGridView

Imports data from Microsoft DataGridView control with its header and cell formatting to Excel worksheet. In addition, this API imports sorted data applied in the control. The following code illustrates how to import data from Microsoft DataGridView control to worksheet.

C#

```
//Initialize DataGridView control
DataGridView dataGridView = new DataGridView();
dataGridView.DataSource = GetDataTable();
//Apply sorting.
dataGridView.Sort(dataGridView.Columns[1],
System.ComponentModel.ListSortDirection.Ascending);
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create();
IWorksheet worksheet = workbook.Worksheets[0];
//Import data from DataGridView control
worksheet.ImportDataGridView(dataGridView, 1, 1, true, true);
workbook.SaveAs("Output.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
'Initialize DataGridView control
Dim dataGridView As DataGridView = New DataGridView()
dataGridView.DataSource = GetDataTable()
'Apply sorting.
dataGridView.Sort(dataGridView.Columns(1),
System.ComponentModel.ListSortDirection.Ascending)
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create()
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Import data from DataGridView control
worksheet.ImportDataGridView(dataGridView, 1, 1, True, True)
workbook.SaveAs("Output.xlsx")
workbook.Close()
excelEngine.Dispose()
```

UWP

```
//XlsIO supports importing of data from data grid view to worksheet in  
Windows Forms and WPF platforms alone.
```

ASP.NET CORE

```
//XlsIO supports importing of data from data grid view to worksheet in  
Windows Forms and WPF platforms alone.
```

XAMARIN

```
//XlsIO supports importing of data from data grid view to worksheet in  
Windows Forms and WPF platforms alone.
```

Working with Formulas

[Formulas](#) are entries in Excel that have equations, by which values are calculated. A typical formula might contain cell references, constants, and even functions.

Enable and Disable Calculation

To perform calculation in an Excel workbook, it is recommended to invoke **EnableSheetCalculations** method of **IWorksheet**. Enabling this method will initialize [CalcEngine](#) objects and retrieves calculated values of formulas in a worksheet.

The following code sample illustrates on how to enable worksheet formula calculations.

C#

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is enabled for the sheet  
sheet.EnableSheetCalculations();
```

VB.NET

```
Dim sheet As IWorksheet = workbook.Worksheets(0)  
'Formula calculation is enabled for the sheet  
sheet.EnableSheetCalculations()
```

UWP

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is enabled for the sheet  
sheet.EnableSheetCalculations();
```

ASP.NET CORE

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is enabled for the sheet  
sheet.EnableSheetCalculations();
```

XAMARIN

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is enabled for the sheet  
sheet.EnableSheetCalculations();
```

On completion of worksheet calculation, it is recommended to invoke **DisableSheetCalculations** method of **IWorksheet**. This will dispose all the [CalcEngine](#) objects.

The following code sample illustrates on how to disable worksheet formula calculations.

C#

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is disabled for the sheet  
sheet.DisableSheetCalculations();
```

VB.NET

```
Dim sheet As IWorksheet = workbook.Worksheets(0)  
'Formula calculation is disabled for the sheet  
sheet.DisableSheetCalculations()
```

UWP

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is disabled for the sheet  
sheet.DisableSheetCalculations();
```

ASP.NET CORE

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is disabled for the sheet  
sheet.DisableSheetCalculations();
```

XAMARIN

```
IWorksheet sheet = workbook.Worksheets[0];  
//Formula calculation is disabled for the sheet  
sheet.DisableSheetCalculations();
```

Writing a Formula

In a worksheet, formulas can be entered by using the **Formula** property of **IRange** instance. Following code example illustrates on how to write a formula.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())  
{  
    IApplication application = excelEngine.Excel;  
    application.DefaultVersion = ExcelVersion.Excel2013;  
    IWorkbook workbook = application.Workbooks.Create(1);  
    IWorksheet sheet = workbook.Worksheets[0];  
    //Setting values to the cells  
    sheet.Range["A1"].Number = 10;  
    sheet.Range["B1"].Number = 10;  
    //Setting formula in the cell  
    sheet.Range["C1"].Formula = "=SUM(A1,B1)";  
    workbook.SaveAs("Formula.xlsx");  
}
```

```
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Setting values to the cells
sheet.Range("A1").Number = 10
sheet.Range("B1").Number = 10
'Setting formula for the range
sheet.Range("C1").Formula = "=SUM(A1,B1)"
workbook.SaveAs("Formula.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting values to the cells
    sheet.Range["A1"].Number = 10;
    sheet.Range["B1"].Number = 10;
    //Setting formula in the cell
    sheet.Range["C1"].Formula = "=SUM(A1,B1)";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Formula";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting values to the cells
    sheet.Range["A1"].Number = 10;
    sheet.Range["B1"].Number = 10;
    //Setting formula in the cell
    sheet.Range["C1"].Formula = "=SUM(A1,B1)";
}
```

```
//Saving the workbook as stream
FileStream stream = new FileStream("Formula.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting values to the cells
    sheet.Range["A1"].Number = 10;
    sheet.Range["B1"].Number = 10;
    //Setting formula in the cell
    sheet.Range["C1"].Formula = "=SUM(A1,B1)";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Formul
            a.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Formula.xlsx",
            "application/msexcel", stream);
    }
}
```

Formula with Cross-sheet References

XlsIO supports using formulas across worksheets. The following code shows how to apply formula with cross-sheet references.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create();
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting formula for the range with cross-sheet reference
    sheet.Range["C2"].Formula = "=SUM(Sheet2!B2, Sheet1!A2)";
}
```

```
workbook.SaveAs("Formula.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()

```

Reading a Formula

Formulas are string values which can be accessed using **Formula** property of **IRange**. If a cell has formula, the **Value** property of **IRange** will also return the formula as string.

The following code shows how to read a formula.

C#

```

//Returns the formula in C1 style notation
string formula = sheet["C1"].Formula;

```

VB.NET

```

'Returns the formula in C1 style notation
Dim formula as String = sheet("C1").Formula

```

UWP

```

//Returns the formula in C1 style notation
string formula = sheet["C1"].Formula;

```

ASP.NET CORE

```

//Returns the formula in C1 style notation

```

```
string formula = sheet["C1"].Formula;
```

XAMARIN

```
//Returns the formula in C1 style notation
string formula = sheet["C1"].Formula;
```

Accessing a Calculated value

To evaluate formula, it is must to [enable sheet calculation](#) in prior. After enabling the sheet calculation, the formula can be evaluated using **CalculatedValue** of **IRange**, which returns a string value.

The following code shows how to access a calculated value.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    sheet.EnableSheetCalculations();
    //Returns the calculated value of a formula using the most current inputs
    string calculatedValue = sheet["A1"].CalculatedValue;
    sheet.DisableSheetCalculations();
    workbook.SaveAs("Formula.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
sheet.EnableSheetCalculations()
'Returns the calculated value of a formula using the most current inputs
Dim calculatedValue As String = sheet("C1").CalculatedValue
sheet.DisableSheetCalculations()
workbook.SaveAs("Formula.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
}
```

```

StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
sheet.EnableSheetCalculations();
//Returns the calculated value of a formula using the most current inputs
string calculatedValue = sheet["C1"].CalculatedValue;
sheet.DisableSheetCalculations();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Formula";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream,
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
sheet.EnableSheetCalculations();
//Returns the calculated value of a formula using the most current inputs
string calculatedValue = sheet["C1"].CalculatedValue;
sheet.DisableSheetCalculations();
//Saving the workbook as stream
FileStream stream = new FileStream("Formula.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sam
ple.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream,
ExcelOpenType.Automatic);

```

```

IWorksheet sheet = workbook.Worksheets[0];
sheet.EnableSheetCalculations();
//Returns the calculated value of a formula using the most current inputs
string calculatedValue = sheet["C1"].CalculatedValue;
sheet.DisableSheetCalculations();
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Formul
a.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Formula.xlsx",
"application/msexcel", stream);
}
}

```

Apart from **CalculatedValue** property, the evaluated values can be accessed as **bool**, **DateTime** and **double** data types. To obtain updated values of these types, **CalculatedValue** property must be called in prior.

To know more about evaluated values, please refer **IRange** in API section.

The following code shows how to access calculated values in different types.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
//Previous Value '2'
sheet["E1"].Number = 3;
sheet.EnableSheetCalculations();
//It has formula 'ISEVEN(E1)'
//Returns the calculated value of a formula as Boolean
bool B1_PreviousValue = sheet["B1"].FormulaBoolValue;
string value = sheet.Range["B1"].CalculatedValue;
bool B1_LatestValue = sheet["B1"].FormulaBoolValue;
//It has formula 'TODAY()'
//Returns the calculated value of a formula as DateTime
DateTime C1_PreviousValue = sheet["C1"].FormulaDateTime;
value = sheet.Range["C1"].CalculatedValue;
DateTime C1_LatestValue = sheet["C1"].FormulaDateTime;
//It has formula '=E1'
}

```

```
//Returns the calculated value of a formula as double
double D1_PreviousValue = sheet["D1"].FormulaNumberValue;
value = sheet.Range["D1"].CalculatedValue;
double D1_LatestValue = sheet["D1"].FormulaNumberValue;
sheet.DisableSheetCalculations();
workbook.SaveAs("Formula.xlsx");
}

//Output
//B1_PreviousValue - true                                     B1_LatestValue - false
//C1_PreviousValue - {3/27/2018 12:00:00 AM}   C1_LatestValue - {3/28/2018
12:00:00 AM}
//D1_PreviousValue - 2.0                                   D1_LatestValue - 3.0
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)

```

Note: Calculated value for external reference formulas can be evaluated in XlsIO.

Applying Argument Separators Based on Cultures

Formula separators vary for different cultures, and exceptions can be thrown in such cases. This can be overcome by setting the separators by using **SetSeparators** method of **IWorkbook**.

Following code illustrates on how to change the formula separators.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Setting the argument separator
workbook.SetSeparators(';', ',', ' ');
workbook.SaveAs("Formula.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Setting the argument separator
workbook.SetSeparators(";", ",")
workbook.SaveAs("Formula.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Setting the argument separator
    workbook.SetSeparators(';', ',');
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Formula";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Setting the argument separator
    workbook.SetSeparators(';', ',');
    //Saving the workbook as stream
    FileStream stream = new FileStream("Formula.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Setting the argument separator
    workbook.SetSeparators(';', ',');
}

```

```
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Formul

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Formula.xlsx",
"application/msexcel", stream);
}
}
```

Array of Formula

Array formula is a special type of formula in Excel. It works with an array or series of data values, rather than a single data value which can be done through **FormulaArray** property of **IRange** instance.

Following code shows how an array of values from [Named Range](#) is used for computation.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Assign array formula
sheet.Range["A1:D1"].FormulaArray = "{1,2,3,4}";
//Adding a named range for the range A1 to D1
sheet.Names.Add("ArrayRange", sheet.Range["A1:D1"]);
//Assign formula array with named range
sheet.Range["A2:D2"].FormulaArray = "ArrayRange+100";
string fileName = "FormulaArray.xlsx";
workbook.SaveAs(fileName);
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Assign array formula
sheet.Range("A1:D1").FormulaArray = "{1,2,3,4}"
'Adding a named range for the range A1 to D1
sheet.Names.Add("ArrayRange", sheet.Range("A1:D1"))
```

```
'Assign formula array with named range
sheet.Range("A2:D2").FormulaArray = "ArrayRange+100"
workbook.SaveAs("FormulaArray.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Assign array formula
    sheet.Range["A1:D1"].FormulaArray = "{1,2,3,4}";
    //Adding a named range for the range A1 to D1
    sheet.Names.Add("ArrayRange", sheet.Range["A1:D1"]);
    //Assign formula array with named range
    sheet.Range["A2:D2"].FormulaArray = "ArrayRange+100";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "FormulaArray";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Assign array formula
    sheet.Range["A1:D1"].FormulaArray = "{1,2,3,4}";
    //Adding a named range for the range A1 to D1
    sheet.Names.Add("ArrayRange", sheet.Range["A1:D1"]);
    //Assign formula array with named range
    sheet.Range["A2:D2"].FormulaArray = "ArrayRange+100";
    //Saving the workbook as stream
    FileStream stream = new FileStream("FormulaArray.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())

    }
}

```

Incremental Formula

The relative cell references in the formulas are automatically incremented by 1, when you fill formulas down a column or across a row by enabling the `EnableIncrementalFormula` property of **IApplication** interface.

The below code snippet shows how to increment the cell references by 1 in the formulas.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Enables the incremental formula to updates the reference in cell
    application.EnableIncrementalFormula = true;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Formula are automatically increments by one for the range of cells
    sheet["A1:A5"].Formula = "=B1+C1";
    workbook.SaveAs("IncrementalFormula.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Enables the incremental formula to updates the reference in cell
application.EnableIncrementalFormula = True
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Formula are automatically increments by one for the range of cells
sheet("A1:A5").Formula = "=B1+C1"
workbook.SaveAs("IncrementalFormula.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Enables the incremental formula to updates the reference in cell
    application.EnableIncrementalFormula = true;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Formula are automatically increments by one for the range of cells
    sheet["A1:A5"].Formula = "=B1+C1";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "IncrementalFormula";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Enables the incremental formula to updates the reference in cell
    application.EnableIncrementalFormula = true;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Formula are automatically increments by one for the range of cells
    sheet["A1:A5"].Formula = "=B1+C1";
    //Saving the workbook as stream
    FileStream stream = new FileStream("IncrementalFormula.xlsx",
    FileMode.Create, FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Enables the incremental formula to updates the reference in cell
    application.EnableIncrementalFormula = true;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Formula are automatically increments by one for the range of cells
    sheet["A1:A5"].Formula = "=B1+C1";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("IncrementalFormula.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("IncrementalFormula.xlsx", "application/msexcel", stream);
    }
}

```

External Formula

XlsIO supports to write and preserve external formula.

External formula is the one which refers to a cell or a range of cells or a defined named range from outside the current worksheet/workbook. The main benefit of using an external reference is that whenever the referenced cell(s) in another worksheet changes, the value returned by the external cell reference is automatically updated.

Following code illustrates the insertion of a formula that refers to cell 'A1' in another workbook which is enclosed in a square bracket [One.xlsx].

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Write an external formula value
    sheet.Range["C1"].Formula = "[One.xlsx]Sheet1!$A$1*5";
    workbook.SaveAs("Formula.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Write an external formula value
sheet.Range("C1").Formula = "[One.xlsx]Sheet1!$A$1*5"
workbook.SaveAs("Formula.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Write an external formula value
    sheet.Range["C1"].Formula = "[One.xlsx]Sheet1!$A$1*5";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Formula";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Write an external formula value
    sheet.Range["C1"].Formula = "[One.xlsx]Sheet1!$A$1*5";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Formula.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())

```

```

{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Write an external formula value
    sheet.Range["C1"].Formula = "[One.xlsx]Sheet1!$A$1*5";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Formul
a.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Formula.xlsx",
"application/msexcel", stream);
    }
}

```

Note: Links are updated automatically in Microsoft Excel to view the result for the preceding code.

Calculated Column

XlsIO supports to create, access and modify [calculated column](#) in a table. When you enter a formula in a table column, Excel creates a calculated column. This column uses a single formula that's automatically extended to additional rows in the column and adjusted for each row. You just enter a formula once, and Excel immediately fills it down to create the calculated column.

Also, XlsIO supports [structured reference](#) in calculated column in table from Excel 2013.

The following code snippet illustrates how to create a calculated column.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create Table with data in the given range
    IListObject table = worksheet.ListObjects.Create("Table1",
worksheet["A1:D3"]);
    //Create data
    worksheet[1, 1].Text = "Products";
    worksheet[1, 2].Text = "Rate";
    worksheet[1, 3].Text = "Quantity";
    worksheet[1, 4].Text = "Total";
}

```

```

worksheet[2, 1].Text = "Item1";
worksheet[2, 2].Number = 200;
worksheet[2, 3].Number = 2;
worksheet[3, 1].Text = "Item2";
worksheet[3, 2].Number = 200;
worksheet[3, 3].Number = 2;
//Set table formula
table.Columns[3].CalculatedFormula = "SUM(20,[Rate]*[Quantity])";
string fileName = "Output.xlsx";
workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Create Table with data in the given range
Dim table As IListObject = worksheet.ListObjects.Create("Table1",
worksheet("A1:D3"))
'Create data
worksheet(1, 1).Text = "Products"
worksheet(1, 2).Text = "Rate"
worksheet(1, 3).Text = "Quantity"
worksheet(1, 4).Text = "Total"
worksheet(2, 1).Text = "Item1"
worksheet(2, 2).Number = 200
worksheet(2, 3).Number = 2
worksheet(3, 1).Text = "Item2"
worksheet(3, 2).Number = 200
worksheet(3, 3).Number = 2
'Set table formula
table.Columns(3).CalculatedFormula = "SUM(20,[Rate]*[Quantity])"
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);

Supported Functions

XlsIO supports all the formulas supported by Excel. Whereas, below is the list of functions that XlsIO performs calculation and returns a calculated value.

Functions	Description
ABS	Returns the absolute value of a number
ACOS	Returns the arccosine of a number
ACOSH	Returns the inverse hyperbolic cosine of a number
ADDRESS	Returns a reference as text to a single cell in a worksheet

AND	Returns TRUE if all of its arguments are TRUE
AREAS	Returns the number of areas in a reference
ASC	Changes full-width (double-byte) English letters or katakana within a character string to half-width (single-byte) characters
ASIN	Returns the arcsine of a number
ASINH	Returns the inverse hyperbolic sine of a number
ATAN	Returns the arctangent of a number
ATAN2	Returns the arctangent from x- and y-coordinates
ATANH	Returns the inverse hyperbolic tangent of a number
AVEDEV	Returns the average of the absolute deviations of data points from their mean
AVERAGE	Returns the average of its arguments
AVERAGEA	Returns the average of its arguments, including numbers, text, and logical values
AVERAGEIF	Returns the average (arithmetic mean) of all the cells in a range that meet a given criterion
AVERAGEIFS	Returns the average (arithmetic mean) of all cells that meet multiple criteria
BESSELI	Returns the modified Bessel function $I_n(x)$
BESSELJ	Returns the Bessel function $J_n(x)$
BESSELK	Returns the modified Bessel function $K_n(x)$
BESSELY	Returns the Bessel function $Y_n(x)$
BIN2DEC	Converts a binary number to decimal
BIN2HEX	Converts a binary number to hexadecimal
BIN2OCT	Converts a binary number to octal
BINOMDIST	Returns the individual term binomial distribution probability
CEILING	Rounds a number to the nearest integer or to the nearest multiple of significance

CELL	Returns information about the formatting, location, or contents of a cell
CHAR	Returns the character specified by the code number
CHIDIST	Returns the one-tailed probability of the chi-squared distribution
CHIINV	Returns the inverse of the one-tailed probability of the chi-squared distribution
CHITEST	Returns the test for independence
CHOOSE	Chooses a value from a list of values
CLEAN	Removes all non-printable characters from text
CODE	Returns a numeric code for the first character in a text string
COLUMN	Returns the column number of a reference
COLUMNS	Returns the number of columns in a reference
COMBIN	Returns the number of combinations for a given number of objects
COMPLEX	Converts real and imaginary coefficients into a complex number
CONCAT	Combines the text from multiple ranges and/or strings
CONCATENATE	Joins several text items into one text item
CONFIDENCE	Returns the confidence interval for a population mean
CONVERT	Converts a number from one measurement system to another
CORREL	Returns the correlation coefficient between two data sets
COS	Returns the cosine of a number
COSH	Returns the hyperbolic cosine of a number
COUNT	Counts how many numbers are in the list of arguments
COUNTA	Counts how many values are in the list of arguments
COUNTBLANK	Counts the number of blank cells within a range
COUNTIF	Counts the number of non-blank cells within a range that meet the given criteria

COVAR	Returns covariance, the average of the products of paired deviations
CRITBINOM	Returns the smallest value for which the cumulative binomial distribution is less than or equal to a criterion value
CUMIPMT	Returns the cumulative interest paid between two periods
CUMPRINC	Returns the cumulative principal paid on a loan between two periods
DATE	Returns the serial number of a particular date
DATEVALUE	Converts a date in the form of text to a serial number
DAY	Converts a serial number to a day of the month
DAYS360	Calculates the number of days between two dates based on a 360-day year
DB	Returns the depreciation of an asset for a specified period by using the fixed-declining balance method
DDB	Returns the depreciation of an asset for a specified period by using the double-declining balance method or some other method that you specify
DEC2BIN	Converts a decimal number to binary
DECHEX	Converts a decimal number to hexadecimal
DEC2OCT	Converts a decimal number to octal
DEGREES	Converts radians to degrees
DELTA	Tests whether two values are equal
DEVSQ	Returns the sum of squares of deviations
DISC	Returns the discount rate for a security
DOLLAR	Converts a number to text, using the \$ (dollar) currency format
DOLLARDE	Converts a dollar price, expressed as a fraction, into a dollar price, expressed as a decimal number
DOLLARFR	Converts a dollar price, expressed as a decimal number, into a dollar price, expressed as a fraction

DURATION	Returns the annual duration of a security with periodic interest payments
EDATE	Returns the serial number of the date that is the indicated number of months before or after the start date
EFFECT	Returns the effective annual interest rate
EOMONTH	Returns the serial number of the last day of the month before or after a specified number of months
ERF	Returns the error function
ERFC	Returns the complementary error function
ERROR.TYPE	Returns a number corresponding to an error type
EVEN	Rounds a number up to the nearest even integer
EXACT	Checks to see if two text values are identical
EXP	Returns e raised to the power of a given number
EXPONDIST	Returns the exponential distribution
FACT	Returns the factorial of a number
FACTDOUBLE	Returns the double factorial of a number
FDIST	Returns the F probability distribution
FIND, FINDB	Finds one text value within another (case-sensitive)
FINV	Returns the inverse of the F probability distribution
FISHER	Returns the Fisher transformation
FISHER	Returns the inverse of the Fisher transformation
FIXED	Formats a number as text with a fixed number of decimals
FLOOR	Rounds a number down, toward zero
FORECAST	Returns a value along a linear trend
FV	Returns the future value of an investment

FVSCHEDULE	Returns the future value of an initial principal after applying a series of compound interest rates
GAMMADIST	Returns the gamma distribution
GAMMAINV	Returns the inverse of the gamma cumulative distribution
GAMMALIN	Returns the natural logarithm of the gamma function, $\hat{\Gamma}(x)$
GCD	Returns the greatest common divisor
GEOMEAN	Returns the geometric mean
GESTEP	Tests whether a number is greater than a threshold value
GROWTH	Returns values along an exponential trend
HARMEAN	Returns the harmonic mean
HEX2BIN	Converts a hexadecimal number to binary
HEX2DEC	Converts a hexadecimal number to decimal
HEX2OCT	Converts a hexadecimal number to octal
HLOOKUP	Looks in the top row of an array and returns the value of the indicated cell
HOUR	Converts a serial number to an hour
HYPERLINK	Creates a shortcut or jump that opens a document stored on a network server, an intranet, or the Internet
HYPGEOMDIST	Returns the hypergeometric distribution
IF	Specifies a logical test to perform
IFERROR	Returns a specified value if a formula evaluates to an error.
IFS	Checks whether one or more conditions are met and returns a value that corresponds to the first TRUE condition
IMABS	Returns the absolute value (modulus) of a complex number
IMAGINARY	Returns the imaginary coefficient of a complex number

IMARGUMENT	Returns the argument theta, an angle expressed in radians
IMCONJUGATE	Returns the complex conjugate of a complex number
IMCOS	Returns the cosine of a complex number
IMDIV	Returns the quotient of two complex numbers
IMEXP	Returns the exponential of a complex number
IMLN	Returns the natural logarithm of a complex number
IMLOG10	Returns the base-10 logarithm of a complex number
IMLOG2	Returns the base-2 logarithm of a complex number
IMPOWER	Returns a complex number raised to an integer power
IMPRODUCT	Returns the product of from 2 to 29 complex numbers
IMREAL	Returns the real coefficient of a complex number
IMSIN	Returns the sine of a complex number
IMSQRT	Returns the square root of a complex number
IMSUB	Returns the difference between two complex numbers
IMSUM	Returns the sum of complex numbers
INDEX	Uses an index to choose a value from a reference or array
INDIRECT	Returns a reference indicated by a text value
INFO	Returns information about the current operating environment
INT	Rounds a number down to the nearest integer
INTERCEPT	Returns the intercept of the linear regression line
INTRATE	Returns the interest rate for a fully invested security
IPMT	Returns the interest payment for an investment for a given period
IRR	Returns the internal rate of return for a series of cash flows

ISBLANK	Returns TRUE if the value is blank
ISERR	Returns TRUE if the value is any error value except #N/A
ISERROR	Returns TRUE if the value is any error value
ISEVEN	Returns TRUE if the number is even
ISLOGICAL	Returns TRUE if the value is a logical value
ISAN	Returns TRUE if the value is the #N/A error value
ISNONTEXT	Returns TRUE if the value is not text
ISNUMBER	Returns TRUE if the value is a number
ISODD	Returns TRUE if the number is odd
ISMPT	Calculates the interest paid during a specific period of an investment
ISREF	Returns TRUE if the value is a reference
ISTEXT	Returns TRUE if the value is text
KURT	Returns the kurtosis of a data set
LARGE	Returns the k-th largest value in a data set
LCM	Returns the least common multiple
LEFT, LEFTB	Returns the leftmost characters from a text value
LEN, LENB	Returns the number of characters in a text string
LN	Returns the natural logarithm of a number
LOG	Returns the logarithm of a number to a specified base
LOG10	Returns the base-10 logarithm of a number
LOGEST	Returns the parameters of an exponential trend
LOGINV	Returns the inverse of the log-normal distribution
LOGNORMDIST	Returns the cumulative log-normal distribution

LOOKUP	Looks up values in a vector or array
LOWER	Converts text to lowercase
MATCH	Looks up values in a reference or array
MAX	Returns the maximum value in a list of arguments
MAXA	Returns the maximum value in a list of arguments, including numbers, text, and logical values
MAXIFS	Returns the maximum value among cells specified by a given set of conditions or criteria
MDETERM	Returns the matrix determinant of an array
MEDIAN	Returns the median of the given numbers
MID, MIDB	Returns a specific number of characters from a text string starting at the position you specify
MIN	Returns the minimum value in a list of arguments
MINA	Returns the smallest value in a list of arguments, including numbers, text, and logical values
MINIFS	Returns the minimum value among cells specified by a given set of conditions or criteria
MINUTE	Converts a serial number to a minute
MINVERSE	Returns the matrix inverse of an array
MIRR	Returns the internal rate of return where positive and negative cash flows are financed at different rates
MMULT	Returns the matrix product of two arrays
MOD	Returns the remainder from division
MODE	Returns the most common value in a data set
MMONTH	Converts a serial number to a month
MROUND	Returns a number rounded to the desired multiple

MULTINOMINAL	Returns the multinomial of a set of numbers
N	Returns a value converted to a number
NA	Returns the error value #N/A
NEGBINOMDIST	Returns the negative binomial distribution
NETWORKDAYS	Returns the number of whole workdays between two dates
NORMDIST	Returns the normal cumulative distribution
NORMINV	Returns the inverse of the normal cumulative distribution
NORMSDIST	Returns the standard normal cumulative distribution
NORMSINV	Returns the inverse of the standard normal cumulative distribution
NOT	Reverses the logic of its argument
NOW	Returns the serial number of the current date and time
NPER	Returns the number of periods for an investment
NPV	Returns the net present value of an investment based on a series of periodic cash flows and a discount rate
OCT2BIN	Converts an octal number to binary
OCT2DEC	Converts an octal number to decimal
OCT2HEX	Converts an octal number to hexadecimal
ODD	Rounds a number up to the nearest odd integer
OFFSET	Returns a reference offset from a given reference
OR	Returns TRUE if any argument is TRUE
PEARSON	Returns the Pearson product moment correlation coefficient
PERCENTILE	Returns the k-th percentile of values in a range
PERCENTRANK	Returns the percentage rank of a value in a data set

PERMUT	Returns the number of permutations for a given number of objects
PI	Returns the value of pi
PMT	Returns the periodic payment for an annuity
POISSON	Returns the Poisson distribution
POWER	Returns the result of a number raised to a power
PPMT	Returns the payment on the principal for an investment for a given period
PROB	Returns the probability that values in a range are between two limits
PRODUCT	Multiplies its arguments
PROPER	Capitalizes the first letter in each word of a text value
PV	Returns the present value of an investment
QUARTILE	Returns the quartile of a data set
QUOTIENT	Returns the integer portion of a division
RADIANS	Converts degrees to radians
RAND	Returns a random number between 0 and 1
RANDBETWEEN	Returns a random number between the numbers you specify
RANK	Returns the rank of a number in a list of numbers
RATE	Returns the interest rate per period of an annuity
RECEIVED	Returns the amount received at maturity for a fully invested security
REPLACE, REPLACEB	Replaces characters within text
REPT	Repeats text a given number of times
RIGHT, RIGHTB	Returns the rightmost characters from a text value
ROMAN	Converts an Arabic numeral to roman, as text
ROUND	Rounds a number to a specified number of digits

ROUNDDOWN	Rounds a number down, toward zero
ROUNDUP	Rounds a number up, away from zero
ROW	Returns the row number of a reference
ROWS	Returns the number of rows in a reference
RSQ	Returns the square of the Pearson product moment correlation coefficient
SEARCH, SEARCHB	Finds one text value within another (not case-sensitive)
SECOND	Converts a serial number to a second
SERIESSUM	Returns the sum of a power series based on the formula
SIGN	Returns the sign of a number
SIN	Returns the sine of the given angle
SINH	Returns the hyperbolic sine of a number
SKEW	Returns the skewness of a distribution
SLN	Returns the straight-line depreciation of an asset for one period
SLOPE	Returns the slope of the linear regression line
SMALL	Returns the k-th smallest value in a data set
SQRT	Returns a positive square root
SQRTPI	Returns the square root of (number * pi)
STANDARDIZE	Returns a normalized value
STDEV	Estimates standard deviation based on a sample
STDEVA	Estimates standard deviation based on a sample, including numbers, text, and logical values
STDEVP	Calculates standard deviation based on the entire population
STDEVPA	Calculates standard deviation based on the entire population, including numbers, text, and logical values

STEYX	Returns the standard error of the predicted y-value for each x in the regression
SUBSTITUTE	Substitutes new text for old text in a text string
SUBTOTAL	Returns a subtotal in a list or database
SUM	Adds its arguments
SUMIF	Adds the cells specified by a given criteria
SUMPRODUCT	Returns the sum of the products of corresponding array components
SUMSQ	Returns the sum of the squares of the arguments
SUMX2MY2	Returns the sum of the difference of squares of corresponding values in two arrays
SUMX2PY2	Returns the sum of the sum of squares of corresponding values in two arrays
SUMXMY2	Returns the sum of squares of differences of corresponding values in two arrays
SWITCH	Evaluates an expression against a list of values and returns the result corresponding to the first matching value. If there is no match, an optional default value may be returned.
SYD	Returns the sum-of-years'digits depreciation of an asset for a specified period
T	Converts its arguments to text
TAN	Returns the tangent of a number
TANH	Returns the hyperbolic tangent of a number
TEXT	Formats a number and converts it to text
TEXTJOIN	Combines the text from multiple ranges and/or strings with a delimiter you specify between each text value that will be combined
TIME	Returns the serial number of a particular time
TIMEVALUE	Converts a time in the form of text to a serial number
TODAY	Returns the serial number of today's date
TRANSPOSE	Returns the transpose of an array

TRIM	Removes spaces from text
TRIMMEAN	Returns the mean of the interior of a data set
TRUNC	Truncates a number to an integer
TYPE	Returns a number indicating the data type of a value
UPPER	Converts text to uppercase
VALUE	Converts a text argument to a number
VAR	Estimates variance based on a sample
VARA	Estimates variance based on a sample, including numbers, text, and logical values
VARP	Calculates variance based on the entire population
VARPA	Calculates variance based on the entire population, including numbers, text, and logical values
VDB	Returns the depreciation of an asset for a specified or partial period by using a declining balance method
VLOOKUP	Looks in the first column of an array and moves across the row to return the value of a cell
WEEKDAY	Converts a serial number to a day of the week
WEEKNUM	Converts a serial number to a number representing where the week falls numerically with a year
WEIBULL	Returns the Weibull distribution
WORKDAY	Returns the serial number of the date before or after a specified number of workdays
XIRR	Returns the internal rate of return for a schedule of cash flows that is not necessarily periodic
YEAR	Converts a serial number to a year
YEARFRAC	Returns the year fraction representing the number of whole days between <i>startdate</i> and <i>enddate</i>

ZTEST	Returns the one-tailed probability-value of a z-test
FALSE	Returns the logical value FALSE
TRUE	Returns the logical value TRUE

Add-in Functions

Add-ins are mini-programs or custom functions that enhance the feature set of the Microsoft Excel application. These Add-ins can be accessed by registering it at first from Excel and refer it using XlsIO. For more details on adding AddIn functions, see [Add or remove Add-ins](#)

The following code illustrates on how to include and access Add-ins in XlsIO.

C#

```
//Step1: Create AddIn (AddIn.xlam)
//AddIn.xlam file has the below custom function
//Function AddInFunction(firstValue As Integer, secondValue As Integer) As Integer
//
//Dim result As Integer
//result = firstValue + secondValue
//AddInFunction = result
//
//End Function
//Step2: Register the AddIn in Excel by adding the above file to Excel
//Application by locating the .xlam file through the menu (Developer -> Add-
//ins -> Browse)
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    IAddInFunctions unknownFunctions = workbook.AddInFunctions;
    //Adding the XLAM file reference to AddIn functions
    //NOTE: The add-in name must be same as the function name
    unknownFunctions.Add(@"D:\AddIn.xlam", "AddInFunction");
    //Use the function. The expected result is 30
    sheet.Range["A3"].Formula = "AddInFunction(10,20)";
    string fileName = "AddIn.xlsx";
    workbook.Version = ExcelVersion.Excel2010;
    workbook.SaveAs(fileName);
}
```

VB.NET

```
'Step1: Create AddIn (AddIn.xlam)
'AddIn.xlam file has the below custom function
'Function AddInFunction(firstValue As Integer, secondValue As Integer) As Integer
'
'Dim result As Integer
```

```

'result = firstValue + secondValue
'AddInFunction = result
'
'End Function
'Step2: Register the AddIn in Excel by adding the above file to Excel
Application by locating the .xlam file through the menu (Developer -> Add-
ins -> Browse)
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim unknownFunctions As IAddInFunctions = workbook.AddInFunctions
'Adding the XLAM file reference to AddIn functions
'NOTE: The add-in name must be same as the function name
unknownFunctions.Add("D:\AddIn.xlam", "AddInFunction")
'Use the function. The expected result is 30
sheet.Range("A3").Formula = "AddInFunction(10,20)"
Dim fileName As String = "AddIn.xlsx"
workbook.Version = ExcelVersion.Excel2010
workbook.SaveAs(fileName)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    IAddInFunctions unknownFunctions = workbook.AddInFunctions;
    //Adding the XLAM file reference to AddIn functions
    //NOTE: The add-in name must be same as the function name
    unknownFunctions.Add("AddInFunction");
    //Use the function. The expected result is 30
    sheet.Range["A3"].Formula = "AddInFunction(10,20)";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "AddIn";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);

```

```

IWorksheet sheet = workbook.Worksheets[0];
IAddInFunctions unknownFunctions = workbook.AddInFunctions;
//Adding the XLAM file reference to AddIn functions
//NOTE: The add-in name must be same as the function name
unknownFunctions.Add("AddInFunction");
//Use the function. The expected result is 30
sheet.Range["A3"].Formula = "AddInFunction(10,20)";
//Saving the workbook as stream
FileStream stream = new FileStream("AddIn.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    IAddInFunctions unknownFunctions = workbook.AddInFunctions;
    //Adding the XLAM file reference to AddIn functions
    //NOTE: The add-in name must be same as the function name
    unknownFunctions.Add("AddInFunction");
    //Use the function. The expected result is 30
    sheet.Range["A3"].Formula = "AddInFunction(10,20)";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("AddIn.
        xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("AddIn.xlsx",
        "application/msexcel", stream);
    }
}

```

Note: If you move the file to another computer, or distribute it, the workbook will expect to find the same Add-In, in the same place, on their computers. But, if the Add-In is moved or deleted from the computer, the workbook won't be able to find it, and your code won't work. Make sure that the Add-In is accessed by locating the .xlam file through the menu (Developer -> Add-ins -> Browse).

Defined Names

Cell ranges can be [defined by names](#) to perform formula calculation. This section explains about creating named ranges and accessing them from workbook or worksheet levels.

The following code shows how to define a named range from workbook level.

C#

```
//Defining a name in workbook level for the cell A1  
IName name = workbook.Names.Add("BookLevelName");  
name.RefersToRange = worksheet.Range["A1"];
```

VB.NET

```
'Defining a name in workbook level for the cell A1  
Dim name As IName = workbook.Names.Add("BookLevelName")  
name.RefersToRange = worksheet.Range("A1")
```

UWP

```
//Defining a name in workbook level for the cell A1  
IName name = workbook.Names.Add("BookLevelName");  
name.RefersToRange = worksheet.Range["A1"];
```

ASP.NET CORE

```
//Defining a name in workbook level for the cell A1  
IName name = workbook.Names.Add("BookLevelName");  
name.RefersToRange = worksheet.Range["A1"];
```

XAMARIN

```
//Defining a name in workbook level for the cell A1  
IName name = workbook.Names.Add("BookLevelName");  
name.RefersToRange = worksheet.Range["A1"];
```

The following code shows how to define a named range from worksheet level.

C#

```
//Defining a name in worksheet level for the cell B1  
IName name = worksheet.Names.Add("SheetLevelName");  
name.RefersToRange = worksheet.Range["B1"];
```

VB.NET

```
'Defining a name in worksheet level for the cell B1  
Dim name As IName = worksheet.Names.Add("SheetLevelName")  
name.RefersToRange = worksheet.Range("B1")
```

UWP

```
//Defining a name in worksheet level for the cell B1  
IName name = worksheet.Names.Add("SheetLevelName");
```

```
name.RefersToRange = worksheet.Range["B1"];
```

ASP.NET CORE

```
//Defining a name in worksheet level for the cell B1
IName name = worksheet.Names.Add("SheetLevelName");
name.RefersToRange = worksheet.Range["B1"];
```

XAMARIN

```
//Defining a name in worksheet level for the cell B1
IName name = worksheet.Names.Add("SheetLevelName");
name.RefersToRange = worksheet.Range["B1"];
```

Named Ranges in Formulas

Following code example illustrates how to create workbook-level named ranges and use it in formulas.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Defining a name in workbook level for the cell A1
    IName name1 = workbook.Names.Add("One");
    name1.RefersToRange = sheet.Range["A1"];
    //Defining a name in workbook level for the cell B1
    IName name2 = workbook.Names.Add("Two");
    name2.RefersToRange = sheet.Range["B1"];
    //Formula using defined names
    sheet.Range["C1"].Formula = "=SUM(One,Two)";
    workbook.SaveAs("Formula.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Defining a name in workbook level for the cell A1
Dim name1 As IName = workbook.Names.Add("One")
name1.RefersToRange = sheet.Range("A1")
'Defining a name in workbook level for the cell B1
Dim name2 As IName = workbook.Names.Add("Two")
name2.RefersToRange = sheet.Range("B1")
'Formula using defined names
sheet.Range("C1").Formula = "=SUM(One,Two)"
workbook.SaveAs("Formula.xlsx")
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Defining a name in workbook level for the cell A1
    IName name1 = workbook.Names.Add("One");
    name1.RefersToRange = sheet.Range["A1"];
    //Defining a name in workbook level for the cell B1
    IName name2 = workbook.Names.Add("Two");
    name2.RefersToRange = sheet.Range["B1"];
    //Formula using defined names
    sheet.Range["C1"].Formula = "=SUM(One,Two)";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Formula";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Defining a name in workbook level for the cell A1
    IName name1 = workbook.Names.Add("One");
    name1.RefersToRange = sheet.Range["A1"];
    //Defining a name in workbook level for the cell B1
    IName name2 = workbook.Names.Add("Two");
    name2.RefersToRange = sheet.Range["B1"];
    //Formula using defined names
    sheet.Range["C1"].Formula = "=SUM(One,Two)";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Formula.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;

```

```

application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Defining a name in workbook level for the cell A1
IName name1 = workbook.Names.Add("One");
name1.RefersToRange = sheet.Range["A1"];
//Defining a name in workbook level for the cell B1
IName name2 = workbook.Names.Add("Two");
name2.RefersToRange = sheet.Range["B1"];
//Formula using defined names
sheet.Range["C1"].Formula = "=SUM(One,Two)";
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Formul
a.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Formula.xlsx",
"application/msexcel", stream);
}
}

```

Deleting Named Ranges

Named ranges defined in workbook and worksheet levels can be deleted in different ways. The following code shows the possibilities of deleting named ranges.

C#

```

//Deleting named range object
IName name = workbook.Names[0];
name.Delete();
//Deleting named range from workbook
workbook.Names["BookLevelName"].Delete();
//Deleting named range from worksheet
sheet.Names["SheetLevelName"].Delete();

```

VB.NET

```

'Deleting named range object
Dim name As IName = workbook.Names(0)
name.Delete()
'Deleting named range from workbook
workbook.Names("BookLevelName").Delete()
'Deleting named range from worksheet
sheet.Names("SheetLevelName").Delete()

```

UWP

```
//Deleting named range object
IName name = workbook.Names[0];
name.Delete();
//Deleting named range from workbook
workbook.Names["BookLevelName"].Delete();
//Deleting named range from worksheet
sheet.Names["SheetLevelName"].Delete();
```

ASP.NET CORE

```
//Deleting named range object
IName name = workbook.Names[0];
name.Delete();
//Deleting named range from workbook
workbook.Names["BookLevelName"].Delete();
//Deleting named range from worksheet
sheet.Names["SheetLevelName"].Delete();
```

XAMARIN

```
//Deleting named range object
IName name = workbook.Names[0];
name.Delete();
//Deleting named range from workbook
workbook.Names["BookLevelName"].Delete();
//Deleting named range from worksheet
sheet.Names["SheetLevelName"].Delete();
```

Formula Auditing

Microsoft Excel constantly checks in the background for potential errors in your worksheets, when open. If an error is located (or, at the least, what Excel thinks is an error), then the cell is "flagged" with a small green triangle in the upper-left corner of the cell. Auditing a formula helps to identify the error in it.

In certain cases, these errors can be ignored so that the error will not appear in further error checks. The **IgnoreErrorOptions** property of **IRange** manages different types of errors checks, for example numbers stored as text, formula calculation errors and validation errors.

To know more about IgnoreErrorOptions, please refer ExcelIgnoreError enumeration in API section.

Following code illustrates on how to ignore or set error indicators.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Sets warning if number is entered as text
    sheet.Range["A2:D2"].IgnoreErrorOptions = ExcelIgnoreError.NumberAsText;
    //Ignores all the error warnings
```

```
sheet.Range["A3"].IgnoreErrorOptions = ExcelIgnoreError.None;
workbook.SaveAs("FormulaAuditing.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Sets warning if number is entered as text
sheet.Range("A2:D2").IgnoreErrorOptions = ExcelIgnoreError.NumberAsText
'Ignores all the error warnings
sheet.Range("A3").IgnoreErrorOptions = ExcelIgnoreError.None
workbook.SaveAs("FormulaAuditing.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet sheet = workbook.Worksheets[0];
    //Sets warning if number is entered as text
    sheet.Range["A2:D2"].IgnoreErrorOptions = ExcelIgnoreError.NumberAsText;
    //Ignores all the error warnings
    sheet.Range["A3"].IgnoreErrorOptions = ExcelIgnoreError.None;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "FormulaAuditing";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet sheet = workbook.Worksheets[0];
//Sets warning if number is entered as text.
sheet.Range["A2:D2"].IgnoreErrorOptions = ExcelIgnoreError.NumberAsText;
//Ignores all the error warnings.
sheet.Range["A3"].IgnoreErrorOptions = ExcelIgnoreError.None;
//Saving the workbook as stream
FileStream file = new FileStream("FormulaAuditing.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(file);
file.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
        assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet sheet = workbook.Worksheets[0];
    //Sets warning if number is entered as text
    sheet.Range["A2:D2"].IgnoreErrorOptions = ExcelIgnoreError.NumberAsText;
    //Ignores all the error warnings
    sheet.Range["A3"].IgnoreErrorOptions = ExcelIgnoreError.None;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("FormulaAuditing.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("FormulaAuditing.xlsx", "application/msexcel", stream);
    }
}

```

Calculation Engine

Essential Calculate is now (from v9.1.x.x) integrated with Essential XlsIO, and thus makes it possible to calculate formulas entered at runtime without any additional references or packages.

Note: Do not add reference to Syncfusion.Calculate.Base. It will throw conflict errors as these are already integrated with XlsIO.

Note: Only the formulas that are supported by Calculate engine can be calculated at runtime using Essential XlsIO.

Calculate Options

Calculate engines provides certain options like calculation modes, Recalculate before Save and Enable iterations to perform specific calculation.

Calculation Modes

There are various calculation [modes](#) that enable users to customize formula calculations according to their needs. They are:

- Automatic
- Automatic except for Data Tables
- Manual

Following code illustrates on how to set calculation mode in XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting calculation mode for a workbook
    workbook.CalculationOptions.CalculationMode = ExcelCalculationMode.Manual;
    workbook.SaveAs("CalculationMode.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("CalculationMode.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("CalculationMode.xlsx", "application/msexcel", stream);
}
}
```

Recalculate Before Save

In Manual mode, this option controls whether Microsoft Excel should recalculate the workbook as a part of Save process. You can set this option by using **RecalcOnSave** property of **ICalculationOptions** interface.

C#

```
ICalculationOptions calcOptions = workbook.CalculationOptions;
//Set RecalcOnSave to false to avoid re calculation of workbook while saving
calcOptions.RecalcOnSave = false;
```

VB.NET

```
Dim calcOptions As ICalculationOptions = workbook.CalculationOptions
'Set RecalcOnSave to false to avoid re calculation of workbook while saving
calcOptions.RecalcOnSave = False
```

UWP

```
ICalculationOptions calcOptions = workbook.CalculationOptions;
//Set RecalcOnSave to false to avoid re calculation of workbook while saving
calcOptions.RecalcOnSave = false;
```

ASP.NET CORE

```
ICalculationOptions calcOptions = workbook.CalculationOptions;
//Set RecalcOnSave to false to avoid re calculation of workbook while saving
calcOptions.RecalcOnSave = false;
```

XAMARIN

```
ICalculationOptions calcOptions = workbook.CalculationOptions;
//Set RecalcOnSave to false to avoid re calculation of workbook while saving
calcOptions.RecalcOnSave = false;
```

Iteration

Iteration is the repeated recalculation of a worksheet until a specific numeric condition is met. If a formula refers back to one of its own cells, it must determine how many times the formula should recalculate.

Iteration settings will control the maximum number of iteration and the amount of acceptable change. By default, **IsIterationEnabled** is false, so that Excel does not try to solve accidental circular references.

Following code snippet illustrates how to set the Iterations.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting iteration
    workbook.CalculationOptions.IsIterationEnabled = true;
    //Number of times to recalculate
    workbook.CalculationOptions.MaximumIteration = 99;
    //Number of acceptable changes
    workbook.CalculationOptions.MaximumChange = 40;
    workbook.SaveAs("Iteration.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Setting Iteration
workbook.CalculationOptions.IsIterationEnabled = True
'Number of times to recalculate
workbook.CalculationOptions.MaximumIteration = 99
'Number of acceptable changes
workbook.CalculationOptions.MaximumChange = 40
workbook.SaveAs("Iteration.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting iteration
    workbook.CalculationOptions.IsIterationEnabled = true;
    //Number of times to recalculate
    workbook.CalculationOptions.MaximumIteration = 99;
    //Number of acceptable changes
    workbook.CalculationOptions.MaximumChange = 40;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Iteration";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
```

```
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting iteration
    workbook.CalculationOptions.IsIterationEnabled = true;
    //Number of times to recalculate
    workbook.CalculationOptions.MaximumIteration = 99;
    //Number of acceptable changes
    workbook.CalculationOptions.MaximumChange = 40;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Iteration.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Setting iteration
    workbook.CalculationOptions.IsIterationEnabled = true;
    //Number of times to recalculate
    workbook.CalculationOptions.MaximumIteration = 99;
    //Number of acceptable changes
    workbook.CalculationOptions.MaximumChange = 40;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Iteration.xlsx", "application/msexcel", stream);
    }
    else
    {

```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Iteration.xlsx",
"application/msexcel", stream);
}
}
```

Working with Conditional Formatting

Conditional formatting allows to format the contents of a cell dynamically. This can be defined and applied in XlsIO through the **ICConditionalFormat** interface.

Create a Conditional Format

The **ICConditionalFormats** represents a collection of conditional formats for a single **IRange**. One or more conditional formats can be added to the range as follows.

C#

```
//Applying conditional formatting to "A1"
ICConditionalFormats condition = worksheet.Range["A1"].ConditionalFormats;
ICConditionalFormat condition1 = condition.AddCondition();
```

VB.NET

```
'Applying conditional formatting to "A1"
Dim condition As ICConditionalFormats =
worksheet.Range("A1").ConditionalFormats
Dim condition1 As ICConditionalFormat = condition.AddCondition()
```

UWP

```
//Applying conditional formatting to "A1"
ICConditionalFormats condition = worksheet.Range["A1"].ConditionalFormats;
ICConditionalFormat condition1 = condition.AddCondition();
```

ASP.NET CORE

```
//Applying conditional formatting to "A1"
ICConditionalFormats condition = worksheet.Range["A1"].ConditionalFormats;
ICConditionalFormat condition1 = condition.AddCondition();
```

XAMARIN

```
//Applying conditional formatting to "A1"
ICConditionalFormats condition = worksheet.Range["A1"].ConditionalFormats;
ICConditionalFormat condition1 = condition.AddCondition();
```

The target range should meet the criteria, which is set using the **ICConditionalFormat** interface. The desired format type is set through the **ExcelCfType** enumerator, which are the supported conditional format types in XlsIO. Refer to the following code.

C#

```
//Represents conditional format rule that the value in target range should
be between 10 and 20
condition1.FormatType = ExcelCfType.CellValue;
```

```
condition1.Operator = ExcelComparisonOperator.Between;
condition1.FirstFormula = "10";
condition1.SecondFormula = "20";
worksheet.Range["A1"].Text = "Enter a number between 10 and 20";
```

VB.NET

```
'Represents conditional format rule that the value in target range should be
between 10 and 20
condition1.FormatType = ExcelCfType.CellValue
condition1.Operator = ExcelComparisonOperator.Between
condition1.FirstFormula = "10"
condition1.SecondFormula = "20"
worksheet.Range("A1").Text = "Enter a number between 10 and 20"
```

UWP

```
//Represents conditional format rule that the value in target range should
be between 10 and 20
condition1.FormatType = ExcelCfType.CellValue;
condition1.Operator = ExcelComparisonOperator.Between;
condition1.FirstFormula = "10";
condition1.SecondFormula = "20";
worksheet.Range["A1"].Text = "Enter a number between 10 and 20";
```

ASP.NET CORE

```
//Represents conditional format rule that the value in target range should
be between 10 and 20
condition1.FormatType = ExcelCfType.CellValue;
condition1.Operator = ExcelComparisonOperator.Between;
condition1.FirstFormula = "10";
condition1.SecondFormula = "20";
worksheet.Range["A1"].Text = "Enter a number between 10 and 20";
```

XAMARIN

```
//Represents conditional format rule that the value in target range should
be between 10 and 20
condition1.FormatType = ExcelCfType.CellValue;
condition1.Operator = ExcelComparisonOperator.Between;
condition1.FirstFormula = "10";
condition1.SecondFormula = "20";
worksheet.Range["A1"].Text = "Enter a number between 10 and 20";
```

When the criteria set for the target range is satisfied, the defined formats (like the one below) are applied in the order of priority. For more details about conditional format priority, see [Manage conditional formatting rule precedence](#).

C#

```
//Setting format properties to be applied when the above condition is met
condition1.BackColor = ExcelKnownColors.Light_orange;
condition1.IsBold = true;
```

```
condition1.IsItalic = true;
```

VB.NET

```
'Setting format properties to be applied when the above condition is met
condition1.BackColor = ExcelKnownColors.Light_orange
condition1.IsBold = True
condition1.IsItalic = True
```

UWP

```
//Setting format properties to be applied when the above condition is met
condition1.BackColor = ExcelKnownColors.Light_orange;
condition1.IsBold = true;
condition1.IsItalic = true;
```

ASP.NET CORE

```
//Setting format properties to be applied when the above condition is met
condition1.BackColor = ExcelKnownColors.Light_orange;
condition1.IsBold = true;
condition1.IsItalic = true;
```

XAMARIN

```
//Setting format properties to be applied when the above condition is met
condition1.BackColor = ExcelKnownColors.Light_orange;
condition1.IsBold = true;
condition1.IsItalic = true;
```

The following code creates and applies various different conditional formats for different ranges in XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Applying conditional formatting to "A1"
    IConditionalFormats condition = worksheet.Range["A1"].ConditionalFormats;
    IConditionalFormat condition1 = condition.AddCondition();
    //Represents conditional format rule that the value in target range should be between 10 and 20
    condition1.FormatType = ExcelCfType.CellValue;
    condition1.Operator = ExcelComparisonOperator.Between;
    condition1.FirstFormula = "10";
    condition1.SecondFormula = "20";
    worksheet.Range["A1"].Text = "Enter a number between 10 and 20";
    //Setting back color and font style to be applied for target range
    condition1.BackColor = ExcelKnownColors.Light_orange;
    condition1.IsBold = true;
```

```

condition1.IsItalic = true;
//Applying conditional formatting to "A3"
condition = worksheet.Range["A3"].ConditionalFormats;
IConditionalFormat condition2 = condition.AddCondition();
//Represents conditional format rule that the cell value should be 1000
condition2.FormatType = ExcelCFTType.CellValue;
condition2.Operator = ExcelComparisonOperator.Equal;
condition2.FirstFormula = "1000";
worksheet.Range["A3"].Text = "Enter the Number as 1000";
//Setting fill pattern and back color to target range
condition2.FillPattern = ExcelPattern.LightUpwardDiagonal;
condition2.BackColor = ExcelKnownColors.Yellow;
//Applying conditional formatting to "A5"
condition = worksheet.Range["A5"].ConditionalFormats;
IConditionalFormat condition3 = condition.AddCondition();
//Setting conditional format rule that the cell value for target range
should be less than or equal to 1000
condition3.FormatType = ExcelCFTType.CellValue;
condition3.Operator = ExcelComparisonOperator.LessOrEqual;
condition3.FirstFormula = "1000";
worksheet.Range["A5"].Text = "Enter a Number which is less than or equal to
1000";
//Setting back color to target range
condition3.BackColor = ExcelKnownColors.Light_green;
workbook.SaveAs("ConditionalFormatting.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013

should be less than or equal to 1000
condition3.FormatType = ExcelCFTType.CellValue;

```

```
condition3.Operator = ExcelComparisonOperator.LessOrEqual;
condition3.FirstFormula = "1000";
worksheet.Range["A5"].Text = "Enter a Number which is less than or equal to 1000";
//Setting back color to target range
condition3.BackColor = ExcelKnownColors.Light_green;
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("ConditionalFormatting.xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("ConditionalFormatting.xlsx", "application/msexcel", stream);
}
}
```

Note: Excel allows the addition of a maximum of three conditions for the same cell in the Biff8 format and XlsIO. However, this restriction is removed from the Excel 2007 formats.

Note: The conditional formats for a single range should be added in descending order in XlsIO.

When proper criteria is met, the output file looks as follows:

Reading Conditional Formats in XlsIO

XlsIO also reads conditional formats from existing excel workbook. The following code example illustrates this.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Read conditional formatting settings
    string formatType =
        worksheet.Range["A1"].ConditionalFormats[0].FormatType.ToString();
    string cfOperator =
        worksheet.Range["A1"].ConditionalFormats[0].Operator.ToString();
    string backColor =
        worksheet.Range["A1"].ConditionalFormats[0].BackColor.ToString();
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
```

```

application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Read conditional formatting settings
Dim formatType As String =
worksheet.Range("A1").ConditionalFormats(0).FormatType.ToString()
Dim cfOperator As String =
worksheet.Range("A1").ConditionalFormats(0).Operator.ToString()
Dim backColor As String =
worksheet.Range("A1").ConditionalFormats(0).BackColor.ToString()
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

Removing Conditional Formats

All the conditional formats for a specified range can be removed using the **Remove** method. This is illustrated as follows.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Removing conditional format for a specified range
    worksheet.Range["E5"].ConditionalFormats.Remove();
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Removing conditional format for a specified range
worksheet.Range("E5").ConditionalFormats.Remove()
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Removing conditional format for a specified range
    worksheet.Range["E5"].ConditionalFormats.Remove();
    //Initializes FileSavePicker
}
```

```

FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Removing conditional format for a specified range
    worksheet.Range["E5"].ConditionalFormats.Remove();
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelOpenType.Automatic);

.xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Removing Conditional Formats at specified index value

A particular conditional format at the specified range can be removed by using the *RemoveAt** method as follows.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Removing first conditional Format at the specified Range
    worksheet.Range["E5"].ConditionalFormats.RemoveAt(0);
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Removing first conditional Format at the specified Range
worksheet.Range("E5").ConditionalFormats.RemoveAt(0)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
}

```

```

StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing first conditional Format at the specified Range
worksheet.Range["E5"].ConditionalFormats.RemoveAt(0);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing first conditional Format at the specified Range
worksheet.Range["E5"].ConditionalFormats.RemoveAt(0);
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sam
ple.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing first conditional Format at the specified Range
worksheet.Range["E5"].ConditionalFormats.RemoveAt(0);
//Saving the workbook as stream

```

```

MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Removing Conditional Formats from entire sheet

The entire conditional formats from the worksheet can be removed as follows.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing Conditional Formatting Settings From Entire Sheet
worksheet.UsedRange.Clear(ExcelClearOptions.ClearConditionalFormats);
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Removing Conditional Formatting Settings From Entire Sheet
worksheet.UsedRange.Clear(ExcelClearOptions.ClearConditionalFormats)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;

```

```

application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing Conditional Formatting Settings From Entire Sheet
worksheet.UsedRange.Clear(ExcelClearOptions.ClearConditionalFormats);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Removing Conditional Formatting Settings From Entire Sheet
worksheet.UsedRange.Clear(ExcelClearOptions.ClearConditionalFormats);
//Saving the workbook as stream

}
}

```

Using FormulaR1C1 property in Conditional Formats

XlsIO sets the formula for the conditional format in R1C1-style notation. The following code example illustrates this.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Using FormulaR1C1 property in Conditional Formatting
IConditionalFormats condition =
worksheet.Range["E5:E18"].ConditionalFormats;
IConditionalFormat condition1 = condition.AddCondition();
condition1.FirstFormulaR1C1 = "=R[1]C[0]";
condition1.SecondFormulaR1C1 = "=R[1]C[1]";
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Using FormulaR1C1 property in Conditional Formatting

```

```

Dim condition As IConditionalFormats =
worksheet.Range("E5:E18").ConditionalFormats
Dim condition1 As IConditionalFormat = condition.AddCondition()
condition1.FirstFormulaR1C1 = "=R[1]C[0]"
condition1.SecondFormulaR1C1 = "=R[1]C[1]"
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Using FormulaR1C1 property in Conditional Formatting
    IConditionalFormats condition =
worksheet.Range["E5:E18"].ConditionalFormats;
    IConditionalFormat condition1 = condition.AddCondition();
    condition1.FirstFormulaR1C1 = "=R[1]C[0]";
    condition1.SecondFormulaR1C1 = "=R[1]C[1]";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Using FormulaR1C1 property in Conditional Formatting
    IConditionalFormats condition =
worksheet.Range["E5:E18"].ConditionalFormats;
    IConditionalFormat condition1 = condition.AddCondition();
    condition1.FirstFormulaR1C1 = "=R[1]C[0]";
    condition1.SecondFormulaR1C1 = "=R[1]C[1]";
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Using FormulaR1C1 property in Conditional Formatting
    IConditionalFormats condition =
        worksheet.Range["E5:E18"].ConditionalFormats;
    IConditionalFormat condition1 = condition.AddCondition();
    condition1.FirstFormulaR1C1 = "=R[1]C[0]";
    condition1.SecondFormulaR1C1 = "=R[1]C[1]";
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Format Unique and Duplicate Values

Format unique and duplicate values of an Excel range using conditional formatting. The values, Unique and Duplicate of the enumeration ExcelCfType helps to achieve the requirement.

The below code example shows how to format unique and duplicate values using conditional formatting in XlsIO.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Fill worksheet with data
    worksheet.Range["A1:B1"].Merge();
    worksheet.Range["A1:B1"].CellStyle.Font.RGBColor = Color.FromArgb(255, 102,
    102, 255);
    worksheet.Range["A1:B1"].CellStyle.Font.Size = 14;
}

```

```

worksheet.Range["A1:B1"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignCenter;
worksheet.Range["A1"].Text = "Global Internet Usage";
worksheet.Range["A1:B1"].CellStyle.Font.Bold = true;
worksheet.Range["A3:B21"].CellStyle.Font.RGBColor = Color.FromArgb(255, 64,
64, 64);
worksheet.Range["A3:B3"].CellStyle.Font.Bold = true;
worksheet.Range["B3"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignRight;
worksheet.Range["A3"].Text = "Country";
worksheet.Range["A4"].Text = "Northern America";
worksheet.Range["A5"].Text = "Central America";
worksheet.Range["A6"].Text = "The Caribbean";
worksheet.Range["A7"].Text = "South America";
worksheet.Range["A8"].Text = "Northern Europe";
worksheet.Range["A9"].Text = "Eastern Europe";
worksheet.Range["A10"].Text = "Western Europe";
worksheet.Range["A11"].Text = "Southern Europe";
worksheet.Range["A12"].Text = "Northern Africa";
worksheet.Range["A13"].Text = "Eastern Africa";
worksheet.Range["A14"].Text = "Middle Africa";
worksheet.Range["A15"].Text = "Western Africa";
worksheet.Range["A16"].Text = "Southern Africa";
worksheet.Range["A17"].Text = "Central Asia";
worksheet.Range["A18"].Text = "Eastern Asia";
worksheet.Range["A19"].Text = "Southern Asia";
worksheet.Range["A20"].Text = "SouthEast Asia";
worksheet.Range["A21"].Text = "Oceania";
worksheet.Range["B3"].Text = "Usage";
worksheet.Range["B4"].Value = "88%";
worksheet.Range["B5"].Value = "61%";
worksheet.Range["B6"].Value = "49%";

The following screenshot represents generated Excel file with unique and duplicate conditional format in XlsIO.

	A	B
1	GLOBAL INTERNET USAGE	
2		
3	Country	Usage
4	Northern America	88%
5	Central America	61%
6	The Caribbean	49%
7	South America	68%
8	Northern Europe	94%
9	Eastern Europe	74%
10	Western Europe	90%
11	Southern Europe	77%
12	Northern Africa	49%
13	Eastern Africa	27%
14	Middle Africa	12%
15	Western Africa	39%
16	Southern Africa	51%
17	Central Asia	50%
18	Eastern Asia	58%
19	Southern Asia	36%
20	SouthEast Asia	58%
21	Oceania	69%

Format Top or Bottom Values

Top/Bottom rule in conditional formatting is used to highlight the top or bottom ranked cells in a data range. Top/Bottom conditional formatting rule can be created and customized using the **ITopBottom** interface in XlsIO.

The properties of **ITopBottom** interface are:

- **Type** - Specifies whether the rank is evaluated from the top or bottom.
- **Percent** - Specifies whether the rank is determined by a percentage value.
- **Rank** - Specifies the maximum number or percentage of cells to be highlighted.

The following screenshot represents the input template of conditional formatting.

Students	Subject 1	Subject 2	Subject 3	Subject 4	Subject 5	Subject 6	Subject 7	Subject 8	Subject 9	Subject 10	Total	Average	Rank
Student 1	99	97	93	100	91	92	92	95	91	89	939	94	3
Student 2	86	88	90	92	91	87	96	75	80	92	877	88	9

Top/Bottom 'n' rank values

The below code example shows how to format top 10 rank values from the given data range using `ITopBottom` Type and `Rank` properties in XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("CFTemplate.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Applying conditional formatting to "N6:N35".
    IConditionalFormats formats = worksheet.Range["N6:N35"].ConditionalFormats;
    IConditionalFormat format = formats.AddCondition();
    //Applying top or bottom rule in the conditional formatting.
    format.FormatType = ExcelCFTType.TopBottom;
    ITopBottom topBottom = format.TopBottom;
    //Set type as Top for TopBottom rule.
    topBottom.Type = ExcelCFTTopBottomType.Top;
    //Set rank value for the TopBottom rule.
    topBottom.Rank = 10;
    //Set color for Conditional Formatting.
}
```

```
format.BackColorRGB = System.Drawing.Color.FromArgb(51, 153, 102);
//Saves the Excel
workbook.SaveAs("TopBottom.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("CFTemplate.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Applying conditional formatting to "N6:N35".
Dim formats As IConditionalFormats =
worksheet.Range("N6:N35").ConditionalFormats
Dim format As IConditionalFormat = formats.AddCondition()
'Set type as Top for TopBottom rule.
format.FormatType = ExcelCFTType.TopBottom
Dim topBottom As ITopBottom = format.TopBottom
'Set rank value for the TopBottom rule.
topBottom.Type = ExcelCFTopBottomType.Top
'Set rank value for the TopBottom rule.
topBottom.Rank = 10
'Set color for Conditional Formattting.
format.BackColorRGB = System.Drawing.Color.FromArgb(51, 153, 102)
'Saves the Excel
workbook.SaveAs("TopBottom.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())

Top-Bottom Rules

74%

Note: ITopBottom Rank value should be in a range between 1 and 1000.

Top/Bottom 'n'% rank values

The below code example shows how to format top 50 percentage rank values from the given data range using ITopBottom Type, Rank and Percent properties in XlsIO

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("CFTemplate.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Applying conditional formatting to "N6:N35".
    IConditionalFormats formats = worksheet.Range["N6:N35"].ConditionalFormats;
    IConditionalFormat format = formats.AddCondition();
    //Applying top or bottom rule in the conditional formatting.
    format.FormatType = ExcelCFTType.TopBottom;
    ITopBottom topBottom = format.TopBottom;
    //Set type as Bottom for TopBottom rule.
    topBottom.Type = ExcelCFTTopBottomType.Bottom;
    //Set true to Percent property for TopBottom rule.
```

```

topBottom.Percent = true;
//Set rank value for the TopBottom rule.
topBottom.Rank = 50;
//Set color for Conditional Formatting.
format.BackColorRGB = System.Drawing.Color.FromArgb(51, 153, 102);
//Saves the Excel
workbook.SaveAs("TopBottom.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("CFTemplate.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Applying conditional formatting to "N6:N35".
Dim formats As IConditionalFormats =
worksheet.Range("N6:N35").ConditionalFormats
Dim format As IConditionalFormat = formats.AddCondition()
'Set type as Top for TopBottom rule.
format.FormatType = ExcelCFTType.TopBottom
Dim topBottom As ITopBottom = format.TopBottom
'Set type as Bottom for TopBottom rule.
topBottom.Type = ExcelCFTTopBottomType.Bottom
'Set true to Percent property for TopBottom rule.
topBottom.Percent = true
Set rank value for the TopBottom rule.
topBottom.Rank = 50
'Set color for Conditional Formatting.
format.BackColorRGB = System.Drawing.Color.FromArgb(51, 153, 102)
'Saves the Excel
workbook.SaveAs("TopBottom.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile openFile = await openPicker.PickSingleFileAsync();
//Open the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
IWorksheet worksheet = workbook.Worksheets[0];
//Applying conditional formatting to "N6:N35".
IConditionalFormats formats = worksheet.Range["N6:N35"].ConditionalFormats;
IConditionalFormat format = formats.AddCondition();
//Applying top or bottom rule in the conditional formatting.
format.FormatType = ExcelCFTType.TopBottom;
ITopBottom topBottom = format.TopBottom;

```

```
//Set type as Bottom for TopBottom rule.
topBottom.Type = ExcelCFTopBottomType.Bottom;
//Set true to Percent property for TopBottom rule.
topBottom.Percent = true;
//Set rank value for the TopBottom rule.
topBottom.Rank = 50;
//Set color for Conditional Formattting.
format.BackColorRGB = System.Drawing.Color.FromArgb(51, 153, 102);
//Save the workbook
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "TopBottom";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"

Top-Bottom Rules

Note: ITopBottom Rank value should be in a range between 1 and 100 when set true to Percent property.

Format Above or Below Average Values

Above/Below average rule in conditional formatting is used to highlight the cells which contains above/below the average values in a data range. Top/Bottom conditional formatting rule can be created and customized using the IAboveBelowAverage interface in XlsIO.

The properties of IAboveBelowAverage are:

- **AverageType** - Specifies whether the conditional formatting rule looks for cell values that are above average or below average or standard deviation.
- **StdDevValue** - Specifies standard deviation number for IAboveBelowAverage conditional formatting rule.

The following screenshot represents the input template of conditional formatting.

Students	Subject 1	Subject 2	Subject 3	Subject 4	Subject 5	Subject 6	Subject 7	Subject 8	Subject 9	Subject 10	Total	Average	Rank

Student 30	89	87	83	86	81	80	92	80	94	92	864	86	13

The below code example shows how to format a range with values that are below average using `IAboveBelowAverage` `AverageType` property in XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("CFTemplate.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Applying conditional formatting to "M6:M35"
    IConditionalFormats formats = worksheet.Range["M6:M35"].ConditionalFormats;
    IConditionalFormat format = formats.AddCondition();
    //Applying above or below average rule in the conditional formatting
    format.FormatType = ExcelCFTType.AboveBelowAverage;
    IAboveBelowAverage aboveBelowAverage = format.AboveBelowAverage;
    //Set AverageType as Below for AboveBelowAverage rule.
    aboveBelowAverage.AverageType = ExcelCFAverageType.Below;
    //Set color for Conditional Formatting.
    format.FontColorRGB = System.Drawing.Color.FromArgb(255, 255, 255);
    format.BackColorRGB = System.Drawing.Color.FromArgb(166, 59, 38);
    //Saves the Excel
    workbook.SaveAs("AboveBelowAverage.xlsx");
}
```

```
}

```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("CFTemplate.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Applying conditional formatting to "M6:M35"
IConditionalFormats formats = worksheet.Range["M6:M35"].ConditionalFormats;
IConditionalFormat format = formats.AddCondition();
'Applying above or below average rule in the conditional formatting
format.FormatType = ExcelCFTType.AboveBelowAverage;
IAboveBelowAverage aboveBelowAverage = format.AboveBelowAverage;
'Set AverageType as Below for AboveBelowAverage rule.
aboveBelowAverage.AverageType = ExcelCFAverageType.Below;
'Set color for Conditional Formattting.
format.FontColorRGB = System.Drawing.Color.FromArgb(255, 255, 255);
format.BackColorRGB = System.Drawing.Color.FromArgb(166, 59, 38);
'Saves the Excel
workbook.SaveAs("AboveBelowAverage.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())

The following screenshot represents the Excel file generated with AboveBelowAverage conditional format with AverageType set as Below in XlsIO.

The screenshot shows an Excel spreadsheet titled "Students Marks Report". The spreadsheet has columns for Student names, 10 subjects, Total, Average, and Rank. The 'Average' column is highlighted with conditional formatting, showing values above and below the average. The 'Rank' column is also highlighted with conditional formatting, showing values above and below the average.

Students	Subject 1	Subject 2	Subject 3	Subject 4	Subject 5	Subject 6	Subject 7	Subject 8	Subject 9	Subject 10	Total	Average	Rank
Student 1	99	97	93	100	91	92	92	95	91	89	939	94	3
Student 2	86	88	90	92	91	87	96	75	80	92	877	88	9
Student 3	91	92	97	94	91	92	95	99	100	94	945	95	1

Above or Below Standard Deviation values

The below code example shows how to format a range with values above standard deviation, using `IAboveBelowAverage` `AverageType` and `StdDevValue` properties in XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("CFTemplate.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Applying conditional formatting to "M6:M35"
    IConditionalFormats formats = worksheet.Range["M6:M35"].ConditionalFormats;
    IConditionalFormat format = formats.AddCondition();
    //Applying above or below average rule in the conditional formatting
    format.FormatType = ExcelCFTType.AboveBelowAverage;
    IAboveBelowAverage aboveBelowAverage = format.AboveBelowAverage;
    //Set AverageType as AboveStdDev for AboveBelowAverage rule.
    aboveBelowAverage.AverageType = ExcelCFAverageType.AboveStdDev;
    //Set value to StdDevValue property for AboveBelowAverage rule.
    aboveBelowAverage.StdDevValue = 1;
    //Set color for Conditional Formatting.
}
```

```
format.FontColorRGB = System.Drawing.Color.FromArgb(255, 255, 255);
format.BackColorRGB = System.Drawing.Color.FromArgb(166, 59, 38);
//Saves the Excel
workbook.SaveAs ("AboveBelowAverage.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("CFTemplate.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Applying conditional formatting to "M6:M35"
IConditionalFormats formats = worksheet.Range["M6:M35"].ConditionalFormats;
IConditionalFormat format = formats.AddCondition();
'Applying above or below average rule in the conditional formatting
format.FormatType = ExcelCFTType.AboveBelowAverage;
IAboveBelowAverage aboveBelowAverage = format.AboveBelowAverage;
'Set AverageType as AboveStdDev for AboveBelowAverage rule.
aboveBelowAverage.AverageType = ExcelCFAverageType.AboveStdDev
'Set value to StdDevValue property for AboveBelowAverage rule.
aboveBelowAverage.StdDevValue = 1
'Set color for Conditional Formattting.
format.FontColorRGB = System.Drawing.Color.FromArgb(255, 255, 255);
format.BackColorRGB = System.Drawing.Color.FromArgb(166, 59, 38);
'Saves the Excel
workbook.SaveAs ("AboveBelowAverage.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile openFile = await openPicker.PickSingleFileAsync();
//Open the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
IWorksheet worksheet = workbook.Worksheets[0];
//Applying conditional formatting to "M6:M35"
IConditionalFormats formats = worksheet.Range["M6:M35"].ConditionalFormats;
IConditionalFormat format = formats.AddCondition();
//Applying above or below average rule in the conditional formatting
format.FormatType = ExcelCFTType.AboveBelowAverage;
IAboveBelowAverage aboveBelowAverage = format.AboveBelowAverage;
//Set AverageType as AboveStdDev for AboveBelowAverage rule.
aboveBelowAverage.AverageType = ExcelCFAverageType.AboveStdDev;
//Set value to StdDevValue property for AboveBelowAverage rule.
aboveBelowAverage.StdDevValue = 1;
//Set color for Conditional Formattting.
```

```

format.FontColorRGB = System.Drawing.Color.FromArgb(255, 255, 255);
format.BackColorRGB = System.Drawing.Color.FromArgb(166, 59, 38);
//Save the workbook
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "AboveBelowAverage";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile outputStorageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(outputStorageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("CFTemplate.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[0];

Student 19	84	90	91	93	90	92	91	81	85	84	881	88	7
Student 20	83	75	74	76	78	89	90	87	82	88	822	82	22
Student 21	89	87	83	80	91	72	92	85	89	94	862	86	14
Student 22	89	87	91	90	90	83	87	91	90	94	892	89	5
Student 23	87	91	90	90	81	79	78	79	80	87	842	84	19
Student 24	79	86	75	75	71	82	85	80	93	94	820	82	23
Student 25	80	79	87	89	91	90	94	93	91	94	888	89	6
Student 26	69	67	71	69	71	69	69	60	71	73	689	69	30
Student 27	73	77	78	82	84	90	91	75	80	85	815	82	24
Student 28	93	87	85	83	71	80	82	85	81	84	831	83	21
Student 29	85	90	93	91	91	92	87	85	85	80	879	88	8
Student 30	89	87	83	86	81	80	92	80	94	92	864	86	13

Note: `IAboveBelowAverage StdDevValue` can be applied only if the `AverageType` is `AboveStdDev` or `BelowStdDev`. The `StdDevValue` value should be in a range between 1 and 3.

Advanced Conditional Format Types

In conjunction with basic conditional formatting, the new formatting visualizations such as **Data Bars**, **Color Scales**, and **Icon Sets** are supported in XlsIO.

Data Bars

Here, the values in each of the selected cells are compared, and a data bar is drawn in each cell representing the value of that cell relative to the other cells in the selected range. This bar provides a clear visual cue for users, making it easier to pick out larger and smaller values in a range.

This can be set and manipulated using the `IDataBar` interface as follows.

C#

```
//Create data bars for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["C7:C46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCFTType.DataBar;
IDataBar dataBar = conditionalFormat.DataBar;
//Set the constraints
dataBar.MinPoint.Type = ConditionValueType.LowestValue;
```

```
dataBar.MaxPoint.Type = ConditionValueType.HighestValue;
//Set color for DataBar
dataBar.BarColor = Color.FromArgb(156, 208, 243);
//Hide the data bar values
dataBar.ShowValue = false;
dataBar.BarColor = Color.Aqua;
```

VB.NET

```
'Create data bars for the data in specified range
Dim formats As IConditionalFormats =
worksheet.Range("C7:C46").ConditionalFormats
Dim format As IConditionalFormat = formats.AddCondition()
format.FormatType = ExcelCfType.DataBar
Dim dataBar As IDataBar = format.DataBar
'Set the constraints
dataBar.MinPoint.Type = ConditionValueType.LowestValue
dataBar.MaxPoint.Type = ConditionValueType.HighestValue
'Set color for DataBar
dataBar.BarColor = System.Drawing.Color.FromArgb(156, 208, 243)
'Hide the data bar values
dataBar.ShowValue = False
dataBar.BarColor = Color.Aqua
```

UWP

```
//Create data bars for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["C7:C46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.DataBar;
IDataBar dataBar = conditionalFormat.DataBar;
//Set the constraints
dataBar.MinPoint.Type = ConditionValueType.LowestValue;
dataBar.MaxPoint.Type = ConditionValueType.HighestValue;
//Set color for DataBar
dataBar.BarColor = Color.FromArgb(255, 156, 208, 243);
//Hide the data bar values
dataBar.ShowValue = false;
dataBar.BarColor = Color.FromArgb(255, 0, 255, 255);
```

ASP.NET CORE

```
//Create data bars for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["C7:C46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.DataBar;
IDataBar dataBar = conditionalFormat.DataBar;
//Set the constraints
dataBar.MinPoint.Type = ConditionValueType.LowestValue;
dataBar.MaxPoint.Type = ConditionValueType.HighestValue;
//Set color for DataBar
dataBar.BarColor = Color.FromArgb(156, 208, 243);
//Hide the data bar values
```

```
dataBar.ShowValue = false;
dataBar.BarColor = Color.Aqua;
```

XAMARIN

```
//Create data bars for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["C7:C46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCFTType.DataBar;
IDataBar dataBar = conditionalFormat.DataBar;
//Set the constraints
dataBar.MinPoint.Type = ConditionValueType.LowestValue;
dataBar.MaxPoint.Type = ConditionValueType.HighestValue;
//Set color for DataBar
dataBar.BarColor = Syncfusion.Drawing.Color.FromArgb(255, 156, 208, 243);
//Hide the data bar values
dataBar.ShowValue = false;
dataBar.BarColor = Color.Aqua;
```

Color Scales

Color Scales let you create visual effects in your data to see how the value of a cell is compared with the values in a range of cells. A color scale uses cell shading, as opposed to bars, to communicate relative values, beyond the relative size of the value of a cell.

Creation of color scales and its formatting rules using the **IColorScale** interface in XlsIO is illustrated as follows.

C#

```
//Create color scale for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["D7:D46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCFTType.ColorScale;
IColorScale colorScale = conditionalFormat.ColorScale;
//Sets 3 - color scale and its constraints
colorScale.SetConditionCount(3);
colorScale.Criteria[0].FormatColorRGB = Color.FromArgb(230, 197, 218);
colorScale.Criteria[0].Type = ConditionValueType.LowestValue;
colorScale.Criteria[0].Value = "0";
colorScale.Criteria[1].FormatColorRGB = Color.FromArgb(244, 210, 178);
colorScale.Criteria[1].Type = ConditionValueType.Percentile;
colorScale.Criteria[1].Value = "50";

Icon Sets

Icon sets present data in three to five categories that are distinguished by a threshold value. Each icon represents a range of values and each cell is annotated with the icon that represents that range.

Icon sets can be created and customized in XlsIO as follows.

C#

```
//Create icon sets for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["E7:E46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.IconSet;
IIconSet iconSet = conditionalFormat.IconSet;
//Apply three symbols icon and hide the data in the specified range
iconSet.IconSet = ExcelIconSetType.ThreeSymbols;
iconSet.IconCriteria[1].Type = ConditionValueType.Percent;
iconSet.IconCriteria[1].Value = "50";
iconSet.IconCriteria[2].Type = ConditionValueType.Percent;
iconSet.IconCriteria[2].Value = "50";
iconSet.ShowIconOnly = true;
```

VB.NET

```

'Create icon sets for the data in specified range
Dim conditionalFormats As IConditionalFormats =
worksheet.Range("E7:E46").ConditionalFormats
Dim conditionalFormat As IConditionalFormat = formats.AddCondition()
format.FormatType = ExcelCfType.IconSet
Dim iconSet As IIconSet = format.IconSet
'Apply three symbols icon and hide the data in the specified range
iconSet.IconSet = ExcelIconSetType.ThreeSymbols
iconSet.IconCriteria(1).Type = ConditionValueType.Percent
iconSet.IconCriteria(1).Value = "50"
iconSet.IconCriteria(2).Type = ConditionValueType.Percent
iconSet.IconCriteria(2).Value = "50"
iconSet.ShowIconOnly = True

```

UWP

```

//Create icon sets for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["E7:E46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.IconSet;
IIconSet iconSet = conditionalFormat.IconSet;
//Apply three symbols icon and hide the data in the specified range
iconSet.IconSet = ExcelIconSetType.ThreeSymbols;
iconSet.IconCriteria[1].Type = ConditionValueType.Percent;
iconSet.IconCriteria[1].Value = "50";
iconSet.IconCriteria[2].Type = ConditionValueType.Percent;
iconSet.IconCriteria[2].Value = "50";
iconSet.ShowIconOnly = true;

```

ASP.NET CORE

```

//Create icon sets for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["E7:E46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.IconSet;
IIconSet iconSet = conditionalFormat.IconSet;
//Apply three symbols icon and hide the data in the specified range
iconSet.IconSet = ExcelIconSetType.ThreeSymbols;
iconSet.IconCriteria[1].Type = ConditionValueType.Percent;
iconSet.IconCriteria[1].Value = "50";
iconSet.IconCriteria[2].Type = ConditionValueType.Percent;
iconSet.IconCriteria[2].Value = "50";
iconSet.ShowIconOnly = true;

```

XAMARIN

```

//Create icon sets for the data in specified range
IConditionalFormats conditionalFormats =
worksheet.Range["E7:E46"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCfType.IconSet;
IIconSet iconSet = conditionalFormat.IconSet;
//Apply three symbols icon and hide the data in the specified range

```

```

iconSet.IconSet = ExcelIconSetType.ThreeSymbols;
iconSet.IconCriteria[1].Type = ConditionValueType.Percent;
iconSet.IconCriteria[1].Value = "50";
iconSet.IconCriteria[2].Type = ConditionValueType.Percent;
iconSet.IconCriteria[2].Value = "50";
iconSet.ShowIconOnly = true;

```

Custom Icon Sets

You can customize the icon set by changing the IconSet and Index properties for each icon criteria.

Custom Icon sets can be created and customized in XlsIO as follows.

C#

```

// Create icon sets for the data in specified range
IConditionalFormats conditionalFormats =
sheet.Range["H1:K6"].ConditionalFormats;
IConditionalFormat conditionalFormat = conditionalFormats.AddCondition();
conditionalFormat.FormatType = ExcelCFTType.IconSet;
IIIconSet iconSet = conditionalFormat.IconSet;
iconSet.IconSet = ExcelIconSetType.ThreeFlags;
IIIconConditionValue iconValue1 = iconSet.IconCriteria[0] as
IIIconConditionValue;
iconValue1.IconSet = ExcelIconSetType.FiveBoxes;
iconValue1.Index = 3;
iconValue1.Type = ConditionValueType.Percent;
iconValue1.Value = "25";
iconValue1.Operator = ConditionalFormatOperator.GreaterThan;
IIIconConditionValue iconValue2 = iconSet.IconCriteria[1] as
IIIconConditionValue;
iconValue2.IconSet = ExcelIconSetType.ThreeSigns;
iconValue2.Index = 2;
iconValue2.Type = ConditionValueType.Percent;
iconValue2.Value = "50";
iconValue2.Operator = ConditionalFormatOperator.GreaterThan;
IIIconConditionValue iconValue3 = iconSet.IconCriteria[2] as
IIIconConditionValue;
iconValue3.IconSet = ExcelIconSetType.FourRating;
iconValue3.Index = 0;
iconValue3.Type = ConditionValueType.Percent;
iconValue3.Value = "75";
iconValue3.Operator = ConditionalFormatOperator.GreaterThan;

```

VB.NET

```

Dim conditionalFormats As IConditionalFormats =
sheet.Range("H1:K6").ConditionalFormats
Dim conditionalFormat As IConditionalFormat =
conditionalFormats.AddCondition
conditionalFormat.FormatType = ExcelCFTType.IconSet
Dim iconSet As IIIconSet = conditionalFormat.IconSet
iconSet.IconSet = ExcelIconSetType.ThreeFlags
Dim iconValue1 As IIIconConditionValue =
CType(iconSet.IconCriteria(0), IIIconConditionValue)
iconValue1.IconSet = ExcelIconSetType.FiveBoxes
iconValue1.Index = 3

```

```

iconValue1.Type = ConditionValueType.Percent
iconValue1.Value = "25"
iconValue1.Operator = ConditionalFormatOperator.GreaterThan
Dim iconValue2 As IIconConditionValue =
CType(iconSet.IconCriteria(1), IIconConditionValue)
iconValue2.IconSet = ExcelIconSetType.ThreeSigns
iconValue2.Index = 2
iconValue2.Type = ConditionValueType.Percent
iconValue2.Value = "50"
iconValue2.Operator = ConditionalFormatOperator.GreaterThan
Dim iconValue3 As IIconConditionValue =
CType(iconSet.IconCriteria(2), IIconConditionValue)
iconValue3.IconSet = ExcelIconSetType.FourRating
iconValue3.Index = 0
iconValue3.Type = ConditionValueType.Percent
iconValue3.Value = "75"
iconValue3.Operator = ConditionalFormatOperator.GreaterThan

```

UWP

```

// Create icon sets for the data in specified range

```

Excel with Conditional Formatting

Note: XlsIO visualization has been enhanced with backward compatibility for Advanced Conditional Formatting.

Working with Data Validation

Data Validation is a list of rules to the data that can be entered in a cell. This can be applied by using **IDataValidation** interface. XlsIO supports following validation types.

- Text Length Validation
- Time Validation
- List Validation
- Number Validation
- Date Validation
- Custom Validation

Text Length Validation

The following code snippet illustrates how to set text length validation.

C#

```
//Data validation for text length
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.TextLength;
//Text length should be lesser than 5 characters
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
```

```
validation.FirstFormula = "0";
validation.SecondFormula = "5";
```

VB.NET

```
'Data validation for text length
Dim validation As IDataValidation = sheet.Range("A3").DataValidation
validation.AllowType = ExcelDataType.TextLength
'Text length should be lesser than 5 characters
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between
validation.FirstFormula = "0"
validation.SecondFormula = "5"
```

UWP

```
//Data validation for text length
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.TextLength;
//Text length should be lesser than 5 characters
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "0";
validation.SecondFormula = "5";
```

ASP.NET CORE

```
//Data validation for text length
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.TextLength;
//Text length should be lesser than 5 characters
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "0";
validation.SecondFormula = "5";
```

XAMARIN

```
//Data validation for text length
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.TextLength;
//Text length should be lesser than 5 characters
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "0";
validation.SecondFormula = "5";
```

Time Validation

The following code snippet illustrates how to set time validation.

C#

```
//Data validation for time
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Time;
//Time between 10:00 and 12:00 'o Clock
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "10.00";
```

```
validation.SecondFormula = "12.00";
```

VB.NET

```
'Data validation for time
Dim validation As IDataValidation = sheet.Range("A3").DataValidation
validation.AllowType = ExcelDataType.Time
'Time between 10:00 and 12:00 'o Clock
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between
validation.FirstFormula = "10.00"
validation.SecondFormula = "12.00"
```

UWP

```
//Data validation for time
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Time;
//Time between 10:00 and 12:00 'o Clock
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "10.00";
validation.SecondFormula = "12.00";
```

ASP.NET CORE

```
//Data validation for time
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Time;
//Time between 10:00 and 12:00 'o Clock
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "10.00";
validation.SecondFormula = "12.00";
```

XAMARIN

```
//Data validation for time
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Time;
//Time between 10:00 and 12:00 'o Clock
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "10.00";
validation.SecondFormula = "12.00";
```

List Validation

The following code snippet illustrates how to set list validation.

C#

```
//Data validation for list
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.ListOfValues = new string[] { "ListItem1", "ListItem2",
"ListItem3" };;
```

VB.NET

```
'Data validation for list  
Dim validation As IDataValidation = sheet.Range("A3").DataValidation  
validation.ListOfValues = New String() { "ListItem1", "ListItem2",  
"ListItem3" }
```

UWP

```
//Data validation for list  
IDataValidation validation = sheet.Range["A3"].DataValidation;  
validation.ListOfValues = new string[] { "ListItem1", "ListItem2",  
"ListItem3" };
```

ASP.NET CORE

```
//Data validation for list  
IDataValidation validation = sheet.Range["A3"].DataValidation;  
validation.ListOfValues = new string[] { "ListItem1", "ListItem2",  
"ListItem3" };
```

XAMARIN

```
//Data validation for list  
IDataValidation validation = sheet.Range["A3"].DataValidation;  
validation.ListOfValues = new string[] { "ListItem1", "ListItem2",  
"ListItem3" };
```

Note: The ListOfValues property should be used when the values in the Data Validation list are entered manually whose limit is only 255 characters including separators.

Number Validation

The following code snippet illustrates how to set number validation.

C#

```
//Data validation for number  
IDataValidation validation = sheet.Range["A3"].DataValidation;  
validation.AllowType = ExcelDataType.Integer;  
//Value between 0 to 10  
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;  
validation.FirstFormula = "0";  
validation.SecondFormula = "10";
```

VB.NET

```
'Data validation for number  
Dim validation As IDataValidation = sheet.Range("A3").DataValidation  
validation.AllowType = ExcelDataType.Integer  
'Value between 0 to 10  
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between  
validation.FirstFormula = "0"  
validation.SecondFormula = "10"
```

UWP

```
//Data validation for number
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Integer;
//Value between 0 to 10
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "0";
validation.SecondFormula = "10";
```

ASP.NET CORE

```
//Data validation for number
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Integer;
//Value between 0 to 10
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "0";
validation.SecondFormula = "10";
```

XAMARIN

```
//Data validation for number
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Integer;
//Value between 0 to 10
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstFormula = "0";
validation.SecondFormula = "10";
```

Date Validation

The following code snippet illustrates how to set date validation.

C#

```
//Data validation for date
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Date;
//Date between 10/5/2003 to 10/5/2004
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstDateTime = new DateTime(2003, 5, 10);
validation.SecondDateTime = new DateTime(2004, 5, 10);
```

VB.NET

```
'Data validation for date
Dim validation As IDataValidation = sheet.Range("A3").DataValidation
validation.AllowType = ExcelDataType.Date
'Date between 10/5/2003 to 10/5/2004
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between
validation.FirstDateTime = New DateTime(2003, 5, 10)
validation.SecondDateTime = New DateTime(2004, 5, 10)
```

UWP

```
//Data validation for date
```

```

IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Date;
//Date between 10/5/2003 to 10/5/2004
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstDateTime = new DateTime(2003, 5, 10);
validation.SecondDateTime = new DateTime(2004, 5, 10);

```

ASP.NET CORE

```

//Data validation for date
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Date;
//Date between 10/5/2003 to 10/5/2004
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstDateTime = new DateTime(2003, 5, 10);
validation.SecondDateTime = new DateTime(2004, 5, 10);

```

XAMARIN

```

//Data validation for date
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.Date;
//Date between 10/5/2003 to 10/5/2004
validation.CompareOperator = ExcelDataValidationComparisonOperator.Between;
validation.FirstDateTime = new DateTime(2003, 5, 10);
validation.SecondDateTime = new DateTime(2004, 5, 10);

```

Custom Validation

Custom validation can be set to a cell with its **AllowType** as **User**. The following code snippet illustrates how to set custom validation.

C#

```

//Data validation for custom data
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.User;
validation.FirstFormula = "=A1>10";

```

VB.NET

```

'Data validation for custom data
Dim validation As IDataValidation = sheet.Range("A3").DataValidation
validation.AllowType = ExcelDataType.User
validation.FirstFormula = "=A1>10"

```

UWP

```

//Data validation for custom data
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.User;
validation.FirstFormula = "=A1>10";

```

ASP.NET CORE

```
//Data validation for custom data
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.User;
validation.FirstFormula = "=A1>10";
```

XAMARIN

```
//Data validation for custom data
IDataValidation validation = sheet.Range["A3"].DataValidation;
validation.AllowType = ExcelDataType.User;
validation.FirstFormula = "=A1>10";
```

The following code snippet shows all the data validation supports discussed previously.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];

    //Data Validation for Text Length
    IDataValidation txtLengthValidation = worksheet.Range["A3"].DataValidation;
    worksheet.Range["A1"].Text = "Enter the Text in A3";
    worksheet.Range["A1"].AutofitColumns();
    txtLengthValidation.AllowType = ExcelDataType.TextLength;
    txtLengthValidation.CompareOperator =
        ExcelDataValidationComparisonOperator.Between;
    txtLengthValidation.FirstFormula = "0";
    txtLengthValidation.SecondFormula = "5";
    //Shows the error message
    txtLengthValidation.ShowErrorBox = true;
    txtLengthValidation.ErrorBoxText = "Text length should be lesser than 5 characters";
    txtLengthValidation.ErrorBoxTitle = "ERROR";
    txtLengthValidation.PromptBoxText = "Data validation for text length";
    txtLengthValidation.ShowPromptBox = true;

    //Data Validation for Time
    IDataValidation timeValidation = worksheet.Range["B3"].DataValidation;
    worksheet.Range["B1"].Text = "Enter the time between 10:00 and 12:00 'o Clock in B3";
    worksheet.Range["B1"].AutofitColumns();
    timeValidation.AllowType = ExcelDataType.Time;
    timeValidation.CompareOperator =
        ExcelDataValidationComparisonOperator.Between;
    timeValidation.FirstFormula = "10.00";
    timeValidation.SecondFormula = "12.00";
    //Shows the error message
    timeValidation.ShowErrorBox = true;
    timeValidation.ErrorBoxText = "Enter a correct time";
    timeValidation.ErrorBoxTitle = "ERROR";
    timeValidation.PromptBoxText = "Data validation for time";
    timeValidation.ShowPromptBox = true;

    //Data Validation for List
    IDataValidation listValidation = worksheet.Range["C3"].DataValidation;
```

```

worksheet.Range["C1"].Text = "Data Validation List in C3";
worksheet.Range["C1"].AutofitColumns();

Working with Charts

Essential XlsIO has support for creating and modifying Excel charts inside a workbook or as a [chart worksheet](#).

Creating a Chart

The **IShape** interface represents the chart in a worksheet. A chart can be created either through the existing data in the worksheet, directly entering series or by adding series one by one.

The following code example illustrates how to create a chart through the existing data in the worksheet.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Create a Chart
    IChartShape chart = sheet.Charts.Add();
    //Set Chart Type
    chart.ChartType = ExcelChartType.Column_Clustered;
    //Set data range in the worksheet
    chart.DataRange = sheet.Range["A1:E5"];
    workbook.SaveAs("Chart.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Create a Chart
Dim chart As IChartShape = sheet.Charts.Add()
'Set Chart Type
chart.ChartType = ExcelChartType.Column_Clustered
'Set data range in the worksheet
chart.DataRange = sheet.Range("A1:E5")
workbook.SaveAs("Chart.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
```

```

{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Create a Chart
    IChartShape chart = sheet.Charts.Add();
    //Set Chart Type
    chart.ChartType = ExcelChartType.Column_Clustered;
    //Set data range in the worksheet
    chart.DataRange = sheet.Range["A1:E5"];
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Chart";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Create a Chart
    IChartShape chart = sheet.Charts.Add();
    //Set Chart Type
    chart.ChartType = ExcelChartType.Column_Clustered;
    //Set data range in the worksheet
    chart.DataRange = sheet.Range["A1:E5"];
    //Saving the workbook as stream
    FileStream stream = new FileStream("Chart.xlsx", FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    // "App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
        assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    // Create a Chart
    IChartShape chart = sheet.Charts.Add();
    // Set Chart Type
    chart.ChartType = ExcelChartType.Column_Clustered;
    // Set data range in the worksheet
    chart.DataRange = sheet.Range["A1:E5"];
    // Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    // Save the document as file and view the saved document
    // The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Chart.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Chart.xlsx", "application/msexcel", stream);
    }
}

```

Creating a Chart from directly entered Values

A chart in XlsIO can also be created from directly entered values. The Following code snippets illustrate how to create a chart from directly entered values.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    object[] yValues = new object[] { 2000, 1000, 1000 };
    object[] xValues = new object[] { "Total Income", "Expenses", "Profit" };
    // Adding series and values
}

```

```

IChartShape chart = sheet.Charts.Add();
IChartSerie serie = chart.Series.Add(ExcelChartType.Pie);
//Enters the X and Y values directly
serie.EnteredDirectlyValues = yValues;
serie.EnteredDirectlyCategoryLabels = xValues;
workbook.SaveAs("Chart.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim yValues As Object() = New Object() {2000, 1000, 1000}
Dim xValues As Object() = New Object() {"Total Income", "Expenses",
"Profit"}
'Adding series and values
Dim chart As IChartShape = sheet.Charts.Add()
Dim serie As IChartSerie = chart.Series.Add(ExcelChartType.Pie)
'Enters the X and Y values directly
serie.EnteredDirectlyValues = yValues
serie.EnteredDirectlyCategoryLabels = xValues
workbook.SaveAs("Chart.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
object[] yValues = new object[] { 2000, 1000, 1000 };
object[] xValues = new object[] { "Total Income", "Expenses", "Profit" };
//Adding series and values
IChartShape chart = sheet.Charts.Add();
IChartSerie serie = chart.Series.Add(ExcelChartType.Pie);
//Enters the X and Y values directly
serie.EnteredDirectlyValues = yValues;
serie.EnteredDirectlyCategoryLabels = xValues;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Chart";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    object[] yValues = new object[] { 2000, 1000, 1000 };
    object[] xValues = new object[] { "Total Income", "Expenses", "Profit" };
    //Adding series and values
    IChartShape chart = sheet.Charts.Add();
    IChartSerie serie = chart.Series.Add(ExcelChartType.Pie);
    //Enters the X and Y values directly
    serie.EnteredDirectlyValues = yValues;
    serie.EnteredDirectlyCategoryLabels = xValues;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Chart.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    object[] yValues = new object[] { 2000, 1000, 1000 };
    object[] xValues = new object[] { "Total Income", "Expenses", "Profit" };
    //Adding series and values
    IChartShape chart = sheet.Charts.Add();
    IChartSerie serie = chart.Series.Add(ExcelChartType.Pie);
    //Enters the X and Y values directly
    serie.EnteredDirectlyValues = yValues;
    serie.EnteredDirectlyCategoryLabels = xValues;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Chart.
        xlsx", "application/msexcel", stream);
    }
    else
    {

```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Chart.xlsx",
"application/msexcel", stream);
}
}
```

Creating a Chart by adding Series

A chart can also be created by adding series one by one. The following code illustrates how to create a chart through series.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Inserts the sample data for the chart
    sheet.Range["A1"].Text = "Month";
    sheet.Range["B1"].Text = "Product A";
    sheet.Range["C1"].Text = "Product B";
    //Months
    sheet.Range["A2"].Text = "Jan";
    sheet.Range["A3"].Text = "Feb";
    sheet.Range["A4"].Text = "Mar";
    sheet.Range["A5"].Text = "Apr";
    sheet.Range["A6"].Text = "May";
    //Create a random Data
    Random r = new Random();
    for (int i = 2; i <= 6; i++)
    {
        for (int j = 2; j <= 3; j++)
        {
            sheet.Range[i, j].Number = r.Next(0, 500);
        }
    }
    IChartShape chart = sheet.Charts.Add();
    //Set chart type
    chart.ChartType = ExcelChartType.Line;
    //Set Chart Title
    chart.ChartTitle = "Product Sales comparison";
    //Set first serie
    IChartSerie productA = chart.Series.Add("ProductA");
    productA.Values = sheet.Range["B2:B6"];
    productA.CategoryLabels = sheet.Range["A2:A6"];
    //Set second serie
    IChartSerie productB = chart.Series.Add("ProductB");
    productB.Values = sheet.Range["C2:C6"];
    productB.CategoryLabels = sheet.Range["A2:A6"];
    workbook.SaveAs("Chart.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
```

```

Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Inserting sample data for the chart
sheet.Range("A1").Text = "Month"
sheet.Range("B1").Text = "Product A"
sheet.Range("C1").Text = "Product B"
'Months
sheet.Range("A2").Text = "Jan"
sheet.Range("A3").Text = "Feb"
sheet.Range("A4").Text = "Mar"
sheet.Range("A5").Text = "Apr"
sheet.Range("A6").Text = "May"
'Create a random data
Dim r As Random = New Random
For i As Integer = 2 To 6
For j As Integer = 2 To 3
sheet.Range(i, j).Number = r.Next(0, 500)
Next j
Next i
Dim chart As IChartShape = sheet.Charts.Add()
'Set chart type
chart.ChartType = ExcelChartType.Line
'Set Chart Title
chart.ChartTitle = "Product Sales comparison"
'Set first serie
Dim productA As IChartSerie = chart.Series.Add("ProductA")
productA.Values = sheet.Range("B2:B6")
productA.CategoryLabels = sheet.Range("A2:A6")
'set second serie
Dim productB As IChartSerie = chart.Series.Add("ProductB")
productB.Values = sheet.Range("C2:C6")
productB.CategoryLabels = sheet.Range("A2:A6")
workbook.SaveAs("Chart.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())

Creating a chart Sheet

The following code snippet shows how to create a chart sheet (separate sheet).

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
//Add the chart sheet
IChart chart = workbook.Charts.Add();
chart.ChartType = ExcelChartType.Column_Clustered;
chart.DataRange = sheet.Range["A1:E5"];
workbook.SaveAs("Chart.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)

```

```
'Add the chart sheet
Dim chart As IChart = workbook.Charts.Add()
chart.ChartType = ExcelChartType.Column_Clustered
chart.DataRange = sheet.Range("A1:E5")
workbook.SaveAs("Chart.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Add the chart sheet
    IChart chart = workbook.Charts.Add();
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.DataRange = sheet.Range["A1:E5"];
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Chart";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Add the chart sheet
    IChart chart = workbook.Charts.Add();
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.DataRange = sheet.Range["A1:E5"];
    //Saving the workbook as stream
```

```

FileStream stream = new FileStream("Chart.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    ///"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
        assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    ///Add the chart sheet
    IChart chart = workbook.Charts.Add();
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.DataRange = sheet.Range["A1:E5"];
    ///Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    ///Save the document as file and view the saved document
    ///The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Chart.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Chart.xlsx", "application/msexcel", stream);
    }
}

```

Creating Custom Charts

A custom chart can be created by using different types of charts for different data series.

For example, you can use a column chart for the first data series and a line chart for the second series. As a result you will have a column chart, combined with a line chart.

This sample also explains different chart properties like

[Set Data Range to Chart](#)

C#

```
//Add a new chart with data range
IChartShape chart = sheet.Charts.Add();
chart.DataRange = sheet.Range["A3:C6"];
```

VB.NET

```
'Add a new chart with data range
Dim chart As IChartShape = sheet.Charts.Add()
chart.DataRange = sheet.Range("A3:C6")
```

UWP

```
//Add a new chart with data range
IChartShape chart = sheet.Charts.Add();
chart.DataRange = sheet.Range["A3:C6"];
```

ASP.NET CORE

```
//Add a new chart with data range
IChartShape chart = sheet.Charts.Add();
chart.DataRange = sheet.Range["A3:C6"];
```

XAMARIN

```
//Add a new chart with data range
IChartShape chart = sheet.Charts.Add();
chart.DataRange = sheet.Range["A3:C6"];
```

Name the Chart and Set Chart Title

C#

```
//Set chart name and chart title
chart.Name = "CrescentCity,CA";
chart.ChartTitle = "Crescent City, CA";
```

VB.NET

```
'Set chart name and chart title
chart.Name = "CrescentCity,CA"
chart.ChartTitle = "Crescent City, CA"
```

UWP

```
//Set chart name and chart title
chart.Name = "CrescentCity,CA";
chart.ChartTitle = "Crescent City, CA";
```

ASP.NET CORE

```
//Set chart name and chart title
chart.Name = "CrescentCity,CA";
chart.ChartTitle = "Crescent City, CA";
```

XAMARIN

```
//Set chart name and chart title
chart.Name = "CrescentCity,CA";
chart.ChartTitle = "Crescent City, CA";
```

*Different Primary Value Axis Properties***C#**

```
//Axis title
chart.PrimaryValueAxis.Title = "Precipitation,in.";
//Axis title area text angle rotation
chart.PrimaryValueAxis.TitleArea.TextRotationAngle = 90;
//Maximum value in the axis
chart.PrimaryValueAxis.MaximumValue = 14.0;
//Number format for axis
chart.PrimaryValueAxis.NumberFormat = "0.0";
```

VB.NET

```
'Axis title
chart.PrimaryValueAxis.Title = "Precipitation,in."
'Axis title area text angle rotation
chart.PrimaryValueAxis.TitleArea.TextRotationAngle = 90
'Maximum value in the axis
chart.PrimaryValueAxis.MaximumValue = 14.0
'Number format for axis
chart.PrimaryValueAxis.NumberFormat = "0.0"
```

UWP

```
//Axis title
chart.PrimaryValueAxis.Title = "Precipitation,in.";
//Axis title area text angle rotation
chart.PrimaryValueAxis.TitleArea.TextRotationAngle = 90;
//Maximum value in the axis
chart.PrimaryValueAxis.MaximumValue = 14.0;
//Number format for axis
chart.PrimaryValueAxis.NumberFormat = "0.0";
```

ASP.NET CORE

```
//Axis title
chart.PrimaryValueAxis.Title = "Precipitation,in.";
//Axis title area text angle rotation
chart.PrimaryValueAxis.TitleArea.TextRotationAngle = 90;
//Maximum value in the axis
chart.PrimaryValueAxis.MaximumValue = 14.0;
//Number format for axis
chart.PrimaryValueAxis.NumberFormat = "0.0";
```

XAMARIN

```
//Axis title
chart.PrimaryValueAxis.Title = "Precipitation,in.";
//Axis title area text angle rotation
chart.PrimaryValueAxis.TitleArea.TextRotationAngle = 90;
//Maximum value in the axis
chart.PrimaryValueAxis.MaximumValue = 14.0;
//Number format for axis
chart.PrimaryValueAxis.NumberFormat = "0.0";
```

Different Secondary Value Axis Properties

C#

```
//MaxCross in axis
chart.SecondaryValueAxis.IsMaxCross = true;
//Axis title
chart.SecondaryValueAxis.Title = "Temperature,deg.F";
//Axis title area text angle rotation
chart.SecondaryValueAxis.TitleArea.TextRotationAngle = 90;
```

VB.NET

```
'MaxCross in axis
chart.SecondaryValueAxis.IsMaxCross = true
'Axis title
chart.SecondaryValueAxis.Title = "Temperature,deg.F"
'Axis title area text angle rotation
chart.SecondaryValueAxis.TitleArea.TextRotationAngle = 90
```

UWP

```
//MaxCross in axis
chart.SecondaryValueAxis.IsMaxCross = true;
//Axis title
chart.SecondaryValueAxis.Title = "Temperature,deg.F";
//Axis title area text angle rotation
chart.SecondaryValueAxis.TitleArea.TextRotationAngle = 90;
```

ASP.NET CORE

```
//MaxCross in axis
chart.SecondaryValueAxis.IsMaxCross = true;
//Axis title
chart.SecondaryValueAxis.Title = "Temperature,deg.F";
//Axis title area text angle rotation
chart.SecondaryValueAxis.TitleArea.TextRotationAngle = 90;
```

XAMARIN

```
//MaxCross in axis
chart.SecondaryValueAxis.IsMaxCross = true;
//Axis title
chart.SecondaryValueAxis.Title = "Temperature,deg.F";
//Axis title area text angle rotation
chart.SecondaryValueAxis.TitleArea.TextRotationAngle = 90;
```

*Different Secondary Category Axis Properties***C#**

```
//MaxCross in axis
chart.SecondaryCategoryAxis.IsMaxCross = true;
//Select border line color
chart.SecondaryCategoryAxis.Border.LineColor = Color.Transparent;
//Select major tick mark option
chart.SecondaryCategoryAxis.MajorTickMark = ExcelTickMark.TickMark_None;
//Select tick label position
chart.SecondaryCategoryAxis.TickLabelPosition =
ExcelTickLabelPosition.TickLabelPosition_None;
```

VB.NET

```
'MaxCross in axis
chart.SecondaryCategoryAxis.IsMaxCross = true
'Select border line color
chart.SecondaryCategoryAxis.Border.LineColor = Color.Transparent
'Select major tick mark option
chart.SecondaryCategoryAxis.MajorTickMark = ExcelTickMark.TickMark_None
'Select tick label position
chart.SecondaryCategoryAxis.TickLabelPosition =
ExcelTickLabelPosition.TickLabelPosition_None
```

UWP

```
//MaxCross in axis
chart.SecondaryCategoryAxis.IsMaxCross = true;
//Select border line color
chart.SecondaryCategoryAxis.Border.LineColor = Color.Transparent;
//Select major tick mark option
chart.SecondaryCategoryAxis.MajorTickMark = ExcelTickMark.TickMark_None;
//Select tick label position
chart.SecondaryCategoryAxis.TickLabelPosition =
ExcelTickLabelPosition.TickLabelPosition_None;
```

ASP.NET CORE

```
//MaxCross in axis
chart.SecondaryCategoryAxis.IsMaxCross = true;
//Select border line color
chart.SecondaryCategoryAxis.Border.LineColor = Color.Transparent;
//Select major tick mark option
chart.SecondaryCategoryAxis.MajorTickMark = ExcelTickMark.TickMark_None;
//Select tick label position
chart.SecondaryCategoryAxis.TickLabelPosition =
ExcelTickLabelPosition.TickLabelPosition_None;
```

XAMARIN

```
//MaxCross in axis
chart.SecondaryCategoryAxis.IsMaxCross = true;
```

```
//Select border line color
chart.SecondaryCategoryAxis.Border.LineColor = Color.Transparent;
//Select major tick mark option
chart.SecondaryCategoryAxis.MajorTickMark = ExcelTickMark.TickMark_None;
//Select tick label position
chart.SecondaryCategoryAxis.TickLabelPosition =
ExcelTickLabelPosition.TickLabelPosition_None;
```

Different Chart Series Fill Properties

C#

```
IChartSerie serieOne = chart.Series[0];
//Series name
serieOne.Name = "Precipitation,in.";
//Series fill type
serieOne.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
//Series two color gradient
serieOne.SerieFormat.Fill.TwoColorGradient(ExcelGradientStyle.Vertical,
ExcelGradientVariants.ShadingVariants_2);
//Series gradient color type
serieOne.SerieFormat.Fill.GradientColorType = ExcelGradientColor.TwoColor;
//Series fore color
serieOne.SerieFormat.Fill.ForeColor = Color.Plum;
```

VB.NET

```
Dim serieOne As IChartSerie = chart.Series(0)
'Series name
serieOne.Name = "Precipitation,in."
'Series fill type
serieOne.SerieFormat.Fill.FillType = ExcelFillType.Gradient
'Series two color gradient
serieOne.SerieFormat.Fill.TwoColorGradient(ExcelGradientStyle.Vertical,
ExcelGradientVariants.ShadingVariants_2)
'Series gradient color type
serieOne.SerieFormat.Fill.GradientColorType = ExcelGradientColor.TwoColor
'Series fore color
serieOne.SerieFormat.Fill.ForeColor = Color.Plum
```

UWP

```
IChartSerie serieOne = chart.Series[0];
//Series name
serieOne.Name = "Precipitation,in.";
//Series fill type
serieOne.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
//Series two color gradient
serieOne.SerieFormat.Fill.TwoColorGradient(ExcelGradientStyle.Vertical,
ExcelGradientVariants.ShadingVariants_2);
//Series gradient color type
serieOne.SerieFormat.Fill.GradientColorType = ExcelGradientColor.TwoColor;
//Series fore color
serieOne.SerieFormat.Fill.ForeColor = Color.Plum;
```

ASP.NET CORE

```

IChartSerie serieOne = chart.Series[0];
//Series name
serieOne.Name = "Precipitation,in.";
//Series fill type
serieOne.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
//Series two color gradient
serieOne.SerieFormat.Fill.TwoColorGradient(ExcelGradientStyle.Vertical,
ExcelGradientVariants.ShadingVariants_2);
//Series gradient color type
serieOne.SerieFormat.Fill.GradientColorType = ExcelGradientColor.TwoColor;
//Series fore color
serieOne.SerieFormat.Fill.ForeColor = Color.Plum;

```

XAMARIN

```

IChartSerie serieOne = chart.Series[0];
//Series name
serieOne.Name = "Precipitation,in.";
//Series fill type
serieOne.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
//Series two color gradient
serieOne.SerieFormat.Fill.TwoColorGradient(ExcelGradientStyle.Vertical,
ExcelGradientVariants.ShadingVariants_2);
//Series gradient color type
serieOne.SerieFormat.Fill.GradientColorType = ExcelGradientColor.TwoColor;
//Series fore color
serieOne.SerieFormat.Fill.ForeColor = Color.Plum;

```

*Different Marker Properties***C#**

```

IChartSerie serieTwo = chart.Series[1];
//Marker style
serieTwo.SerieFormat.MarkerStyle = ExcelChartMarkerType.Diamond;
//Marker size
serieTwo.SerieFormat.MarkerSize = 8;
//Marker background color
serieTwo.SerieFormat.MarkerBackgroundColor = Color.DarkGreen;
//Marker foreground color
serieTwo.SerieFormat.MarkerForegroundColor = Color.DarkGreen;

```

VB.NET

```

Dim serieTwo As IChartSerie = chart.Series(1)
'Marker style
serieTwo.SerieFormat.MarkerStyle = ExcelChartMarkerType.Diamond
'Marker size
serieTwo.SerieFormat.MarkerSize = 8
'Marker background color
serieTwo.SerieFormat.MarkerBackgroundColor = Color.DarkGreen
'Marker foreground color
serieTwo.SerieFormat.MarkerForegroundColor = Color.DarkGreen

```

UWP

```
IChartSerie serieTwo = chart.Series[1];  
//Marker style  
serieTwo.SerieFormat.MarkerStyle = ExcelChartMarkerType.Diamond;  
//Marker size  
serieTwo.SerieFormat.MarkerSize = 8;  
//Marker background color  
serieTwo.SerieFormat.MarkerBackgroundColor = Color.DarkGreen;  
//Marker foreground color  
serieTwo.SerieFormat.MarkerForegroundColor = Color.DarkGreen;
```

ASP.NET CORE

```
IChartSerie serieTwo = chart.Series[1];  
//Marker style  
serieTwo.SerieFormat.MarkerStyle = ExcelChartMarkerType.Diamond;  
//Marker size  
serieTwo.SerieFormat.MarkerSize = 8;  
//Marker background color  
serieTwo.SerieFormat.MarkerBackgroundColor = Color.DarkGreen;  
//Marker foreground color  
serieTwo.SerieFormat.MarkerForegroundColor = Color.DarkGreen;
```

XAMARIN

```
IChartSerie serieTwo = chart.Series[1];  
//Marker style  
serieTwo.SerieFormat.MarkerStyle = ExcelChartMarkerType.Diamond;  
//Marker size  
serieTwo.SerieFormat.MarkerSize = 8;  
//Marker background color  
serieTwo.SerieFormat.MarkerBackgroundColor = Color.DarkGreen;  
//Marker foreground color  
serieTwo.SerieFormat.MarkerForegroundColor = Color.DarkGreen;
```

*Different Legend Properties***C#**

```
//Legend without overlapping the chart  
chart.Legend.IncludeInLayout = true;  
//Legend position  
chart.Legend.Position = ExcelLegendPosition.Bottom;  
//View legend horizontally  
chart.Legend.IsVerticalLegend = false;
```

VB.NET

```
'Legend without overlapping the chart  
chart.Legend.IncludeInLayout = true  
'Legend position  
chart.Legend.Position = ExcelLegendPosition.Bottom  
'View legend horizontally  
chart.Legend.IsVerticalLegend = false
```

UWP

```
//Legend without overlapping the chart
chart.Legend.IncludeInLayout = true;
//Legend position
chart.Legend.Position = ExcelLegendPosition.Bottom;
//View legend horizontally
chart.Legend.IsVerticalLegend = false;
```

ASP.NET CORE

```
//Legend without overlapping the chart
chart.Legend.IncludeInLayout = true;
//Legend position
chart.Legend.Position = ExcelLegendPosition.Bottom;
//View legend horizontally
chart.Legend.IsVerticalLegend = false;
```

XAMARIN

```
//Legend without overlapping the chart
chart.Legend.IncludeInLayout = true;
//Legend position
chart.Legend.Position = ExcelLegendPosition.Bottom;
//View legend horizontally
chart.Legend.IsVerticalLegend = false;
```

The complete code snippet illustrating the above options along with creating custom charts is shown below.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Merge cells
    sheet.Range["A1:D1"].Merge();
    //Set Font style as bold
    sheet.Range["A1"].CellStyle.Font.Bold = true;
    //Insert data for the chart
    sheet.Range["A1"].Text = "Crescent City, CA";
    sheet.Range["B3"].Text = "Precipitation,in.";
    sheet.Range["C3"].Text = "Temperature,deg.F";
    sheet.Range["A4"].Text = "Jan";
    sheet.Range["A5"].Text = "Feb";
    sheet.Range["A6"].Text = "March";
    sheet.Range["B4"].Number = 10.9;
    sheet.Range["B5"].Number = 8.9;
    sheet.Range["B6"].Number = 8.6;
    sheet.Range["C4"].Number = 47.5;
    sheet.Range["C5"].Number = 48.7;
```

```

Remove a chart

The following code snippet shows how to remove the chart from the worksheet using **Remove** method.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    IChartShape chart = sheet.Charts[0];
    //Remove the chart from the worksheet
    chart.Remove();
    workbook.SaveAs("Chart.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
```

```

Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim chart As IChartShape = sheet.Charts(0)
'Remove the chart from the worksheet
chart.Remove()
workbook.SaveAs("Chart.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;

```

Chart Appearance Settings

The appearance of a chart can be modified according to the convenience and usage.

Elements of Chart

The following screen shot shows the elements of chart.

1. The chart area of the chart.
2. The plot area of the chart.
3. The data points of the data series that are plotted in the chart.
4. The horizontal (category) and vertical (value) axis along which the data is plotted in the chart.
5. The legend of the chart.
6. A chart axis title that you can use in the chart.
7. A data label that you can use to identify the details of a data point in a data series.

Chart Area Appearance

The following code snippet shows how to modify the appearance of the chart area.

C#

```
//Format Chart Area
IChartFrameFormat chartArea = chart.ChartArea;
//Chart Area Settings
chartArea.Fill.FillType = ExcelFillType.Gradient;
//Set Fill Effects
chartArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartArea.Fill.ForeColor = Color.White;
```

VB.NET

```
'Format Chart Area
Dim chartArea As IChartFrameFormat = chart.ChartArea
'Chart Area Settings
chartArea.Fill.FillType = ExcelFillType.Gradient
'Set Fill Effects
chartArea.Fill.BackColor = Color.FromArgb(205, 217, 234)
chartArea.Fill.ForeColor = Color.White
```

UWP

```
//Format Chart Area
IChartFrameFormat chartArea = chart.ChartArea;
//Chart Area Settings
chartArea.Fill.FillType = ExcelFillType.Gradient;
//Set Fill Effects
chartArea.Fill.BackColor = Color.FromArgb(255, 205, 217, 234);
chartArea.Fill.ForeColor = Color.FromArgb(255, 255, 255, 255);
```

ASP.NET CORE

```
//Format Chart Area
IChartFrameFormat chartArea = chart.ChartArea;
//Chart Area Settings
chartArea.Fill.FillType = ExcelFillType.Gradient;
//Set Fill Effects
chartArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartArea.Fill.ForeColor = Color.White;
```

XAMARIN

```
//Format Chart Area
IChartFrameFormat chartArea = chart.ChartArea;
//Chart Area Settings
chartArea.Fill.FillType = ExcelFillType.Gradient;
//Set Fill Effects
chartArea.Fill.BackColor = Syncfusion.Drawing.Color.FromArgb(205, 217, 234);
chartArea.Fill.ForeColor = Syncfusion.Drawing.Color.White;
```

Plot Area Appearance

The following code snippet shows how to modify the appearance of the plot area.

C#

```
//Set Plot Area
IChartFrameFormat chartPlotArea = chart.PlotArea;
//Set fill color
chartPlotArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartPlotArea.Fill.ForeColor = Color.White;
```

VB.NET

```
'Set Plot Area
Dim chartPlotArea As IChartFrameFormat = chart.PlotArea
'Set fill color
chartPlotArea.Fill.BackColor = Color.FromArgb(205, 217, 234)
chartPlotArea.Fill.ForeColor = Color.White
```

UWP

```
//Set Plot Area
IChartFrameFormat chartPlotArea = chart.PlotArea;
//Set fill color
chartPlotArea.Fill.BackColor = Color.FromArgb(255, 205, 217, 234);
chartPlotArea.Fill.ForeColor = Color.FromArgb(255, 255, 255, 255);
```

ASP.NET CORE

```
//Set Plot Area
IChartFrameFormat chartPlotArea = chart.PlotArea;
//Set fill color
chartPlotArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartPlotArea.Fill.ForeColor = Color.White;
```

XAMARIN

```
//Set Plot Area
IChartFrameFormat chartPlotArea = chart.PlotArea;
//Set fill color
chartPlotArea.Fill.BackColor = Syncfusion.Drawing.Color.FromArgb(205, 217, 234);
chartPlotArea.Fill.ForeColor = Syncfusion.Drawing.Color.White;
```

Data Labels Appearance

The following code snippet illustrates how to modify the appearance of data labels.

C#

```
IChartSerie serie = chart.Series[0];
//Set data labels color
serie.DataPoints.DefaultDataPoint.DataLabels.Color = ExcelKnownColors.Blue;
serie.DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
```

VB.NET

```
Dim serie As IChartSerie = chart.Series(0)
'Set data labels color
serie.DataPoints.DefaultDataPoint.DataLabels.Color = ExcelKnownColors.Blue
serie.DataPoints.DefaultDataPoint.DataLabels.IsValue = True
```

UWP

```
IChartSerie serie = chart.Series[0];
//Set data labels color
serie.DataPoints.DefaultDataPoint.DataLabels.Color = ExcelKnownColors.Blue;
serie.DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
```

ASP.NET CORE

```
IChartSerie serie = chart.Series[0];
//Set data labels color
serie.DataPoints.DefaultDataPoint.DataLabels.Color = ExcelKnownColors.Blue;
serie.DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
```

XAMARIN

```
IChartSerie serie = chart.Series[0];
//Set data labels color
```

```
serie.DataPoints.DefaultDataPoint.DataLabels.Color = ExcelKnownColors.Blue;
serie.DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
```

Series Appearance

The following code snippet illustrates how to modify the appearance of chart series.

C#

```
IChartSerie serie = chart.Series[0];
//Fill Effects
serie.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
serie.SerieFormat.Fill.ForeColor = Color.Yellow;
```

VB.NET

```
Dim serie As IChartSerie = chart.Series(0)
'Fill Effects
serie.SerieFormat.Fill.FillType = ExcelFillType.Gradient
serie.SerieFormat.Fill.ForeColor = Color.Yellow
```

UWP

```
IChartSerie serie = chart.Series[0];
//Fill Effects
serie.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
serie.SerieFormat.Fill.ForeColor = Color.FromArgb(255, 255, 255, 0);
```

ASP.NET CORE

```
IChartSerie serie = chart.Series[0];
//Fill Effects
serie.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
serie.SerieFormat.Fill.ForeColor = Color.Yellow;
```

XAMARIN

```
IChartSerie serie = chart.Series[0];
//Fill Effects
serie.SerieFormat.Fill.FillType = ExcelFillType.Gradient;
serie.SerieFormat.Fill.ForeColor = Syncfusion.Drawing.Color.Yellow;
```

The complete code snippet illustrating the above options is shown below.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    IChartShape chart = sheet.Charts.Add();
    chart.DataRange = sheet.UsedRange;
```

```

//Format Chart Area
IChartFrameFormat chartArea = chart.ChartArea;
//Fill Effects
chartArea.Fill.FillType = ExcelFillType.Gradient;
//Set chart area fill color
chartArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartArea.Fill.ForeColor = Color.WhiteSmoke;
//Format Plot Area
IChartFrameFormat chartPlotArea = chart.PlotArea;
//Fill Effects
chartPlotArea.Fill.FillType = ExcelFillType.Gradient;
//Set plot area fill color
chartPlotArea.Fill.BackColor = Color.FromArgb(205, 217, 234);
chartPlotArea.Fill.ForeColor = Color.YellowGreen;
workbook.SaveAs("Chart.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim chart As IChartShape = sheet.Charts.Add()

Font settings for chart legend and data labels

Essential XlsIO allows you to set the desired font to legend and series data labels for legend through [TextArea](#) in [IChartLegend](#). Similarly, desired font for data labels of chart series can be set through [DataLabels](#) in [IChartDataPoints](#).

The font style includes font name, font size and font color which are set through [FontName](#), [Size](#) and [Color](#) properties respectively.

Refer the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Adding a chart in Excel worksheet
    IChartShape chart = sheet.Charts.Add();
    chart.DataRange = sheet.Range["A1:B5"];
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.IsSeriesInRows = false;
    //Displaying the data label values of chart series
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
    chart.Series[1].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
    //Setting font name, size and color for chart legend
    chart.Legend.TextArea.FontName = "Tahoma";
    chart.Legend.TextArea.Size = 20;
    chart.Legend.TextArea.Color = ExcelKnownColors.Red;
    //Setting font name, size and color for data labels of first series
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.FontName = "Tahoma";
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.Size = 20;
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.Color =
    ExcelKnownColors.Red;
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```

Border Style for Chart Series

A unique border style like line color, line weight, and line pattern can be set for each chart series. Also, these settings can be made for each data point in the chart series.

Refer the following complete code snippets.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Adding chart in the worksheet
IChartShape chart = worksheet.Charts.Add();
chart.DataRange = worksheet.Range["A1:B5"];
chart.ChartType = ExcelChartType.Column_Clustered;
chart.IsSeriesInRows = false;
//Accessing first chart series
IChartSerie serie = chart.Series[0];
//Formatting the series border
serie.SerieFormat.LineProperties.LineColor = Color.Brown;
}

```

```

serie.SerieFormat.LineProperties.LinePattern =
ExcelChartLinePattern.CircleDot;
serie.SerieFormat.LineProperties.LineWeight = ExcelChartLineWeight.Wide;
workbook.SaveAs ("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding chart in the worksheet
Dim chart As IChartShape = worksheet.Charts.Add
chart.DataRange = worksheet.Range("A1:B5")
chart.ChartType = ExcelChartType.Column_Clustered
chart.IsSeriesInRows = False
'Accessing first chart series
Dim serie As IChartSerie = chart.Series(0)
'Formatting the series border
serie.SerieFormat.LineProperties.LineColor = Color.Brown
serie.SerieFormat.LineProperties.LinePattern =
ExcelChartLinePattern.CircleDot
serie.SerieFormat.LineProperties.LineWeight = ExcelChartLineWeight.Wide
workbook.SaveAs ("Output.xlsx")
End Using

```

UWP

```

```

Adjust space between chart bars

Spaces between chart bars are of two types.

1. **Series Overlap** : Space between bars of different data series of single category.
2. **Gap Width** : Space between different categories.

Essential XlsIO allows you to adjust the space between chart bars using [Overlap](#) and [GapWidth](#) properties of **IChartFormat** interface.

Refer the following complete code snippets.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Adding chart in the worksheet
IChartShape chart = worksheet.Charts.Add();
chart.DataRange = worksheet.Range["A1:B5"];
chart.ChartType = ExcelChartType.Column_Clustered;
chart.IsSeriesInRows = false;
}

```

```
//Adding space between bars of different series of single category
chart.Series[0].SerieFormat.CommonSerieOptions.Overlap = 60;
//Adding space between bars of different categories
chart.Series[0].SerieFormat.CommonSerieOptions.GapWidth = 80;
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding chart in the worksheet
Dim chart As IChartShape = worksheet.Charts.Add
chart.DataRange = worksheet.Range("A1:B5")
chart.ChartType = ExcelChartType.Column_Clustered
chart.IsSeriesInRows = False
'Adding space between bars of different series of single category
chart.Series(0).SerieFormat.CommonSerieOptions.Overlap = 60
'Adding space between bars of different categories
chart.Series(0).SerieFormat.CommonSerieOptions.GapWidth = 80
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{

.xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Hide Chart Gridlines

Excel chart consists of two types of gridlines such as **major gridlines** and **minor gridlines**. Major gridlines represent the main values in the axis and minor gridlines represent possible values between two adjacent axis values. You can show or hide these gridlines using [HasMajorGridlines](#) and [HasMinorGridlines](#) of **IXChartAxis** interface.

Essential XlsIO supports formatting of gridlines as well through the [MajorGridlines](#) and [MinorGridlines](#) of **IXChartAxis**.

Refer the following complete code snippets.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding chart in the Excel worksheet
    IXChartShape chart = worksheet.Charts.Add();
    chart.DataRange = worksheet.Range["A1:B5"];
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.IsSeriesInRows = false;
    //Hiding major gridlines
    chart.PrimaryValueAxis.HasMajorGridLines = false;
    //Showing minor gridlines
    chart.PrimaryValueAxis.HasMinorGridLines = true;
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")

```

```

Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding chart in the Excel worksheet
Dim chart As IChartShape = worksheet.Charts.Add
chart.DataRange = worksheet.Range("A1:B5")
chart.ChartType = ExcelChartType.Column_Clustered
chart.IsSeriesInRows = False
'Hiding major gridlines
chart.PrimaryValueAxis.HasMajorGridLines = False
'Showing minor gridlines
chart.PrimaryValueAxis.HasMinorGridLines = True
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

Add High-Low Lines

High-low lines are used in Excel line charts and stock charts that connect the highest and lowest points of a category.

The following code snippet shows how to add High-low lines in a stock chart.

C#

```
using (ExcelEngine engine = new ExcelEngine())
{
    IApplication application = engine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IChartShape chart = worksheet.Charts[0];
    IChartSerie chartSerie = chart.Series[0];
    //Set HasHighLowLines property to true.
    chartSerie.SerieFormat.CommonSerieOptions.HasHighLowLines = true;
    //Apply formats to HighLowLines.
    chartSerie.SerieFormat.CommonSerieOptions.HighLowLines.LineColor =
    Color.Blue;
    workbook.SaveAs("HighLowLines.xlsx");
    workbook.Close();
}
```

VB.NET

```
Using engine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = engine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim chart As IChartShape = worksheet.Charts(0)
Dim chartSerie As IChartSerie = chart.Series(0)
'Set HasHighLowLines property to true.
chartSerie.SerieFormat.CommonSerieOptions.HasHighLowLines = True;
'Apply formats to HighLowLines.
chartSerie.SerieFormat.CommonSerieOptions.HighLowLines.LineColor =
Color.Blue
workbook.SaveAs("HighLowLines.xlsx")
workbook.Close()
End Using
```

UWP

```
using (ExcelEngine engine = new ExcelEngine())
{
    IApplication application = engine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the file picker
}
```

```

FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opening an existing workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(file);
IWorksheet worksheet = workbook.Worksheets[0];
IChartShape chart = worksheet.Charts[0];
IChartSerie chartSerie = chart.Series[0];
//Set HasHighLowLines property to true.
chartSerie.SerieFormat.CommonSerieOptions.HasHighLowLines = true;
//Apply formats to HighLowLines.
chartSerie.SerieFormat.CommonSerieOptions.HighLowLines.LineColor =
Color.Blue;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "HighLowLines";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

workbook.Close();
}

```

The following screen shot shows the high-low lines in the line chart.

Add Drop Lines

Drop lines are used in Excel area and line charts that helps viewers to determine the data point down to the horizontal axis.

The following code snippet shows how to add Drop lines in a stock chart.

C#

```
using (ExcelEngine engine = new ExcelEngine())
{
    IApplication application = engine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IChartShape chart = worksheet.Charts[0];
    IChartSerie chartSerie = chart.Series[0];
    //Set HasDropLines property to true.
    chartSerie.SeriesFormat.CommonSeriesOptions.HasDropLines = true;
    //Apply formats to DropLines.
    chartSerie.SeriesFormat.CommonSeriesOptions.DropLines.LineColor = Color.Green;
    workbook.SaveAs("DropLines.xlsx");
    workbook.Close();
}
```

VB.NET

```
Using engine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = engine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim chart As IChartShape = worksheet.Charts(0)
Dim chartSerie As IChartSerie = chart.Series(0)
'Set HasDropLines property to true.
chartSerie.SeriesFormat.CommonSeriesOptions.HasDropLines = True;
'Apply formats to DropLines.
chartSerie.SeriesFormat.CommonSeriesOptions.DropLines.LineColor = Color.Green
workbook.SaveAs("DropLines.xlsx")
workbook.Close()
```

End Using**UWP**

```

using (ExcelEngine engine = new ExcelEngine())
{
    IApplication application = engine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the file picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");

}
```

The following screen shot shows the drop lines in the line chart.

Add Series Lines

Series lines are used in Excel stacked bar and column charts that create lines from one bar to another that connect every data point in a series.

Series lines in Excel Pie-of-pie and bar-of-pie charts are used to create lines that connect the main pie chart with the secondary pie or bar chart.

The following code snippet shows how to add series lines in a pie chart.

C#

```
using (ExcelEngine engine = new ExcelEngine())
{
    IApplication application = engine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IChartShape chart = worksheet.Charts[0];
    IChartSerie chartSerie = chart.Series[0];
    //Set HasSeriesLines property to true.
    chartSerie.SerieFormat.CommonSerieOptions.HasSeriesLines = true;
    //Apply formats to SeriesLines.
    chartSerie.SerieFormat.CommonSerieOptions.PieSeriesLine.LineColor =
    Color.Red;
    workbook.SaveAs("SeriesLines.xlsx");
    workbook.Close();
}
```

VB.NET

```
Using engine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = engine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim chart As IChartShape = worksheet.Charts(0)
Dim chartSerie As IChartSerie = chart.Series(0)
'Set HasSeriesLines property to true.
chartSerie.SerieFormat.CommonSerieOptions.HasSeriesLines = True;
```

```
'Apply formats to SeriesLines.
chartSerie.SerieFormat.CommonSerieOptions.PieSeriesLine.LineColor =
Color.Red
workbook.SaveAs("SeriesLines.xlsx")
workbook.Close()
End Using
```

UWP

```
using (ExcelEngine engine = new ExcelEngine())
{
    IApplication application = engine.Excel;

```

The following screen shot shows the series lines in the stacker bar chart.

Fill Chart Elements with Picture

Chart elements helps in modifying the chart appearance. The different chart elements are plot area, chart area, axes, titles, data points, legend, and data labels.

Fill plot area with picture

Plot area holds the data series of a chart. This plot area can be filled with solid colors, texture, picture, and pattern.

Essential XlsIO allows you to fill plot area with picture using the [UserPicture](#) of **IFill** interface. Refer to the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding chart in the worksheet
    IChartShape chart = worksheet.Charts.Add();
    chart.DataRange = worksheet.Range["A1:C6"];
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.IsSeriesInRows = false;
    //Filling plot area of the chart with picture
    chart.PlotArea.Fill.UserPicture("Image.png");
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
```

```

'Adding chart in the worksheet
Dim chart As IChartShape = worksheet.Charts.Add
chart.DataRange = worksheet.Range("A1:C6")
chart.ChartType = ExcelChartType.Column_Clustered
chart.IsSeriesInRows = False
'Filling plot area of the chart with picture
chart.PlotArea.Fill.UserPicture("Image.png")
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

Fill chart area with picture

Chart area holds plot area, legend, axes, data table, and so on. This chart area can be filled with solid colors, texture, picture, and pattern.

Similar to plot area, chart area can be filled with picture using [UserPicture](#) of [IFill](#) interface. Refer to the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Adding chart in the worksheet
IChartShape chart = worksheet.Charts.Add();
chart.DataRange = worksheet.Range["A1:C6"];
chart.ChartType = ExcelChartType.Column_Clustered;
chart.IsSeriesInRows = false;
//Filling chart area of the chart with picture
chart.ChartArea.Fill.UserPicture("Image.png");
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding chart in the worksheet
Dim chart As IChartShape = worksheet.Charts.Add
chart.DataRange = worksheet.Range("A1:C6")
chart.ChartType = ExcelChartType.Column_Clustered
chart.IsSeriesInRows = False
'Filling chart area of the chart with picture
chart.ChartArea.Fill.UserPicture("Image.png")
workbook.SaveAs("Output.xlsx")
```

End Using**UWP**

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the file picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opening an existing workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding chart in the worksheet
    IChartShape chart = worksheet.Charts.Add();
    chart.DataRange = worksheet.Range["A1:C6"];
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.IsSeriesInRows = false;
    //"App" is the class of portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;

    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
    "application/msexcel", stream);
}
}
```

Applying 3D Formats

The following code example explains how to apply 3D settings such as rotation, side wall, back wall, and floor settings.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(2);
    IWorksheet sheet = workbook.Worksheets[0];
    //Insert the data in sheet-1
    sheet.Range["B1"].Text = "Product-A";
    sheet.Range["C1"].Text = "Product-B";
    sheet.Range["D1"].Text = "Product-C";
    sheet.Range["A2"].Text = "Jan";
    sheet.Range["A3"].Text = "Feb";
    sheet.Range["B2"].Number = 25;
    sheet.Range["B3"].Number = 20;
    sheet.Range["C2"].Number = 35;
    sheet.Range["C3"].Number = 25;
    sheet.Range["D2"].Number = 40;
    sheet.Range["D3"].Number = 55;
    IChartShape chart = sheet.Charts.Add();
    chart.DataRange = sheet.Range["A1:D3"];
    chart.ChartType = ExcelChartType.Column_Clustered_3D;
    //Set Rotation of the 3D chart view
    chart.Rotation = 90;
    //Set Back wall fill option
    chart.BackWall.Fill.FillType = ExcelFillType.Gradient;
    //Set Back wall thickness
    chart.BackWall.Thickness = 10;
    //Set Texture Type
    chart.BackWall.Fill.GradientColorType = ExcelGradientColor.TwoColor;
    chart.BackWall.Fill.GradientStyle = ExcelGradientStyle.Diagonal_Down;
    chart.BackWall.Fill.ForeColor = Color.WhiteSmoke;
    chart.BackWall.Fill.BackColor = Color.LightBlue;
    //Set side wall fill option
    chart.SideWall.Fill.FillType = ExcelFillType.SolidColor;
    //Set side wall fore and back color
    chart.SideWall.Fill.BackColor = Color.White;
    chart.SideWall.Fill.ForeColor = Color.White;
    //Set floor fill option
    chart.Floor.Fill.FillType = ExcelFillType.Pattern;
    chart.Floor.Fill.Pattern =
    ExcelGradientPattern.Pat_10_Percent.Pat_30_Percent;
    //Set floor fore and Back color
    chart.Floor.Fill.ForeColor = Color.Blue;
    chart.Floor.Fill.BackColor = Color.White;
}
```

```
//Set floor thickness

Customizing chart and Chart Elements

Positioning Chart

Chart can be positioned by specifying row and column indexes. The following code samples illustrates how to position a chart in a worksheet.

C#

```
//Positioning chart in a worksheet
chart.TopRow = 5;
chart.LeftColumn = 5;
chart.RightColumn = 10;
chart.BottomRow = 10;
```

VB.NET

```
'Positioning chart in a worksheet
chart.TopRow = 5
chart.LeftColumn = 5
chart.RightColumn = 10
chart.BottomRow = 10
```

UWP

```
//Positioning chart in a worksheet
chart.TopRow = 5;
chart.LeftColumn = 5;
chart.RightColumn = 10;
chart.BottomRow = 10;
```

ASP.NET CORE

```
//Positioning chart in a worksheet
chart.TopRow = 5;
chart.LeftColumn = 5;
chart.RightColumn = 10;
chart.BottomRow = 10;
```

XAMARIN

```
//Positioning chart in a worksheet
chart.TopRow = 5;
chart.LeftColumn = 5;
chart.RightColumn = 10;
chart.BottomRow = 10;
```

Positioning Chart Elements

The following code examples illustrate how to position the chart elements.

C#

```
//Manually positioning plot area
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.inner;
chart.PlotArea.Layout.LeftMode = LayoutModes.edge;
chart.PlotArea.Layout.TopMode = LayoutModes.edge;
//Manually positioning chart legend
chart.Legend.Layout.LeftMode = LayoutModes.edge;
chart.Legend.Layout.TopMode = LayoutModes.edge;
```

VB.NET

```
'Manually positioning plot area
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.inner
chart.PlotArea.Layout.LeftMode = LayoutModes.edge
chart.PlotArea.Layout.TopMode = LayoutModes.edge
'Manually positioning chart legend
chart.Legend.Layout.LeftMode = LayoutModes.edge
chart.Legend.Layout.TopMode = LayoutModes.edge
```

UWP

```
//Manually positioning plot area
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.inner;
chart.PlotArea.Layout.LeftMode = LayoutModes.edge;
chart.PlotArea.Layout.TopMode = LayoutModes.edge;
//Manually positioning chart legend
chart.Legend.Layout.LeftMode = LayoutModes.edge;
chart.Legend.Layout.TopMode = LayoutModes.edge;
```

ASP.NET CORE

```
//Manually positioning plot area
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.inner;
chart.PlotArea.Layout.LeftMode = LayoutModes.edge;
chart.PlotArea.Layout.TopMode = LayoutModes.edge;
//Manually positioning chart legend
chart.Legend.Layout.LeftMode = LayoutModes.edge;
chart.Legend.Layout.TopMode = LayoutModes.edge;
```

XAMARIN

```
//Manually positioning plot area
```

```
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.inner;
chart.PlotArea.Layout.LeftMode = LayoutModes.edge;
chart.PlotArea.Layout.TopMode = LayoutModes.edge;
//Manually positioning chart legend
chart.Legend.Layout.LeftMode = LayoutModes.edge;
chart.Legend.Layout.TopMode = LayoutModes.edge;
```

Resizing Chart

The following code sample illustrates how to resize a chart in a worksheet.

C#

```
IShape chartShape = chart as IShape;
//Set Height of the chart in pixels
chartShape.Height = 300;
//Set Width of the chart
chartShape.Width = 500;
```

VB.NET

```
Dim chartShape As IShape = chart as IShape
'Set Height of the chart
chartShape.Height = 300
'Set Width of the chart
chartShape.Width = 500
```

UWP

```
IShape chartShape = chart as IShape;
//Set Height of the chart in pixels
chartShape.Height = 300;
//Set Width of the chart
chartShape.Width = 500;
```

ASP.NET CORE

```
IShape chartShape = chart as IShape;
//Set Height of the chart in pixels
chartShape.Height = 300;
//Set Width of the chart
chartShape.Width = 500;
```

XAMARIN

```
IShape chartShape = chart as IShape;
//Set Height of the chart in pixels
chartShape.Height = 300;
//Set Width of the chart
chartShape.Width = 500;
```

Resizing Chart Elements

The following code examples illustrate how to resize chart elements such as plot area and legend.

C#

```
//Manually resizing chart plot area
chart.PlotArea.Layout.Left = 50;
chart.PlotArea.Layout.Top = 75;
chart.PlotArea.Layout.Width = 300;
chart.PlotArea.Layout.Height = 200;
//Manually resizing chart legend
chart.Legend.Layout.Left = 400;
chart.Legend.Layout.Top = 150;
chart.Legend.Layout.Width = 150;
chart.Legend.Layout.Height = 100;
```

VB.NET

```
'Manually resizing chart plot area
chart.PlotArea.Layout.Left = 50
chart.PlotArea.Layout.Top = 75
chart.PlotArea.Layout.Width = 300
chart.PlotArea.Layout.Height = 200
'Manually resizing chart legend
chart.Legend.Layout.Left = 400
chart.Legend.Layout.Top = 150
chart.Legend.Layout.Width = 150
chart.Legend.Layout.Height = 100
```

UWP

```
//Manually resizing chart plot area
chart.PlotArea.Layout.Left = 50;
chart.PlotArea.Layout.Top = 75;
chart.PlotArea.Layout.Width = 300;
chart.PlotArea.Layout.Height = 200;
//Manually resizing chart legend
chart.Legend.Layout.Left = 400;
chart.Legend.Layout.Top = 150;
chart.Legend.Layout.Width = 150;
chart.Legend.Layout.Height = 100;
```

ASP.NET CORE

```
//Manually resizing chart plot area
chart.PlotArea.Layout.Left = 50;
chart.PlotArea.Layout.Top = 75;
chart.PlotArea.Layout.Width = 300;
chart.PlotArea.Layout.Height = 200;
//Manually resizing chart legend
chart.Legend.Layout.Left = 400;
chart.Legend.Layout.Top = 150;
chart.Legend.Layout.Width = 150;
chart.Legend.Layout.Height = 100;
```

XAMARIN

```
//Manually resizing chart plot area
```

```

chart.PlotArea.Layout.Left = 50;
chart.PlotArea.Layout.Top = 75;
chart.PlotArea.Layout.Width = 300;
chart.PlotArea.Layout.Height = 200;
//Manually resizing chart legend
chart.Legend.Layout.Left = 400;
chart.Legend.Layout.Top = 150;
chart.Legend.Layout.Width = 150;
chart.Legend.Layout.Height = 100;

```

Chart with transparent background

The following code example explains how to apply transparency to chart area.

C#

```

//Applying transparency to chart area
chart.ChartArea.Fill.Transparency = 0.9;

```

VB.NET

```

'Applying transparency to chart area
chart.ChartArea.Fill.Transparency = 0.9

```

UWP

```

//Applying transparency to chart area
chart.ChartArea.Fill.Transparency = 0.9;

```

ASP.NET CORE

```

//Applying transparency to chart area
chart.ChartArea.Fill.Transparency = 0.9;

```

XAMARIN

```

//Applying transparency to chart area
chart.ChartArea.Fill.Transparency = 0.9;

```

The complete code snippet illustrating the above options is shown below.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    IChartShape chart = sheet.Charts[0];
    //Positioning chart in a worksheet
    chart.TopRow = 5;
    chart.LeftColumn = 5;
    chart.RightColumn = 10;
}

```

```

chart.BottomRow = 10;
//Manually positioning plot area
chart.PlotArea.Layout.LayoutTarget = LayoutTargets.inner;
chart.PlotArea.Layout.LeftMode = LayoutModes.edge;
chart.PlotArea.Layout.TopMode = LayoutModes.edge;
//Manually positioning chart legend
chart.Legend.Layout.LeftMode = LayoutModes.edge;
chart.Legend.Layout.TopMode = LayoutModes.edge;
IShape chartShape = chart as IShape;
//Set Height of the chart in pixels
chartShape.Height = 300;
//Set Width of the chart
chartShape.Width = 500;
//Manually resizing chart plot area
chart.PlotArea.Layout.Left = 50;
chart.PlotArea.Layout.Top = 75;
chart.PlotArea.Layout.Width = 300;
chart.PlotArea.Layout.Height = 200;
//Manually resizing chart legend
chart.Legend.Layout.Left = 400;
chart.Legend.Layout.Top = 150;
chart.Legend.Layout.Width = 200;
chart.Legend.Layout.Height = 100;
//Applying transparency to chart area
chart.ChartArea.Fill.Transparency = 0.9;
workbook.SaveAs ("Chart.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()

"application/msexcel", stream);
}
}
```

Note: In order to position the chart elements, plot area should be smaller than chart area.

Explode a Pie Chart

Essential XlsIO allows you to explode either all data points at a single explosion value or each data point at different explosion using [Percent](#) of **ISeriesDataFormat** interface.

You can either create a pie chart and then explode it or directly create an exploded pie chart using XlsIO. Selecting **Pie_Exploded** as **ChartType** inserts a pie chart with a default explosion of **25%**. Learn how to [Create an Exploded Pie Chart](#).

Refer the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Adding pie chart in the worksheet
IChartShape chart = worksheet.Charts.Add();
chart.DataRange = worksheet.Range["A3:B7"];
chart.ChartType = ExcelChartType.Pie;
chart.IsSeriesInRows = false;
//Showing the values of data points
chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
//Exploding the pie chart to 40%
chart.Series[0].SerieFormat.Percent = 40;
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding pie chart in the worksheet
```

```

Dim chart As IChartShape = worksheet.Charts.Add
chart.DataRange = worksheet.Range("A3:B7")
chart.ChartType = ExcelChartType.Pie
chart.IsSeriesInRows = False
'Showing the values of data points
chart.Series(0).DataPoints.DefaultDataPoint.DataLabels.IsValue = True
'Exploding the pie chart to 40%
chart.Series(0).SerieFormat.Percent = 40
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;

```

Add Picture to Chart and assign Hyperlink

Essential XlsIO supports assigning hyperlink to the picture added in a chart in the Excel workbook. To achieve this, create a [chart in workbook](#) and add picture to the chart using [AddPicture](#) of **IPictures** interface. You can assign hyperlink to the picture using [Add](#) property of **IHyperlinks** interface.

Refer to the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding chart in the workbook
    IChart chart = workbook.Charts.Add();
    chart.DataRange = worksheet.Range["A1:B6"];
    chart.ChartType = ExcelChartType.Column_Clustered;
    chart.IsSeriesInRows = false;
    //Adding picture on the chart
    chart.Pictures.AddPicture("Image.png");
    //Adding hyperlink to the picture on chart
    worksheet.HyperLinks.Add((workbook.Charts[0].Pictures[0] as IShape),
    ExcelHyperLinkType.Url, "http://www.Syncfusion.com", "click here");
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding chart in the workbook
Dim chart As IChart = workbook.Charts.Add
chart.DataRange = worksheet.Range("A1:B6")
chart.ChartType = ExcelChartType.Column_Clustered
chart.IsSeriesInRows = False
'Adding picture on the chart
chart.Pictures.AddPicture("Image.png")
'Adding hyperlink to the picture on chart
worksheet.HyperLinks.Add(workbook.Charts(0).Pictures(0),
ExcelHyperLinkType.Url, "http://www.Syncfusion.com", "click here")
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the file picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opening an existing workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding chart in the workbook
    IChart chart = workbook.Charts.Add();
    chart.DataRange = worksheet.Range["A1:B6"];

    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {

```

```

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Note: XlsIO supports adding picture only to a chart in the workbook, but does not support adding picture to a chart in the worksheet.

Add DataTable to Chart

Data table beneath the chart clearly represents the chart content in table format. While creating a chart, the data table is hidden, and the option should be manually enabled to view it.

Essential XlsIO supports adding data table using [HasDataTable](#) of **IChart** interface. Enabling this property adds the data table beneath the chart.

Refer the following complete code snippets.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Assigning data in the worksheet
    worksheet.Range["A1"].Text = "Items";
    worksheet.Range["B1"].Text = "Amount(in $)";
    worksheet.Range["C1"].Text = "Count";
    worksheet.Range["A2"].Text = "Beverages";
    worksheet.Range["A3"].Text = "Condiments";
    worksheet.Range["A4"].Text = "Confections";
    worksheet.Range["A5"].Text = "Dairy Products";
    worksheet.Range["A6"].Text = "Grains / Cereals";
    worksheet.Range["B2"].Number = 2776;
    worksheet.Range["B3"].Number = 1077;
    worksheet.Range["B4"].Number = 2287;
    worksheet.Range["B5"].Number = 1368;
    worksheet.Range["B6"].Number = 3325;
    worksheet.Range["C2"].Number = 925;
    worksheet.Range["C3"].Number = 378;

Sparkline

[Sparkline](#) is a small chart in a worksheet cell that provides a visual representation of data.

Sparkline Creation Using XlsIO

XlsIO provides support for creation, modification and removal of Sparklines.

- **ISparklineGroups** interface caches the SparklineGroup that need to be added to the Spreadsheet.
- **ISparklineGroup** represents Sparklines in object, and has properties that allows to customize it.
- **ISparklines** interface returns the collection of Sparkline present in a Worksheet.
- **ISparkline** represents a sparkline in the Sparklines. Currently, XlsIO supports all the three types of sparklines - Line, Column, Win/Loss.

Following code example illustrates how to create Sparklines by using XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("spark.xlsx",
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
//Add SparklineGroups
ISparklineGroup sparklineGroup = sheet.SparklineGroups.Add();
//Add SparkLineType
sparklineGroup.SparklineType = SparklineType.Line;
sparklineGroup.MarkersColor = Color.BlueViolet;
//Add sparklines
ISparklines sparklines = sparklineGroup.Add();
```

```

IRange dataRange = sheet.Range["B2:F4"];
IRange referenceRange = sheet.Range["G2:G4"];
sparklines.Add(dataRange, referenceRange);
string fileName = "Sparkline.xlsx";
workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("spark.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Add SparklineGroups
Dim sparklineGroup As ISparklineGroup = sheet.SparklineGroups.Add()
'Add SparkLineType
sparklineGroup.SparklineType = SparklineType.Line
sparklineGroup.MarkersColor = Color.BlueViolet
'Add sparklines
Dim sparklines As ISparklines = sparklineGroup.Add()
Dim dataRange As IRange = sheet.Range("B2:F4")
Dim referenceRange As IRange = sheet.Range("G2:G4")
sparklines.Add(dataRange, referenceRange)
Dim fileName As String = "Sparkline.xlsx"
workbook.SaveAs(fileName)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

}
}

```

Modifying an existing spark line

XlsIO provides an option to edit the data of existing Sparklines. The following code snippet shows how to achieve this.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sparkline.xlsx",
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
ISparklineGroup sparklineGroup = sheet.SparklineGroups[0];
ISparklines sparklines = sparklineGroup[0];
IRange dataRange = sheet["A1:C4"];
IRange referenceRange = sheet["D1:D4"];
//Edit the existing sparklines data
sparklines.RefreshRanges(dataRange, referenceRange);
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013

```

```

Dim workbook As IWorkbook = application.Workbooks.Open("Sparkline.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim sparklineGroup As ISparklineGroup = sheet.SparklineGroups(0)
Dim sparklines As ISparklines = sparklineGroup(0)
Dim dataRange As IRange = sheet("A1:C4")
Dim referenceRange As IRange = sheet("D1:D4")
'Edit the existing sparklines data
sparklines.RefreshRanges(dataRange, referenceRange)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    ISparklineGroup sparklineGroup = sheet.SparklineGroups[0];
    ISparklines sparklines = sparklineGroup[0];
    IRange dataRange = sheet["A1:C4"];
    IRange referenceRange = sheet["D1:D4"];
    //Edit the existing sparklines data
    sparklines.RefreshRanges(dataRange, referenceRange);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;

    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx", "application/msexcel", stream);
    }
}

```

Removing Sparklines

XlsIO provides an API to remove sparklines from the sparkline group and also the sparkline group from the worksheet. This is illustrated in the following code.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sparkline.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    ISparklineGroup sparklineGroup = sheet.SparklineGroups[0];
    ISparklines sparklines = sparklineGroup[0];
    //Remove sparkline specified by index from the sparklines
    sparklines.Remove(sparklines[1]);
    //Remove sparklines from the sparkline group
    sparklineGroup.Remove(sparklines);
    //Remove sparkline group from the sheet
    sheet.SparklineGroups.Remove(sparklineGroup);
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",

```

Note: Sparklines are supported only from Excel 2007 onwards and are ignored in the earlier versions.

Excel 2016 Charts

Essential XlsIO supports creating and manipulating new and modern chart types such as waterfall, histogram, pareto, box and whisker, tree map, and sunburst, all of which are introduced in Microsoft Excel 2016.

Funnel

[Funnel](#) charts show values across multiple stages in a process.

Following code example illustrates how to create Funnel chart.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2016;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);

```

```

IWorksheet sheet = workbook.Worksheets[0];
//Create a chart
IChartShape chart = sheet.Charts.Add();
//Set chart type as Funnel
chart.ChartType = ExcelChartType.Funnel;
//Set data range in the worksheet
chart.DataRange = sheet.Range["A1:B6"];
//Set the chart title
chart.ChartTitle = "Funnel";
//Formatting the legend and data label option
chart.HasLegend = false;
chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.Size = 8;
workbook.SaveAs("Funnel.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Create a chart
Dim chart As IChartShape = sheet.Charts.Add()
'Set chart type as Funnel
chart.ChartType = ExcelChartType.Funnel
'Set data range in the worksheet
chart.DataRange = sheet.Range("A1:B6")
'Set the chart title
chart.ChartTitle = "Funnel"
'Formatting the legend and data label option
chart.HasLegend = False
chart.Series(0).DataPoints.DefaultDataPoint.DataLabels.IsValue = True
chart.Series(0).DataPoints.DefaultDataPoint.DataLabels.Size = 8
workbook.SaveAs("Funnel.xlsx")
End Using

```

UWP

Waterfall

Waterfall chart helps to quickly understand the finances of business owners by viewing profit and loss statements. With a Waterfall chart, you can quickly illustrate the line items in your financial data and get a clear picture of how each item is impacting your bottom line.

Following code example illustrates how to create Waterfall chart.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Create a chart
    IChartShape chart = sheet.Charts.Add();
    //Set chart type as Waterfall
    chart.ChartType = ExcelChartType.WaterFall;
    //Set data range in the worksheet
    chart.DataRange = sheet["A2:B8"];
    //Data point settings as total in chart
    chart.Series[0].DataPoints[3].SetAsTotal = true;
    chart.Series[0].DataPoints[6].SetAsTotal = true;
    //Showing the connector lines between data points
    chart.Series[0].SerieFormat.ShowConnectorLines = true;
    //Set the chart title
    chart.ChartTitle = "Company Profit (in USD)";
    //Formatting data label and legend option
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.IsValue = true;
    chart.Series[0].DataPoints.DefaultDataPoint.DataLabels.Size = 8;
    chart.Legend.Position = ExcelLegendPosition.Right;
    workbook.SaveAs("Waterfall.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()

Working with Template Markers

A template marker is a special marker symbol created in an Excel template that appends multiple records from a data source into a worksheet. This marker automatically maps the column name in the data source and names of the marker fields in the template Excel document and fills the data (text or image). Essential XlsIO allows you to bind the template markers to data from various sources, such as

- DataTable
- Collection objects
- Nested collection objects
- Arrays

Template marker Syntax

Each marker starts with a prefix character (by default it is “%” character). The marker is followed by the variable name and properties which are delimited by a character (by default it is semicolon “;”).

```
%<MarkerVariable>.<Property>
```

For example: %Customers.CompanyName

Where, “Customers” is marker variable name and CompanyName is the property name

You can change the marker prefix and delimiter characters by the **MarkerPrefix** and **ArgumentSeparator** properties of the ITemplateMarkersProcessor instance respectively.

Arguments

You can specify the following arguments with the marker to customize the worksheet.

Horizontal-This argument specifies the horizontal direction of the data filling for variables.

Syntax: %<MarkerVariable>.<Property>;horizontal

Vertical-This argument specifies the vertical direction of the data filling for variables. By default, data will be filled in vertical direction

Syntax: %<MarkerVariable>.<Property>;vertical

insert-This argument inserts new row or column, depending on the direction argument for each new cell. Note that by default, the rows will not be inserted.

Syntax: %<MarkerVariable>.<Property>;insert

insert:copystyles-This argument copies styles from the above row or left column.

Syntax: %<MarkerVariable>.<Property>;insert:copystyles

jump:[cell reference in R1C1 notation]-This argument binds the data to the cell at the specified reference. Cell reference addresses can be relative or absolute.

Syntax: %<MarkerVariable>.<Property>;jump:R2C2

copyrange:[top-left cell reference in R1C1]:[bottom-right cell reference in R1C1]-Copies the specified cells after each cell import.

Syntax: %<MarkerVariable>.<Property>;copyrange:R2C2:R4C4

default-This argument adds the property value once per object for the corresponding records in the column while importing nested collection objects.

Syntax: %<MarkerVariable>.<Property>default

merge-This argument merges the cells in the column for each object set while importing nested collection objects.

Syntax: %<MarkerVariable>.<Property>merge

repeat-This argument repeats the property value for the corresponding records in the column while importing nested collection objects.

Syntax: %<MarkerVariable>.<Property>repeat

collapsegroup-This argument groups the cells in the column for each object set and collapse the data while importing nested collection objects.

Syntax: %<MarkerVariable>.<Property>collapsegroup

expandgroup-This argument groups the cells in the column for each object set and expand the data while importing nested collection objects.

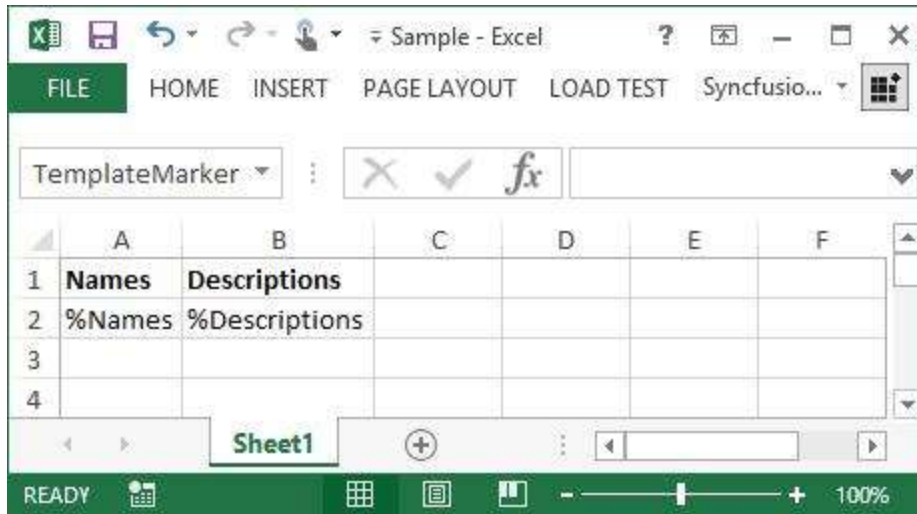

Syntax: %<MarkerVariable>.<Property>expandgroup

[Bind from Array](#)

An array of data can be binded to the marker in the template document.

Syntax: %VariableArray

The following screenshot represents the input template which has a template marker.

Following code example illustrates how to bind the data from an array to a marker.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    ExcelEngine excelEngine = new ExcelEngine();
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
        workbook.CreateTemplateMarkersProcessor();
    //Insert Array Horizontally
    string[] names = new string[] { "Mickey", "Donald", "Tom", "Jerry" };
    string[] descriptions = new string[] { "Mouse", "Duck", "Cat", "Mouse" };
    //Add collections to the marker variables where the name should match with
    //input template
    marker.AddVariable("Names", names);
    marker.AddVariable("Descriptions", descriptions);
    //Process the markers in the template
    marker.ApplyMarkers();
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("TemplateMarker.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Create Template Marker Processor
Dim marker As ITemplateMarkersProcessor =
    workbook.CreateTemplateMarkersProcessor()
'Insert Array Horizontally
Dim names As String() = New String() {"Mickey", "Donald", "Tom", "Jerry"}
Dim descriptions As String() = New String() {"Mouse", "Duck", "Cat",
    "Mouse"}
'Add collections to the marker variables where the name should match with
input template
```

```

marker.AddVariable("Names", names)
marker.AddVariable("Descriptions", descriptions)
'Process the markers in the template
marker.ApplyMarkers()
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("TemplateMarker.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream = assembly.GetManifestResourceStream("Sample.xlsx");
    IWorkbook workbook = await
    excelEngine.Excel.Workbooks.OpenAsync(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
    workbook.CreateTemplateMarkersProcessor();
    //Insert Array Horizontally
    string[] names = new string[] { "Mickey", "Donald", "Tom", "Jerry" };
    string[] descriptions = new string[] { "Mouse", "Duck", "Cat", "Mouse" };
    //Add collections to the marker variables where the name should match with
    input template
    marker.AddVariable("Names", names);
    marker.AddVariable("Descriptions", descriptions);
    //Process the markers in the template
    marker.ApplyMarkers();
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "TemplateMarker";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

    input template
    marker.AddVariable("Names", names);
    marker.AddVariable("Descriptions", descriptions);
    //Process the markers in the template
    marker.ApplyMarkers();
    //Saving the workbook as stream
    workbook.Version = ExcelVersion.Excel2013;
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    //Save the stream as Excel document and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    await
    DependencyService.Get<ISaveWindowsPhone>().SaveAndView("TemplateMarker.xlsx"
    , "application/msexcel", outputStream);
    else
    DependencyService.Get<ISave>().SaveAndView("TemplateMarker.xlsx",
    "application/msexcel", outputStream);
    //Dispose the input and output stream instances
}

```

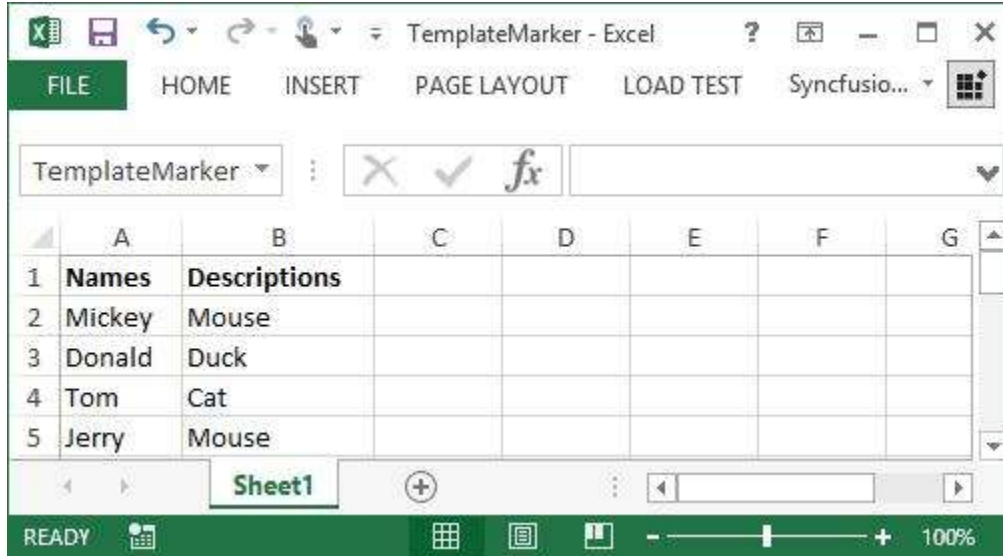

```

InputStream.Dispose();
OutputStream.Dispose();
}

```

The following screenshot represents generated Excel file in which the array of data is bounded.

You can also add or insert template markers using XlsIO APIs as follows.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Insert Simple marker
    sheet.Range["B2"].Text = "%Marker";
    //Insert marker which gets value of Author name
    sheet.Range["C2"].Text = "%Marker2.Worksheet.Workbook.Author";
    //Insert marker which gets cell address
    sheet.Range["H2"].Text = "%ArrayProperty.Cells.Address";
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
        workbook.CreateTemplateMarkersProcessor();
    //Add collections to the marker variables where the name should match with
    input template
    marker.AddVariable("Marker", "First test of markers");
    marker.AddVariable("Marker2", sheet.Range["B2"]);
    marker.AddVariable("ArrayProperty", sheet.Range["B2:G2"]);
    //Process the markers in the template
    marker.ApplyMarkers();
    workbook.Version = ExcelVersion.Excel2013;
    workbook.SaveAs("TemplateMarker.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()

```

```

Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx")
IWorksheet sheet = workbook.Worksheets(0)
'Insert Simple marker
sheet.Range("B2").Text = "%Marker"
'Insert marker which gets value of Author name
sheet.Range("C2").Text = "%Marker2.Worksheet.Workbook.Author"
'Insert marker which gets cell address
sheet.Range("H2").Text = "%ArrayProperty.Cells.Address"
'Create Template Marker Processor
Dim marker As ITemplateMarkersProcessor =

inputStream.Dispose();
outputStream.Dispose();
}

```

Bind from DataTable

Syntax:

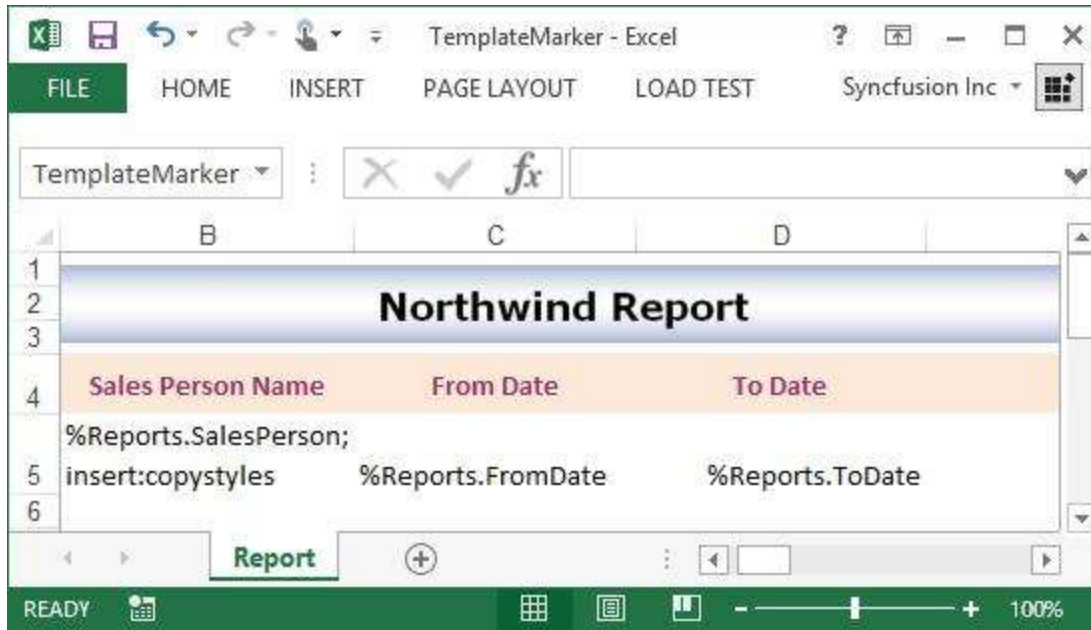

```
%<DataSource>.<FieldName>
```

For example: %Products.ProductName

Where, “Products” is a data source which can be data tables, datasets, data readers and data views and ProductName is the field name or column name

By default, DataTable values will be filled in the worksheet as a string format. You can detect data type and number format of DataTable values by using VariableTypeAction enumerator. To know more about the VariableTypeAction enumerator, please refer **VariableTypeAction** in API section.

The following screenshot represents the input template which has a template marker.

The following code snippet illustrates how to detect data type and apply number format with template marker.

C#

```
using(ExcelEngine excelEngine = new ExcelEngine())
{
    IWorkbook workbook =
    excelEngine.Excel.Workbooks.Open("TemplateMarker.xlsx");
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
    workbook.CreateTemplateMarkersProcessor();
    DataTable reports = new DataTable();
    reports.Columns.Add("SalesPerson");
    reports.Columns.Add("FromDate", typeof(DateTime));
    reports.Columns.Add("ToDate", typeof(DateTime));
    reports.Rows.Add("Andy Bernard", new DateTime(2014, 09, 08), new
    DateTime(2014, 09, 11));
    reports.Rows.Add("Jim Halpert", new DateTime(2014, 09, 11), new
    DateTime(2014, 09, 15));
    reports.Rows.Add("Karen Fillippelli", new DateTime(2014, 09, 15), new
    DateTime(2014, 09, 20));
    reports.Rows.Add("Phyllis Lapin", new DateTime(2014, 09, 21), new
    DateTime(2014, 09, 25));
    reports.Rows.Add("Stanley Hudson", new DateTime(2014, 09, 26), new
    DateTime(2014, 09, 30));
    //Add collection to the marker variables where the name should match with
    input template
    //Detects number format in DataTable values
    marker.AddVariable("Reports",
    reports, VariableTypeAction.DetectNumberFormat);

platforms alone.

```

The following screenshot represents an Excel file in which the data type is detected and then number format is applied.

Bind from Collection Objects with images

You can generate reports more appealingly with image support in template markers. The possible image formats are as follows:

- GIF
- JPEG
- PNG
- BMP
- TIFF

XlsIO detects the property as image when its type is `System.Drawing.Image` or `byte []`. The image can be formatted using the following arguments.

No	Image arguments	Description
1	No argument Ex: %Reports.Image;	Image is applied with a default size (50x50 pixels) and position (Top-Left).
2	fittocell Ex: %Reports.Image;fittocell	The image is applied to cell width and height.
3	size:width,height Ex: %Reports.Image;size:60	Image is applied to the specified size (width, height). Height parameter is optional. Value of width is applied when height is not specified.

	(or) <code>%Reports.Image;size:60,60</code> (or) <code>%Reports.Image;size:60,auto</code> (or) <code>%Reports.Image;size:auto,60</code> (or) <code>%Reports.Image;size:auto,auto</code>	You can specify either width or height value as "auto" to set ratio value of other size value. If both width and height value is set as "auto" then the Image is applied to the original size
4	<code>position:position</code> Ex: <code>%Reports.Image;position:middle-center</code> (or) <code>%Reports.Image;position:right</code>	Image is positioned (top-left, top-center, etc.,) within the cell.

In the following example, a marker is added for merging images. Data source and property name is specified (`%Reports.Image;`) for image also.

Sales Person Photo	Name	Sales Jan- June	Sales July - Dec	Change
<code>%Reports.Image;insert:copystyles</code>	<code>%Reports.SalesPerson</code>	<code>%Reports.SalesJanJun</code>	<code>%Reports.SalesJulDec</code>	<code>%Reports.Change</code>

Marker added for merging images

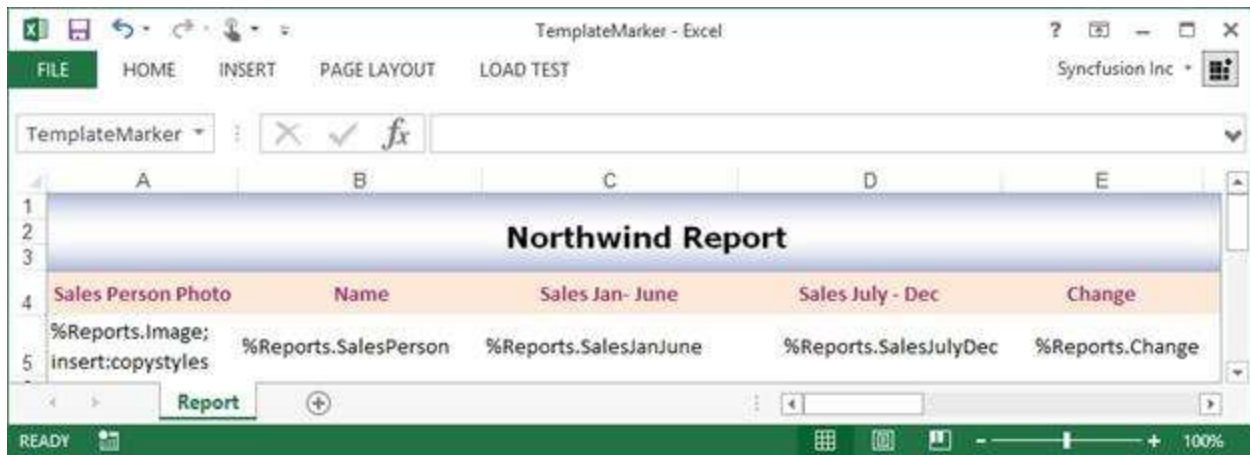

Note: Image can be used in array, DataTable, and collection objects.

Different positions of the image are maintained internally in the `ImageVerticalPosition` and `ImageHorizontalPosition` enumerators. To learn more about this, refer to the **ImageVerticalPosition** and **ImageHorizontalPosition** enumerators respectively in API section.

The output of all the image insertion options with input templates are as follows.

Default image input and output

Input template

Generated output

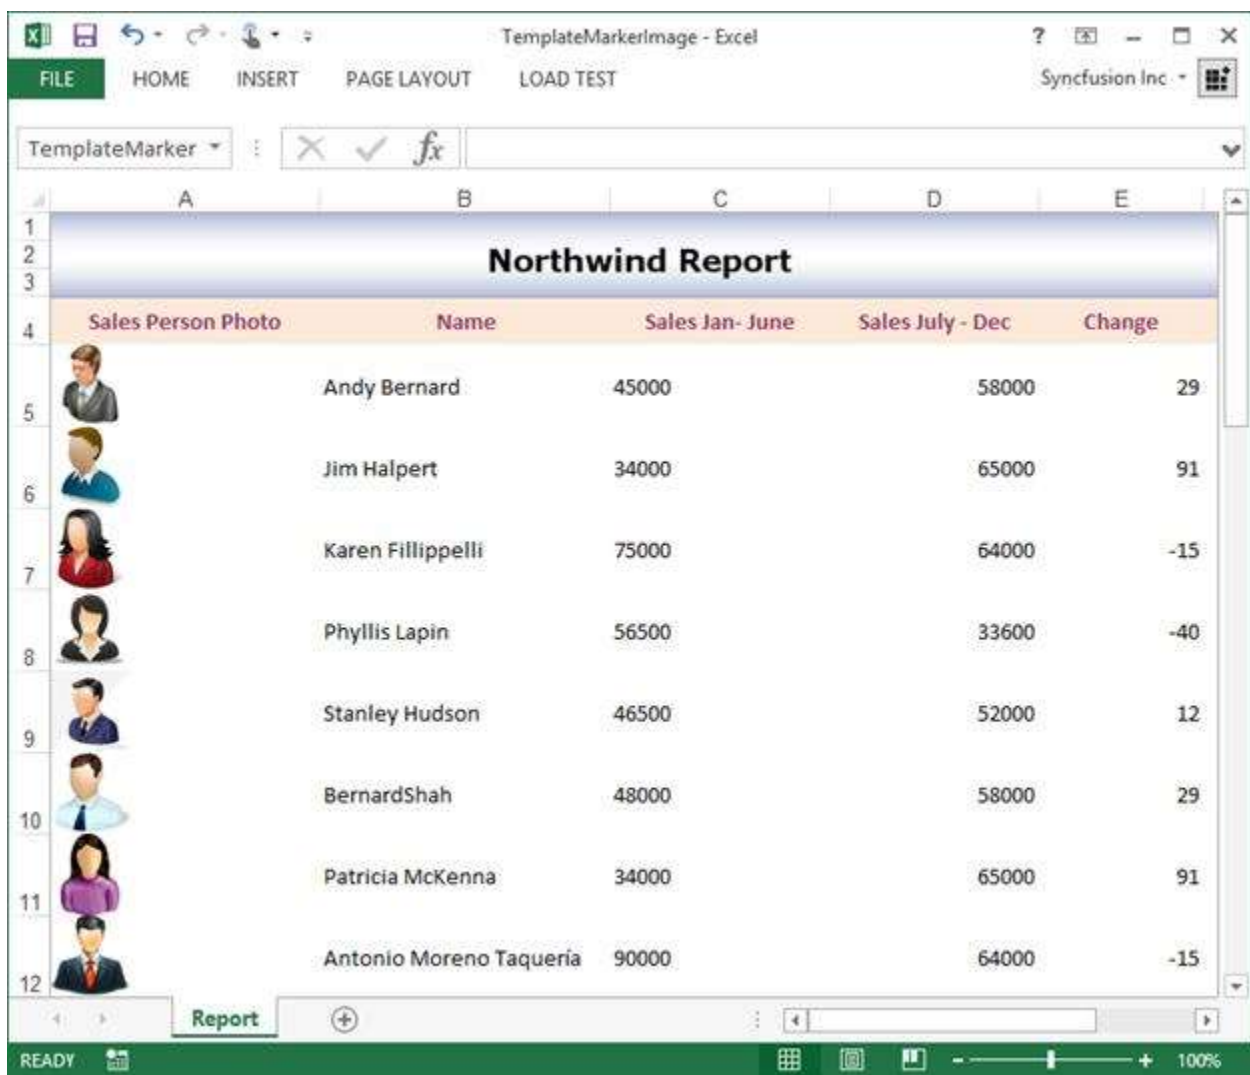

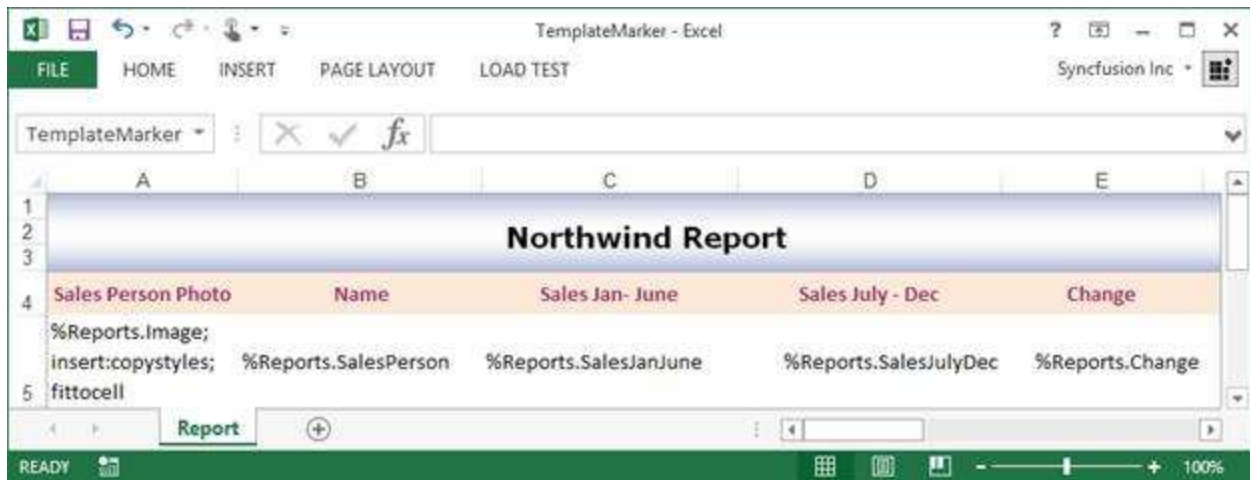

Image with FitToCell attribute

Input template

Generated output

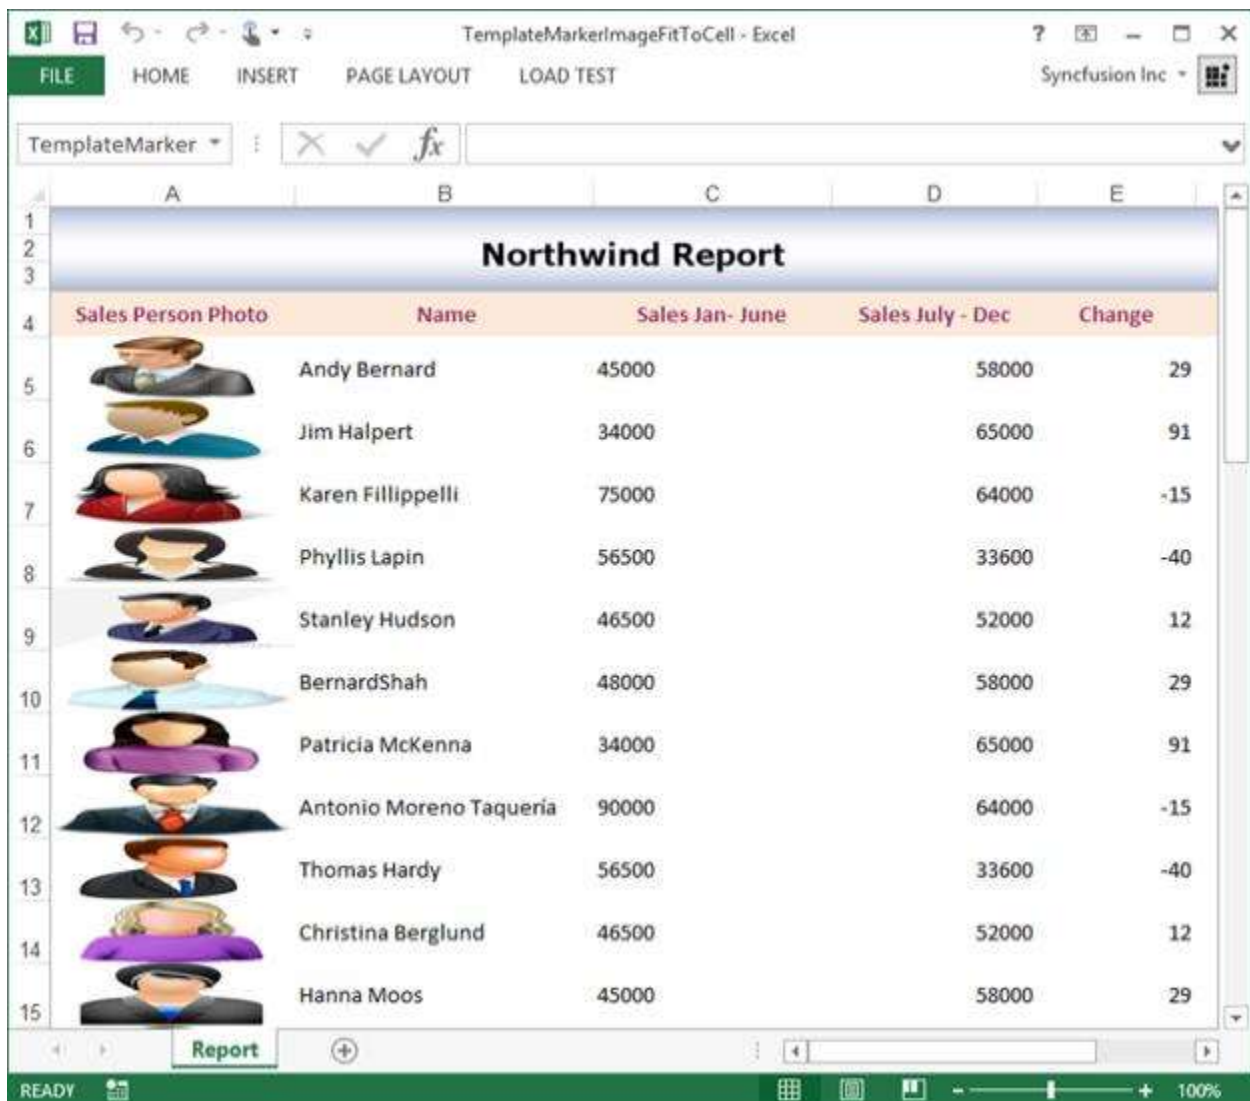

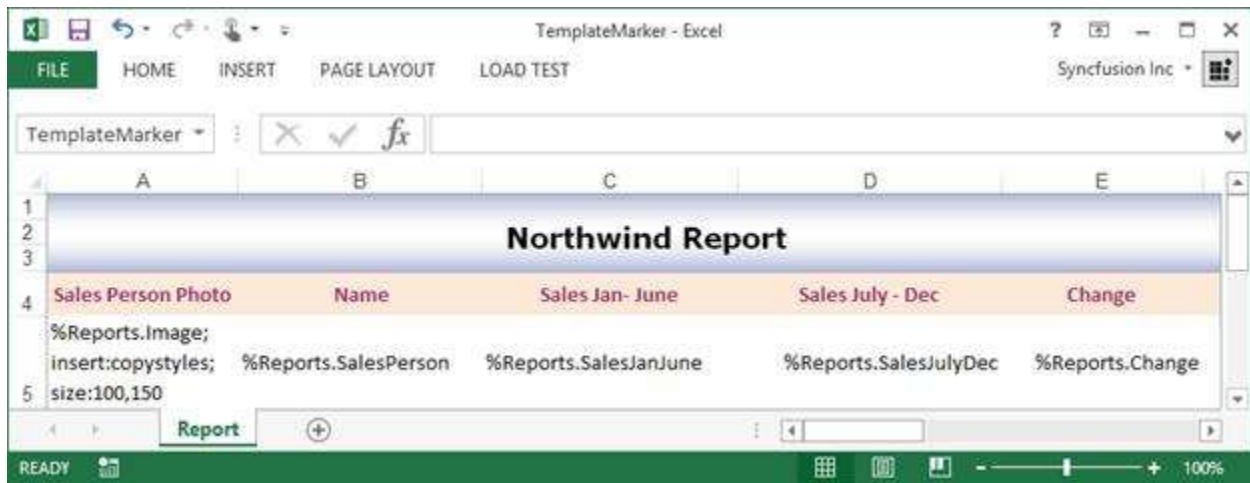

Image with Size

Input template

Generated output

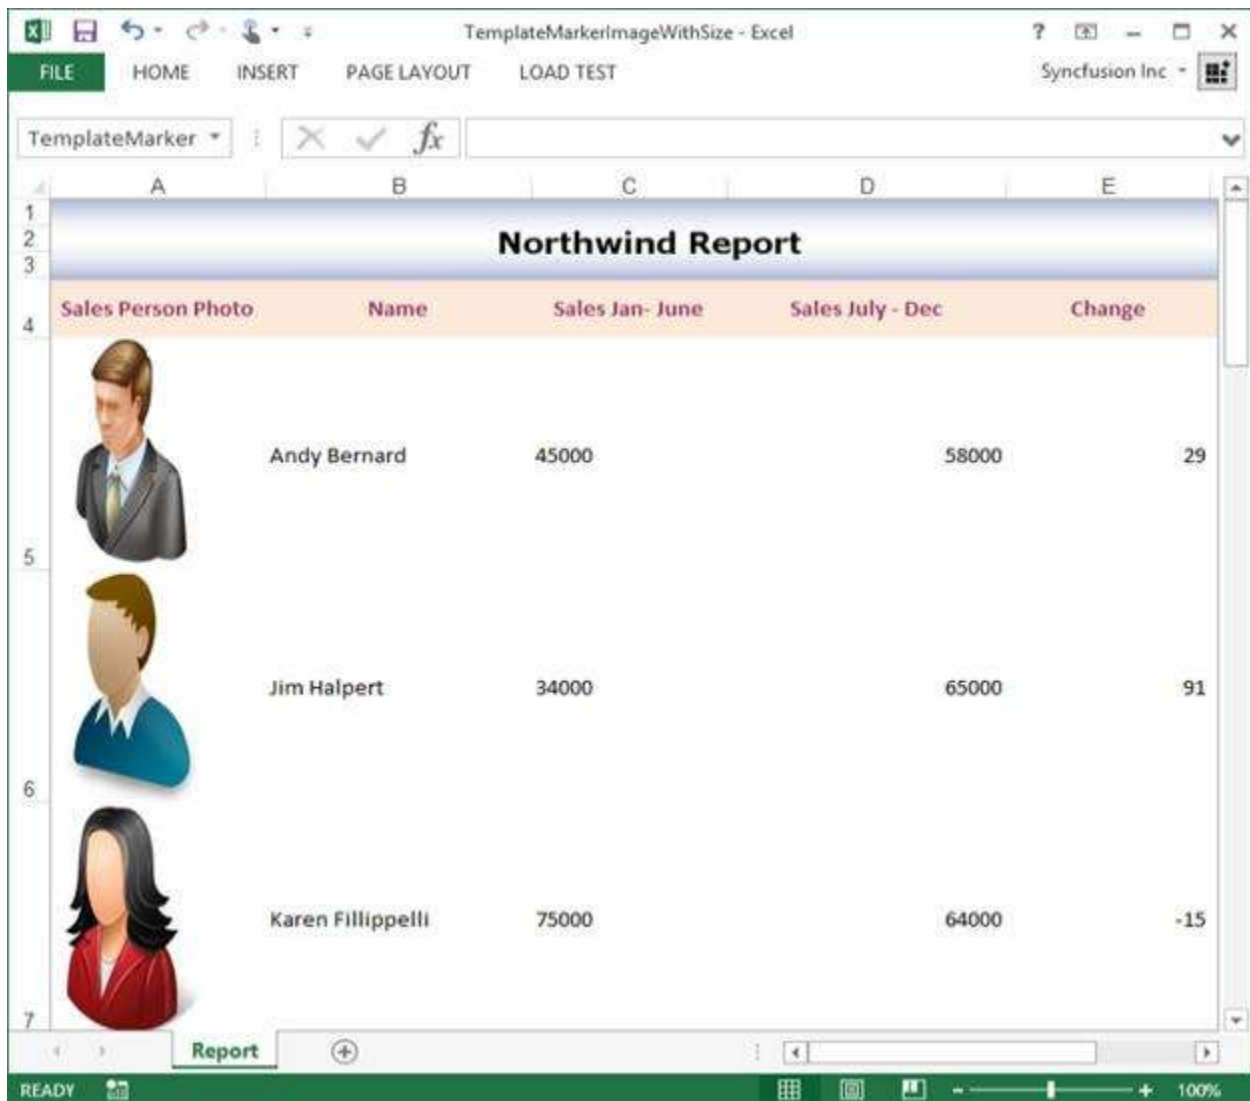

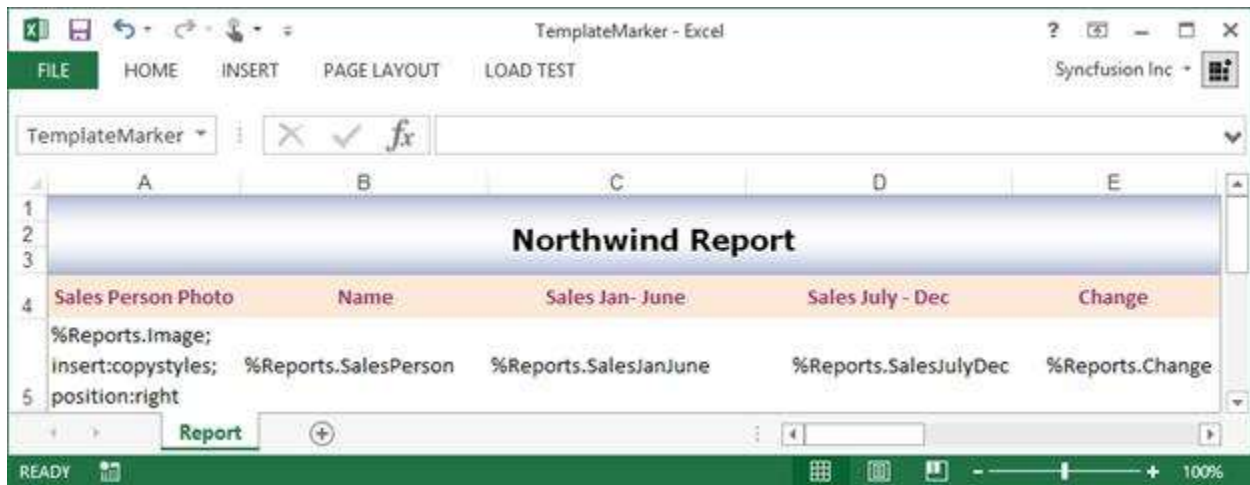

Image with Position

Input template

Generated output

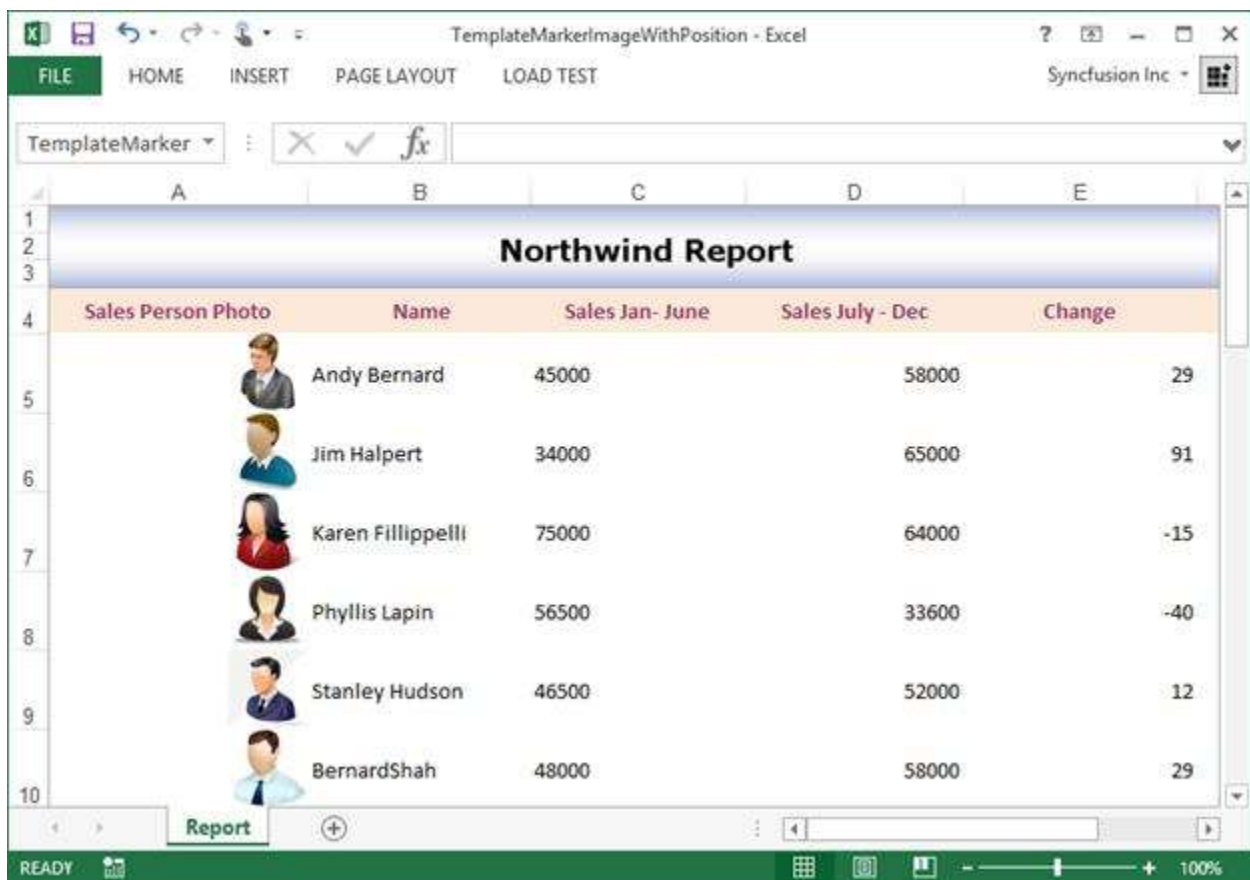

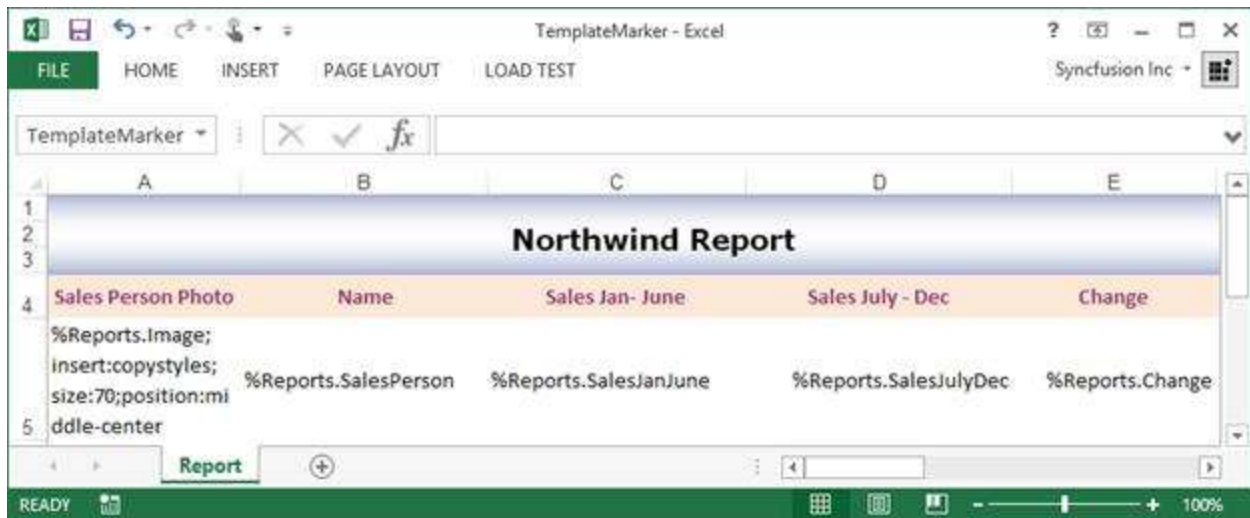

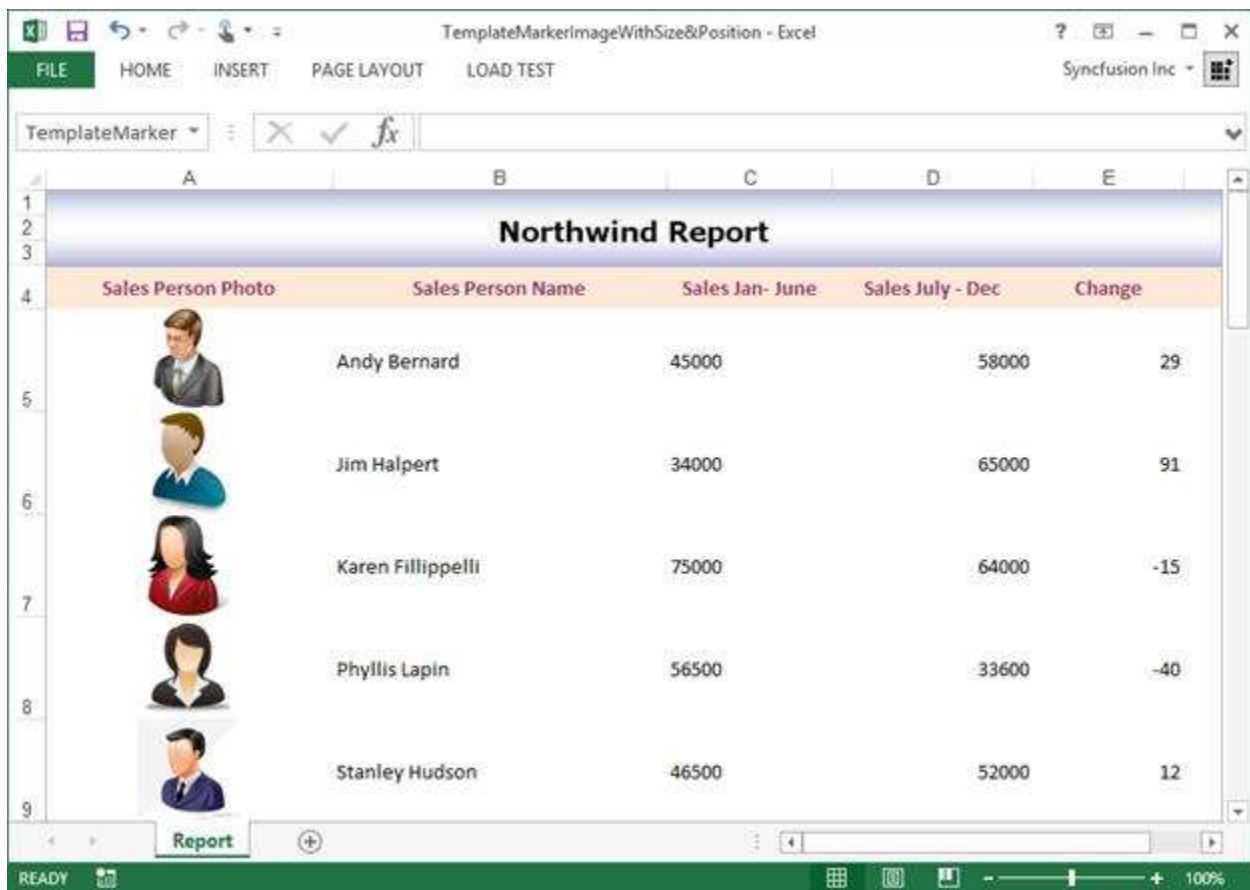

Image with position and size

Input template

Generated output

You can also refer to the [Template based data filling using Template Markers](#) section in [Getting Started](#) for the sample regarding template marker with images.

Bind from Nested Collection Objects with import data and group options

You can bind the data from Nested collection objects with import data options and group options.

The import data options are:

- Default
- Merge
- Repeat

The import data group options are:

- Collapse Group
- Expand Group

The following code snippet illustrates how to import data from nested collection objects with template marker.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("TemplateMarker.xlsx")
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
    workbook.CreateTemplateMarkersProcessor();
    //Add collection to the marker variables where the name should match with
    input template
    marker.AddVariable("Customer", GetSalesReports());
    //Process the markers in the template
    marker.ApplyMarkers();
    workbook.SaveAs("TemplateMarkerNestedCollection.xlsx");
}
```

VB.NET

```
using excelEngine As ExcelEngine = new ExcelEngine()
Dim workbook As IWorkbook =
excelEngine.Excel.Workbooks.Open("TemplateMarker.xlsx")
'Create Template Marker Processor
Dim marker As ITemplateMarkersProcessor =
workbook.CreateTemplateMarkersProcessor()
'Add collection to the marker variables where the name should match with
input template
marker.AddVariable("Customer", GetSalesReports())
'Process the markers and detect the number format along with the data type
in the template
marker.ApplyMarkers()
workbook.SaveAs("TemplateMarkerNestedCollection.xlsx");
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
```

```

openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile openFile = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
//Create Template Marker Processor
ITemplateMarkersProcessor marker =
workbook.CreateTemplateMarkersProcessor();
//Add collection to the marker variables where the name should match with
input template
marker.AddVariable("Customer", GetSalesReports());
//Process the markers in the template
marker.ApplyMarkers();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "TemplateMarkerNestedCollection";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

//Binding data from data table is supported only from ASP.NET Core 2.0
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
FileStream fileStream = new FileStream("TemplateMarker.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream);
//Create Template Marker Processor
ITemplateMarkersProcessor marker =
workbook.CreateTemplateMarkersProcessor();
//Add collection to the marker variables where the name should match with
input template
marker.AddVariable("Customer", GetSalesReports());
//Process the markers in the template
marker.ApplyMarkers();
//Saving the workbook as stream
FileStream stream = new FileStream("TemplateMarkerNestedCollection.xlsx",
FileMode.Create, FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
Assembly assembly = typeof(App).GetTypeInfo().Assembly;

```

```

Stream inputStream =
assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.TemplateMarker.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream);
//Create Template Marker Processor
ITemplateMarkersProcessor marker =
workbook.CreateTemplateMarkersProcessor();
//Add collection to the marker variables where the name should match with
input template
marker.AddVariable("Customer", GetSalesReports());
//Process the markers in the template
marker.ApplyMarkers();
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("TemplateMarkerNestedCollection.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("TemplateMarkerNestedCollection.xlsx", "application/msexcel", stream);
}
}

```

The following code snippet provides supporting methods and classes for the previous code.

C#

```

//Gets a list of sales reports
public static List<Customer> GetSalesReports()

Sheet1 100%

Merge option input and output

Input template

The screenshot shows an Excel spreadsheet with a 'Sales Report' template. The report is structured as follows:

Customer Name	Customer Id	Customer Age	Order Id	Order Price
%Customer.Name; merge	%Customer.Id; merge	%Customer.Age; merge	%Customer.Orders.Order_Id	%Customer.Orders.Price

Generated output

The screenshot shows an Excel spreadsheet with a 'Sales Report' table. The table has 5 columns: Customer Name, Customer Id, Customer Age, Order Id, and Order Price. The data is organized into groups of 3 rows for each customer, with the first row of each group containing the customer's details and the subsequent two rows containing order details. The first customer, Andy Bernard, has a Customer Id of 2107 and Age of 45, with three orders (1408, 1278, 1123). This pattern repeats for five other customers: Jim Halpert, Karen Fillippelli, Phyllis Lapin, and Stanley Hudson. The bottom of the spreadsheet shows 'Sheet1' as the active sheet and a zoom level of 100%.

	Customer Name	Customer Id	Customer Age	Order Id	Order Price
5	Andy Bernard	2107	45	1408	451.75
6				1278	340
7				1123	290.5
8	Jim Halpert	11564	34	1408	451.75
9				1278	340
10				1123	290.5
11	Karen Fillippelli	2097	35	1408	451.75
12				1278	340
13				1123	290.5
14	Phyllis Lapin	1846	37	1408	451.75
15				1278	340
16				1123	290.5
17	Stanley Hudson	12167	41	1408	451.75
18				1278	340
19				1123	290.5

Repeat option input and output

Input template

The screenshot shows an Excel spreadsheet with a 'Sales Report' template. The report is structured as follows:

Customer Name	Customer Id	Customer Age	Order Id	Order Price
%Customer.Name; repeat	%Customer.Id; repeat	%Customer.Age; repeat	%Customer.Orders.Order_Id	%Customer.Orders.Price

Generated output

The screenshot shows an Excel spreadsheet with a 'Sales Report' table. The table has five columns: Customer Name, Customer Id, Customer Age, Order Id, and Order Price. The data is organized into groups of three rows each, with the first row of each group having a highlighted 'Customer Name' cell. The formula bar shows 'Andy Bernard'.

	Customer Name	Customer Id	Customer Age	Order Id	Order Price
5	Andy Bernard	2107	45	1408	451.75
6	Andy Bernard	2107	45	1278	340
7	Andy Bernard	2107	45	1123	290.5

Generated output

The screenshot displays an Excel spreadsheet with a 'Sales Report' table. The table is structured as follows:

Customer Name	Customer Id	Customer Age	Order Id	Order Price
Andy Bernard	2107	45	1408	451.75
Jim Halpert	11564	34	1408	451.75
Karen Fillippelli	2097	35	1408	451.75
Phyllis Lapin	1846	37	1408	451.75
Stanley Hudson	12167	41	1408	451.75

Expand group option input and output

Template marker with conditional formatting

You can create or apply conditional format to the template marker range.

The following screenshot represents the input template, which has a template marker.

Northwind Report			
Sales Person Name	Sales Jan- June	Sales July - Dec	Change
%Reports.SalesPerson;			
insert:copystyles	%Reports.SalesJanJun	%Reports.SalesJulDec	%Reports.Change

The following code sample illustrates how to create or apply conditional format to the marker.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    #region Initialize Workbook
    IWorkbook workbook =
    excelEngine.Excel.Workbooks.Open("TemplateMarker.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    #endregion
    #region Create Template Marker
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
    workbook.CreateTemplateMarkersProcessor();
    IConditionalFormats conditionalFormats =
    marker.CreateConditionalFormats(worksheet["C5"]);
    #region Data Bar
    //Apply markers using Formula
    IConditionalFormat condition = conditionalFormats.AddCondition();
    //Set Data bar and icon set for the same cell
    //Set the format type
    condition.FormatType = ExcelCFTType.DataBar;
    IDataBar dataBar = condition.DataBar;
    //Set the constraint
    dataBar.MinPoint.Type = ConditionValueType.LowestValue;
    dataBar.MinPoint.Value = "0";
    dataBar.MaxPoint.Type = ConditionValueType.HighestValue;
    dataBar.MaxPoint.Value = "0";
    //Set color for Bar
    dataBar.BarColor = Color.FromArgb(156, 208, 243);
    //Hide the value in data bar
    dataBar.ShowValue = false;
    #endregion
    #region IconSet
    condition = conditionalFormats.AddCondition();
    condition.FormatType = ExcelCFTType.IconSet;
    IIconSet iconSet = condition.IconSet;
    iconSet.IconSet = ExcelIconSetType.FourRating;
    iconSet.IconCriteria[0].Type = ConditionValueType.LowestValue;
    iconSet.IconCriteria[0].Value = "0";
    iconSet.IconCriteria[1].Type = ConditionValueType.HighestValue;
    iconSet.IconCriteria[1].Value = "0";
    iconSet.ShowIconOnly = true;
    #endregion
    conditionalFormats = marker.CreateConditionalFormats(worksheet["D5"]);
    #region Color Scale
    condition = conditionalFormats.AddCondition();
    condition.FormatType = ExcelCFTType.ColorScale;
    IColorScale colorScale = condition.ColorScale;
    //Sets 3 - color scale
    colorScale.SetConditionCount(3);
    colorScale.Criteria[0].FormatColorRGB = Color.FromArgb(230, 197, 218);
    colorScale.Criteria[0].Type = ConditionValueType.LowestValue;
    colorScale.Criteria[0].Value = "0";
    colorScale.Criteria[1].FormatColorRGB = Color.FromArgb(244, 210, 178);
    colorScale.Criteria[1].Type = ConditionValueType.Percentile;
```

```

colorScale.Criteria[1].Value = "50";

        SalesJanJun = salesJanJun;
        SalesJulDec = salesJulDec;
        Change = change;
    }
}
```

The following screenshot represents generated Excel file in which the conditional format is applied.

Template marker with Hyperlink

You can add hyperlink to the template marker range.

The following screenshot represents the input template, which has a template marker.

The following code snippet illustrates how to detect data type and apply number format with template marker.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("TemplateMarker.xlsx")
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
    workbook.CreateTemplateMarkersProcessor();
    //Add collection to the marker variables where the name should match with
    input template
    marker.AddVariable("Company", GetCompanyDetails());
    //Process the markers in the template
    marker.ApplyMarkers();
    workbook.SaveAs("TemplateMarkerHyperlink.xlsx");
}
```

VB.NET

```
using excelEngine As ExcelEngine = new ExcelEngine()
Dim workbook As IWorkbook =
excelEngine.Excel.Workbooks.Open("TemplateMarker.xlsx")
'Create Template Marker Processor
```

```

Dim marker As ITemplateMarkersProcessor =
workbook.CreateTemplateMarkersProcessor()
'Add collection to the marker variables where the name should match with
input template
marker.AddVariable("Company", GetCompanyDetails());
'Process the markers and detect the number format along with the data type
in the template
marker.ApplyMarkers()
workbook.SaveAs("TemplateMarkerHyperlink.xlsx");
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsx");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile openFile = await openPicker.PickSingleFileAsync();
    //Opens the workbook
    IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
workbook.CreateTemplateMarkersProcessor();
    //Add collection to the marker variables where the name should match with
input template
    marker.AddVariable("Company", GetCompanyDetails());
    //Process the markers in the template
    marker.ApplyMarkers();
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "TemplateMarkerHyperlink";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

//Binding data from data table is supported only from ASP.NET Core 2.0
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("TemplateMarker.xlsx", FileMode.Open,
FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    //Create Template Marker Processor
    ITemplateMarkersProcessor marker =
workbook.CreateTemplateMarkersProcessor();

```

```
//Add collection to the marker variables where the name should match with
input template
marker.AddVariable("Company", GetCompanyDetails());
//Process the markers in the template
marker.ApplyMarkers();
//Saving the workbook as stream
FileStream stream = new FileStream("TemplateMarkerHyperlink.xlsx",
    FileMode.Create, FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())

Working with Tables

Creating a table

XlsIO supports reading and writing the table which helps to organize and analyze the related data.

- **IListObjects** represents a collection of tables in the worksheet.
- **IListObject** represent a table in the worksheet.

You can also create a calculated column in the table. For more details, refer [here](#).

Note: In XlsIO, tables are supported only for Excel 2007 and later formats (*.xlsx files).

The following code sample explains the creation of a simple table by the range of data from an existing worksheet.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create table with the data in given range
    IListObject table = worksheet.ListObjects.Create("Table1",
        worksheet["A1:C8"]);
    string fileName = "Output.xlsx";
    workbook.SaveAs(fileName);
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Create table with the data in given range
Dim table As IListObject = worksheet.ListObjects.Create("Table1",
worksheet("A1:C8"))
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from an embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("Table.Sample.xlsx");
IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Create table with the data in given range
IListObject table = worksheet.ListObjects.Create("Table1",
worksheet["A1:C8"]);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Create table with the data in given range

```

```

IListObject table = worksheet.ListObjects.Create("Table1",
worksheet["A1:C8"]);
string fileName = "Output.xlsx";
//Saving the workbook as stream
FileStream stream = new FileStream(fileName, FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Table.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create table with the data in given range
    IListObject table = worksheet.ListObjects.Create("Table1",
    worksheet["A1:C8"]);
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "Output.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
        "application/msexcel", outputStream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
        "application/msexcel", outputStream);
    }
}

```

Accessing a table

The existing tables in the worksheet can be accessed, as follows.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Accessing first table in the sheet
IListObject table = worksheet.ListObjects[0];
//Modifying table name
table.Name = "SalesTable";
string fileName = "Output.xlsx";
workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Accessing first table in the sheet
Dim table As IListObject = worksheet.ListObjects(0)
'Modifying table name
table.Name = "SalesTable"
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from an embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("Table.Sample.xlsx");
IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Accessing first table in the sheet
IListObject table = worksheet.ListObjects[0];
//Modifying table name
table.Name = "SalesTable";
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from the FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
}

```

```
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing first table in the sheet
    IListObject table = worksheet.ListObjects[0];
    //Modifying table name
    table.Name = "SalesTable";
    string fileName = "Output.xlsx";
    //Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Table.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing first table in the sheet
    IListObject table = worksheet.ListObjects[0];
    //Modifying table name
    table.Name = "SalesTable";
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "Output.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {

```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName, "application/msexcel", outputStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName, "application/msexcel", outputStream);
}
}
```

Formatting a table

You can apply built-in styles to the table using XlsIO. You can also customize the table with other table style options such as Header/total row, first/last column, and banded rows to make a table easier to read.

The following code snippet illustrates how to apply built-in table style.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;

Apply Custom Table Style

You can apply custom table style to the table using XlsIO. You can create custom table style in which you can specified border, font, back ground color and format. You can also customized table in with other table style options such as Header/total row, first/last column, banded rows q to make a table easier to read.

The below code example shows how to apply custom table style in XlsIO.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2016;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Create data
worksheet[1, 1].Text = "Products";
worksheet[1, 2].Text = "Qtr1";
}

```

```

worksheet[1, 3].Text = "Qtr2";
worksheet[1, 4].Text = "Qtr3";
worksheet[1, 5].Text = "Qtr4";
worksheet[2, 1].Text = "Alfreds Futterkiste";
worksheet[2, 2].Number = 744.6;
worksheet[2, 3].Number = 162.56;
worksheet[2, 4].Number = 5079.6;
worksheet[2, 5].Number = 1249.2;
worksheet[3, 1].Text = "Antonio Moreno";
worksheet[3, 2].Number = 5079.6;
worksheet[3, 3].Number = 1249.2;
worksheet[3, 4].Number = 943.89;
worksheet[3, 5].Number = 349.6;
worksheet[4, 1].Text = "Around the Horn";
worksheet[4, 2].Number = 1267.5;
worksheet[4, 3].Number = 1062.5;
worksheet[4, 4].Number = 744.6;
worksheet[4, 5].Number = 162.56;

Insert or remove columns in a table

IListObject is a collection of columns, whereas a single column is represented by an instance of **IListObjectColumn**. XlsIO supports to insert or remove columns from the table using worksheet, as follows.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a table
    IListObject table = worksheet.ListObjects.Create("Table1",
        worksheet["A1:C8"]);
    //Inserting a column in the table
    worksheet.InsertColumn(2, 2);
    // Removing a column from the table
    worksheet.DeleteColumn(2, 1);
    string fileName = "Output.xlsx";
    workbook.SaveAs(fileName);
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Creating table
Dim table As IListObject = worksheet.ListObjects.Create("Table1",
    worksheet("A1:C8"))
'Inserting a column in the table
worksheet.InsertColumn(2, 2)
'Removing a column from the table
worksheet.DeleteColumn(2, 1)
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Table.Sample.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream,
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a table
    IListObject table = worksheet.ListObjects.Create("Table1",
        worksheet["A1:C8"]);
    //Inserting a column in the table
    worksheet.InsertColumn(2, 2);
    //Removing a column from the table
    worksheet.DeleteColumn(2, 1);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream,
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a table
    IListObject table = worksheet.ListObjects.Create("Table1",
        worksheet["A1:C8"]);
    //Inserting a column in the table
    worksheet.InsertColumn(2, 2);
    //Removing a column from the table
    worksheet.DeleteColumn(2, 1);
    string fileName = "Output.xlsx";
    //Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
}

```

```
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Table.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a table
    IListObject table = worksheet.ListObjects.Create("Table1",
        worksheet["A1:C8"]);
    //Inserting a column in the table
    worksheet.InsertColumn(2, 2);
    //Removing a column from the table
    worksheet.DeleteColumn(2, 1);
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "Output.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
            "application/msexcel", outputStream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
            "application/msexcel", outputStream);
    }
}
```

Note: Inserting rows or columns in a worksheet within the table range modifies table structure.

Adding a total row

The "Total Row" is added to a table by accessing the **Table Columns**. It is possible to set calculation function to be used to the total row cells by using the **ExcelTotalsCalculation** enumerator. To learn more about this enumerator, refer to the **ExcelTotalsCalculation** in API section. These cells are updated after they are calculated.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating a table
    IListObject table = worksheet.ListObjects.Create("Table1",
        worksheet["A1:C8"]);
    //Adding total row
    table.ShowTotals = true;
    table.Columns[0].TotalsRowLabel = "Total";
    table.Columns[1].TotalsCalculation = ExcelTotalsCalculation.Sum;
    table.Columns[2].TotalsCalculation = ExcelTotalsCalculation.Sum;
    string fileName = "Output.xlsx";
    workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Creating a table
Dim table As IListObject = worksheet.ListObjects.Create("Table1",
    worksheet("A1:C8"))
'Adding total row
table.ShowTotals = True
table.Columns(0).TotalsRowLabel = "Total"
table.Columns(1).TotalsCalculation = ExcelTotalsCalculation.Sum
table.Columns(2).TotalsCalculation = ExcelTotalsCalculation.Sum
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Table.Sample.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream,

"application/msexcel", outputStream);
}
}

```

Create a table from external connection

External connection support allows to work with most recent data right in the workbook. After the data is imported, only refresh operations are performed to retrieve the updated data.

The following code snippet explains the method of importing data through an external connection in the workbook.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Database path
string dataPath = Path.GetFullPath(@"c:\company\DB\TestDB.mdb");
//Connection string for DataSource
string ConnectionString =
"OLEDB;Provider=Microsoft.JET.OLEDB.4.0;Password=\"\";User ID=Admin;Data
Source=" + dataPath;
//Adding a connection to the workbook

```

```

IConnection Connection = workbook.Connections.Add("Connection1", "Sample
connection with MsAccess", ConnectionString, "", ExcelCommandType.Sql);
//Adding a QueryTable to sheet object
worksheet.ListObjects.AddEx(ExcelListObjectSourceType.SrcQuery, Connection,
worksheet.Range["A1"]);
//Command text for the connection
worksheet.ListObjects[0].QueryTable.CommandText = "Select * from tableTest";
//The query performs asynchronous action
worksheet.ListObjects[0].QueryTable.BackgroundQuery = true;
//The query table is refreshed when the workbook is opened
worksheet.ListObjects[0].QueryTable.RefreshOnFileOpen = true;
//Represents the connection description
Connection.Description = "Sample Connection";
//Import data to the sheet from the database
worksheet.ListObjects[0].Refresh();
//Auto-fits the columns
worksheet.UsedRange.AutoFitColumns();
string fileName = "Output.xlsx";
workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Database path
Dim dataPath As String = Path.GetFullPath("c:\company\DB\TestDB.mdb")
'Connection string for DataSource
Dim ConnectionString As String =
"OLEDB;Provider=Microsoft.JET.OLEDB.4.0;Password=""";User ID=Admin;Data
Source=" + dataPath
'Adding a connection to the workbook
Dim Connection As IConnection = workbook.Connections.Add("Connection1",
"Sample connection with MsAccess", ConnectionString, "",
ExcelCommandType.Sql)
'Adding a QueryTable to sheet object
worksheet.ListObjects.AddEx(ExcelListObjectSourceType.SrcQuery, Connection,
worksheet.Range("A1"))
'Command text for the connection
worksheet.ListObjects(0).QueryTable.CommandText = "Select * from tableTest"
'The query performs asynchronous action
worksheet.ListObjects(0).QueryTable.BackgroundQuery = True
'The QueryTable is refreshed when the workbook is opened
worksheet.ListObjects(0).QueryTable.RefreshOnFileOpen = True
'Represents the connection description
Connection.Description = "Sample Connection"
'Import data to the sheet from the database
worksheet.ListObjects(0).Refresh()
'Auto-fits the columns
worksheet.UsedRange.AutoFitColumns()
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using

```

	Odbc	Stars with Odbc

Adding parameters to query in Excel table

Excel tables can be created by importing data from SQL Server through Excel data connections. The queries used to fetch data from SQL Server can be modified at run-time with the help of its parameters. There are three types of parameters which are applied to the WHERE clause of the SQL query. Let's see the types in detail and how to implement them.

Note: Excel table must be refreshed to obtain the filtered result with parameters. Table refresh operation is not supported in UWP, ASP.NET Core and Xamarin platforms.

Set parameter as Prompt

The following code example illustrates how to set parameter through prompt event.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("QueryTable.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Get query table from list objects.
    QueryTableImpl queryTable = worksheet.ListObjects[0].QueryTable;
    //Set SQL query to the query table Add parameters to the query table.
    queryTable.CommandText = "select * from Employee_Details where Emp_Age >
?;";
    //Add parameters to the query table.
    IParameter parameter = queryTable.Parameters.Add("parameter1",
ExcelParameterDataType.SQLSmallInt);
    //Set parameter value through prompt.
    parameter.SetParam(ExcelParameterType.Prompt, "Prompt");
    //Set prompt event handler to update parameter value.
    parameter.Prompt += new PromptEventHandler(SetParameter);
    //Refresh the listobject
    worksheet.ListObjects[0].Refresh();
    workbook.SaveAs("PromptParameter.xlsx");
    workbook.Close();
}

private void SetParameter(object sender, PromptEventArgs args)
{
    args.Value = 20;
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("QueryTable.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Get query table from list objects.
Dim queryTable As QueryTableImpl = worksheet.ListObjects(0).QueryTable
```

```

'Set SQL query to the query table Add parameters to the query table.
queryTable.CommandText = "select * from Employee_Details where Emp_Age > ?;"
'Add parameters to the query table.
Dim parameter As IParameter = queryTable.Parameters.Add("parameter1",
ExcelParameterDataType.SQLSmallInt)
'Set parameter value through prompt.
parameter.SetParam(ExcelParameterType.Prompt, "Prompt")
'Set prompt event handler to update parameter value
parameter.Prompt += New PromptEventHandler(SetParameter)
'Refresh the listobject
worksheet.ListObjects(0).Refresh()
workbook.SaveAs("PromptParameter.xlsx")
workbook.Close()
End Using
Private Sub SetParameter(ByVal sender As Object, ByVal args As
PromptEventArgs)
args.Value = 20
End Sub

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("Sample.QueryTable.xlsx");
IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Get query table from list objects.
QueryTableImpl queryTable = worksheet.ListObjects[0].QueryTable;
//Set SQL query to the query table Add parameters to the query table.
queryTable.CommandText = "select * from Employee_Details where Emp_Age >
?;";
//Add parameters to the query table.
IParameter parameter = queryTable.Parameters.Add("parameter1",
ExcelParameterDataType.SQLSmallInt);
//Set parameter value through prompt.
parameter.SetParam(ExcelParameterType.Prompt, "Prompt");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "PromptParameter";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    FileStream fileStream = new FileStream("QueryTable.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    ///Get query table from list objects.
    QueryTableImpl queryTable = worksheet.ListObjects[0].QueryTable;
    ///Set SQL query to the query table Add parameters to the query table.
    queryTable.CommandText = "select * from Employee_Details where Emp_Age >
    ?;";
    ///Add parameters to the query table.
    IParameter parameter = queryTable.Parameters.Add("parameter1",
    ExcelParameterDataType.SQLSmallInt);
    ///Set parameter value through prompt.
    parameter.SetParam(ExcelParameterType.Prompt, "Prompt");
    ///Saving the workbook as stream
    FileStream stream = new FileStream("PromptParameter.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    ///Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    ///Gets input Excel document from embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Sample.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    ///Get query table from list objects.
    QueryTableImpl queryTable = worksheet.ListObjects[0].QueryTable;
    ///Set SQL query to the query table Add parameters to the query table.
    queryTable.CommandText = "select * from Employee_Details where Emp_Age >
    ?;";
    ///Add parameters to the query table.
    IParameter parameter = queryTable.Parameters.Add("parameter1",
    ExcelParameterDataType.SQLSmallInt);
    ///Set parameter value through prompt.
    parameter.SetParam(ExcelParameterType.Prompt, "Prompt");
    ///Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    outputStream.Position = 0;
    ///Save the document as file and view the saved document
    ///The operation in SaveAndView under Xamarin varies among Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
}

```

```

if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Prompt
Parameter.xlsx", "application/msexcel", outputStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("PromptParameter.xl
sx", "application/msexcel", outputStream);
}
}

```

Set parameter as Constant

The following code example illustrates how to set parameter through *constant* type.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("QueryTable.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
//Get query table from list objects.
QueryTableImpl queryTable = worksheet.ListObjects[0].QueryTable;
//Set SQL query to the query table Add parameters to the query table.
queryTable.CommandText = "select * from Employee_Details where Emp_Age <
?;";
//Add parameters to the query table.
IParameter parameter = queryTable.Parameters.Add("parameter1",
ExcelParameterDataType.SQLSmallInt);
//Set constant to the parameter value.
parameter.SetParam(ExcelParameterType.Constant, 30);
//Refresh the listobject
worksheet.ListObjects[0].Refresh();
workbook.SaveAs("ConstantParameter.xlsx");
workbook.Close();
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("QueryTable.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Get query table from list objects.
Dim queryTable As QueryTableImpl = worksheet.ListObjects(0).QueryTable
'Set SQL query to the query table Add parameters to the query table.

Set parameter as Range

The following code example illustrates how to set parameter type to a specific range.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("QueryTable.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Get query table from list objects.
    QueryTableImpl queryTable = worksheet.ListObjects[0].QueryTable;
    //Set SQL query to the query table Add parameters to the query table.
    queryTable.CommandText = "select * from Employee_Details where Emp_Age > ?;";
    //Add parameters to the query table.
    IParameter parameter = queryTable.Parameters.Add("parameter1",
        ExcelParameterDataType.SQLSmallInt);
    //Set range to the parameter value.
    parameter.SetParam(ExcelParameterType.Range, worksheet.Range["H1"]);
    //Refresh the listobject
    worksheet.ListObjects[0].Refresh();
    workbook.SaveAs("RangeParameter.xlsx");
    workbook.Close();
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("QueryTable.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Get query table from list objects.
Dim queryTable As QueryTableImpl = worksheet.ListObjects(0).QueryTable
'Set SQL query to the query table Add parameters to the query table.
queryTable.CommandText = "select * from Employee_Details where Emp_Age > ?;";
'Add parameters to the query table.
Dim parameter As IParameter = queryTable.Parameters.Add("parameter1",
    ExcelParameterDataType.SQLSmallInt)
'Set range to the parameter value.
parameter.SetParam(ExcelParameterType.Range, worksheet.Range["H1"])
'Refresh the listobject
worksheet.ListObjects(0).Refresh()
workbook.SaveAs("RangeParameter.xlsx")
workbook.Close()
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection

Working with Pictures

XlsIO allows to insert Pictures into a worksheet. Refer to the following code snippet.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding a picture
    IPictureShape shape = worksheet.Pictures.AddPicture(1, 1, "Image.png");
    workbook.SaveAs("AddingImage.xlsx");
}

```

```
}

```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding a picture
Dim shape As IPictureShape = worksheet.Pictures.AddPicture(1, 1,
"Image.png")
workbook.SaveAs("AddingImage.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding a picture
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream imageStream =
assembly.GetManifestResourceStream("UWP.Data.Image.png");
IPictureShape shape = worksheet.Pictures.AddPicture(1, 1, imageStream);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "AddingImage";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding a picture
FileStream imageStream = new FileStream("Image.png", FileMode.Open,
FileAccess.Read);
IPictureShape shape = worksheet.Pictures.AddPicture(1, 1, imageStream);
//Saving the workbook as stream
FileStream stream = new FileStream("AddingImage.xlsx", FileMode.Create,
FileAccess.ReadWrite);
```

```
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding a picture
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream imageStream =
        assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Image.png");
    IPictureShape shape = worksheet.Pictures.AddPicture(1, 1, imageStream);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Adding
        Image.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("AddingImage.xlsx",
        "application/msexcel", stream);
    }
}
```

Positioning and Re-Sizing Pictures

Pictures can be re-sized, positioned, and formatted using various properties of **IPictureShape** interface. Refer to the following code snippet.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding a Picture
    IPictureShape shape = worksheet.Pictures.AddPicture(1, 1, "Image.png");
    //Positioning a Picture
    shape.Top = 100;
```

```

shape.Left = 100;
//Re-sizing a Picture
shape.Height = 100;
shape.Width = 100;
workbook.SaveAs("AddingImage.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding a Picture
Dim shape As IPictureShape = worksheet.Pictures.AddPicture(1, 1,
"Image.png")
'Positioning a Picture
shape.Top = 100
shape.Left = 100
'Re-sizing a Picture
shape.Height = 100
shape.Width = 100
workbook.SaveAs("AddingImage.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding a picture
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream imageStream =
assembly.GetManifestResourceStream("UWP.Data.Image.png");
IPictureShape shape = worksheet.Pictures.AddPicture(1, 1, imageStream);
//Positioning a Picture
shape.Top = 100;
shape.Left = 100;
//Re-sizing a Picture
shape.Height = 100;
shape.Width = 100;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "AddingImage";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

}
}
```

Adding Images from External Link

An image can be added to a worksheet as an external link without downloading the original image. The picture will be downloaded every time the spreadsheet is opened in Microsoft Excel. The image is not physically embedded into the Excel document, but points to a web resource. Refer to the following code snippet.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Add image from the specified url at the specified location in the
worksheet
worksheet.Pictures.AddPictureAsLink(1, 1, 5, 7,
"https://cdn.syncfusion.com/content/images/company-
logos/Syncfusion_Logo_Image.png");
//Save workbook
workbook.SaveAs("ExternalImage.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Add image from the specified url at the specified location in the worksheet
worksheet.Pictures.AddPictureAsLink(1, 1, 5, 7,
"https://cdn.syncfusion.com/content/images/company-
logos/Syncfusion_Logo_Image.png")
'Save workbook
workbook.SaveAs("ExternalImage.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
```

```

application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Add image from the specified url at the specified location in the
worksheet
worksheet.Pictures.AddPictureAsLink(1, 1, 5, 7,
"https://cdn.syncfusion.com/content/images/company-
logos/Syncfusion_Logo_Image.png");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "ExternalImage";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Add image from the specified url at the specified location in the
worksheet
worksheet.Pictures.AddPictureAsLink(1, 1, 5, 7,
"https://cdn.syncfusion.com/content/images/company-
logos/Syncfusion_Logo_Image.png");
//Saving the workbook as stream
FileStream stream = new FileStream("ExternalImage.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Add image from the specified url at the specified location in the
worksheet
worksheet.Pictures.AddPictureAsLink(1, 1, 5, 7,
"https://cdn.syncfusion.com/content/images/company-
logos/Syncfusion_Logo_Image.png");
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
}

```

```

stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("ExternalImage.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("ExternalImage.xlsx", "application/msexcel", stream);
}
}

```

Adding SVG Images

SVG images can be inserted in Excel documents for displaying images with accuracy when scaling or zooming page. Adding SVG images is now supported in XlsIO with SVG and its fallback raster image data as parameters as in the following code snippet.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
FileStream svgStream = new FileStream("Sample.svg", FileMode.Open);
FileStream pngStream = new FileStream("Sample.png", FileMode.Open);
//Add svg image with given svg and png streams
worksheet.Pictures.AddPicture(1, 1, svgStream, pngStream);
//Save workbook
workbook.SaveAs("Svg.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim svgStream As New FileStream("Sample.svg", FileMode.Open)
Dim pngStream As New FileStream("Sample.png", FileMode.Open)
'Add svg image with given svg and png streams
worksheet.Pictures.AddPicture(1, 1, svgStream, pngStream)
'Save workbook
workbook.SaveAs("Svg.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    ///"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream svgStream =
    assembly.GetManifestResourceStream("UWP.Data.Sample.svg");
    Stream pngStream =
    assembly.GetManifestResourceStream("UWP.Data.Sample.png");
    ///Add svg image with given svg and png streams
    worksheet.Pictures.AddPicture(1, 1, svgStream, pngStream);
    ///Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Svg";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});

}
}

```

Working with Pivot Tables

You can easily arrange and summarize complex data in a [Pivot Table](#). Creation and Manipulation of pivot table is supported in Excel 2007 and later formats, and pivot table in an existing document can be preserved for Excel 2003 format.

Create a pivot table

Steps to create a simple pivot table:

- Add pivot cache
- Add pivot table
- Add row and column fields
- Add data fields

Pivot tables do not take data directly from the source data, but take from the pivot cache that memorizes a snapshot of the data. The **IPivotCache** interface caches the data that needs to be summarized.

The data in worksheet is added to the pivot cache as follows.

C#

```

//Create Pivot cache with the given data range
IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:H50"]);

```

VB.NET

```
'Create Pivot cache with the given data range  
Dim cache As IPivotCache = workbook.PivotCaches.Add(worksheet("A1:H50"))
```

UWP

```
//Create Pivot cache with the given data range  
IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:H50"]);
```

ASP.NET CORE

```
//Create Pivot cache with the given data range  
IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:H50"]);
```

XAMARIN

```
//Create Pivot cache with the given data range  
IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:H50"]);
```

IPivotTable represents a single pivot table object created from the cache. It has properties that customizes the pivot table. The following code creates a blank pivot table.

C#

```
//Create "PivotTable1" with the cache at the specified range  
IPivotTable pivotTable = worksheet.PivotTables.Add("PivotTable1",  
worksheet["A1"], cache);
```

VB.NET

```
'Create "PivotTable1" with the cache at the specified range  
Dim pivotTable As IPivotTable = worksheet.PivotTables.Add("PivotTable1",  
worksheet("A1"), cache)
```

UWP

```
//Create "PivotTable1" with the cache at the specified range  
IPivotTable pivotTable = worksheet.PivotTables.Add("PivotTable1",  
worksheet["A1"], cache);
```

ASP.NET CORE

```
//Create "PivotTable1" with the cache at the specified range  
IPivotTable pivotTable = worksheet.PivotTables.Add("PivotTable1",  
worksheet["A1"], cache);
```

XAMARIN

```
//Create "PivotTable1" with the cache at the specified range  
IPivotTable pivotTable = worksheet.PivotTables.Add("PivotTable1",  
worksheet["A1"], cache);
```

The pivot table should be populated with required fields. The **IPivotField** represents a single field in the pivot table, which includes row, column, and data field axes.

C#

```
//Add Pivot table fields (row and column fields)
pivotTable.Fields[2].Axis = PivotAxisTypes.Row;
pivotTable.Fields[6].Axis = PivotAxisTypes.Row;
pivotTable.Fields[3].Axis = PivotAxisTypes.Column;
```

VB.NET

```
'Add Pivot table fields (row and column fields)
pivotTable.Fields(2).Axis = PivotAxisTypes.Row
pivotTable.Fields(6).Axis = PivotAxisTypes.Row
pivotTable.Fields(3).Axis = PivotAxisTypes.Column
```

UWP

```
//Add Pivot table fields (row and column fields)
pivotTable.Fields[2].Axis = PivotAxisTypes.Row;
pivotTable.Fields[6].Axis = PivotAxisTypes.Row;
pivotTable.Fields[3].Axis = PivotAxisTypes.Column;
```

ASP.NET CORE

```
//Add Pivot table fields (row and column fields)
pivotTable.Fields[2].Axis = PivotAxisTypes.Row;
pivotTable.Fields[6].Axis = PivotAxisTypes.Row;
pivotTable.Fields[3].Axis = PivotAxisTypes.Column;
```

XAMARIN

```
//Add Pivot table fields (row and column fields)
pivotTable.Fields[2].Axis = PivotAxisTypes.Row;
pivotTable.Fields[6].Axis = PivotAxisTypes.Row;
pivotTable.Fields[3].Axis = PivotAxisTypes.Column;
```

The **IPivotDataFields** represents a collection of data fields in the pivot table. The data field is added with the required subtotal function using the **PivotSubtotalTypes** enumeration. To learn more about different subtotal types supported in pivot tables, refer to the **PivotSubtotalTypes** in API section. The following code explains how to configure a pivot field as a data field.

C#

```
//Add data field
IPivotField field = pivotTable.Fields[5];
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
```

VB.NET

```
'Add data field
Dim field As IPivotField = pivotTable.Fields(5)
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum)
```

UWP

```
//Add data field
IPivotField field = pivotTable.Fields[5];
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
```

ASP.NET CORE

```
//Add data field
IPivotField field = pivotTable.Fields[5];
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
```

XAMARIN

```
//Add data field
IPivotField field = pivotTable.Fields[5];
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
```

The following code snippet illustrates how to create a pivot table with existing data in the worksheet using XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotData.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IWorksheet pivotSheet = workbook.Worksheets[1];
    //Create Pivot cache with the given data range
    IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:H50"]);
    //Create "PivotTable1" with the cache at the specified range
    IPivotTable pivotTable = pivotSheet.PivotTables.Add("PivotTable1",
    pivotSheet["A1"], cache);
    //Add Pivot table fields (Row and Column fields)
    pivotTable.Fields[2].Axis = PivotAxisTypes.Row;
    pivotTable.Fields[6].Axis = PivotAxisTypes.Row;
    pivotTable.Fields[3].Axis = PivotAxisTypes.Column;
    //Add data field
    IPivotField field = pivotTable.Fields[2];
    pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
    workbook.SaveAs("PivotTable.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotData.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim pivotSheet As IWorksheet = workbook.Worksheets(1)
```

```

'Create Pivot cache with the given data range
Dim cache As IPivotCache = workbook.PivotCaches.Add(worksheet("A1:H50"))
'Create "PivotTable1" with the cache at the specified range
Dim pivotTable As IPivotTable = pivotSheet.PivotTables.Add("PivotTable1",
pivotSheet("A1"), cache)
'Add Pivot table fields (Row and Column fields)
pivotTable.Fields(2).Axis = PivotAxisTypes.Row
pivotTable.Fields(6).Axis = PivotAxisTypes.Row
pivotTable.Fields(3).Axis = PivotAxisTypes.Column
'Add data field
Dim field As IPivotField = pivotTable.Fields(2)
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum)
workbook.SaveAs("PivotTable.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
assembly.GetManifestResourceStream("PivotTable.PivotData.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];

    //Add data field
    IPivotField field = pivotTable.Fields[2];
    pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
}

```

```

string fileName = "PivotTable.xlsx";
outputStream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies among Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
    "application/msexcel", outputStream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
    "application/msexcel", outputStream);
}
}

```

Editing and formatting a pivot table

A pivot table can be accessed from the **IPivotTables** interface that have the collection of pivot tables in the worksheet. The following code shows how to dynamically refresh the data in a pivot table. In prior:

- Create the pivot table using Excel GUI.
- Specify the named range to be the data source of the pivot table.
- Make sure that the "Refresh on Open" option of the pivot table is selected.
- Dynamically refresh the data in the named range.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
    IWorksheet pivotSheet = workbook.Worksheets[0];
    //Change the range values that the Pivot Tables range refers to
    workbook.Names["PivotRange"].RefersToRange = pivotSheet.Range["A1:D27"];
    workbook.SaveAs("PivotTable_DynamicRange.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim pivotSheet As IWorksheet = workbook.Worksheets(0)
'Change the range values that the Pivot Tables range refers to
workbook.Names("PivotRange").RefersToRange = pivotSheet.Range("A1:D27")
workbook.SaveAs("PivotTable_DynamicRange.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet pivotSheet = workbook.Worksheets[0];
    //Change the range values that the Pivot Tables range refers to
    workbook.Names["PivotRange"].RefersToRange = pivotSheet.Range["A1:D27"];
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "PivotTable_DynamicRange";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet pivotSheet = workbook.Worksheets[0];
    //Change the range values that the Pivot Tables range refers to
    workbook.Names["PivotRange"].RefersToRange = pivotSheet.Range["A1:D27"];
    string fileName = "PivotTable_DynamicRange.xlsx";
    //Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection

```

```

Stream inputStream =
assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet pivotSheet = workbook.Worksheets[0];
//Change the range values that the Pivot Tables range refers to
workbook.Names["PivotRange"].RefersToRange = pivotSheet.Range["A1:D27"];
//Saving the workbook as stream
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
string fileName = "PivotTable_DynamicRange.xlsx";
outputStream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies among Windows Phone,
Android, and iOS platforms. Refer to the xlsio/xamarin section for
respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
"application/msexcel", outputStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
"application/msexcel", outputStream);
}
}

```

XlsIO supports 85 built-in styles of Excel 2007 used to create a table with rich formatting using the **PivotBuiltInStyles** property as follows. To learn more about various built-in styles supported, refer to the **PivotBuiltInStyles** enumeration in API section.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
IWorksheet worksheet = workbook.Worksheets[1];
IPivotTable pivotTable = worksheet.PivotTables[0];
//Set BuiltInStyle
pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12;
workbook.SaveAs("PivotTable_Style.xlsx");
//No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = false;
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(1)

```

```

Dim pivotTable As IPivotTable = sheet.PivotTables(0)
' Set BuiltInStyle
pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12
workbook.SaveAs("PivotTable_Style.xlsx")
' No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = False
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    // Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    // Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet worksheet = workbook.Worksheets[1];
    IPivotTable pivotTable = worksheet.PivotTables[0];
    // Set BuiltInStyle
    pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12;
    // Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "PivotTable_Style";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    // Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    // Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

    FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet worksheet = workbook.Worksheets[1];
    IPivotTable pivotTable = worksheet.PivotTables[0];
    // Set BuiltInStyle
    pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12;
    string fileName = "PivotTable_Style.xlsx";
    // Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[1];
    IPivotTable pivotTable = worksheet.PivotTables[0];
    //Set BuiltInStyle
    pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12;
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "PivotTable_Style.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
            "application/msexcel", outputStream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
            "application/msexcel", outputStream);
    }
}

```

Refresh a pivot table

When you update the pivot table data source, refresh the pivot table manually to load the new data source into it. Essential XlsIO supports this refreshing of pivot table data source through **IsRefreshOnLoad** property of **PivotCacheImpl**.

Refer the following complete code snippets.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Updating a new value in the pivot data
    worksheet.Range["C2"].Value = "250";
}

```

```
//Accessing the pivot table
IPivotTable pivotTable = worksheet.PivotTables[0];
PivotTableImpl pivotTableImpl = pivotTable as PivotTableImpl;
//Refreshing pivot cache to update the pivot table
pivotTableImpl.Cache.IsRefreshOnLoad = true;
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Updating a new value in the pivot data
worksheet.Range("C2").Value = "250"
'Accessing the pivot table
Dim pivotTable As IPivotTable = worksheet.PivotTables(0)
Dim pivotTableImpl As PivotTableImpl = CType(pivotTable, PivotTableImpl)
'Refreshing pivot cache to update the pivot table
pivotTableImpl.Cache.IsRefreshOnLoad = True
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Instantiates the file picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");

Expand or collapse rows in pivot table

Essential XlsIO allows you to expand and collapse the **PivotFieldItems** or simply the pivot table rows using **IsHiddenDetails** of **PivotItemOptions**.

Refer the following complete code snippets.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create pivot cache with the given data range
    IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:C13"]);
    //Create "PivotTable1" with the cache at the specified range
    IPivotTable pivotTable = worksheet.PivotTables.Add("PivotTable1",
    worksheet["E1"], cache);
    //Add pivot table fields (Row and Column fields)
    pivotTable.Fields[0].Axis = PivotAxisTypes.Row;
    pivotTable.Fields[1].Axis = PivotAxisTypes.Row;
    //Add data field
    IPivotField field = pivotTable.Fields[2];
    pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum);
    //Initialize PivotItemOptions
    PivotItemOptions options = new PivotItemOptions();
    options.IsHiddenDetails = false;
    //Collapsing the first and second items of the first pivot field using
    PivotItemOptions
    (pivotTable.Fields[0] as PivotFieldImpl).AddItemOption(0, options);
    (pivotTable.Fields[0] as PivotFieldImpl).AddItemOption(1, options);
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Create pivot cache with the given data range
Dim cache As IPivotCache = workbook.PivotCaches.Add(worksheet("A1:C13"))
'Create "PivotTable1" with the cache at the specified range
```

```

Dim pivotTable As IPivotTable = worksheet.PivotTables.Add("PivotTable1",
worksheet("E1"), cache)
'Add pivot table fields (Row and Column fields)
pivotTable.Fields(0).Axis = PivotAxisTypes.Row
pivotTable.Fields(1).Axis = PivotAxisTypes.Row
'Add data field
Dim field As IPivotField = pivotTable.Fields(2)
pivotTable.DataFields.Add(field, "Sum", PivotSubtotalTypes.Sum)
'Initialize PivotItemOptions
Dim options As PivotItemOptions = New PivotItemOptions
options.IsHiddenDetails = False
'Collapsing the first and second items of the first pivot field using
PivotItemOptions
CType(pivotTable.Fields(0), PivotFieldImpl).AddItemOption(0, options)
CType(pivotTable.Fields(0), PivotFieldImpl).AddItemOption(1, options)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())

}
}

```

Applying pivot table filters

The filtered data of a pivot table displays only the subset of data that meets the specified criteria. This can be achieved in XlsIO using the **IPivotFilters** interface.

Applying page filters

The page field filter or report filter can filter the pivot table based on the page field items. The following code snippet illustrates how to apply multiple filters to the page field items.

C#

```

//Set field axis to page
pivotTable.Fields[4].Axis = PivotAxisTypes.Page;
//Apply page field filter
IPivotField pageField = pivotTable.Fields[4];
//Select multiple items in page field to filter
pageField.Items[1].Visible = false;
pageField.Items[2].Visible = false;

```

VB.NET

```
'Set field axis to page
pivotTable.Fields(4).Axis = PivotAxisTypes.Page
'Apply page field filter
Dim pageField As IPivotField = pivotTable.Fields(4)
'Select multiple items in page field to filter
pageField.Items(1).Visible = False
pageField.Items(2).Visible = False
```

UWP

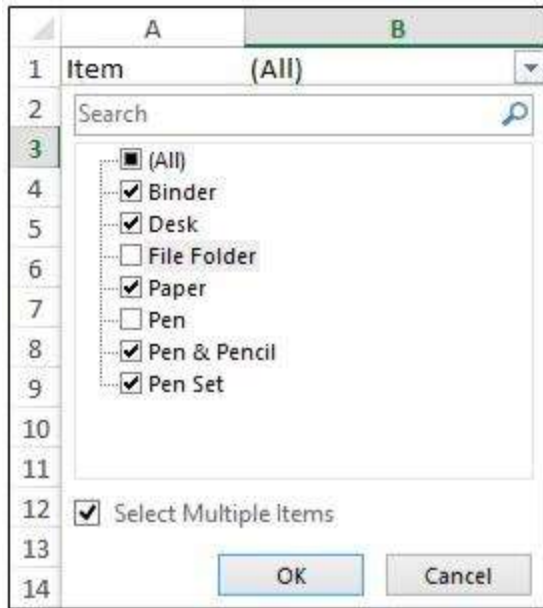

```
//Set field axis to page
pivotTable.Fields[4].Axis = PivotAxisTypes.Page;
//Apply page field filter
IPivotField pageField = pivotTable.Fields[4];
//Select multiple items in page field to filter
pageField.Items[1].Visible = false;
pageField.Items[2].Visible = false;
```

ASP.NET CORE

```
//Set field axis to page
pivotTable.Fields[4].Axis = PivotAxisTypes.Page;
//Apply page field filter
IPivotField pageField = pivotTable.Fields[4];
//Select multiple items in page field to filter
pageField.Items[1].Visible = false;
pageField.Items[2].Visible = false;
```

XAMARIN

```
//Set field axis to page
pivotTable.Fields[4].Axis = PivotAxisTypes.Page;
//Apply page field filter
IPivotField pageField = pivotTable.Fields[4];
//Select multiple items in page field to filter
pageField.Items[1].Visible = false;
pageField.Items[2].Visible = false;
```

Applying row or column filters

The row and column field filters can filter the pivot table based on labels, values, and items of the fields. The following code example illustrates how to apply these filters to a pivot table.

Label Filter

C#

```
//Apply row field filter
IPivotField rowField = pivotTable.Fields[2];
//Applying Label based row field filter
rowField.PivotFilters.Add(PivotFilterType.CaptionEqual, null, "Central",
null);
```

VB.NET

```
'Apply row field filter
Dim rowField As IPivotField = pivotTable.Fields(2)
'Applying Label based row field filter
rowField.PivotFilters.Add(PivotFilterType.CaptionEqual, Nothing, "Central",
Nothing)
```

UWP

```
//Apply row field filter
IPivotField rowField = pivotTable.Fields[2];
//Applying Label based row field filter
rowField.PivotFilters.Add(PivotFilterType.CaptionEqual, null, "Central",
null);
```

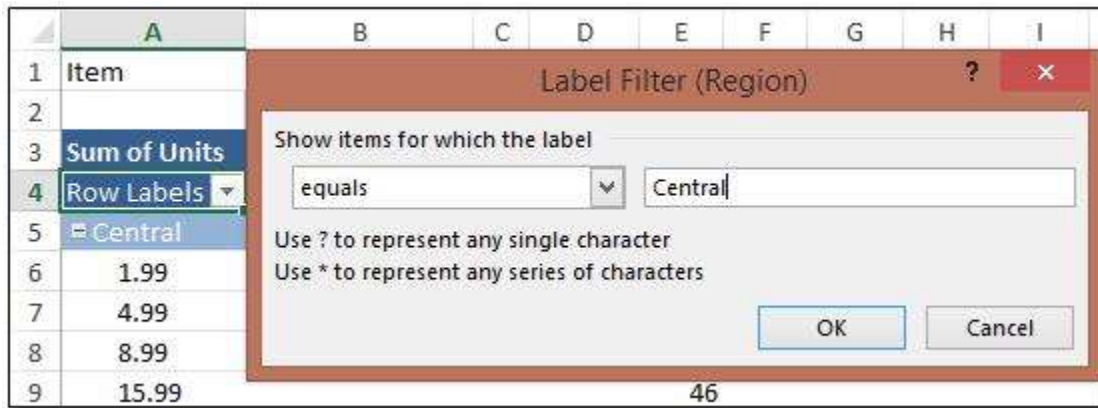

ASP.NET CORE

```
//Apply row field filter
IPivotField rowField = pivotTable.Fields[2];
```

```
//Applying Label based row field filter
rowField.PivotFilters.Add(PivotFilterType.CaptionEqual, null, "Central",
null);
```

XAMARIN

```
//Apply row field filter
IPivotField rowField = pivotTable.Fields[2];
//Applying Label based row field filter
rowField.PivotFilters.Add(PivotFilterType.CaptionEqual, null, "Central",
null);
```

Value Filter

C#

```
IPivotField field = pivotTable.Fields[2];
//Apply value filter
field.PivotFilters.Add(PivotFilterType.ValueLessThan, field, "1341", null);
```

VB.NET

```
'Apply row field filter
Dim field As IPivotField = pivotTable.Fields(2)
'Applying value filter
field.PivotFilters.Add(PivotFilterType.ValueLessThan, field, "1341",
Nothing)
```

UWP

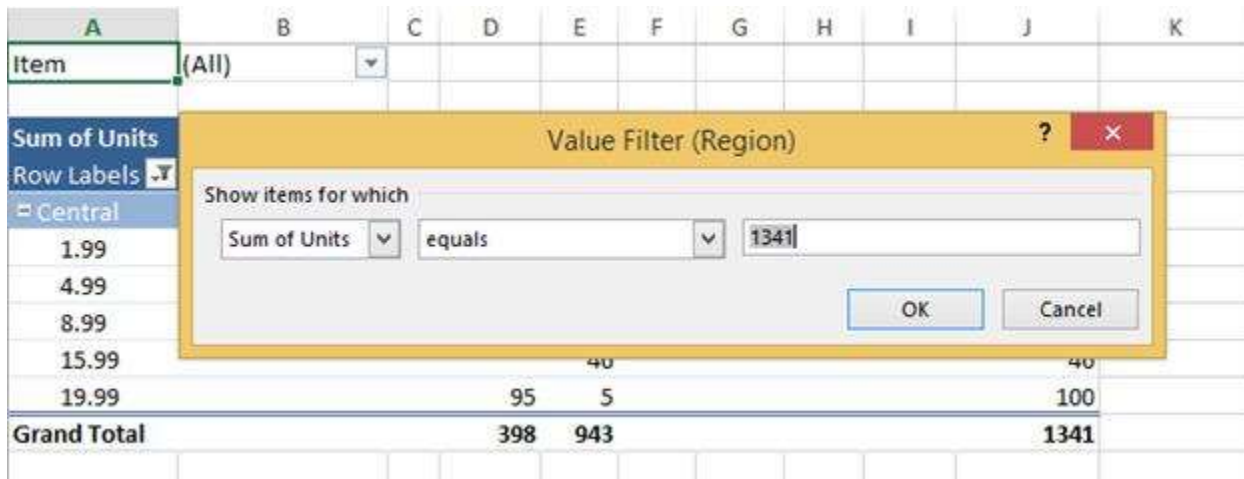

```
IPivotField field = pivotTable.Fields[2];
//Apply value filter
field.PivotFilters.Add(PivotFilterType.ValueLessThan, field, "1341", null);
```

ASP.NET CORE

```
IPivotField field = pivotTable.Fields[2];
//Apply value filter
field.PivotFilters.Add(PivotFilterType.ValueLessThan, field, "1341", null);
```

XAMARIN

```
IPivotField field = pivotTable.Fields[2];
//Apply value filter
field.PivotFilters.Add(PivotFilterType.ValueLessThan, field, "1341", null);
```

"application/msexcel", outputStream);
}
}

```

Applying pivot table settings

Excel provides various options through the PivotTableOptions dialog box to customize the appearance of the pivot table.

XlsIO supports these pivot table options using the IPivotTableOptions interface to control various settings for the existing pivot table. To learn more about various pivot table options, refer to the **IPivotTableOptions** in API section. The following code illustrates how to access the PivotTableOptions object.

C#

```

//Enable ColumnHeaderCaption
IPivotTable pivotTable = worksheet.PivotTables[0];

```

```
IPivotTableOptions options = pivotTable.Options;
```

VB.NET

```
'Enable ColumnHeaderCaption  
Dim pivotTable As IPivotTable = worksheet.PivotTables(0)  
Dim options As IPivotTableOptions = pivotTable.Options
```

UWP

```
//Enable ColumnHeaderCaption  
IPivotTable pivotTable = worksheet.PivotTables[0];  
IPivotTableOptions options = pivotTable.Options;
```

ASP.NET CORE

```
//Enable ColumnHeaderCaption  
IPivotTable pivotTable = worksheet.PivotTables[0];  
IPivotTableOptions options = pivotTable.Options;
```

XAMARIN

```
//Enable ColumnHeaderCaption  
IPivotTable pivotTable = worksheet.PivotTables[0];  
IPivotTableOptions options = pivotTable.Options;
```

Show or hide the field list

To show or hide the pivot table field list pane, use the ShowFieldList property.

C#

```
//Enable ShowFieldList  
options.ShowFieldList = false;
```

VB.NET

```
'Enable ShowFieldList  
options.ShowFieldList = False
```

UWP

```
//Enable ShowFieldList  
options.ShowFieldList = false;
```

ASP.NET CORE

```
//Enable ShowFieldList  
options.ShowFieldList = false;
```

XAMARIN

```
//Enable ShowFieldList
```

```
options.ShowFieldList = false;
```

Header caption

The **RowHeaderCaption** and **ColumnHeaderCaption** properties allows to edit the respective pivot table headers. The header caption can be enabled or disabled using the **DisplayFieldCaption** property.

C#

```
//Enable header captions
options.RowHeaderCaption = "Payment Dates";
options.ColumnHeaderCaption = "Payments";
```

VB.NET

```
'Enable header captions
options.RowHeaderCaption = "Payment Dates"
options.ColumnHeaderCaption = "Payments"
```

UWP

```
//Enable header captions
options.RowHeaderCaption = "Payment Dates";
options.ColumnHeaderCaption = "Payments";
```

ASP.NET CORE

```
//Enable header captions
options.RowHeaderCaption = "Payment Dates";
options.ColumnHeaderCaption = "Payments";
```

XAMARIN

```
//Enable header captions
options.RowHeaderCaption = "Payment Dates";
options.ColumnHeaderCaption = "Payments";
```

Grand total

XlsIO provides an equivalent API to perform grand totals with the properties as follows.

C#

```
//Enable GrandTotals
pivotTable.ColumnGrand = false;
pivotTable.RowGrand = true;
```

VB.NET

```
'Enable GrandTotals
pivotTable.ColumnGrand = False
pivotTable.RowGrand = False
```

UWP

```
//Enable GrandTotals  
pivotTable.ColumnGrand = false;  
pivotTable.RowGrand = true;
```

ASP.NET CORE

```
//Enable GrandTotals  
pivotTable.ColumnGrand = false;  
pivotTable.RowGrand = true;
```

XAMARIN

```
//Enable GrandTotals  
pivotTable.ColumnGrand = false;  
pivotTable.RowGrand = true;
```

Show or hide collapse button

You can also show or hide the **Collapse** button that appears in the fields of the pivot table, when more than one item exists in a field. The following code example illustrates how to do this.

C#

```
//Enable ShowDrillIndicators  
pivotTable.ShowDrillIndicators = true;
```

VB.NET

```
'Enable ShowDrillIndicators  
pivotTable.ShowDrillIndicators = True
```

UWP

```
//Enable ShowDrillIndicators  
pivotTable.ShowDrillIndicators = true;
```

ASP.NET CORE

```
//Enable ShowDrillIndicators  
pivotTable.ShowDrillIndicators = true;
```

XAMARIN

```
//Enable ShowDrillIndicators  
pivotTable.ShowDrillIndicators = true;
```

Display field caption and filter option

The filter buttons and field names in the pivot table can be shown or hidden, as in the following code.

C#

```
//Enable DisplayFieldCaption  
pivotTable.DisplayFieldCaptions = true;
```

VB.NET

```
'Enable DisplayFieldCaption  
pivotTable.DisplayFieldCaptions = True
```

UWP

```
//Enable DisplayFieldCaption  
pivotTable.DisplayFieldCaptions = true;
```

ASP.NET CORE

```
//Enable DisplayFieldCaption  
pivotTable.DisplayFieldCaptions = true;
```

XAMARIN

```
//Enable DisplayFieldCaption  
pivotTable.DisplayFieldCaptions = true;
```

Repeating row label on each page

You can set the row label on each page while printing, and the header can be viewed on each page.

C#

```
//Enable RepeatItemsOnEachPrintedPage  
pivotTable.RepeatItemsOnEachPrintedPage = true;
```

VB.NET

```
'Enable RepeatItemsOnEachPrintedPage  
pivotTable.RepeatItemsOnEachPrintedPage = True
```

UWP

```
//Enable RepeatItemsOnEachPrintedPage  
pivotTable.RepeatItemsOnEachPrintedPage = true;
```

ASP.NET CORE

```
//Enable RepeatItemsOnEachPrintedPage  
pivotTable.RepeatItemsOnEachPrintedPage = true;
```

XAMARIN

```
//Enable RepeatItemsOnEachPrintedPage  
pivotTable.RepeatItemsOnEachPrintedPage = true;
```

Repeat Labels

You can repeat labels for row or column fields when the [pivot table layout](#) is set to tabular or outline layout forms.

Specific Pivot Field

The following code illustrates how to set the repeat labels option to a specific pivot field.

C#

```
//Set repeat labels option to a specific pivot field  
pivotTable.Fields[0].RepeatLabels = true;
```

VB.NET

```
'Set repeat labels option to a specific pivot field  
pivotTable.Fields(0).RepeatLabels = True
```

UWP

```
//Set repeat labels option to a specific pivot field  
pivotTable.Fields[0].RepeatLabels = true;
```

ASP.NET CORE

```
//Set repeat labels option to a specific pivot field  
pivotTable.Fields[0].RepeatLabels = true;
```

XAMARIN

```
//Set repeat labels option to a specific pivot field  
pivotTable.Fields[0].RepeatLabels = true;
```

All Pivot Fields

The following code illustrates how to set the repeat labels option to all the pivot fields.

C#

```
//Set repeat labels option to all the pivot fields  
pivotTable.Options.RepeatAllLabels(true);
```

VB.NET

```
'Set repeat labels option to all the pivot fields  
pivotTable.Options.RepeatAllLabels(True)
```

UWP

```
//Set repeat labels option to all the pivot fields  
pivotTable.Options.RepeatAllLabels(true);
```

ASP.NET CORE

```
//Set repeat labels option to all the pivot fields
pivotTable.Options.RepeatAllLabels(true);
```

XAMARIN

```
//Set repeat labels option to all the pivot fields
pivotTable.Options.RepeatAllLabels(true);
```

Sort by value in Pivot Table

Pivot field AutoSort allows you to sort the pivot row or column fields based on the data field values. You can perform the sorting in following direction:

- Top to Bottom
- Left to Right

Sort a Pivot Table Field Top to Bottom

Top to Bottom sorting can sort the pivot table column field values based on the sort type. To apply Top to Bottom sorting in pivot table, you should apply the sorting in pivot row field by AutoSort method. The following code example illustrates how to apply Top to Bottom sorting to a pivot table.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    // Pivot Top to Bottom sorting.
    IPivotField rowField = pivotTable.RowFields[0];
    rowField.AutoSort(PivotFieldSortType.Ascending, 1);
    workbook.SaveAs("PivotFieldAutoSort.xlsx");
    excelEngine.ThrowNotSavedOnDestroy = false;
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(1)
Dim pivotTable As IPivotTable = sheet.PivotTables(0)
' Pivot Top to Bottom sorting.
Dim rowField As IPivotField = pivotTable.RowFields(0)
rowField.AutoSort(PivotFieldSortType.Ascending, 1)
workbook.SaveAs("PivotTableCalculate.xlsx")
excelEngine.ThrowNotSavedOnDestroy = False
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    // Pivot Top to Bottom sorting.
    IPivotField rowField = pivotTable.RowFields[0];
    rowField.AutoSort(PivotFieldSortType.Ascending, 1);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "PivotFieldAutoSort";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    // Pivot Top to Bottom sorting.
    IPivotField rowField = pivotTable.RowFields[0];
    rowField.AutoSort(PivotFieldSortType.Ascending, 1);
    string fileName = "PivotFieldAutoSort.xlsx";
    //Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly

```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet sheet = workbook.Worksheets[1];
IPivotTable pivotTable = sheet.PivotTables[0];
// Pivot Top to Bottom sorting.
IPivotField rowField = pivotTable.RowFields[0];
rowField.AutoSort(PivotFieldSortType.Ascending, 1);
//Saving the workbook as stream
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
string fileName = "PivotFieldAutoSort.xlsx";
outputStream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies among Windows Phone,
Android, and iOS platforms. Refer to the xlsio/xamarin section for
respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
"application/msexcel", outputStream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
"application/msexcel", outputStream);
}
}

```

Sort a Pivot Table Field Left to Right

Left to Right sorting can sort the pivot table row field values based on the sort type. To apply Left to Right sorting in pivot table, you should apply the sorting in pivot column field by AutoSort method. The following code example illustrates how to apply Left to Right sorting to a pivot table.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
IWorksheet sheet = workbook.Worksheets[1];
IPivotTable pivotTable = sheet.PivotTables[0];
// Pivot table Left to Right sorting.
IPivotField columnField = pivotTable.ColumnFields[0];
columnField.AutoSort(PivotFieldSortType.Ascending, 1);
workbook.SaveAs("PivotFieldAutoSort.xlsx");
excelEngine.ThrowNotSavedOnDestroy = false;
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(1)
Dim pivotTable As IPivotTable = sheet.PivotTables(0)
' Pivot table Left to Right sorting.
Dim rowField As columnField = pivotTable.ColumnFields(0)
columnField.AutoSort(PivotFieldSortType.Ascending, 1)
workbook.SaveAs("PivotTableCalculate.xlsx")
excelEngine.ThrowNotSavedOnDestroy = False
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    // Pivot table Left to Right sorting.
    IPivotField columnField = pivotTable.ColumnFields[0];
    columnField.AutoSort(PivotFieldSortType.Ascending, 1);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "PivotFieldAutoSort";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    // Pivot table Left to Right sorting.
    IPivotField columnField = pivotTable.ColumnFields[0];
    columnField.AutoSort(PivotFieldSortType.Ascending, 1);
}

```

```

string fileName = "PivotFieldAutoSort.xlsx";
//Saving the workbook as stream
FileStream stream = new FileStream(fileName, FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    // Pivot table Left to Right sorting.
    IPivotField columnField = pivotTable.ColumnFields[0];
    columnField.AutoSort(PivotFieldSortType.Ascending, 1);
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "PivotFieldAutoSort.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
        "application/msexcel", outputStream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
        "application/msexcel", outputStream);
    }
}

```

Note: PivotCacheImpl.IsRefreshOnLoad property is set as true when applying AutoSort to pivot fields.

Other pivot table operations

Adding calculated field in the existing pivot table

Calculated field is a special type of database field that perform calculations by using the contents of other fields in the pivot table with the given formula. The formula can contain operators and expressions as in other worksheet formulas. You can use constants and refer to the data from the PivotTable.

You can read and create the calculated fields in the existing pivot table. The following are the Excel restrictions when using the formula:

- Formula cannot contain cell references or defined names.
- Formula cannot contain Worksheet functions that require cell references.
- Formula cannot use array functions.

The calculated field in XlsIO can be achieved using the following code sample.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
        "Sales/Total*100");
    workbook.SaveAs("PivotTableCalculate.xlsx");
    excelEngine.ThrowNotSavedOnDestroy = false;
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(1)
Dim pivotTable As IPivotTable = sheet.PivotTables(0)
' Add calculated field to the first pivot table
Dim field As IPivotField = pivotTable.CalculatedFields.Add("Percent",
    "Sales/Total*100")
workbook.SaveAs("PivotTableCalculate.xlsx")
excelEngine.ThrowNotSavedOnDestroy = False
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
}
```

```

IPivotField field = pivotTable.CalculatedFields.Add("Percent",
"Sales/Total*100");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "PivotTableCalculate";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
    "Sales/Total*100");
    string fileName = "PivotTableCalculate.xlsx";
    //Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
    "Sales/Total*100");
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
}

```

```

string fileName = "PivotTableCalculate.xlsx";
outputStream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies among Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
    "application/msexcel", outputStream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
    "application/msexcel", outputStream);
}
}

```

The formula can also be set to the IPivotField property as follows.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
    "Sales/Total*100");
    //Set Field Formula
    field.Formula = "Sales/Total*200";
    workbook.SaveAs("PivotTable.xlsx");
    excelEngine.ThrowNotSavedOnDestroy = false;
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim pivotTable As IPivotTable = sheet.PivotTables(0)
Dim field As IPivotField = pivotTable.CalculatedFields.Add("Percent",
"Sales/Total*100")
'Set Field Formula
field.Formula = "Sales/Total*200"
workbook.SaveAs("PivotTable.xlsx")
excelEngine.ThrowNotSavedOnDestroy = False
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
        "Sales/Total*100");
    //Set Field Formula
    field.Formula = "Sales/Total*200";
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "PivotTableCalculate";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(fileStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
        "Sales/Total*100");
    //Set Field Formula
    field.Formula = "Sales/Total*200";
    string fileName = "PivotTableCalculate.xlsx";
    //Saving the workbook as stream
    FileStream stream = new FileStream(fileName, FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("PivotTable.PivotTable.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet sheet = workbook.Worksheets[1];
    IPivotTable pivotTable = sheet.PivotTables[0];
    //Add calculated field to the first pivot table
    IPivotField field = pivotTable.CalculatedFields.Add("Percent",
        "Sales/Total*100");
    //Set Field Formula
    field.Formula = "Sales/Total*200";
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "PivotTableCalculate.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
            "application/msexcel", outputStream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
            "application/msexcel", outputStream);
    }
}

```

Layout the pivot table like Excel

A pivot table can be created similar to the Excel layout.

The following code example illustrates how to enable Essential XlsIO to layout the pivot table like Excel.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotData.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IWorksheet pivotSheet = workbook.Worksheets[1];
    IPivotCache cache = workbook.PivotCaches.Add(worksheet["A1:H50"]);
}

```

```

IPivotTable pivotTable = pivotSheet.PivotTables.Add("PivotTable1",
pivotSheet["A1"], cache);
pivotTable.Fields[4].Axis = PivotAxisTypes.Page;
pivotTable.Fields[2].Axis = PivotAxisTypes.Row;
pivotTable.Fields[6].Axis = PivotAxisTypes.Row;
pivotTable.Fields[3].Axis = PivotAxisTypes.Column;
IPivotField dataField = pivotSheet.PivotTables[0].Fields[5];
pivotTable.DataFields.Add(dataField, "Sum of Units",
PivotSubtotalTypes.Sum);
pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12;
//pivot table layout
pivotTable.Layout();
workbook.SaveAs("PivotTable.xlsx");
excelEngine.ThrowNotSavedOnDestroy = false;
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotData.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim pivotSheet As IWorksheet = workbook.Worksheets(1)
Dim cache As IPivotCache = workbook.PivotCaches.Add(worksheet("A1:H50"))
Dim pivotTable As IPivotTable = pivotSheet.PivotTables.Add("PivotTable1",
pivotSheet("A1"), cache)
pivotTable.Fields(4).Axis = PivotAxisTypes.Page
pivotTable.Fields(2).Axis = PivotAxisTypes.Row
pivotTable.Fields(6).Axis = PivotAxisTypes.Row
pivotTable.Fields(3).Axis = PivotAxisTypes.Column
Dim dataField As IPivotField = pivotSheet.PivotTables(0).Fields(5)
pivotTable.DataFields.Add(dataField, "Sum of Units", PivotSubtotalTypes.Sum)
pivotTable.BuiltInStyle = PivotBuiltInStyles.PivotStyleDark12
'pivot table layout
pivotTable.Layout()
workbook.SaveAs("PivotTable.xlsx")
excelEngine.ThrowNotSavedOnDestroy = False
End Using

```

UWP

```

//XlsIO supports pivot table layout in Windows Forms, WPF, ASP.NET, and
ASP.NET MVC platforms.

```

ASP.NET CORE

```

//XlsIO supports pivot table layout in Windows Forms, WPF, ASP.NET, and
ASP.NET MVC platforms.

```

XAMARIN

```

//XlsIO supports pivot table layout in Windows Forms, WPF, ASP.NET, and
ASP.NET MVC platforms.

```

Working with Pivot Charts

PivotCharts are interactive graphical representations of PivotTable data that allows rapid analysis of the displayed data. In XlsIO, **PivotCharts** are created by **ICChart** interface by setting its pivot source as **PivotTable**.

Note: XlsIO supports PivotCharts only for XLSX format.

To create a pivot table, refer [Create Pivot Table](#).

The following code snippet illustrates how to create a PivotChart.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("PivotTable.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IPivotTable pivotTable = worksheet.PivotTables[0];
    //Adding a chart to workbook
    IChart pivotChart = workbook.Charts.Add();
    //Set PivotTable as PivotSource to the chart
    pivotChart.PivotSource = pivotTable;
    //Set PivotChart type
    pivotChart.PivotChartType = ExcelChartType.Column_Clustered;
    workbook.SaveAs("PivotChart.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = ExcelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("PivotTable.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim pivotTable As IPivotTable = worksheet.PivotTables(0)
'Adding a chart to workbook
Dim pivotChart As IChart = workbook.Charts.Add()
'Set PivotTable as PivotSource to the chart
pivotChart.PivotSource = pivotTable
'Set PivotChart type
pivotChart.PivotChartType = ExcelChartType.Column_Clustered
workbook.SaveAs("PivotChart.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
```

```

//Gets input Excel document from embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("PivotChart.PivotTable.xlsx");
IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
IWorksheet worksheet = workbook.Worksheets[0];
IPivotTable pivotTable = workbook.Worksheets[1].PivotTables[0];
//Adding a chart to workbook
IChart pivotChart = workbook.Charts.Add();
//Set PivotTable as PivotSource to the chart
pivotChart.PivotSource = pivotTable;
//Set PivotChart type
pivotChart.PivotChartType = ExcelChartType.Column_Clustered;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "PivotChart";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream fileStream = new FileStream("PivotTable.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(fileStream);
IWorksheet worksheet = workbook.Worksheets[0];
IPivotTable pivotTable = worksheet.PivotTables[0];
//Adding a chart to workbook
IChart pivotChart = workbook.Charts.Add();
//Set PivotTable as PivotSource to the chart
pivotChart.PivotSource = pivotTable;
//Set PivotChart type
pivotChart.PivotChartType = ExcelChartType.Column_Clustered;
string fileName = "PivotChart.xlsx";
//Saving the workbook as stream
FileStream stream = new FileStream(fileName, FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly

```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("PivotChart.PivotTable.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet worksheet = workbook.Worksheets[0];
IPivotTable pivotTable = worksheet.PivotTables[0];
//Adding a chart to workbook
IChart pivotChart = workbook.Charts.Add();
//Set PivotTable as PivotSource to the chart
pivotChart.PivotSource = pivotTable;
//Set PivotChart type
pivotChart.PivotChartType = ExcelChartType.Column_Clustered;
string fileName = "PivotChart.xlsx";
//Saving the workbook as stream
MemoryStream outputStream = new MemoryStream();
workbook.SaveAs(outputStream);
//Save the stream as an Excel document and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
await DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
"application/msexcel", outputStream);
else
DependencyService.Get<ISave>().SaveAndView(fileName, "application/msexcel",
outputStream);
//Dispose the input and output stream instances
inputStream.Dispose();
outputStream.Dispose();
}

```

PivotChart Options

The following code snippet shows how to set field buttons in a pivot chart.

Note: The PivotChart properties are supported exclusively from Excel 2010 onwards.

C#

```

//Adding PivotChart to the workbook
IChart pivotChart = workbook.Charts.Add();
//Set Field Buttons
pivotChart.ShowAllFieldButtons = false;
pivotChart.ShowAxisFieldButtons = false;
pivotChart.ShowLegendFieldButtons = false;
pivotChart.ShowReportFilterFieldButtons = false;
pivotChart.ShowValueFieldButtons = false;

```

VB.NET

```

'Insert the PivotChart sheet to the workbook
Dim pivotChartSheet As IChart = workbook.Charts.Add()
'Set Field Buttons
pivotChartSheet.ShowAllFieldButtons = False
pivotChartSheet.ShowAxisFieldButtons = False

```

```
pivotChartSheet.ShowLegendFieldButtons = False  
pivotChartSheet.ShowReportFilterFieldButtons = False  
pivotChartSheet.ShowValueFieldButtons = False
```

UWP

```
//Adding PivotChart to the workbook  
IChart pivotChart = workbook.Charts.Add();  
//Set Field Buttons  
pivotChart.ShowAllFieldButtons = false;  
pivotChart.ShowAxisFieldButtons = false;  
pivotChart.ShowLegendFieldButtons = false;  
pivotChart.ShowReportFilterFieldButtons = false;  
pivotChart.ShowValueFieldButtons = false;
```

ASP.NET CORE

```
//Adding PivotChart to the workbook  
IChart pivotChart = workbook.Charts.Add();  
//Set Field Buttons  
pivotChart.ShowAllFieldButtons = false;  
pivotChart.ShowAxisFieldButtons = false;  
pivotChart.ShowLegendFieldButtons = false;  
pivotChart.ShowReportFilterFieldButtons = false;  
pivotChart.ShowValueFieldButtons = false;
```

XAMARIN

```
//Adding PivotChart to the workbook  
IChart pivotChart = workbook.Charts.Add();  
//Set Field Buttons  
pivotChart.ShowAllFieldButtons = false;  
pivotChart.ShowAxisFieldButtons = false;  
pivotChart.ShowLegendFieldButtons = false;  
pivotChart.ShowReportFilterFieldButtons = false;  
pivotChart.ShowValueFieldButtons = false;
```

Security

You can protect an anonymous user from viewing, moving, editing or deleting important data from a worksheet or workbook by [protecting a worksheet or workbook](#), with or without a password.

Protect Workbook

To keep others from making structural changes to your documents such as moving, deleting and adding sheets, you can protect the workbook in the following ways.

Encryption with password

There are two different passwords to encrypt a document.

1. **Password To Open** - This password helps to protect your workbook from unauthorized viewing or accessing.
2. **Password to Modify** - This password helps to allow give specific users permission to modify the workbook data and save changes to the file.

Read-Only Recommended – If the excel file is set as Read-only recommended, then Microsoft Excel displays a message recommending that you open the workbook as read-only when users open the excel file. This can be set with or without requiring a password to open the file.

The Following code snippets illustrate how to achieve the above options.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Encrypt the workbook with password
    workbook.PasswordToOpen = "password";
    //Set the password to modify the workbook
    workbook.SetWriteProtectionPassword("modify_password");
    //Set the workbook as read-only
    workbook.ReadOnlyRecommended = true;
    workbook.SaveAs("Encrypt.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Encrypt the workbook with password
workbook.PasswordToOpen = "password"
'Set the password to modify the workbook
workbook.SetWriteProtectionPassword("modify_password")
'Set the workbook as read-only
workbook.ReadOnlyRecommended = True
workbook.SaveAs("Encrypt.xlsx")
End Using
```

UWP

```
//Encrypt and Decrypt can be performed by referring .NET Standard assemblies
in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Encrypt the workbook with password
    workbook.PasswordToOpen = "password";
    //Set the password to modify the workbook
    workbook.SetWriteProtectionPassword("modify_password");
    //Set the workbook as read-only
    workbook.ReadOnlyRecommended = true;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
}
```

```

savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from the FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
Stream stream = file.AsStreamForWrite();
workbook.SaveAs(stream);
await file.FlushAsync();
stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Encrypt the workbook with password
    workbook.PasswordToOpen = "password";
    //Set the password to modify the workbook
    workbook.SetWriteProtectionPassword("modify_password");
    //Set the workbook as read-only
    workbook.ReadOnlyRecommended = true;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Encrypt.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Encrypt the workbook with password
    workbook.PasswordToOpen = "password";
    //Set the password to modify the workbook
    workbook.SetWriteProtectionPassword("modify_password");
    //Set the workbook as read-only
    workbook.ReadOnlyRecommended = true;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {

```

```
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx", "application/msexcel", stream);
}
}
```

Now, the encrypted workbook can be saved. Refer [Save Excel file](#).

Opening an encrypted workbook

You can open an existing encrypted workbook (decrypting) from either the file system or the stream using the following overloads.

C#

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(fileName,
ExcelParseOptions.Default, false, "password");
```

VB.NET

```
'Creates a new instance for ExcelEngine
Dim excelEngine As New ExcelEngine()
'Loads or open an existing workbook through Open method of IWorkbooks
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open(fileName,
ExcelParseOptions.Default, False, "password")
```

UWP

```
//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(fileName,
ExcelParseOptions.Default, false, "password");
```

ASP.NET CORE

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(workbookStream,
ExcelParseOptions.Default, false, "password");
```

XAMARIN

```
//Creates a new instance for ExcelEngine
ExcelEngine excelEngine = new ExcelEngine();
```

```
//Loads or open an existing workbook through Open method of IWorkbooks
IWorkbook workbook = excelEngine.Excel.Workbooks.Open(fileName,
ExcelParseOptions.Default, false, "password");
```

Removing encryption

The following code illustrates how to remove a protection for an encrypted document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx",
    ExcelParseOptions.Default, true, "password");
    //Removing a protection
    workbook.PasswordToOpen = string.Empty;
    workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx",
ExcelParseOptions.Default, True, "password")
'Removing a protection
workbook.PasswordToOpen = String.Empty
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelParseOptions.Default, true, "password");
    IWorksheet sheet = workbook.Worksheets[0];
    //Removing a protection
    workbook.PasswordToOpen = string.Empty;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
```

```

savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from the FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
Stream stream = file.AsStreamForWrite();
workbook.SaveAs(stream);
await file.FlushAsync();
stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelParseOptions.Default, true, "password");
    //Removing a protection
    workbook.PasswordToOpen = string.Empty;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelParseOptions.Default, true, "password");
    IWorksheet sheet = workbook.Worksheets[0];
    //Removing a protection
    workbook.PasswordToOpen = string.Empty;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)

```

```

{
    Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output.xlsx", "application/msexcel", stream);
}
else
{
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx", "application/msexcel", stream);
}
}

```

Protect workbook elements

XlsIO provides options to protect and unprotect workbook elements with password. The following code example illustrates how to protect a workbook with a password.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    bool isProtectWindow = true;
    bool isProtectContent = true;
    //Protect Workbook
    workbook.Protect(isProtectWindow, isProtectContent, "password");
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook =
application.Workbooks.Open("ProtectWorkbook.xlsx")
Dim isProtectWindow As Boolean = True
Dim isProtectContent As Boolean = True
'protect workbook
workbook.Protect(isProtectWindow, isProtectContent, "password")
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

//Encrypt and Decrypt can be performed by referring .NET Standard assemblies
in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection

```

```

Stream inputStream =
assembly.GetManifestResourceStream("Security.Sample.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream,
ExcelParseOptions.Default, true, "password");
IWorksheet sheet = workbook.Worksheets[0];
bool isProtectWindow = true;
bool isProtectContent = true;
//Protect Workbook
workbook.Protect(isProtectWindow, isProtectContent, "password");
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from the FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
Stream stream = file.AsStreamForWrite();
workbook.SaveAs(stream);
await file.FlushAsync();
stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
FileStream inputStream = new FileStream("ProtectWorkbook.xlsx",
FileMode.Open, FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(inputStream);
bool isProtectWindow = true;
bool isProtectContent = true;
//Protect Workbook
workbook.Protect(isProtectWindow, isProtectContent, "password");
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from an embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("Security.Sample.xlsx");

```

```

IWorkbook workbook = application.Workbooks.Open(inputStream,
ExcelParseOptions.Default, true, "password");
IWorksheet sheet = workbook.Worksheets[0];
bool isProtectWindow = true;
bool isProtectContent = true;
//Protect Workbook
workbook.Protect(isProtectWindow, isProtectContent, "password");
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Unprotect Workbook elements

You can unprotect or remove protection for a workbook as shown below.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("ProtectedWorkbook.xlsx");
//Unprotect (unlock) Workbook using Password
workbook.Unprotect("password");
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()

application.Workbooks.Open("ProtectedWorkbook.xlsx")
'Unprotect (unlock) Workbook using Password
workbook.Unprotect("password")
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IWorksheet sheet = workbook.Worksheets[0];
    //Unprotect (unlock) Workbook using Password
    workbook.Unprotect("password");
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    workbook.SaveAs(stream);
    await file.FlushAsync();
    stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("ProtectedWorkbook.xlsx",
        FileMode.Open, FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    //Unprotect (unlock) Workbook using Password
    workbook.Unprotect("password");
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;

```

```

application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from an embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("Security.Sample.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream,
ExcelParseOptions.Default, true, "password");
IWorksheet sheet = workbook.Worksheets[0];
//Unprotect (unlock) Workbook using Password
workbook.Unprotect("password");
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Protect Worksheet

XlsIO provides support for protecting and unprotecting elements in worksheets by using the **Protect** method of **IWorksheet**. The following code example illustrates how to protect a worksheet with a password.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Protecting the Worksheet by using a Password
sheet.Protect("syncfusion", ExcelSheetProtection.All);
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013

```

```

Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Protecting the Worksheet by using a Password
sheet.Protect("syncfusion", ExcelSheetProtection.All)
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

//Encrypt and Decrypt can be performed by referring .NET Standard assemblies
in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Protecting the Worksheet by using a Password
    sheet.Protect("syncfusion", ExcelSheetProtection.All);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    workbook.SaveAs(stream);
    await file.FlushAsync();
    stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Protecting the Worksheet by using a Password
    sheet.Protect("syncfusion", ExcelSheetProtection.All);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```

IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Protecting the Worksheet by using a Password
sheet.Protect("syncfusion", ExcelSheetProtection.All);
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
Android and iOS platforms. Please refer xlsio/xamarin section for respective
code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
"application/msexcel", stream);
}
}

```

Note: By using the ExcelSheetProtection enumerator, you can set protection to the workbook elements/operations.

Chart Sheet Protection

Essential XlsIO can also provide support to protect or unprotect a chart sheet.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("sample.xlsx");
IChart chart = workbook.Charts[0];
//Protect chart sheet
chart.Protect("syncfusion", ExcelSheetProtection.All);
workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim chart As IChart = workbook.Charts(0)
'Protect chart sheet
chart.Protect("syncfusion", ExcelSheetProtection.All)

```

```
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IChart chart = workbook.Charts[0];
    //Protect chart sheet
    chart.Protect("syncfusion", ExcelSheetProtection.All);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    workbook.SaveAs(stream);
    await file.FlushAsync();
    stream.Dispose();
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("ChartSheet.xlsx", FileMode.Open,
        FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IChart chart = workbook.Charts[0];
    //Protect chart sheet
    chart.Protect("syncfusion", ExcelSheetProtection.All);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
        FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IChart chart = workbook.Charts[0];
    //Protect chart sheet
    chart.Protect("syncfusion", ExcelSheetProtection.All);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Un-Protect Worksheet

You can also unprotect the worksheet by using the **Unprotect** method of XlsIO. The following code example illustrates how to remove worksheet protection.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet sheet = workbook.Worksheets[0];
    //Unprotecting (unlocking) the Worksheet using the Password
    sheet.Unprotect("syncfusion");
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("sample.xlsx")
Dim sheet As IWorkbook = workbook.Worksheets(0)
'Unprotecting (unlocking) the Worksheet using the Password
sheet.Unprotect("syncfusion")
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelParseOptions.Default, true, "password");
    IWorksheet sheet = workbook.Worksheets[0];
    //Unprotecting (unlocking) the Worksheet using the Password
    sheet.Unprotect("syncfusion");
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    workbook.SaveAs(stream);
    await file.FlushAsync();
    stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unprotecting (unlocking) the Worksheet using the Password
    worksheet.Unprotect("syncfusion");
    //Saving the workbook as stream

```

```

FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IWorksheet sheet = workbook.Worksheets[0];
    //Unprotecting (unlocking) the Worksheet using the Password
    sheet.Unprotect("syncfusion");
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Removing protection of a Chart Sheet

You can remove the protection of a chart sheet as shown below.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IChart chart = workbook.Charts[0];
    //Unprotect chart sheet
}

```

```
chart.Unprotect("syncfusion");
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim chart As IChart = workbook.Charts(0)
'Unprotect chart sheet
chart.Unprotect("syncfusion")
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IChart chart = workbook.Charts[0];
    //Unprotect chart sheet
    chart.Unprotect("syncfusion");
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    workbook.SaveAs(stream);
    await file.FlushAsync();
    stream.Dispose();
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(inputStream);
IChart chart = workbook.Charts[0];
//Unprotect chart sheet
chart.Unprotect("syncfusion");
//Saving the workbook as stream
FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IChart chart = workbook.Charts[0];
    //Unprotect chart sheet
    chart.Unprotect("syncfusion");
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    //Android and iOS platforms. Please refer xlsio/xamarin section for respective
    //code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}

```

Protect Cell

XlsIO supports locking and unlocking cells by using the cell's **Locked** property of **CellStyle**. This can be manipulated to make certain cells editable in a protected worksheet.

Note: By default, cells are locked. Lock or Unlock cell in an unprotected worksheet has no effect.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unlocking a cell to edit in worksheet protection mode
    worksheet.Range["A1"].CellStyle.Locked = false;
    workbook.SaveAs("Output.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Unlocking a cell to edit in worksheet protection mode
worksheet.Range("A1").CellStyle.Locked = False
workbook.SaveAs("Output.xlsx")
End Using

```

UWP

```

//Encrypt and Decrypt can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
        ExcelParseOptions.Default, true, "password");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unlocking a cell to edit in worksheet protection mode
    worksheet.Range["A1"].CellStyle.Locked = false;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx" });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    workbook.SaveAs(stream);
    await file.FlushAsync();
    stream.Dispose();
}

```

```
}

```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    FileStream inputStream = new FileStream("Sample.xlsx", FileMode.Open,
    FileAccess.Read);
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unlocking a cell to edit in worksheet protection mode
    worksheet.Range["A1"].CellStyle.Locked = false;
    //Saving the workbook as stream
    FileStream stream = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("Security.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelParseOptions.Default, true, "password");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Unlocking a cell to edit in worksheet protection mode
    worksheet.Range["A1"].CellStyle.Locked = false;
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android and iOS platforms. Please refer xlsio/xamarin section for respective
    code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Output
        .xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx",
        "application/msexcel", stream);
    }
}
```

```
}
```

Note: Security features are now supported in .NET Standard 1.4 onwards.

Working with Drawing Objects

Form Controls

You can add and manipulate the text Box, option button, check box, and combo box controls into the worksheet. Enable these controls to create forms which are very user friendly.

Note: Support for Active X Form controls is not yet available.

This section explains the usage of the following [Form Controls](#).

- Text Box
- Check Box
- Combo Box
- Option Button

Text Box

The **ITextBoxShape** interface represents a text box in a worksheet. Various properties like Horizontal and Vertical Alignment, Alternative Text, Text Rotation, and so on are also supported.

The following code example illustrates how to add and manipulate a text box control.

C#

```

```

Comments

ICommentShape object represents a [comment](#) in a worksheet. You can insert both **Regular** and **Rich Text** comments. The following code example illustrates how to insert and manipulate comments.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Adding comments to a cell
sheet.Range["A1"].AddComment().Text = "Comments";
//Add Rich Text Comments
IRange range = sheet.Range["A6"];
range.AddComment().RichText.Text = "RichText";
IRichTextString richText = range.Comment.RichText;
//Formatting first 4 characters
IFont redFont = workbook.CreateFont();
redFont.Bold = true;
redFont.Color = ExcelKnownColors.Red;
richText.SetFont(0, 3, redFont);
}

```

```
workbook.SaveAs("Comments.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Adding comments to a cell
sheet.Range("A1").AddComment().Text = "Comments"
'Add Rich Text Comments
Dim range As IRange = sheet.Range("A6")
range.AddComment().RichText.Text = "RichText"
Dim richText As IRichTextString = range.Comment.RichText
'Formatting first 4 characters
Dim redFont As IFont = workbook.CreateFont()
redFont.Bold = True
redFont.Color = ExcelKnownColors.Red
richText.SetFont(0, 3, redFont)
workbook.SaveAs("Comments.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Adding comments to a cell
sheet.Range["A1"].AddComment().Text = "Comments";
//Add Rich Text Comments
IRange range = sheet.Range["A6"];
range.AddComment().RichText.Text = "RichText";
IRichTextString richText = range.Comment.RichText;
//Formatting first 4 characters
IFont redFont = workbook.CreateFont();
redFont.Bold = true;
redFont.Color = ExcelKnownColors.Red;
richText.SetFont(0, 3, redFont);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Comments";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Adding comments to a cell
    sheet.Range["A1"].AddComment().Text = "Comments";
    //Add Rich Text Comments
    IRange range = sheet.Range["A6"];
    range.AddComment().RichText.Text = "RichText";
    IRichTextString richText = range.Comment.RichText;
    //Formatting first 4 characters
    IFont redFont = workbook.CreateFont();
    redFont.Bold = true;
    redFont.Color = ExcelKnownColors.Red;
    richText.SetFont(0, 3, redFont);
    //Saving the workbook as stream
    FileStream stream = new FileStream("Comments.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Adding comments to a cell
    sheet.Range["A1"].AddComment().Text = "Comments";
    //Add Rich Text Comments
    IRange range = sheet.Range["A6"];
    range.AddComment().RichText.Text = "RichText";
    IRichTextString richText = range.Comment.RichText;
    //Formatting first 4 characters
    IFont redFont = workbook.CreateFont();
    redFont.Bold = true;
    redFont.Color = ExcelKnownColors.Red;
    richText.SetFont(0, 3, redFont);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies between Windows Phone,
    Android, and iOS platforms. Refer to the xlsio/xamarin section for
    respective code samples
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {

```

```

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Comments.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Comments.xlsx", "application/msexcel", stream);
}
}

```

You can also fill the comments with various types of fills by using the **IFill** interface. Following code example illustrates how to fill the comment shape with a TwoColor gradient.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Adding comments to a cell
    sheet.Range["A1"].AddComment().Text = "Comments";
    //Accessing existing comment
    ICommentShape shape = sheet.Range["A1"].Comment;
    //Format the comment
    shape.Fill.TwoColorGradient();
    shape.Fill.GradientStyle = ExcelGradientStyle.Horizontal;
    shape.Fill.GradientColorType = ExcelGradientColor.TwoColor;
    shape.Fill.ForeColorIndex = ExcelKnownColors.Red;
    shape.Fill.BackColorIndex = ExcelKnownColors.White;
    workbook.SaveAs("FormatComments.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Adding comments to a cell
sheet.Range("A1").AddComment().Text = "Comments"
'Accessing existing comment
Dim shape As ICommentShape = sheet.Range("A1").Comment
'Format the comment
shape.Fill.TwoColorGradient()
shape.Fill.GradientStyle = ExcelGradientStyle.Horizontal
shape.Fill.GradientColorType = ExcelGradientColor.TwoColor
shape.Fill.ForeColorIndex = ExcelKnownColors.Red
shape.Fill.BackColorIndex = ExcelKnownColors.White
workbook.SaveAs("FormatComments.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Adding comments to a cell
    sheet.Range["A1"].AddComment().Text = "Comments";
    //Accessing existing comment
    ICommentShape shape = sheet.Range["A1"].Comment;
    //Format the comment
    shape.Fill.TwoColorGradient();
    shape.Fill.GradientStyle = ExcelGradientStyle.Horizontal;
    shape.Fill.GradientColorType = ExcelGradientColor.TwoColor;
    shape.Fill.ForeColorIndex = ExcelKnownColors.Red;
    shape.Fill.BackColorIndex = ExcelKnownColors.White;
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;

}

```

Show or Hide Excel Comments

Comments in an Excel document can be shown or hidden using **IsVisible** property. The following code example illustrates this.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding comments in the worksheet
    worksheet.Range["E5"].AddComment();
    worksheet.Range["E15"].AddComment();
    //Adding text in comments
    worksheet.Comments[0].Text = "Comment1";
    worksheet.Comments[1].Text = "Comment2";
    //Show comment
    worksheet.Comments[0].IsVisible = true;
}

```

```
//Hide comment
worksheet.Comments[1].IsVisible = false;
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding comments in the worksheet
worksheet.Range("E5").AddComment()
worksheet.Range("E15").AddComment()
'Adding text in comments
worksheet.Comments(0).Text = "Comment1"
worksheet.Comments(1).Text = "Comment2"
'Show comment
worksheet.Comments(0).IsVisible = True
'Hide comment
worksheet.Comments(1).IsVisible = False
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding comments in the worksheet
worksheet.Range["E5"].AddComment();
worksheet.Range["E15"].AddComment();
//Adding text in comments
worksheet.Comments[0].Text = "Comment1";
worksheet.Comments[1].Text = "Comment2";
//Show comment
worksheet.Comments[0].IsVisible = true;
//Hide comment
worksheet.Comments[1].IsVisible = false;
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

AutoShapes

The **IShape** interface represents an [AutoShape](#) in an Excel workbook.

To learn more about various AutoShape types supported in XlsIO, refer to the **AutoShapeType** enumeration in API section.

The following code example illustrates how to insert and format AutoShapes.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding an AutoShape
    IShape shape1 =
        worksheet.Shapes.AddAutoShapes(AutoShapeType.RoundedRectangle, 2, 7, 60,
        192);
    IShape shape2 = worksheet.Shapes.AddAutoShapes(AutoShapeType.CircularArrow,
    8, 7, 60, 192);
    //Set the value inside the shape
    shape1.TextFrame.TextRange.Text = "AutoShape";
    //Format the shape
    shape1.Fill.ForeColorIndex = ExcelKnownColors.Light_blue;
    shape1.TextFrame.VerticalAlignment = ExcelVerticalAlignment.MiddleCentered;
    //Read an AutoShape
    shape1 = worksheet.Shapes[0];
    shape1.TextFrame.TextRange.Text = "RoundedRectangle";
    //Remove an AutoShape
    shape2 = worksheet.Shapes[1];
    shape2.Remove();
    workbook.SaveAs("Autoshapes.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding an AutoShape
Dim shape1 As IShape =
    worksheet.Shapes.AddAutoShapes(AutoShapeType.RoundedRectangle, 2, 7, 60,
    192)

```

```

Dim shape2 As IShape =
worksheet.Shapes.AddAutoShapes(AutoShapeType.CircularArrow, 8, 7, 60, 192)
'Set the value inside the shape.
shape1.TextFrame.TextRange.Text = "AutoShape"
'Format the shape
shape1.Fill.ForeColorIndex = ExcelKnownColors.Light_blue
shape1.TextFrame.VerticalAlignment = ExcelVerticalAlignment.MiddleCentered
'Read an AutoShape
shape1 = worksheet.Shapes(0)
shape1.TextFrame.TextRange.Text = "RoundedRectangle"
'Remove an AutoShape
shape2 = worksheet.Shapes(1)
shape2.Remove()
workbook.SaveAs("Autoshapes.xlsx")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;

}

```

Group Shapes

Group shape can be used to work with multiple shapes at a single instant.

For example, you can change positions, size or set colors for all shapes at the same time through a single group shape.

Create Group Shapes

The shapes in the worksheet can be grouped into a single shape by creating group shape in XlsIO using IGroupShape interface.

The following code example illustrates how to create a group shape.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("GroupShape.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Select the shapes you want to group
IShape[] groupItems = new IShape[] { shapes[0], shapes[1] };
// Group the selected shapes
IGroupShape GroupShape = shapes.Group(groupItems);
workbook.SaveAs("GroupShape.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("GroupShape.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim shapes As IShapes = worksheet.Shapes
' Select the shapes you want to group
Dim groupItems As IShape() = New IShape() {shapes(0), shapes(1)}
' Group the selected shapes

```

```
Dim GroupShape As IGroupShape = shapes.Group(groupItems)
workbook.SaveAs("GroupShape.xlsx")
workbook.Close()
excelEngine.Dispose()
```

UWP

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile openFile = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Select the shapes you want to group
IShape[] groupItems = new IShape[] { shapes[0], shapes[1] };
// Group the selected shapes
IGroupShape GroupShape = shapes.Group(groupItems);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "GroupShape";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
workbook.Close();
excelEngine.Dispose();
```

ASP.NET CORE

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
FileStream inputStream = new FileStream("GroupShape.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Select the shapes you want to group
IShape[] groupItems = new IShape[] { shapes[0], shapes[1] };
// Group the selected shapes
IGroupShape GroupShape = shapes.Group(groupItems);
FileStream file = new FileStream("GroupShape.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(file);
file.Dispose();
workbook.Close();
excelEngine.Dispose();
```

XAMARIN

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream fileStream = assembly.GetManifestResourceStream("GroupShape.xlsx");
IWorkbook workbook = application.Workbooks.Open(fileStream);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Select the shapes you want to group
IShape[] groupItems = new IShape[] { shapes[0], shapes[1] };
// Group the selected shapes
IGroupShape GroupShape = shapes.Group(groupItems);
workbook.SaveAs("GroupShape.xlsx");
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
workbook.Close();
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("GroupS
hape.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("GroupShape.xlsx",
"application/msexcel", stream);
}
excelEngine.Dispose();

```

Ungroup shapes

Group shape can be ungrouped, and its inner shapes are added to worksheet as an individual shape.

The following code example illustrates how to ungroup the shape.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("GroupShape.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Ungroup the selected specified group shape
shapes.Ungroup(shapes[0] as IGroupShape);
workbook.SaveAs("GroupShape.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("GroupShape.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim shapes As IShapes = worksheet.Shapes
' Ungroup the selected specified group shape
shapes.Ungroup(TryCast(shapes(0), IGroupShape))
workbook.SaveAs("GroupShape.xlsx")
workbook.Close()
excelEngine.Dispose()

```

UWP

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile openFile = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Ungroup the selected specified group shape
shapes.Ungroup(shapes[0] as IGroupShape);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "GroupShape";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
workbook.Close();
excelEngine.Dispose();

```

ASP.NET CORE

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
FileStream inputStream = new FileStream("GroupShape.xlsx", FileMode.Open,
FileAccess.Read);
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Ungroup the selected specified group shape
shapes.Ungroup(shapes[0] as IGroupShape);
FileStream file = new FileStream("GroupShape.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(file);
file.Dispose();
workbook.Close();

```

```
excelEngine.Dispose();
```

XAMARIN

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream fileStream = assembly.GetManifestResourceStream("GroupShape.xlsx");
IWorkbook workbook = application.Workbooks.Open(fileStream);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Ungroup the selected specified group shape
shapes.Ungroup(shapes[0] as IGroupShape);
workbook.SaveAs("GroupShape.xlsx");
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
workbook.Close();
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)

Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("GroupS
hape.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("GroupShape.xlsx",
"application/msexcel", stream);
}
excelEngine.Dispose();
```

Ungroup all shapes

When ungrouping the group shape, its immediate inner shapes only be ungrouped. Ungroup the group shape and its all the inner shapes can be possible in XlsIO.

In Ungroup method, “isAll” boolean value indicates whether the group inner shape will be grouped or not.

The following code example illustrates how to ungroup the group shape and its inner shapes.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("GroupShape.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Ungroup the selected specified group shape and its inner shapes by
// specifying isAll property
shapes.Ungroup(shapes[0] as IGroupShape, true);
workbook.SaveAs("GroupShape.xlsx");
workbook.Close();
```

```
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("GroupShape.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim shapes As IShapes = worksheet.Shapes
' Ungroup the selected specified group shape and its inner shapes by
specifying isAll property
shapes.Ungroup(TryCast(shapes(0), IGroupShape), True)
workbook.SaveAs("GroupShape.xlsx")
workbook.Close()
excelEngine.Dispose()
```

UWP

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsx");
openPicker.FileTypeFilter.Add(".xls");
StorageFile openFile = await openPicker.PickSingleFileAsync();
//Opens the workbook
IWorkbook workbook = await application.Workbooks.OpenAsync(openFile);
IWorksheet worksheet = workbook.Worksheets[0];
IShapes shapes = worksheet.Shapes;
// Ungroup the selected specified group shape and its inner shapes by
specifying isAll property
shapes.Ungroup(shapes[0] as IGroupShape, true);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "GroupShape";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker

excelEngine.Dispose();
```

OLE Objects

IOleObject object represents an [OLE Object](#) in a worksheet.

Note: XlsIO supports OLE Objects for XLSX format in Windows, ASP.NET, and WPF platforms only.

OLE Objects and Linking Types

XlsIO supports two types of association of the objects:

- Linked objects
- Embedded objects

1. Linked Objects

Linked objects remains as a separate files. When the file is opened in another machine, then the linked object should be in the same location as created.

The following sample code illustrates how to link an OLE Object to an Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    Image image = Image.FromFile("image.png");
    //Select the object, image for the display icon and the type of the
OLEObject to insert
    IOleObject ole2 = sheet.OleObjects.Add("Document.docx", image,
    OleLinkType.Link);
    workbook.SaveAs("LinkedObjects.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim image As Image = Image.FromFile("image.png")
'Select the object, image for the display icon and the type of the OLEObject
to insert
Dim ole2 As IOleObject = sheet.OleObjects.Add("Document.docx", image,
OleLinkType.Link)
workbook.SaveAs("LinkedObjects.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream imageStream =
    assembly.GetManifestResourceStream("UWP.Data.image.png");
    //Get image from stream
    Syncfusion.XlsIO.Image image =
    Syncfusion.XlsIO.Image.FromStream(imageStream);
    //Add ole object
    IOleObject oleObject =
    worksheet.OleObjects.AddLink(@"..\..\Data\Document.docx", image);
    //Initializes FileSavePicker
}
```

```

FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "LinkedObjects";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create image stream
    FileStream imageStream = new FileStream("image.png", FileMode.Open);
    //Get image from stream
    Image image = Image.FromStream(imageStream);
    //Add ole object
    IOleObject oleObject =
    worksheet.OleObjects.AddLink(@"..\..\Data\Document.docx", image);
    //Saving the workbook as stream
    FileStream stream = new FileStream("LinkedObjects.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream imageStream =
    assembly.GetManifestResourceStream("SampleBrowser.XlsIO.Samples.Template.Ima
    ge.png");
    //Get image from stream
    Syncfusion.Drawing.Image image =
    Syncfusion.Drawing.Image.FromStream(imageStream);
    //Add ole object
    IOleObject oleObject =
    worksheet.OleObjects.AddLink(@"..\..\Data\Document.docx", image);
    //Saving the workbook as stream
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream);
    stream.Position = 0;
}

```

```
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android, and iOS platforms. Refer to the xlsio/xamarin section for
//respective code samples
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
TargetPlatform.Windows)
{
Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView("Linked
Objects.xlsx", "application/msexcel", stream);
}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("LinkedObjects.xlsx
", "application/msexcel", stream);
}
}
```

2. Embedded Objects

Embedded objects are stored in the document. When the file is opened in another machine, the embedded object can be viewed without having access to the original data.

The following sample code illustrates how to embed an OLE Object to an Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
Image image = Image.FromFile("image.png");
// Select the object, image for the display icon and the type of the
OLEObject to insert
IOleObject ole1 = sheet.OleObjects.Add("Test.pptx", image,
OleLinkType.Embed);
workbook.SaveAs("EmbeddedObjects.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim image As Image = Image.FromFile("image.png")
'Select the object, image for the display icon and the type of the OLEObject
to insert
Dim ole1 As IOleObject = sheet.OleObjects.Add("Test.pptx", image,
OleLinkType.Embed)
workbook.SaveAs("EmbeddedObjects.xlsx")
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    // "App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream =
    assembly.GetManifestResourceStream("UWP.Data.Test.pptx");
    Stream imageStream =
    assembly.GetManifestResourceStream("UWP.Data.image.png");
    //Get image from stream
    Syncfusion.XlsIO.Image image =
    Syncfusion.XlsIO.Image.FromStream(imageStream);
    //Add ole object
    IOleObject oleObject = worksheet.OleObjects.Add(inputStream, image,
    OleObjectType.PowerPointPresentation);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "EmbeddedObjects";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
    });
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Create file stream and image stream
    FileStream inputStream = new FileStream("Test.pptx", FileMode.Open);
    FileStream imageStream = new FileStream("image.png", FileMode.Open);
    //Get image from stream
    Image image = Image.FromStream(imageStream);
    //Add ole object
    IOleObject oleObject = worksheet.OleObjects.Add(inputStream, image,
    OleObjectType.PowerPointPresentation);
    //Saving the workbook as stream
    FileStream stream = new FileStream("EmbeddedObjects.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(stream);
    stream.Dispose();
}

edObjects.xlsx", "application/msexcel", stream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("EmbeddedObjects.xl
sx", "application/msexcel", stream);
    }
}

```

The following code example illustrates how to insert and manipulate OLEObjects with their properties.

To learn more about OLEObjects, refer to the **IOleObjects** in API section.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    ///Icon image
    Image image = Image.FromFile("Images.png");
}

```

```

//Select the object, image for the display icon and the type of the
OleObject to insert
IOleObject oleObject1 = sheet.OleObjects.Add("Employee.docx", image,
OleLinkType.Embed);
//Select the object, image for the display icon and the type of the
OleObject to insert
IOleObject oleObject2 = sheet.OleObjects.Add("Customer.docx", image,
OleLinkType.Embed);
//Displays image as icon
oleObject1.DisplayAsIcon = true;
//Set the location of the OleObject
oleObject1.Location = sheet["K8"];
//Reads icon as a image
Image image1 = oleObject1.Picture;
//Reads OleObject as a IPictureShape
IPictureShape shape = oleObject1.Shape;
//Set the size of the OleObject
oleObject1.Size = new Size(30, 30);
//Remove OleObjects
oleObject2 = sheet.OleObjects[1];
oleObject2.Shape.Remove();
workbook.SaveAs("OleObjects.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Icon image
Dim image As Image = Image.FromFile("Images.png")
'Select the object, image for the display icon and the type of the OleObject
to insert
Dim oleObject1 As IOleObject = sheet.OleObjects.Add("Employee.docx", image,
OleLinkType.Embed)
'Select the object, image for the display icon and the type of the OleObject
to insert
Dim oleObject2 As IOleObject = sheet.OleObjects.Add("Customer.docx", image,
OleLinkType.Embed)
'Displays image as icon
oleObject1.DisplayAsIcon = True
'Set the location of the OleObject
oleObject1.Location = sheet("K8")
'Reads icon as a image
Dim image1 As Image = oleObject1.Picture
'Reads OleObject as a IPictureShape
Dim shape As IPictureShape = oleObject1.Shape
'Set the size of the OleObject
oleObject1.Size = New Size(30, 30)
'Remove OleObjects
oleObject2 = sheet.OleObjects(1)
oleObject2.Shape.Remove()
workbook.SaveAs("OleObjects.xlsx")
End Using

```

UWP

```

```

Working with Macros

Macro is a set of process that can be run repeatedly in Excel document.

Creating a Macro

XlsIO allows to create macros in Excel document through **IVbaProject** interface. The macro document can be saved into different formats such as XLS, XLTM and XLSM.

XlsIO supports creating macro in following types using **VbaModuleType** enum.

- Document
- StdModule
- Class
- MsForm

You can add a Vba module through **IVbaModules** interface in XlsIO.

Document

Document is the default module type which will be added for every worksheet and one for entire workbook while creating VbaProject.

C#

```
//Adding Document to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Document", VbaModuleType.Document);
```

VB.NET

```
//Adding Document to the workbook
Dim project As IVbaProject = workbook.VbaProject
Dim [module] As IVbaModule = project.Modules.Add("Document ", VbaModuleType.Document)
```

UWP

```
//Adding Document to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Document ", VbaModuleType.Document);
```

ASP.NET CORE

```
//Adding Document to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Document ", VbaModuleType.Document);
```

XAMARIN

```
//Adding Document to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Document", VbaModuleType.Document);
```

The following code illustrate how to use Document module in Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Accessing sheet module
    IVbaModule vbaModule = vbaModules[sheet.CodeName];
```

```
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \"Workbook Opened\" \n End Sub";
//Saving as macro document
workbook.SaveAs("Output.xlsm");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the excel application object.
Dim application As IApplication = excelEngine.Excel
'Creating new Workbook
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating Vba project
Dim project As IVbaProject = workbook.VbaProject
'Accessing vba modules collection
Dim vbaModules As IVbaModules = project.Modules
'Accessing sheet module
Dim vbaModule As IVbaModule = vbaModules(sheet.CodeName)
'Adding vba code to the module
vbaModule.Code = "Sub Auto_Open" & vbLf & " MsgBox "" Workbook Opened "" " &
vbLf & " End Sub"
'Saving as macro document
workbook.SaveAs("Output.xlsm")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
// Accessing sheet module
IVbaModule vbaModule = vbaModules[sheet.CodeName];
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \" Workbook Opened \" \n End Sub";
// Save the Workbook
StorageFile storageFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.UI.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm"
});
storageFile = await savePicker.PickSaveFileAsync();
}
```

```

}
else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
storageFile = await local.CreateFileAsync("Output.xlsm",
CreationCollisionOption.ReplaceExisting);
}
//Saving the workbook
await workbook.SaveAsAsync(storageFile, ExcelSaveType.SaveAsMacro);
// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the excel application object.
IApplication application = excelEngine.Excel;
// Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
// Accessing sheet module
IVbaModule vbaModule = vbaModules[sheet.CodeName];
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \" Workbook Opened \" \n End Sub";
//Saving as macro document
FileStream output = new FileStream("Output.xlsm", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Accessing sheet module
IVbaModule vbaModule = vbaModules[sheet.CodeName];
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \"Workbook Opened\" \n End Sub";
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
//Save the stream into XLSM file

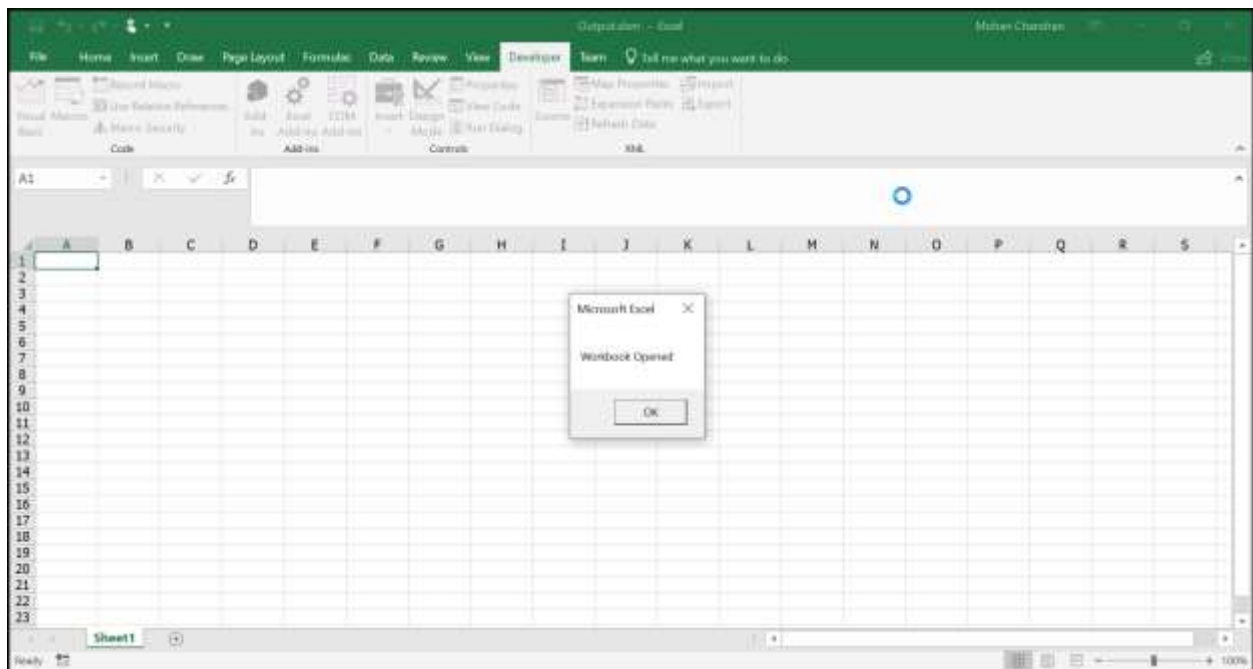

```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsx",  
"application/msexcel", stream);  
}
```

The Vba project in the output looks like below.

The macro output in the Excel document looks like below.

[StdModule](#)

StdModule is the module created for whenever a macro process is recorded in Excel document.

The following code illustrate how to add a StdModule using Add method. Here, the parameters name and **VbaModuleType** enum value is used.

- Test – Macro module name added to the Vba project.
- StdModule – Type of the Vba module.

C#

```
//Adding StdModule to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.StdModule);
```

VB.NET

```
//Adding StdModule to the workbook
Dim project As IVbaProject = workbook.VbaProject
Dim [module] As IVbaModule = project.Modules.Add("Test",
VbaModuleType.StdModule)
```

UWP

```
//Adding StdModule to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.StdModule);
```

ASP.NET CORE

```
//Adding StdModule to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.StdModule);
```

XAMARIN

```
//Adding StdModule to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.StdModule);
```

The following code illustrate how to create a macro using StdModule in Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Adding a vba module
```

```

IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
//Saving as macro document
workbook.SaveAs("Output.xlsm");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
    'Instantiate the excel application object.
    Dim application As IApplication = excelEngine.Excel
    'Creating new Workbook
    Dim workbook As IWorkbook = application.Workbooks.Create(1)
    Dim sheet As IWorksheet = workbook.Worksheets(0)
    'Creating Vba project
    Dim project As IVbaProject = workbook.VbaProject
    'Accessing vba modules collection
    Dim vbaModules As IVbaModules = project.Modules
    'Adding a vba module
    Dim vbaModule As IVbaModule = vbaModules.Add("StdModule",
        VbaModuleType.StdModule)
    'Adding vba code to the module
    vbaModule.Code = "Sub Auto_Open" & vbLf & " MsgBox \"Macro Added\" " & vbLf
    & " End Sub"
    'Saving as macro document
    workbook.SaveAs("Output.xlsm")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Adding a vba module
    IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
    //Adding vba code to the module
    vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
    // Save the Workbook
    StorageFile storageFile;
    if
    (! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.UI.Input.HardwareButtons")))
    {
        FileSavePicker savePicker = new FileSavePicker();
        savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
        savePicker.SuggestedFileName = "Output";
    }
}

```

```

savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm"
});
storageFile = await savePicker.PickSaveFileAsync();
}
else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
storageFile = await local.CreateFileAsync("Output.xlsm",
CreationCollisionOption.ReplaceExisting);
}
//Saving the workbook
await workbook.SaveAsAsync(storageFile, ExcelSaveType.SaveAsMacro);
// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the excel application object.
IApplication application = excelEngine.Excel;
// Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
//Saving as macro document
FileStream output = new FileStream("Output.xlsm", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
}

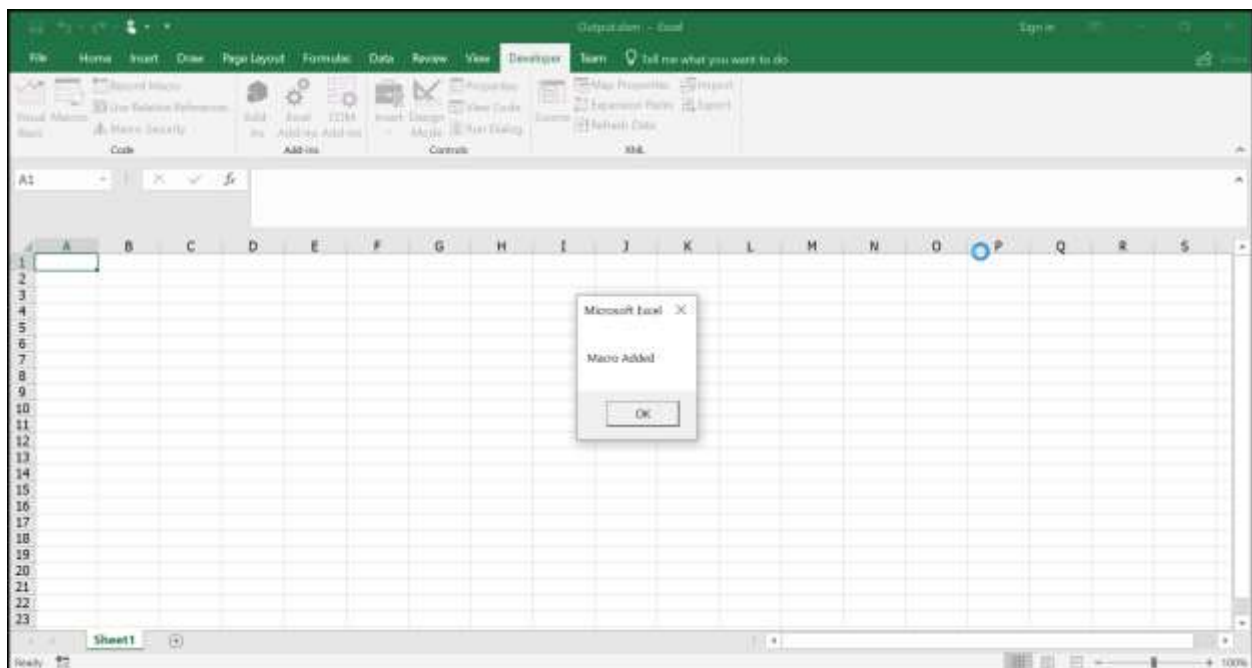

```

```
MemoryStream stream = new MemoryStream();  
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);  
//Save the stream into XLSX file  
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsx",  
"application/msexcel", stream);  
}
```

The Vba project in the output Excel document looks like below.

The Macro output in the Excel document looks like below.

Class

Class module allows us to create our own object model to use it where same kind of objects needs to be added with different values such as creating the employee information list. XlsIO supports creating a class module in Excel document.

The following code illustrate how to add a class in XlsIO. Here, the parameters name and VbaModuleType enum value is used.

- Test – Class name used in the Vba project
- ClassModule – Type of Vba module

C#

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.ClassModule);
```

VB.NET

```
//Adding class module to the workbook
Dim project As IVbaProject = workbook.VbaProject
Dim [module] As IVbaModule = project.Modules.Add("Test",
VbaModuleType.ClassModule)
```

UWP

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.ClassModule);
```

ASP.NET CORE

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.ClassModule);
```

XAMARIN

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("Test", VbaModuleType.StdModule);
```

The following code illustrate how to use class module to run a macro with another module in Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
```

```

IWorksheet sheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a class module
IVbaModule clsModule = vbaModules.Add("Test", VbaModuleType.ClassModule);
clsModule.Code = "Public Sub Create()\n MsgBox \"Created a class module\" \n\n End Sub";
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("Module1", VbaModuleType.StdModule);
//Using class in StdModule
vbaModule.Code = "Sub Auto_Open()\n Dim obj As New test \n obj.Create \n End Sub";
//Saving as macro document
workbook.SaveAs("Output.xlsm");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the excel application object.
Dim application As IApplication = excelEngine.Excel
'Creating new Workbook
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating Vba project
Dim project As IVbaProject = workbook.VbaProject
'Accessing vba modules collection
Dim vbaModules As IVbaModules = project.Modules
'Adding a vba module
Dim vbaModule As IVbaModule = vbaModules.Add("StdModule",
VbaModuleType.StdModule)
'Adding vba code to the module
vbaModule.Code = "Sub Auto_Open" & vbCrLf & " MsgBox \"Macro Added\" " & vbCrLf
& " End Sub"
'Saving as macro document
workbook.SaveAs("Output.xlsm")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a class module
IVbaModule clsModule = vbaModules.Add("Test", VbaModuleType.ClassModule);

```

```

clsModule.Code = "Public Sub Create()\n MsgBox \"Created a class module\" \n
End Sub";
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("Module1", VbaModuleType.StdModule);
//Using class in StdModule
vbaModule.Code = "Sub Auto_Open()\n Dim obj As New test \n obj.Create \n End
Sub";
// Save the Workbook
StorageFile storageFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent ("Windows.Phone.U
I.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm"
});
storageFile = await savePicker.PickSaveFileAsync();
}
else
{

    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
    //Save the stream into XLSX file
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
    "application/msexcel", stream);
}
```

The Vba project in the output Excel document looks like below.

The Macro output in the Excel document looks like below.

MsForm

MsForm is the form module in which we can have form controls such as textbox, label, buttons etc. Form module cannot be created by XlsIO, but it allows to copy from a form module existing another workbook to new workbook.

The following code illustrate how to add a class in XlsIO. Here, the parameters name and VbaModuleType enum value is used.

- UserForm – Class name used in the Vba project

- MsForm – Type of Vba module

C#

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("UserForm", VbaModuleType.MsForm);
```

VB.NET

```
//Adding class module to the workbook
Dim project As IVbaProject = workbook.VbaProject
Dim [module] As IVbaModule = project.Modules.Add("UserForm",
VbaModuleType.MsForm)
```

UWP

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("UserForm", VbaModuleType.MsForm);
```

ASP.NET CORE

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("UserForm", VbaModuleType.MsForm);
```

XAMARIN

```
//Adding class module to the workbook
IVbaProject project = workbook.VbaProject;
IVbaModule module = project.Modules.Add("UserForm", VbaModuleType.MsForm);
```

The following code illustrate how to copy a form from another workbook to new workbook.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Opening form module existing workbook
    IWorkbook newBook = application.Workbooks.Open("Test.xls");
    IVbaProject newProject = newBook.VbaProject;
    //Accessing existing form module
    IVbaModule form = newProject.Modules["UserForm1"];
    //Adding a form module in new workbook
```

```

IVbaModule formModule = project.Modules.Add(form.Name,
VbaModuleType.MsForm);
//Copying the form code behind
formModule.Code = form.Code;
//Copying the designer of the form
formModule.DesignerStorage = form.DesignerStorage;
//Saving as macro document
workbook.SaveAs ("Output.xlsm");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the excel application object.
Dim application As IApplication = excelEngine.Excel

VbaModuleType.MsForm);
//Copying the form code behind
formModule.Code = form.Code;
//Copying the designer of the form
formModule.DesignerStorage = form.DesignerStorage;
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
//Save the stream into XLSX file
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
"application/msexcel", stream);
}

```

The Vba project in the output Excel document looks like below.

Assigning Macro to Shapes

XlsIO supports assigning macros to the shape controls in the Excel document through **OnAction** property.

The following code illustrate how to assign macros to shapes in Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Adding a vba module
    IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
    //Adding vba code to the module
    vbaModule.Code = "Sub Invoke()\n MsgBox \"Macro Added\" \n End Sub";
    //Adding a auto shape
    IShape shape = sheet.Shapes.AddAutoShapes(AutoShapeType.Rectangle, 1, 2, 60,
    70);
    shape.Name = "Shape1";
    //Assigning a Macro to shape
    shape.OnAction = "StdModule.Invoke";
    //Saving as macro document
    workbook.SaveAs("Output.xlsm");
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the excel application object.
Dim application As IApplication = excelEngine.Excel
'Creating new Workbook
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Creating Vba project
Dim project As IVbaProject = workbook.VbaProject
'Accessing vba modules collection
Dim vbaModules As IVbaModules = project.Modules
'Adding a vba module
Dim vbaModule As IVbaModule = vbaModules.Add("StdModule",
VbaModuleType.StdModule)
'Adding vba code to the module
vbaModule.Code = "Sub Invoke()" & vbLf & " MsgBox ""Macro Added"" " & vbLf &
" End Sub"
'Adding a auto shape
Dim shape As IShape = sheet.Shapes.AddAutoShapes(AutoShapeType.Rectangle, 1,
2, 60, 70)
shape.Name = "Shape1"
'Assigning a Macro to shape
shape.OnAction = "StdModule.Invoke"
'Saving as macro document
workbook.SaveAs("Output.xlsm")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Invoke()\n MsgBox \"Macro Added\" \n End Sub";
//Adding a auto shape
IShape shape = sheet.Shapes.AddAutoShapes(AutoShapeType.Rectangle, 1, 2, 60,
70);
shape.Name = "Shape1";
//Assigning a Macro to shape
shape.OnAction = "StdModule.Invoke";
// Save the Workbook
StorageFile storageFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.U
I.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();

```

```

savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm"
});
storageFile = await savePicker.PickSaveFileAsync();
}
else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
storageFile = await local.CreateFileAsync("Output.xlsm",
CreationCollisionOption.ReplaceExisting);
}
//Saving the workbook
await workbook.SaveAsAsync(storageFile, ExcelSaveType.SaveAsMacro);
// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the excel application object.
IApplication application = excelEngine.Excel;
// Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet sheet = workbook.Worksheets[0];
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Invoke()\n MsgBox \"Macro Added\" \n End Sub";
//Adding a auto shape
IShape shape = sheet.Shapes.AddAutoShapes(AutoShapeType.Rectangle, 1, 2, 60,
70);
shape.Name = "Shape1";
//Assigning a Macro to shape
shape.OnAction = "StdModule.Invoke";
//Saving as macro document
FileStream output = new FileStream("Output.xlsm", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
}

```

XAMARIN

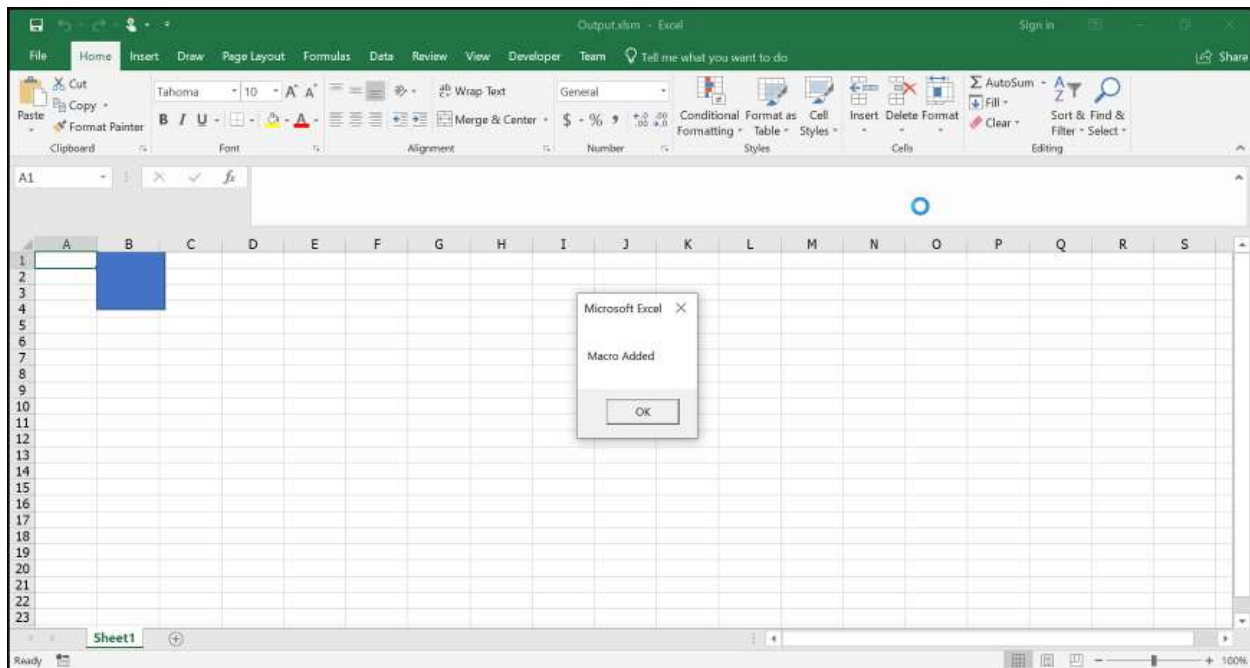

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Creating new workbook
IWorkbook workbook = application.Workbooks.Create(1);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];

```

```
//Creating Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Adding a vba module
IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Invoke()\n MsgBox \"Macro Added\" \n End Sub";
//Adding a auto shape
IShape shape = sheet.Shapes.AddAutoShapes(AutoShapeType.Rectangle, 1, 2, 60,
70);
shape.Name = "Shape1";
//Assigning a Macro to shape
shape.OnAction = "StdModule.Invoke";
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
//Save the stream into XLSX file
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
"application/msexcel", stream);
}
```

When the shape is clicked, the output looks like below.

Saving macro enabled document into stream

By default, while saving the Excel workbook into stream, the file type will be based on the Excel version used. For Excel97to2003 version, the file format will be XLS type. Above this version, the document will be saved as XLSX format. So, while saving the macro enabled documents into XLSM and XLTM formats into stream, the **ExcelSaveType** should be provided as **SaveAsMacro** and **SaveAsMacroTemplate**.

The following code illustrate how to save macro-enabled documents into stream.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
```

```

{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Adding a vba module
    IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
    //Adding vba code to the module
    vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
    //Saving as Macro in XLSM format
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
    'Instantiate the excel application object.
    Dim application As IApplication = excelEngine.Excel
    'Creating new Workbook
    Dim workbook As IWorkbook = application.Workbooks.Create(1)
    Dim sheet As IWorksheet = workbook.Worksheets(0)
    'Creating Vba project
    Dim project As IVbaProject = workbook.VbaProject
    'Accessing vba modules collection
    Dim vbaModules As IVbaModules = project.Modules
    'Adding a vba module
    Dim vbaModule As IVbaModule = vbaModules.Add("StdModule",
    VbaModuleType.StdModule)
    'Adding vba code to the module
    vbaModule.Code = "Sub Auto_Open" & vbCrLf & " MsgBox \"Macro Added\" " & vbCrLf
    & " End Sub"
    'Saving as Macro in XLSM format
    Dim stream As MemoryStream = New MemoryStream()
    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro)
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Adding a vba module

```

```

IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
//Adding vba code to the module
vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
//Saving as Macro in XLTM format
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacroTemplate);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet sheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;

    IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
    //Adding vba code to the module
    vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
    //Saving as Macro in XLTM format
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacroTemplate);
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Creating new workbook
    IWorkbook workbook = application.Workbooks.Create(1);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Creating Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Adding a vba module
    IVbaModule vbaModule = vbaModules.Add("StdModule", VbaModuleType.StdModule);
    //Adding vba code to the module
    vbaModule.Code = "Sub Auto_Open\n MsgBox \"Macro Added\" \n End Sub";
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
}

```

Editing a Macro

XlsIO allows to edit the existing macros in the Excel documents. To edit macros in Excel document, the module containing the macro code needs to be modified. By using the name of the module, it can be accessed and edited in XlsIO.

The following code illustrate how to edit existing macro in Excel document.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    // Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Opening a workbook
    IWorkbook workbook = application.Workbooks.Open("Test.xls");
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet sheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Access a Vba Module
    IVbaModule vbaModule = vbaModules["Module1"];
    //Edit the macro
    vbaModule.Name = "CreateData";
    vbaModule.Code = "Sub Auto_Open()\n MsgBox \"Macro is edited\" \n End Sub ";
    //Saving as macro document
    workbook.SaveAs("Output.xlsm");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
    'Instantiate the excel application object.
    Dim application As IApplication = excelEngine.Excel
    'Opening a Workbook
    Dim workbook As IWorkbook = application.Workbooks.Open("Test.xls")
    Dim sheet As IWorksheet = workbook.Worksheets(0)
    'Creating Vba project
    Dim project As IVbaProject = workbook.VbaProject
    'Accessing vba modules collection
    Dim vbaModules As IVbaModules = project.Modules
    'Accessing a vba module
    Dim vbaModule As IVbaModule = vbaModules("Module1")
    'Editing a module
    vbaModule.Name = "CreateData"
    vbaModule.Code = "Sub Auto_Open() " & vbLf & " MsgBox ""Macro is edited"" " &
vbLf & " End Sub "
    'Saving as macro document
    workbook.SaveAs("Output.xlsm")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
```

```

IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsm");
openPicker.FileTypeFilter.Add(".xltn");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opening a workbook with a worksheet
IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Accessing Vba project

// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the excel application object.
IApplication application = excelEngine.Excel;
//Opening form module existing workbook
FileStream input = new FileStream(DataPathBase + "Test.xls", FileMode.Open,
FileAccess.ReadWrite);

```

```

IWorkbook workbook = application.Workbooks.Open(input);
IWorksheet sheet = workbook.Worksheets[0];
//Accessing Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Access a Vba Module
IVbaModule vbaModule = vbaModules["Module1"];
//Edit the macro
vbaModule.Name = "CreateData";
vbaModule.Code = "Sub Auto_Open()\n MsgBox \"Macro is edited\" \n End Sub ";
//Saving as macro document
FileStream output = new FileStream("Output.xlsm", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
input.Close();
output.Close();
}

```

XAMARIN

```

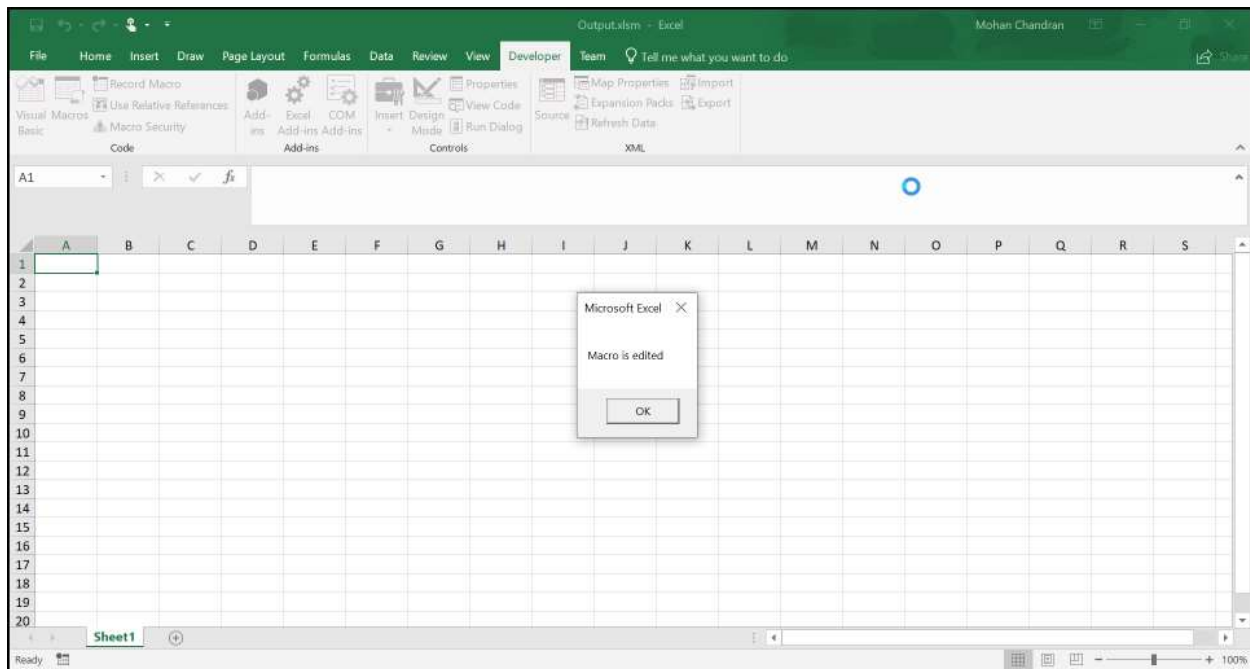

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("App.Test.xls");
//Opening the workbook
IWorkbook workbook = application.Workbooks.Open(inputStream);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Accessing Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Access a Vba Module
IVbaModule vbaModule = vbaModules["Module1"];
//Edit the macro
vbaModule.Name = "CreateData";
vbaModule.Code = "Sub Auto_Open()\n MsgBox \"Macro is edited\" \n End Sub ";
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
//Save the stream into XLSX file
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
"application/msexcel", stream);
}

```

The Vba project in the output Excel document looks like below.

The Macro output in the Excel document looks like below.

Note: Macros are parsed only when accessed. By default, opening and saving a macro file will preserve its macros.

Removing Macros

Excel macro-enabled documents can be saved as normal documents where the macro process is not necessary. XlsIO supports saving the macro-enabled documents such as XLS, XLSM, XLTM without macros and normal documents such as XLSX and XLS. For that, macro in the Excel documents needs to be removed.

Macro in the Excel document can be removed in the following ways.

- Remove(String name)
- RemoveAt(int index)
- Clear()
- SkipOnSave

Remove(string name)

Macro process exist in the Vba project's code modules. To remove a macro, the Vba modules needs to be removed.

- name – Name of the Vba module needs to be removed.

The following code illustrate how to remove a module using Remove method.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    // Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Opening a workbook
    IWorkbook workbook = application.Workbooks.Open("Test.xls");
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet sheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove macro module
    vbaModules.Remove("Module1");
    //Saving as macro document
    workbook.SaveAs("Output.xlsm");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
    'Instantiate the excel application object.
    Dim application As IApplication = excelEngine.Excel
    'Opening a Workbook
    Dim workbook As IWorkbook = application.Workbooks.Open("Test.xls")
    Dim sheet As IWorksheet = workbook.Worksheets(0)
    'Creating Vba project
    Dim project As IVbaProject = workbook.VbaProject
    'Accessing vba modules collection
    Dim vbaModules As IVbaModules = project.Modules
    //Remove macro module
    vbaModules.Remove("Module1")
    'Saving as macro document
    workbook.SaveAs("Output.xlsm")
End Using
```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsm");
    openPicker.FileTypeFilter.Add(".xltm");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opening a workbook with a worksheet
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
    ExcelOpenType.Automatic);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove macro module
    vbaModules.Remove("Module1");
    // Save the Workbook
    StorageFile storageFile;
    if
    (! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.U
    I.Input.HardwareButtons")))
    {
        FileSavePicker savePicker = new FileSavePicker();
        savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
        savePicker.SuggestedFileName = "Output";
        savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm"
        });
        storageFile = await savePicker.PickSaveFileAsync();
    }
    else
    {
        StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
        storageFile = await local.CreateFileAsync("Output.xlsm",
        CreationCollisionOption.ReplaceExisting);
    }
    //Saving the workbook
    await workbook.SaveAsync(storageFile, ExcelSaveType.SaveAsMacro);
    // Launch the saved file
    await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    //Opening form module existing workbook

```

```

FileStream input = new FileStream(DataPathBase + "Test.xls", FileMode.Open,
    FileAccess.ReadWrite);
IWorkbook workbook = application.Workbooks.Open(input);
IWorksheet sheet = workbook.Worksheets[0];
//Accessing Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Remove macro module
vbaModules.Remove("Module1");
//Saving as macro document
FileStream output = new FileStream("Output.xlsm", FileMode.Create,
    FileAccess.ReadWrite);
workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
input.Close();
output.Close();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    // "App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream = assembly.GetManifestResourceStream("App.Test.xls");
    //Opening the workbook
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove macro module
    vbaModules.Remove("Module1");
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
    //Save the stream into XLSX file
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
        "application/msexcel", stream);
}

```

RemoveAt(int index)

Vba module can be removed using the position from the IVbaModules collection.

- Index – Position of the Vba module in the modules collection.

The following code illustrate how to remove a macro using module index.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    // Instantiate the excel application object.

```

```

IApplication application = excelEngine.Excel;
// Opening a workbook
IWorkbook workbook = application.Workbooks.Open("Test.xls");
workbook.Version = ExcelVersion.Excel2016;
IWorksheet sheet = workbook.Worksheets[0];
//Accessing Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Remove macro module
vbaModules.RemoveAt(0);
//Saving as macro document
workbook.SaveAs("Output.xlsm");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
    'Instantiate the excel application object.
    Dim application As IApplication = excelEngine.Excel
    'Opening a Workbook
    Dim workbook As IWorkbook = application.Workbooks.Open("Test.xls")
    Dim sheet As IWorksheet = workbook.Worksheets(0)
    'Creating Vba project
    Dim project As IVbaProject = workbook.VbaProject
    'Accessing vba modules collection
    Dim vbaModules As IVbaModules = project.Modules
    //Remove macro module
    vbaModules.RemoveAt(0)
    'Saving as macro document
    workbook.SaveAs("Output.xlsm")
End Using

```

UWP

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsm");
    openPicker.FileTypeFilter.Add(".xltn");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opening a workbook with a worksheet
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
        ExcelOpenType.Automatic);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove macro module
    vbaModules.RemoveAt(0);
}

```

```

// Save the Workbook
StorageFile storageFile;
if
(
  !(Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.UI.Input.HardwareButtons"))
)
{
  FileSavePicker savePicker = new FileSavePicker();
  savePicker.SuggestedStartLocation = PickerLocationId.Desktop;

  savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm" });
  storageFile = await savePicker.PickSaveFileAsync();
}
else
{
  StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
  storageFile = await local.CreateFileAsync("Output.xlsm",
    CreationCollisionOption.ReplaceExisting);
}
//Saving the workbook
await workbook.SaveAsAsync(storageFile, ExcelSaveType.SaveAsMacro);
// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
  //Instantiate the excel application object.
  IApplication application = excelEngine.Excel;
  //Opening form module existing workbook
  FileStream input = new FileStream(DataPathBase + "Test.xls", FileMode.Open,
    FileAccess.ReadWrite);
  IWorkbook workbook = application.Workbooks.Open(input);
  IWorksheet sheet = workbook.Worksheets[0];
  //Accessing Vba project
  IVbaProject project = workbook.VbaProject;
  //Accessing vba modules collection
  IVbaModules vbaModules = project.Modules;
  //Remove macro module
  vbaModules.RemoveAt(0);
  //Saving as macro document
  FileStream output = new FileStream("Output.xlsm", FileMode.Create,
    FileAccess.ReadWrite);
  workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
  input.Close();
  output.Close();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
  IApplication application = excelEngine.Excel;
  /"App" is the class of Portable project

```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("App.Test.xls");
//Opening the workbook
IWorkbook workbook = application.Workbooks.Open(inputStream);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Accessing Vba project
IVbaProject project = workbook.VbaProject;
//Accessing vba modules collection
IVbaModules vbaModules = project.Modules;
//Remove macro module
vbaModules.RemoveAt(0);
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
//Save the stream into XLSX file
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
"application/msexcel", stream);
}

```

Clear()

Clear() method removes all the Vba modules at once by clearing the module collection.

The following code illustrate how to remove all macros using clear method.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    // Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    // Opening a workbook
    IWorkbook workbook = application.Workbooks.Open("Test.xls");
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet sheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove all macros
    vbaModules.Clear();
    //Saving as macro document
    workbook.SaveAs("Output.xlsm");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
    'Instantiate the excel application object.
    Dim application As IApplication = excelEngine.Excel
    'Opening a Workbook
    Dim workbook As IWorkbook = application.Workbooks.Open("Test.xls")
    Dim sheet As IWorksheet = workbook.Worksheets(0)
    'Creating Vba project
    Dim project As IVbaProject = workbook.VbaProject
    'Accessing vba modules collection
    Dim vbaModules As IVbaModules = project.Modules

```

```
//Remove all macros
vbaModules.Clear()
'Saving as macro document
workbook.SaveAs ("Output.xlsm")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Instantiates the File Picker
    FileOpenPicker openPicker = new FileOpenPicker();
    openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
    openPicker.FileTypeFilter.Add(".xlsm");
    openPicker.FileTypeFilter.Add(".xltn");
    openPicker.FileTypeFilter.Add(".xls");
    StorageFile file = await openPicker.PickSingleFileAsync();
    //Opening a workbook with a worksheet
    IWorkbook workbook = await application.Workbooks.OpenAsync(file,
        ExcelOpenType.Automatic);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove all macros
    vbaModules.Clear();
    // Save the Workbook
    StorageFile storageFile;
    if
    (! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent ("Windows.Phone.U
        I.Input.HardwareButtons")))
    {
        FileSavePicker savePicker = new FileSavePicker();
        savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
        savePicker.SuggestedFileName = "Output";
        savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsm"
        });
        storageFile = await savePicker.PickSaveFileAsync();
    }
    else
    {
        StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
        storageFile = await local.CreateFileAsync("Output.xlsm",
            CreationCollisionOption.ReplaceExisting);
    }
    //Saving the workbook
    await workbook.SaveAsAsync(storageFile, ExcelSaveType.SaveAsMacro);
    // Launch the saved file
    await Windows.System.Launcher.LaunchFileAsync(storageFile);
}
```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    //Instantiate the excel application object.
    IApplication application = excelEngine.Excel;
    //Opening form module existing workbook
    FileStream input = new FileStream(DataPathBase + "Test.xls", FileMode.Open,
    FileAccess.ReadWrite);
    IWorkbook workbook = application.Workbooks.Open(input);
    IWorksheet sheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove all macros
    vbaModules.Clear();
    //Saving as macro document
    FileStream output = new FileStream("Output.xlsm", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(output, ExcelSaveType.SaveAsMacro);
    input.Close();
    output.Close();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //"App" is the class of Portable project
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    Stream inputStream = assembly.GetManifestResourceStream("App.Test.xls");
    //Opening the workbook
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    workbook.Version = ExcelVersion.Excel2016;
    IWorksheet worksheet = workbook.Worksheets[0];
    //Accessing Vba project
    IVbaProject project = workbook.VbaProject;
    //Accessing vba modules collection
    IVbaModules vbaModules = project.Modules;
    //Remove all macros
    vbaModules.Clear();
    MemoryStream stream = new MemoryStream();
    workbook.SaveAs(stream, ExcelSaveType.SaveAsMacro);
    //Save the stream into XLSX file
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsm",
    "application/msexcel", stream);
}

```

SkipOnSave

SkipOnSave allows to resave the Excel document into normal XLSX and XLS documents.

The following code illustrate how to save the macro-enabled document into normal Excel document.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())

```

```
{
// Instantiate the excel application object.
IApplication application = excelEngine.Excel;
// Opening a workbook
IWorkbook workbook = application.Workbooks.Open("Test.xls");
workbook.Version = ExcelVersion.Excel2016;
IWorksheet sheet = workbook.Worksheets[0];
//Skip Macros while saving
application.SkipOnSave = SkipExtRecords.Macros;
//Saving as Excel without macro
workbook.SaveAs("Output.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the excel application object.
Dim application As IApplication = excelEngine.Excel
'Opening a Workbook
Dim workbook As IWorkbook = application.Workbooks.Open("Test.xls")
Dim sheet As IWorksheet = workbook.Worksheets(0)
//Skip Macros while saving
application.SkipOnSave = SkipExtRecords.Macros
'Saving as Excel without macro
workbook.SaveAs("Output.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsm");
openPicker.FileTypeFilter.Add(".xltn");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opening a workbook with a worksheet
IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
workbook.Version = ExcelVersion.Excel2016;
IWorksheet worksheet = workbook.Worksheets[0];
//Skip Macros while saving
application.SkipOnSave = SkipExtRecords.Macros;
// Save the Workbook
StorageFile storageFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.UI.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
```

```

savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
storageFile = await savePicker.PickSaveFileAsync();
}
else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
storageFile = await local.CreateFileAsync("Output.xlsx",
CreationCollisionOption.ReplaceExisting);
}
//Saving the workbook without macro
await workbook.SaveAsAsync(storageFile, ExcelSaveType.SaveAsXLS);
// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the excel application object.
IApplication application = excelEngine.Excel;
//Opening form module existing workbook
FileStream input = new FileStream(DataPathBase + "Test.xls", FileMode.Open,
FileAccess.ReadWrite);
IWorkbook workbook = application.Workbooks.Open(input);
IWorksheet sheet = workbook.Worksheets[0];
//Skip Macros while saving
application.SkipOnSave = SkipExtRecords.Macros;
//Saving as Excel without macro
FileStream output = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(output, ExcelSaveType.SaveAsXLS);
input.Close();
output.Close();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())

MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream, ExcelSaveType.SaveAsXLS);
//Save the stream into XLSX file
}

```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xlsx",
"application/msexcel", stream);
}
```

Excel to PDF Conversion

XlsIO allows you to convert an entire workbook or a single worksheet into PDF document. Refer to the following links for assemblies/nuget packages required based on platforms to convert Excel document into PDF.

- [Assemblies Information](#)
- [NuGet Information](#)

Note: Excel to PDF conversion works proper in Blazor server-side alone and not in client-side.

Workbook to PDF

The following code illustrates how to convert an Excel workbook to PDF.

C#

```
using(ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic);
    //Open the Excel document to Convert
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Initialize PDF document
    PdfDocument pdfDocument = new PdfDocument();
    //Convert Excel document into PDF document
    pdfDocument = converter.Convert();
    //Save the PDF file
    pdfDocument.Save("ExcelToPDF.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
'Open the Excel document to convert
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Initialize the PDF document
Dim pdfDocument As PdfDocument = New PdfDocument()
'Convert Excel document into PDF document
pdfDocument = converter.Convert()
'Save the PDF file
pdfDocument.Save("ExcelToPDF.pdf")
End Using
```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
#region Excel To PDF
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Gets assembly

To learn more about different conversion settings in Excel To PDF conversion, refer to the ExcelToPdfConverterSettings in API section.

Worksheet to PDF

The following code shows how to convert a particular sheet to PDF document.

C#

```
Using(ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //convert the sheet to PDF
    ExcelToPdfConverter converter = new ExcelToPdfConverter(sheet);
    PdfDocument pdfDocument= new PdfDocument();
    pdfDocument = converter.Convert();
    pdfDocument.Save("ExcelToPDF.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Converts the particular sheet
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(sheet)
Dim pdfDocument As PdfDocument = New PdfDocument()
pdfDocument = converter.Convert()
'Save the PDF file
pdfDocument.Save("ExcelToPDF.pdf")
End Using
```

}
```

Excel with chart to PDF

XlsIO allows you to convert a workbook/worksheet with charts or a single chart into PDF document.

To preserve the charts during Excel To PDF conversion in .NET Framework, initialize the **ChartToImageConverter** of **IApplication** interface otherwise the charts present in worksheet gets skipped.

The following code illustrates how to convert an Excel with chart to PDF document.

C#

```
Using(ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
```

```

//Instantiating the ChartToImageConverter and assigning the
ChartToImageConverter instance of XlsIO application
application.ChartToImageConverter = new ChartToImageConverter();
//Tuning chart image quality
application.ChartToImageConverter.ScalingMode = ScalingMode.Best;
IWorkbook workbook = application.Workbooks.Open("chart.xlsx");
IWorksheet worksheet = workbook.Worksheets[0];
ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
PdfDocument pdfDocument = new PdfDocument();
pdfDocument = converter.Convert();
pdfDocument.Save("ExcelToPDF.pdf");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Instantiating the ChartToImageConverter and assigning the
ChartToImageConverter instance of XlsIO application
application.ChartToImageConverter = New ChartToImageConverter()
'Tuning chart image quality
application.ChartToImageConverter.ScalingMode = ScalingMode.Best
Dim workbook As IWorkbook = application.Workbooks.Open("chart.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim converter As New ExcelToPdfConverter(workbook)
Dim pdfDocument As New PdfDocument()
pdfDocument = converter.Convert()
pdfDocument.Save("ExcelToPDF.pdf")
End Using

```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard 2.0
assemblies in UWP platform

    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().Save("ExcelToPDF.pdf", "application/pdf", stream);
    }
    excelStream.Dispose();
    stream.Dispose();
}

```

Substitute Font in Excel-to-PDF Conversion

By default, XlsIO substitutes unsupported fonts to Microsoft Sans Serif in Excel-to-PDF conversion. However, you may require substituting a different font or the same font for the unsupported font during the conversion. XlsIO supports substituting unsupported or missing fonts from the event

SubstituteFont. The event has the below arguments:

AlternateFontName – Substitutes an available font in the machine for the **OriginalFontName**.

AlternateFontStream – Substitutes a font from stream that is added as embedded resource for the **OriginalFontName**.

The following code illustrates how to perform Excel-to-PDF conversion by substituting unsupported fonts in the machine.

C#

```

using Syncfusion.ExcelToPdfConverter;
using Syncfusion.Pdf;
using Syncfusion.XlsIO;
using Syncfusion.XlsIO.Implementation;
using System.IO;
using System.Reflection;

```

```

namespace FontSubstitution
{
    class Program
    {
        static void Main(string[] args)
        {
            using (ExcelEngine excelEngine = new ExcelEngine())
            {
                IApplication application = excelEngine.Excel;
                application.DefaultVersion = ExcelVersion.Xlsx;
                //Initializes the SubstituteFont event to perform font substitution in
                Excel-to-PDF conversion.
                application.SubstituteFont += new
                SubstituteFontEventHandler(SubstituteFont);
                IWorkbook workbook = application.Workbooks.Open("Template.xlsx");
                IWorksheet worksheet = workbook.Worksheets[0];
                ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
                PdfDocument pdfDocument = new PdfDocument();
                pdfDocument = converter.Convert();
                pdfDocument.Save("ExcelToPDF.pdf");
            }
        }

Excel to PDF conversion in Linux OS

In Linux OS, you can perform the Excel to PDF conversion using .NET Core (Targeting .netcoreapp) application. You can refer [Excel to PDF conversion NuGet packages](#) to know about the packages required to deploy .NET Core (Targeting .netcoreapp) application with Excel to PDF conversion capabilities.

In addition to the previous NuGet packages, SkiaSharp.Linux helper NuGet package is required that can be generated by the following steps:

1. Download libSkiaSharp.so [here](#).
2. Create a folder and name it as SkiaSharp.Linux and place the downloaded file in the folder structure "SkiaSharp.Linux\runtimes\linux-x64\native"
3. Create a nuspec file with name SkiaSharp.Linux.nuspec using the following metadata information and place it inside SkiaSharp.Linux folder. The nuspec file can be customized.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<package xmlns="http://schemas.microsoft.com/packaging/2012/06/nuspec.xsd">
  <metadata>
    <id>SkiaSharp.Linux</id>
    <version>1.59.3</version>
    <title>SkiaSharp for Linux</title>
    <authors>Syncfusion Inc.</authors>
    <owners>Syncfusion Inc.</owners>
    <requireLicenseAcceptance>false</requireLicenseAcceptance>
    <description>SkiaSharp for Linux is a supporting package for Linux
platforms.</description>
    <tags>linux, cross-platform, skiasharp, net-standard, net-core, excel-to-
pdf</tags>
    <dependencies>
      <group targetFramework=".NETStandard1.4">
        <dependency id="SkiaSharp" version="1.59.3" />
      </group>
    </dependencies>
  </metadata>
</package>
```

4. Make sure that the nuget.exe file is present along with SkiaSharp.Linux folder (in the parent folder of SkiaSharp.Linux folder). If not, download it from [here](#).
5. Open a command prompt and navigate to SkiaSharp.Linux folder.
6. Execute the following command.

C#

```
Using(ExcelEngine excelEngine = new ExcelEngine())
{
  IApplication application = excelEngine.Excel;
  IWorkbook workbook = application.Workbooks.Open("Excel.xlsx");
  // Convert the workbook
  ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
  // Print the converted PDF document
  converter.Print();
}
```

```
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Excel.xlsx")
'Convert the workbook
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Print the converted PDF document
converter.Print()
End Using
```

UWP

```
//XlsIO supports Excel To PDF conversion in Windows Forms, WPF, ASP.NET, and

Print with printer settings

The following code snippet illustrates how to print the Excel document with printer settings in XlsIO.

C#

```
Using(excelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
IWorkbook workbook = application.Workbooks.Open("Excel.xlsx");
//Convert the workbook
ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
//Initialize the printer settings
PrinterSettings printerSettings = new PrinterSettings();
//customizing the printer settings
printerSettings.PrinterName = "HP LaserJet Pro MFP M127-M128 PCLmS";
printerSettings.Copies = 2;
printerSettings.FromPage = 2;
printerSettings.ToPage = 3;
printerSettings.DefaultPageSettings.Color = false;
printerSettings.Duplex = Duplex.Vertical;
//Print the converted PDF document with printer settings
converter.Print(printerSettings);
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Excel.xlsx")
'Convert the workbook
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Initialize the printer settings
Dim printerSettings As PrinterSettings = New PrinterSettings
'customizing the printer settings
printerSettings.PrinterName = "HP LaserJet Pro MFP M127-M128 PCLmS"
printerSettings.Copies = 2
printerSettings.FromPage = 2
printerSettings.ToPage = 3
printerSettings.DefaultPageSettings.Color = false
printerSettings.Duplex = Duplex.Vertical
'Print the converted PDF document with printer settings
converter.Print(printerSettings)
End Using

```

```

ASP.NET CORE

```
//XlsIO supports Excel To PDF conversion in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms. Refer to the Workbook to PDF section to convert using web service.
```

XAMARIN

```
//XlsIO supports Excel To PDF conversion in Windows Forms, WPF, ASP.NET, and ASP.NET MVC platforms. Refer to the Workbook to PDF section to convert using web service.
```

Note: Printing support is applicable only in Windows Forms and WPF platforms.

Supported elements

This feature supports the following elements:

- Styles
- Rich-text formatting
- Headers and footers
- Images
- Picture recolor
- Black and white
- Color change
- DuoTone
- Gray scale
- Text boxes
- Hyperlinks
- Document properties
- Table styles
- Text rotations
- Excel page setup options
- Unicode
- Print titles
- Page breaks
- Print area
- Print order
- 2D charts
- 3D charts
- AutoShapes
- Group shapes
- Conditional formats
- Pivot tables

Unsupported elements

The following list contains unsupported elements that presently not preserved in the generated PDF document:

- Gradient fill
- Comments

- Sparklines
- Pivot charts
- SmartArt graphics
- Different first page headers
- Different odd and even pages
- Conditional formats
- Data bars
- Color scales
- Tables
- Custom styles
- Row and column headings
- Form controls
- ActiveX controls
- OLE objects

Excel to PDF Converter Settings

XlsIO allows you to convert an entire workbook or a single worksheet into PDF document with conversion settings of Excel to PDF converter.

Auto-detect Complex Script

This property enables the complex script validation for the text present in Excel document and renders it into PDF document. Its default value is FALSE.

The following complete code snippet explains how to enable [AutoDetectComplexScript](#) property while converting an Excel document to PDF.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Enable AutoDetectComplexScript property
    settings.AutoDetectComplexScript = true;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
```

```

Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Enable AutoDetectComplexScript property
settings.AutoDetectComplexScript = True
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using

```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform

```

{% endtabs%}

Custom Paper Size

This property helps to set the required paper size in inches. The default value is empty(i.e.,{Width = 0.0 Height = 0.0}).

The following complete code snippet explains how to set [CustomPaperSize](#) while converting Excel document to PDF.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Set CustomerPaperSize
    settings.CustomPaperSize = new SizeF(10, 20);
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set CustomerPaperSize
settings.CustomPaperSize = New SizeF(10, 20)
'Load the Excel document into ExcelToPdfConverter
```

```

Display Gridlines

This property helps to set the gridlines display style in Excel to PDF converted document. Three display styles are **Auto**, **Invisible** and **Visible**. These are maintained under [GridLinesDisplayStyle](#) enumeration.

Auto

Gridlines will not be rendered in the output PDF document, when display style is selected as **Auto**. Its default value is Invisible. The following code snippet explains how to select **Auto** display style for gridlines.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Set the gridlines display style as Auto
    settings.DisplayGridLines = GridLinesDisplayStyle.Auto;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set the gridlines display style as Auto

```

```

settings.DisplayGridLines = GridLinesDisplayStyle.Auto
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using

```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform

```

Embed Fonts

The Excel content will be rendered improperly when Arial Unicode MS Font is missing in the machine. In this case, enabling the [EmbedFonts](#) property renders the content properly.

The following code snippet explains how to enable **EmbedFonts** property.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Enable EmbedFonts
    settings.EmbedFonts = true;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Enable EmbedFonts
settings.EmbedFonts = True
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using
```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())

"application/pdf", stream);
}
```

Export Bookmarks

The default value of [ExportBookmarks](#) property is TRUE and hence bookmarks are exported to PDF document by default, in Excel to PDF conversion. Disabling this property skips the bookmarks in conversion.

The following code snippet explains how to disable [ExportBookmarks](#) property.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Disable ExportBookmarks
    settings.ExportBookmarks = false;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Disable ExportBookmarks
settings.ExportBookmarks = False
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using
```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;

    stream.Position = 0;
```

```
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.pdf",
"application/pdf", stream);
}
```

Export Quality Image

The default value of [ExportQualityImage](#) is FALSE. Enabling this property exports quality image to PDF document.

The following complete code snippet explains how to enable ExportQualityImage property.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Enable ExportQualityImage
    settings.ExportQualityImage = true;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Enable ExportQualityImage
settings.ExportQualityImage = True
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using
```

UWP

```
//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())

    "application/pdf", stream);
}
```

Header Footer Option

Two properties available under [HeaderFooterOption](#) are ShowHeader and ShowFooter.

Show Header

Document header will be rendered to PDF document by default. This can be skipped by disabling the [ShowHeader](#) property.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Disable ShowHeader
    settings.HeaderFooterOption.ShowHeader = false;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Disable ShowHeader
settings.HeaderFooterOption.ShowHeader = False
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using
```

UWP

```
//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    //Get assembly
```

```

Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Get input Excel document from an embedded resource collection
Stream excelStream =
assembly.GetManifestResourceStream("UWPSample.Sample.xlsx");
IWorkbook workbook = application.Workbooks.Open(excelStream);
//Initialize XlsIORendererSettings
XlsIORendererSettings settings = new XlsIORendererSettings();
//Disable ShowHeader
settings.HeaderFooterOption.ShowHeader = false;
//Initialize XlsIORenderer
XlsIORenderer renderer = new XlsIORenderer();
//Convert the Excel document to PDF with renderer settings
PdfDocument document = renderer.ConvertToPDF(workbook, settings);
//Save the PDF document

    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.pdf",
    "application/pdf", stream);
}
```

Layout Options

This property helps to select the layout option for the Excel document in Excel to PDF conversion. Five layout options available and maintained under [LayoutOptions](#) enumeration are **Automatic**, **CustomScaling**, **FitAllColumnsOnOnePage**, **FitAllRowsOnOnePage**, **FitSheetOnOnePage** and **NoScaling**.

Automatic

Selecting **Automatic** under LayoutOptions prints the worksheets at their actual size. It's default value is **NoScaling**. The following code snippet explains how to select the layout option as **Automatic**.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Set layout option as Automatic
    settings.LayoutOptions = LayoutOptions.Automatic;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set layout option as Automatic
settings.LayoutOptions = LayoutOptions.Automatic
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using

```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;

    "application/pdf", stream);
}
```

Custom Scaling

Selecting **CustomScaling** under **LayoutOptions** prints the worksheets at specified scaling, i.e., zoom value set in under page setup. The following code snippet explains how to use this.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
```

```
//Initialize ExcelToPdfConverterSettings
ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
//Set layout option as CustomScaling
settings.LayoutOptions = LayoutOptions.CustomScaling;
//Load the Excel document into ExcelToPdfConverter
ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
//Convert the Excel document to PDF with converter settings
PdfDocument document = converter.Convert(settings);
//Save the PDF document
document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set layout option as CustomScaling
settings.LayoutOptions = LayoutOptions.CustomScaling
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using
```

UWP

```
//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2016;
//Get assembly

    document.Save(stream);
    stream.Position = 0;
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.pdf",
        "application/pdf", stream);
}
```

No Scaling

Selecting **NoScaling** under **LayoutOptions** prints the worksheets at their actual size. The following code snippet explains how to select the layout option as **NoScaling**.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Set layout option as NoScaling
    settings.LayoutOptions = LayoutOptions.NoScaling;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set layout option as NoScaling
settings.LayoutOptions = LayoutOptions.NoScaling
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using

```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard

    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.pdf",
        "application/pdf", stream);
}

```

PDF Conformance Level

Excel to PDF converter settings allows you to set the PDF conformance level. Excel to PDF currently supports following PDF conformances.

- PDF/A-1b conformance
- PDF/X-1a conformance

Note: 1. To know more details about PDF conformance refer <https://help.syncfusion.com/file-formats/pdf/working-with-pdf-conformance>

2. Pdf_X1A2001 is not supported for NETStandard.

The following code illustrates how to set the [PdfConformanceLevel](#) while converting Excel workbook to PDF.

C#

```

using(ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
        ExcelOpenType.Automatic);
    //Open the Excel document to Convert
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Initialize Excel to PDF converter settings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
}

```

```
// Set the conformance for PDF/A-1b conversion
settings.PdfConformanceLevel = PdfConformanceLevel.Pdf_A1B;
//Convert Excel document into PDF document
PdfDocument pdfDocument = converter.Convert(settings);
//Save the PDF file
pdfDocument.Save("ExcelToPDF.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
'Open the Excel document to convert
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Initialize Excel to PDF converter settings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set the conformance for PDF/A-1b conversion
settings.PdfConformanceLevel = PdfConformanceLevel.Pdf_A1B
'Convert Excel document into PDF document
Dim pdfDocument As PdfDocument = converter.Convert(settings)
'Save the PDF file
pdfDocument.Save("ExcelToPDF.pdf")
End Using
```

UWP

```
//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
#region Excel To PDF

```

Template Document

[TemplateDocument](#) property helps to store the PDF document.

The following complete code snippet explains how to convert and save two Excel documents into single PDF document using TemplateDocument property.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook1 = application.Workbooks.Open("Sample1.xlsx");
    IWorkbook workbook2 = application.Workbooks.Open("Sample2.xlsx");
```

```

//Load the Excel documents into ExcelToPdfConverter
ExcelToPdfConverter converter1 = new ExcelToPdfConverter(workbook1);
ExcelToPdfConverter converter2 = new ExcelToPdfConverter(workbook2);
//Convert the first Excel document to PDF
PdfDocument document = converter1.Convert();
//Initialize ExcelToPdfConverterSettings
ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
//Set the document as TemplateDocument
settings.TemplateDocument = document;
//Create a new PDF document and convert the second Excel document with settings
PdfDocument newDocument = new PdfDocument();
newDocument = converter2.Convert(settings);
//Save the new PDF Document
newDocument.Save("Output.pdf");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook1 As IWorkbook = application.Workbooks.Open("Sample1.xlsx")
Dim workbook2 As IWorkbook = application.Workbooks.Open("Sample2.xlsx")
'Load the Excel documents into ExcelToPdfConverter
Dim converter1 As ExcelToPdfConverter = New ExcelToPdfConverter(workbook1)
Dim converter2 As ExcelToPdfConverter = New ExcelToPdfConverter(workbook2)
'Convert the first Excel document to PDF
Dim document As PdfDocument = converter1.Convert
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Set the document as TemplateDocument
settings.TemplateDocument = document
'Create a new PDF document and convert the second Excel document with settings
Dim newDocument As PdfDocument = New PdfDocument
newDocument = converter2.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using

```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())
{

}
```

Throw When Excel File Is Empty

The default value of [ThrowWhenExcelFileIsEmpty](#) property is FALSE, and hence the empty Excel document will be converted to PDF without any exception. Enabling this property throws **ExcelToPdfConverterException**, saying that the Excel document is Empty.

The following code snippet explains this.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Initialize ExcelToPdfConverterSettings
    ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
    //Enabling ThrowWhenExcelFileIsEmpty throws exception
    settings.ThrowWhenExcelFileIsEmpty = true;
    //Load the Excel document into ExcelToPdfConverter
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    //Convert the Excel document to PDF with converter settings
    PdfDocument document = converter.Convert(settings);
    //Save the PDF document
    document.Save("Output.pdf");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Initialize ExcelToPdfConverterSettings
Dim settings As ExcelToPdfConverterSettings = New
ExcelToPdfConverterSettings()
'Enabling ThrowWhenExcelFileIsEmpty throws exception
settings.ThrowWhenExcelFileIsEmpty = True
'Load the Excel document into ExcelToPdfConverter
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
'Convert the Excel document to PDF with converter settings
Dim document As PdfDocument = converter.Convert(settings)
'Save the PDF document
document.Save("Output.pdf")
End Using
```

UWP

```

//Excel To PDF conversion can be performed by referring .NET Standard
assemblies in UWP platform
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2016;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Initialize XlsIORendererSettings
    XlsIORendererSettings settings = new XlsIORendererSettings();
    //Enabling ThrowWhenExcelFileIsEmpty throws exception
    settings.ThrowWhenExcelFileIsEmpty = true;
    //Initialize XlsIORenderer
    XlsIORenderer renderer = new XlsIORenderer();
    //Convert the Excel document to PDF with renderer settings
    PdfDocument document = renderer.ConvertToPDF(workbook, settings);
    //Save the PDF document
    MemoryStream stream = new MemoryStream();
    document.Save(stream);
    Save(stream, "Output.pdf");
}
//Save the PDF stream as a file
#region Setting output location
async void Save(Stream stream, string filename)
{
    stream.Position = 0;
    StorageFile stFile;
    if

    MemoryStream stream = new MemoryStream();
    document.Save(stream);
    stream.Position = 0;
    Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.pdf",
        "application/pdf", stream);
}

```

Capture Warnings in Excel-to-PDF Conversion

XlsIO intentionally skips unsupported elements and substitutes unsupported fonts. The elements that were not converted and the fonts that were intentionally substituted can be raised as warnings, to decide whether to proceed the conversion with the warnings or to stop the conversion.

It is recommended to implement `IWarning` interface in a supporting class. The interface holds the properties,

Type – the element that failed to convert **Description** – the description of the failed element

In addition, a decision to continue the conversion process can be done here by setting boolean value to the property `Cancel`. If `Cancel` is set to TRUE the conversion cancels, else the conversion continues.

The following code snippet shows how to capture warnings during Excel-to-PDF conversion.

C#

```
using Syncfusion.ExcelToPdfConverter;
using Syncfusion.Pdf;
using Syncfusion.XlsIO;
namespace CaptureWarnings
{
    class Program
    {
        static void Main(string[] args)
        {
            using(ExcelEngine excelEngine = new ExcelEngine())
            {
                IApplication application = excelEngine.Excel;
                application.DefaultVersion = ExcelVersion.Excel2013;
                IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
                    ExcelOpenType.Automatic);
                //Open the Excel document to convert.
                ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
                //Initialize warning class to capture warnings during the conversion.
                Warning warning = new Warning();
                //Initialize Excel-to-PDF converter settings.
                ExcelToPdfConverterSettings settings = new ExcelToPdfConverterSettings();
                //Set the warning class that is implemented.
                settings.Warning = warning;
                //Convert Excel document into PDF document.
                PdfDocument pdfDocument = converter.Convert(settings);
                //If conversion process canceled null returned.
                if(pdfDocument != null)
                {
                    //Save the PDF file.
                    pdfDocument.Save("ExcelToPDF.pdf");
                }
            }
        }
        /// <summary>
        /// A supporting class that implements IWarning.
        /// </summary>
        public class Warning : IWarning
        {
            public void ShowWarning(WarningInfo warning)
            {
                //Cancel the conversion process if the warning type is conditional
                //formatting.
                if (warning.Type == WarningType.ConditionalFormatting)
                {
                    Cancel = true;
                }
                //To view or log the warning, you can make use of warning.Description.

Worksheet to Image conversion

Assemblies Required

Refer to the following links for assemblies/nuget packages required based on platforms to convert the worksheet to image.

- [Assemblies Information](#)
- [NuGet Information](#)

Note: Worksheet to Image conversion works proper in Blazor server-side alone and not in client-side.

Convert as bitmap

The following code shows how to convert the specified range of rows and columns in the worksheet to bitmap.

C#

```
// Convert as bitmap  
Image image = sheet.ConvertToImage(1, 1, 10, 20);  
image.Save("Sample.png", ImageFormat.Png);
```

VB.NET

```
'Convert as bitmap  
Dim image As Image = sheet.ConvertToImage(1, 1, 10, 20)  
image.Save("Sample.png", ImageFormat.Png)
```

UWP

```
//Worksheet To Image conversion can be performed by referring .NET Standard  
assemblies in UWP platform.  
// Initialize XlsIORenderer  
application.XlsIORenderer = new XlsIORenderer();  
//Create a new memory stream to save the image  
Stream stream = new MemoryStream();  
//Convert worksheet to image and save it to stream.  
worksheet.ConvertToImage(1, 1, 10, 20, stream);
```

ASP.NET CORE

```
// Initialize XlsIORenderer  
application.XlsIORenderer = new XlsIORenderer();  
//Create a new memory stream to save the image  
Stream stream = new MemoryStream();  
//Convert worksheet to image and save it to stream.  
worksheet.ConvertToImage(1, 1, 10, 20, stream);
```

XAMARIN

```
// Initialize XlsIORenderer  
application.XlsIORenderer = new XlsIORenderer();  
//Create a new memory stream to save the image  
Stream stream = new MemoryStream();  
//Convert worksheet to image and save it to stream.  
worksheet.ConvertToImage(1, 1, 10, 20, stream);
```

Save as stream

The following code snippet shows how to save a sheet as stream.

C#

```
// Converts and save as stream
MemoryStream stream = new MemoryStream();
sheet.ConvertToImage(1, 1, 10, 20, ImageType.Metafile, stream);
```

VB.NET

```
'Converts and save as stream
Dim stream As MemoryStream = New MemoryStream()
sheet.ConvertToImage(1, 1, 10, 20, ImageType.Metafile, stream)
```

UWP

```
//Worksheet To Image conversion can be performed by referring .NET Standard
//assemblies in UWP platform.
// Initialize XlsIORenderer
application.XlsIORenderer = new XlsIORenderer();
//Create a new memory stream to save the image
Stream stream = new MemoryStream();
//Convert worksheet to image and save it to stream.
worksheet.ConvertToImage(1, 1, 10, 20, stream);
```

ASP.NET CORE

```
// Initialize XlsIORenderer
application.XlsIORenderer = new XlsIORenderer();
// Converts and save as stream
MemoryStream stream = new MemoryStream();
sheet.ConvertToImage(1, 1, 10, 20, stream);
```

XAMARIN

```
// Initialize XlsIORenderer
application.XlsIORenderer = new XlsIORenderer();
// Converts and save as stream
MemoryStream stream = new MemoryStream();
sheet.ConvertToImage(1, 1, 10, 20, stream);
```

The complete code snippet of the previous options is shown as follows.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
    ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Convert as bitmap
    Image image = sheet.ConvertToImage(1, 1, 10, 20);
    image.Save("Sample.png", ImageFormat.Png);
    //Converts and save as stream
    MemoryStream stream = new MemoryStream();
```

```

sheet.ConvertToImage(1, 1, 10, 20, ImageType.Metafile, stream);
//Save the workbook to disk
workbook.SaveAs("Sample.xlsx");
//No exception will be thrown if there are unsaved workbooks
excelEngine.ThrowNotSavedOnDestroy = false;
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Convert as bitmap
Dim image As Image = worksheet.ConvertToImage(1, 1, 10, 20)
image.Save("Sample.png", ImageFormat.Png)
'Converts and save as stream
Dim stream As MemoryStream = New MemoryStream()
worksheet.ConvertToImage(1, 1, 10, 20, ImageType.Metafile, stream)
'Save the workbook to disk
workbook.SaveAs("Sample.xlsx")
'No exception will be thrown if there are unsaved workbooks.
excelEngine.ThrowNotSavedOnDestroy = False
End Using

```

UWP

```

//Worksheet To Image conversion can be performed by referring .NET Standard assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from an embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("WorksheetToImage.Sample.xlsx");
IWorkbook workbook = application.Workbooks.Open(inputStream,
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
//Initialize XlsIORenderer
application.XlsIORenderer = new XlsIORenderer();
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Image Files", new List<string>() {
".png", ".jpeg", ".jpg" });
//Creates a storage file from the FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Converts and save to stream
var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
Stream stream = file.AsStreamForWrite();

```

```

sheet.ConvertToImage(1, 1, 10, 20, stream);
await file.FlushAsync();
stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook =
        application.Workbooks.Open(File.OpenRead("Sample.xlsx"),
            ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    //Initialize XlsIORenderer
    application.XlsIORenderer = new XlsIORenderer();
    //Converts and save as stream
    MemoryStream stream = new MemoryStream();
    sheet.ConvertToImage(1, 1, 10, 20, stream);
    //Close and Dispose
    workbook.Close();
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream =
        assembly.GetManifestResourceStream("WorksheetToImage.Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet sheet = workbook.Worksheets[0];
    //Initializing XlsIORenderer
    application.XlsIORenderer = new XlsIORenderer();
    //Converts and save to stream.
    MemoryStream stream = new MemoryStream();
    sheet.ConvertToImage(1, 1, 10, 20, stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
        TargetPlatform.Windows)
        DependencyService.Get<ISaveWindowsPhone>()
            .SaveAndView("Test.png", "image/png", stream);
    else
        DependencyService.Get<ISave>().SaveAndView("Test.png", "image/png", stream);
}

```

- Note:** 1. Instance of XlsIORenderer class is mandatory to convert the worksheet to image using .NET Standard assemblies.
2. In .NET Standard, the Image format and quality can be specified using the ExportImageOptions class. By default the ImageFormat is set to PNG and ScalingMode is set to Best.
3. Worksheet to image conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards.

Non-Supported Features:

- Subscript/Superscript
- Shrink to fit
- Shapes (except TextBox shape and Image)
- Complex conditional formatting
- Gradient fill is partially supported

Chart to image conversion

Refer to the following links for assemblies/nuget packages required based on platforms to convert the chart to image.

- [Assemblies Information](#)
- [NuGet Information](#)

The following code snippet shows how to convert an Excel chart to an image using the **ExcelChartToImageConverter** class.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    application.ChartToImageConverter = new ChartToImageConverter();
    application.ChartToImageConverter.ScalingMode = ScalingMode.Best;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    IChart chart = worksheet.Charts[0];
    //Creating the memory stream for chart image
    MemoryStream stream = new MemoryStream();
    //Saving the chart as image
    chart.SaveAsImage(stream);
    Image image = Image.FromStream(stream);
    //Saving image stream to file
    image.Save("Output.png");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
```

```

Dim ChartToImageConverter As chartToImageConverter = New
ChartToImageConverter()
application.ChartToImageConverter = ChartToImageConverter
application.ChartToImageConverter.ScalingMode = ScalingMode.Best
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
Dim chart As IChart = worksheet.Charts(0)
'Creating the memory stream for chart image
Dim stream As New MemoryStream()
'Saving the chart as image
chart.SaveAsImage(stream)
Dim image As Image = Image.FromStream(stream)
'Saving image stream to file
image.Save("Output.png")
End Using

```

UWP

```

//Chart To Image conversion can be performed by referring .NET Standard
assemblies in UWP platform.
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Initializing XlsIORenderer
    application.XlsIORenderer = new XlsIORenderer();
    //Set converter chart image format to PNG
    application.XlsIORenderer.ChartRenderingOptions.ImageFormat =
    ExportImageFormat.Png;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream = assembly.GetManifestResourceStream("Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream,
    ExcelOpenType.Automatic);
    IWorksheet sheet = workbook.Worksheets[0];
    IChart chart = worksheet.Charts[0];
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Image Files", new List<string>() {
    ".png", ".jpeg", ".jpg" });
    //Creates a storage file from the FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Converts and save to stream
    var file = await storageFile.OpenAsync(FileAccessMode.ReadWrite);
    Stream stream = file.AsStreamForWrite();
    chart.SaveAsImage(stream);
    await file.FlushAsync();
    stream.Dispose();
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

```

```

{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    // Initialize XlsIORenderer
    application.XlsIORenderer = new XlsIORenderer();
    //Set converter chart image format to PNG
    application.XlsIORenderer.ChartRenderingOptions.ImageFormat =
    ExportImageFormat.Png;
    IWorkbook workbook =
    application.Workbooks.Open(File.OpenRead("Sample.xlsx"),
    ExcelOpenType.Automatic);
    IWorksheet worksheet = workbook.Worksheets[0];
    IChart chart = worksheet.Charts[0];
    //Creating the memory stream for chart image
    MemoryStream stream = new MemoryStream();
    //Saving the chart as image
    chart.SaveAsImage(stream);
    //Close and Dispose
    workbook.Close();
    stream.Dispose();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    //Initializing XlsIORenderer
    application.XlsIORenderer = new XlsIORenderer();
    //Set converter chart image format to PNG
    application.XlsIORenderer.ChartRenderingOptions.ImageFormat =
    ExportImageFormat.Png;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from an embedded resource collection
    Stream inputStream = assembly.GetManifestResourceStream("Sample.xlsx");
    IWorkbook workbook = application.Workbooks.Open(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    IChart chart = worksheet.Charts[0];
    //Creating the memory stream for chart image
    MemoryStream stream = new MemoryStream();
    //Saving the chart as image
    chart.SaveAsImage(stream);
    stream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
        DependencyService.Get<ISaveWindowsPhone>().
        SaveAndView("Test.png", "image/png", stream);
    else
        DependencyService.Get<ISave>().SaveAndView("Test.png", "image/png", stream);
}

```

Note: 1. Instance of XlsIORenderer class is mandatory to convert the chart to image using .NET Standard 2.0 assemblies.

2. In .NET Standard, the Image format and quality can be specified using the ChartRenderingOptions property of XlsIORenderer class. By default the ImageFormat for chart is set to JPEG and ScalingMode is set to Best.

3. Chart conversion to image and PDF are supported from .NET Framework 4.0 and .NET Standard 2.0 onwards

4. Chart to Image conversion also works proper in Blazor server-side alone and not in client-side.

Supported chart types

XlsIO supports the following chart types in image conversion.

Chart Type	Chart Subtypes
Area	<i>Area</i> <i>AreaStacked</i> <i>AreaStacked100</i> <i>Area3D</i>
Bar	<i>BarClustered</i> <i>BarStacked</i> <i>BarStacked100</i> <i>BarClustered3D</i> <i>BarStacked3D</i> <i>BarStacked100_3D</i>
Bubble	Bubble
Column	<i>ColumnClustered</i> <i>ColumnStacked</i> <i>ColumnStacked100</i> <i>Column3D</i> <i>ColumnClustered3D</i> <i>ColumnStacked3D</i> <i>* ColumnStacked1003D</i>
Doughnut	<i>Doughnut</i> <i>Doughnut_Exploded</i>
Line	<i>Line</i> <i>LineMarkers</i> <i>* Line3D</i>
Pie	<i>Pie</i> <i>PieExploded</i> <i>Pie3D</i> <i>PieExploded3D</i>

Radar	<i>Radar</i> <i>RadarFilled</i> <i>* RadarMarkers</i>
Scatter	<i>ScatterLine</i> <i>ScatterLineMarkers</i> <i>ScatterMarkers</i> <i>ScatterSmoothedLine</i> <i>* ScatterSmoothedLine_Markers</i>
Stock	<i>StockHighLowClose</i> <i>StockOpenHighLowClose</i>
Excel 2016 Charts	<i>Funnel</i> <i>Waterfall</i> <i>Histogram</i> <i>Pareto</i>

Note: From the above supported chart types table, Waterfall and Line_3D charts are not supported in chart to image conversion in .NET Standard 2.0 onwards.

Supported chart elements

XlsIO supports the following chart elements in image conversion:

Chart Elements:

1. Axis
2. Axis titles
3. Chart title
4. Data labels
5. Grid lines
6. Legend
7. Trend line

Excel to ODS Conversion

The Open Document Format for Office Applications (ODF) is also known as OpenDocument. It is an XML-based file format for spreadsheets, charts, presentations, and word processing documents. It was developed with the aim of providing an open and XML-based file format specification for office applications. OpenOffice uses ODF format as its default document format. The OpenDocument Spreadsheet (ODS) is the file format for Excel documents. XlsIO supports conversion of XLS/XLSX documents to ODS.

Saving ODS in different platforms

The following code snippet illustrates the creation of an Excel file and exporting it to ODS format.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    worksheet.Range["A1"].Text = "Month";
    worksheet.Range["B1"].Text = "Sales";
    worksheet.Range["A5"].Text = "Total";
    worksheet.Range["A2"].Text = "January";
    worksheet.Range["A3"].Text = "February";
    worksheet.AutofitColumn(1);
    worksheet.Range["B2"].Number = 68878;
    worksheet.Range["B3"].Number = 71550;
    worksheet.Range["B5"].Formula = "SUM(B2:B4)";
    //Comments
    IComment comment = worksheet.Range["B5"].AddComment();
    comment.RichText.Text = "This cell has formula.";
    IRichTextString richText = comment.RichText;
    IFont blueFont = workbook.CreateFont();
    blueFont.Color = ExcelKnownColors.Blue;
    richText.SetFont(0, 13, blueFont);
    IFont redFont = workbook.CreateFont();
    redFont.Color = ExcelKnownColors.Red;
    richText.SetFont(14, 20, redFont);
    //Formatting
    IStyle style = workbook.Styles.Add("Style1");
    style.Color = Color.DarkBlue;
    style.Font.Color = ExcelKnownColors.WhiteCustom;
    worksheet.Range["A1:B1"].CellStyleName = "Style1";
    worksheet.Range["A5:B5"].CellStyleName = "Style1";
    //Save in ODS format
    workbook.SaveAs("Output.ods");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
```

```

worksheet.Range("A1").Text = "Month"
worksheet.Range("B1").Text = "Sales"
worksheet.Range("A5").Text = "Total"
worksheet.Range("A2").Text = "January"
worksheet.Range("A3").Text = "February"
worksheet.AutofitColumn(1)
worksheet.Range("B2").Number = 68878
worksheet.Range("B3").Number = 71550
worksheet.Range("B5").Formula = "SUM(B2:B4) "
'Comments
Dim comment As IComment = worksheet.Range("B5").AddComment()
comment.RichText.Text = "This cell has formula."

Data Validation		No
Tables		Planned
PivotTable		No
Charts		Planned
Drawing		Planned
OLE Objects		No

Custom XML Support

When you embed XML data in a document, the data is named as custom XML part, which is used to store arbitrary XML data in the workbook.

Essential XlsIO supports the following functionalities with Custom XML:

- Adding CustomXmlPart to workbook
- Reading CustomXmlPart from workbook

Add Custom XML

Adding Custom XML part to workbook is achieved by using the **Add** method of **ICustomXmlPart** interface.

The following code snippet illustrates on how to add a Custom XML part.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding CustomXmlData to Workbook
    ICustomXmlPart customXmlPart = workbook.CustomXmlparts.Add("SD10003");
    //Add XmlData to CustomXmlPart
    byte[] xmlData = File.ReadAllBytes("Test.xml");
    customXmlPart.Data = xmlData;
    workbook.SaveAs("CustomXml.xlsx");
}
```

```
}

```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding CustomXmlData to Workbook
Dim customXmlPart As ICustomXmlPart = workbook.CustomXmlparts.Add("SD10003")
'Add XmlData to CustomXmlPart
Dim xmlData() As Byte = File.ReadAllBytes("Test.xml")
customXmlPart.Data = xmlData
workbook.SaveAs("CustomXml.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Gets assembly
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
//Gets input Excel document from embedded resource collection
Stream inputStream =
assembly.GetManifestResourceStream("CustomXml.Test.xml");
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding CustomXmlData to Workbook
ICustomXmlPart customXmlPart = workbook.CustomXmlparts.Add("SD10003");
//Add XmlData to CustomXmlPart
customXmlPart.Data = new byte[inputStream.Length];
inputStream.Read(customXmlPart.Data, 0, customXmlPart.Data.Length);
//Initializes FileSavePicker
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "CustomXml";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
```

```
//Adding CustomXmlData to Workbook
ICustomXmlPart customXmlPart = workbook.CustomXmlparts.Add("SD10003");
//Add XmlData to CustomXmlPart
byte[] xmlData = File.ReadAllBytes("Test.xml");
customXmlPart.Data = xmlData;
//Saving the workbook as stream
FileStream stream = new FileStream("CustomXml.xlsx", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(stream);
stream.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("CustomXml.Test.xml");
    IWorkbook workbook = application.Workbooks.Create(1);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Adding CustomXmlData to Workbook
    ICustomXmlPart customXmlPart = workbook.CustomXmlparts.Add("SD10003");
    //Add XmlData to CustomXmlPart
    customXmlPart.Data = new byte[inputStream.Length];
    inputStream.Read(customXmlPart.Data, 0, customXmlPart.Data.Length);
    //Saving the workbook as stream
    MemoryStream outputStream = new MemoryStream();
    workbook.SaveAs(outputStream);
    string fileName = "CustomXml.xlsx";
    outputStream.Position = 0;
    //Save the document as file and view the saved document
    //The operation in SaveAndView under Xamarin varies among Windows Phone,
    //Android, and iOS platforms. Refer to the xlsio/xamarin section for
    //respective code samples.
    if (Device.OS == TargetPlatform.WinPhone || Device.OS ==
    TargetPlatform.Windows)
    {
        Xamarin.Forms.DependencyService.Get<ISaveWindowsPhone>().SaveAndView(fileName,
        "application/msexcel", outputStream);
    }
    else
    {
        Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView(fileName,
        "application/msexcel", outputStream);
    }
}
```

Read Custom XML

Reading Custom XML part from workbook is achieved by using the **GetById** method of **ICustomXmlPart** interface. The following code snippet illustrates on how to read Custom XML parts from workbook.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Open("CustomXml.xlsx");
    IWorksheet worksheet = workbook.Worksheets[0];
    //Access CustomXmlPart from Workbook
    ICustomXmlPart customXmlPart = workbook.CustomXmlparts.GetById("SD10003");
    //Access XmlData from CustomXmlPart
    byte[] xmlData = customXmlPart.Data;
    System.Text.Encoding.Default.GetString(xmlData);
    workbook.SaveAs("CustomXml.xlsx");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("CustomXml.xlsx")
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Access CustomXmlPart from Workbook
Dim customXmlPart As ICustomXmlPart =
workbook.CustomXmlparts.GetById("SD10003")
'Access XmlData from CustomXmlPart
Dim xmlData As Byte() = customXmlPart.Data
System.Text.Encoding.Default.GetString(xmlData)
workbook.SaveAs("CustomXml.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    //Gets assembly
    Assembly assembly = typeof(App).GetTypeInfo().Assembly;
    //Gets input Excel document from embedded resource collection
    Stream inputStream =
    assembly.GetManifestResourceStream("CustomXml.CustomXml.xlsx");
    IWorkbook workbook = await application.Workbooks.OpenAsync(inputStream);
    IWorksheet worksheet = workbook.Worksheets[0];
    //Access CustomXmlPart from Workbook
    ICustomXmlPart customXmlPart = workbook.CustomXmlparts.GetById("SD10003");
    //Access XmlData from CustomXmlPart
    byte[] xmlData = customXmlPart.Data;
    System.Text.Encoding.UTF8.GetString(xmlData);
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
}
```

```

savePicker.SuggestedFileName = "CustomXml";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
//Creates a storage file from FileSavePicker
StorageFile storageFile = await savePicker.PickSaveFileAsync();
//Saves changes to the specified storage file
await workbook.SaveAsAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())

Note: Custom XML cannot be modified when the file is saved in Excel 97-2003 (*.xls) format.

Custom XML can be created and modified when the file is saved in Excel 2007 and later versions (*.xlsx).

Migration from Office Automation to Syncfusion XlsIO

Why Syncfusion's XlsIO over Office Automation?

- Office automation can be extremely slow when deployed on a server. It is highly unstable when multiple Excel objects are instantiated on the server. However, XlsIO is designed to work under these circumstances and is a 100% native .NET component, so, it can easily handle concurrent requests from multiple users.
- XlsIO has a very intuitive and easy to use object model. You can create richly formatted spreadsheets in just a few minutes.
- Essential XlsIO has a royalty free licensing model compared to office automation, where the users are expected to have Microsoft Excel licenses when deployed on the server.

To migrate from Microsoft's Interop to Syncfusion's XlsIO due to its stunning performance, it is an easy way. If you don't know how to use the features, this section provides some important Excel features, which are listed below. When you click a topic, it navigates to the particular page. Each topic contains:

- Feature description
- Interop and XlsIO codes(both in C# and VB) for comparison and easy migration.

Topic links

- [Wrap Text in Excel](#)
- [Set Background for Excel Worksheet](#)

Supported Features by File Formats

The list of supported and non-supported Excel file format features in *Essential XlsIO* is given in the following table. *XLS* represents Excel 97 to 2003 format and *XLSX* represents Excel 2007 and above formats.

Feature	XLS			XLSX			XLS to XLSX
	Read	Write	Preserve	Read	Write	Preserve	
Document Properties	Yes	Yes	-	Yes	Yes	-	Yes
Font settings	Yes	Yes	-	Yes	Yes	-	Yes
Alignments	Yes	Yes	-	Yes	Yes	-	Yes
Number formatting	Yes	Yes	-	Yes	Yes	-	Yes
Border settings	Yes	Yes	-	Yes	Yes	-	Yes
Fill settings	Yes	Yes	-	Yes	Yes	-	Yes
Cell styles	Yes	Yes	-	Yes	Yes	-	Yes
Conditional formatting	Yes	Yes	-	Yes	Yes	-	Yes
Cell size[Row/column height/width, autofit]	Yes	Yes	-	Yes	Yes	-	Yes
Hide/Unhide rows/cols	Yes	Yes	-	Yes	Yes	-	Yes
Hide/Unhide worksheet	Yes	Yes	-	Yes	Yes	-	Yes
Copy/Move worksheet	Yes	Yes	-	Yes	Yes	-	-
Sheet protection	Yes	Yes	-	Yes	Yes	-	Yes

Workbook protection	Yes	Yes	-	Yes	Yes	-	Yes
Sheet format[sheet name, tab color]	Yes	Yes	-	Yes	Yes	-	Yes
Image	Yes	Yes	-	Yes	Yes	-	Yes
Charts	Yes	Yes	-	Yes	Yes	-	Yes
Hyperlinks	Yes	Yes	-	Yes	Yes	-	Yes
Header/Footer	Yes	Yes	-	Yes	Yes	-	Yes
Pivot tables	No	No	Yes	Yes	Yes	-	No
Pivot Chart	No	No	Yes	Yes	Yes	-	No
AutoShapes	No	No	Yes	Yes	Yes	-	No
Text Box	Yes	Yes	-	Yes	Yes	-	Yes
Check Box	Yes	Yes	-	Yes	Yes	-	Yes
Combo Box	Yes	Yes	-	Yes	Yes	-	Yes
Page setup	Yes	Yes	-	Yes	Yes	-	Yes
[Margin,origin,page size]							
Page breaks	Yes	Yes	-	Yes	Yes	-	Yes
Background image	Yes	Yes	-	Yes	Yes	-	Yes
Print settings[Print area,Print titles,page order]	Yes	Yes	-	Yes	Yes	-	Yes
Formulas	Yes	Yes	-	Yes	Yes	-	Yes
Calculation options	Yes	Yes	-	Yes	Yes	-	Yes
Names	Yes	Yes	-	Yes	Yes	-	Yes
Formula auditing [Ignore error]	Yes	Yes	-	Yes	Yes	-	Yes

Filter	Yes	Yes	-	Yes	Yes	-	Yes
Data validation	Yes	Yes	-	Yes	Yes	-	Yes
Custom XML	Yes	Yes	-	Yes	Yes	-	Yes
Collection Objects	Yes	Yes	-	Yes	Yes	-	Yes
Template marker	Yes	Yes	-	Yes	Yes	-	Yes
Outlines[group/ungroup, summary settings]	Yes	Yes	-	Yes	Yes	-	Yes
Comments	Partial	Partial	-	partial	partial	-	Yes
Freeze pane, split pane	Yes	Yes	-	Yes	Yes	-	Yes
View[Zoom, show/hide gridlines, show/hide headings], horizontal/vertical scroll bars	Yes	Yes	-	Yes	Yes	-	Yes
Macros	No	No	Yes	No	No	Yes	No
Encryption and Decryption	Yes	Yes	-	Yes	Yes	-	Yes
Track changes	No	No	No	No	No	No	No
Themes	-	-	-	Yes partial	No	-	-
Cell gradient	-	-	-	Yes	Yes	-	-
Conditional Formatting	Yes	Yes	-	Yes	Yes	-	Yes
Advanced CF [Icon Set, Data bars, Color scales, Specific Date]	-	-	-	Yes	Yes	-	-
Tables	No	No	No	Yes	Yes	-	No
RGB colors	Yes	Yes	Indexed color	Yes	Yes	-	Yes

OLE Objects	No	No	Yes (Full Trust Only)	Yes (Full Trust Only)	Yes (Full Trust Only)	-	No
-------------	----	----	-----------------------	-----------------------	-----------------------	---	----

Supported Features by Platforms

The list of various supported and non-supported Excel features of Essential XlsIO in different platforms is given in this section.

Supported Features by .NET Framework and .NET Standard

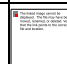

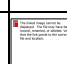

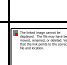

The list of supported and non-supported Excel features in .NET Framework and .NET Standard is given below.

Workbook Features	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Create an Excel workbook from scratch or modify an existing workbook.		
Open an existing Excel workbook from file system or stream.		
Save Excel workbook to a local file, stream, or stream it to a client browser.		
Read worksheets on demand when Excel file contains multiple worksheets.		
Hide and unhide worksheets.		
Add or extract custom XML documents.		
Add or modify document properties.		

Import and Export	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Import data from DataTable, DataColumn, DataView, Array to worksheet.		
Import data from collection objects to worksheet.		

Import data from nested collection objects to worksheet.		
Import data into a pre-formatted template using Template Markers.		
Importing large amounts of data with minimal memory consumption can be achieved using the import on save option.		
Export data from worksheet to datatable and collection objects.		
Export data from worksheet to nested class.		
Imports data from various external sources like Microsoft Access, SQL Server and Excel, which maintain the connection to refresh data dynamically.		

Formulas	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Read and write Excel formulas.		
Add or modify named ranges in workbook and worksheet levels.		
Performs calculation for a range of cells using named ranges.		
Apply or modify Excel formula auditing settings.		
Enable automatic and manual calculation options.		

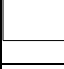

Charts	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Creation and manipulation of Excel 2-D charts.		
Creation and manipulation of Excel 3-D charts.		
Creation and manipulation of custom charts.		

Creation and manipulation of sparklines.		
Creation and manipulation of Excel 2016 charts.		
Pivot Tables		
Creation and manipulation of pivot tables (while saving as XLS format, the pivot table is preserved as it is from the input XLS file).		
Apply various pivot table settings like page filter, row filter, and column filter (while saving as XLS format, pivot table is preserved as-is from the input XLS file).		
Supports pivot table settings such as visibility of field list, collapse button, field caption and field option, header captions, etc.		

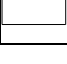

Security	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Open and save encrypted and decrypted documents.		
Protect and unprotect workbook.		
Protect and unprotect worksheets.		
Lock and unlock cells for write protection.		

Worksheet Features	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Formatting		
Creation and manipulation of conditional formatting (supports		

icon sets, data bars, color scales, and specific date in XLSX).		
Auto fit or resize rows and columns.		
Apply or modify number formats.		
Apply or modify fill settings.		
Apply or modify font settings.		
Apply or modify cell border settings.		
Apply or modify all the cell text alignments.		
Excel 2007 themes.		
Copy/Paste		
Add or copy worksheets within or across workbooks.		
Copy a range to another range across worksheets.		
Copy a range with different copy options.		
Move a range to another range across worksheets.		
Data		
Creation and manipulation of data validation.		
Apply or modify AutoFilters to filter worksheet data.		
Apply or modify data sorting.		
Find and replace data.		
Row/Column Manipulation		
Apply or modify view settings to freeze, unfreeze, and split panes.		

Hide or unhide rows and columns.		
Merge and unmerge cells.		
Auto-Fit Rows and Columns.		
Insert		
Insertion and deletion of images in worksheets.		
Apply or modify background image in a worksheet.		
Add, remove and modify hyperlinks.		
Group or ungroup rows and columns.		
Add or modify subtotals of grouped data.		
Addition and deletion of OLE objects.		
Page Setup		
Get or set header and footer settings.		
Apply or modify horizontal and vertical page breaks.		
Apply or modify custom page breaks.		
Apply various page setup options like paper size, orientation, scaling, margins, etc.		
Apply print settings.		
Shapes		
Creation and manipulation of AutoShapes.		
Creation and manipulation of check boxes.		

Creation and manipulation of combo boxes.		
Creation and manipulation of comments.		
Creation and manipulation of text boxes.		
Miscellaneous		
Preserve Macros		

Conversion	.NET Framework (WF, WPF, ASP.NET and ASP.NET MVC)	.NET Standard (UWP, .NET Core and Xamarin)
Converts Excel to PDF.		
Converts an entire Excel worksheet into a single image.		
Converts specific range of an Excel worksheet into a single image.		
Converts Excel chart to image.		
Converts Excel to HTML.		
Converts Excel document to ODS (Open Document Spreadsheet).		

Note: Worksheet to image conversion is supported from .NET Framework 2.0 and .NET Standard 1.4 onwards.

Supported Features in Blazor Platform

The list of supported and non-supported Excel features in Blazor platform is given below.

Features	Blazor Server-Side	Blazor Client-Side
Excel elements - text, image, table, auto filter, data sort, hyperlink, data validation, conditional formatting, formula, pivot table, comment, shape, chart, grouping, page setting and more.		
Presentation formatting - text, table, conditional formatting, styles.		

Create an Excel workbook from scratch.		
Open an existing Excel workbook and edit.		
Read worksheets on demand when Excel file contains multiple worksheets.		
Import data from DataTable, DataColumn, DataView, Array, Collection Objects and Nested Collection Objects to worksheet.		
Import data into a pre-formatted template using Template Markers.		
Export data from worksheet to datatable, nested class objects and nested collection objects.		
Access or modify built-in document properties.		
Read and write Excel formulas.		
Encryption and decryption.		
Find and replace text.		
Add or copy worksheets within or across workbooks.		
Copy a range to another range across worksheets.		
Move a range to another range across worksheets.		
Save chart as image.		

File formats	Blazor Server-Side		Blazor Client-Side	
	Open	Save	Open	Save
Excel 97-2003 formats (.XLS, .XLT)				
Excel 2007 and above formats (.XLSX, .XLTX, *.XLSM)				
XML Spreadsheet 2003 (* .XML)				

CSV				
Excel to PDF	N/A		N/A	
Excel to HTML	N/A		N/A	
Worksheet to Image (PNG, JPEG)	N/A		N/A	

Improving Performance

This section gives you an idea for improving performance while developing with XlsIO.

UsedRange

Get **UsedRange** globally. It is recommended to get the UsedRange in loops as follows

C#

```
int lastRow = sheet.UsedRange.LastRow;
for(int i=0;i<lastRow;i++)
{
    //codes
}
//Do not use like below.
for(int i = 0;i<sheet.UsedRange.LastRow;i++)
{
    //codes
}
```

VB.NET

```
Dim lastRow As Integer = sheet.UsedRange.LastRow
For i As Integer = 0 To lastRow - 1
    'codes
Next
'Do not use like below.
For i As Integer = 0 To sheet.UsedRange.LastRow - 1
    'codes
Next
```

Range Access

Use **IMigrantRange** instead of **IRange** to optimize performance while dealing with large data.

The **IMigrantRange** interface can be used to access and manipulate worksheet range. This is an optimal method of writing values with better memory performance.

The following code example illustrates how the **IMigrantRange** is accessed.

C#

```
IMigrantRange migrantRange = workbook.Worksheets[0].MigrantRange;
// Writing Data.
for (int row = 1; row <= rowCount; row++)
```

```

{
    for (int column = 1; column <= colCount; column++)
    {
        // Writing values.
        migrantRange.ResetRowColumn(row, column);
        // Setting value of this migrant range which is similar to IRange object.
        migrantRange.Value = "Syncfusion";
    }
}

```

VB.NET

```

'Writing Data.
Dim row As Integer
Dim migrantRange As IMigrantRange = workbook.Worksheets(0).MigrantRange
For row = 1 To rowCount Step row + 1
    Dim column As Integer
    For column = 1 To colCount Step column + 1
        'Writing values.
        migrantRange.ResetRowColumn(row, column)
        ' Setting value of this migrant range which is similar to IRange object.
        migrantRange.Value = "Syncfusion"
    Next
Next

```

IMigrantRange provides us a **SetValue** method in which different value for the range can be assigned. Following code snippet illustrates regarding this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
excelEngine.Excel.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = excelEngine.Excel.Workbooks.Create();
IWorksheet sheet = workbook.Worksheets[0];
IMigrantRange migrantRange = workbook.Worksheets[0].MigrantRange;
// Writing values.
migrantRange.ResetRowColumn(1, 1);
//Setting boolean value
migrantRange.SetValue(true);
migrantRange.ResetRowColumn(1, 2);
//Setting DateTime value
migrantRange.SetValue(DateTime.Now);
migrantRange.ResetRowColumn(1, 3);
//Setting double value
migrantRange.SetValue(5.5);
migrantRange.ResetRowColumn(1, 4);
//Setting int value
migrantRange.SetValue(5);
migrantRange.ResetRowColumn(1, 5);
//Setting string value
migrantRange.SetValue("Syncfusion");
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("MigrantRange.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
excelEngine.Excel.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Create()
Dim sheet As IWorksheet = workbook.Worksheets(0)
Dim migrantRange As IMigrantRange = workbook.Worksheets(0).MigrantRange
' Writing values.
migrantRange.ResetRowColumn(1, 1)
'Setting boolean value
migrantRange.SetValue(True)
migrantRange.ResetRowColumn(1, 2)
'Setting DateTime value
migrantRange.SetValue(DateTime.Now)
migrantRange.ResetRowColumn(1, 3)
'Setting double value
migrantRange.SetValue(5.5)
migrantRange.ResetRowColumn(1, 4)
'Setting int value
migrantRange.SetValue(5)
migrantRange.ResetRowColumn(1, 5)
'Setting string value
migrantRange.SetValue("Syncfusion")
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("MigrantRange.xlsx")
workbook.Close()
excelEngine.Dispose()

```

Styles

Use global styles, rather than using different cell styles for each cell/range. See [Applying global styles](#).

Use Begin and End call while using more than one global style for a worksheet.

C#

```

//Defining body style
IStyle bodyStyle = workbook.Styles.Add("BodyStyle");
bodyStyle.BeginUpdate();
bodyStyle.Color = Color.FromArgb(239, 243, 247);
bodyStyle.Borders[ExcelBordersIndex.EdgeLeft].LineStyle =
ExcelLineStyle.Thin;
bodyStyle.Borders[ExcelBordersIndex.EdgeRight].LineStyle =
ExcelLineStyle.Thin;
bodyStyle.EndUpdate();

```

VB.NET

```

'Defining body style
Dim bodyStyle As IStyle = workbook.Styles.Add("BodyStyle")
bodyStyle.BeginUpdate()
bodyStyle.Color = Color.FromArgb(239, 243, 247)
bodyStyle.Borders(ExcelBordersIndex.EdgeLeft).LineStyle =
ExcelLineStyle.Thin

```

```
bodyStyle.Borders(ExcelBordersIndex.EdgeRight).LineStyle =
ExcelLineStyle.Thin
bodyStyle.EndUpdate()
```

AutoFit

Minimize AutoFit manipulations which reduces the time consumption.

For improved performance in Excel to PDF conversion, it is recommended to set the **IApplication.SkipAutoFitRow** property as TRUE.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
//Skips AutoFitting of rows during conversion
application.SkipAutoFitRow = true;
```

VB.NET

```
Dim excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
'Skips AutoFitting of rows during conversion
application.SkipAutoFitRow = True
```

Importing DataTable

ImportDataTable overload method which has **ImportOnSave** argument allows you to import data with less memory consumption along with improved method performance by serializing the data directly on save method. This option is preferred for larger data that need to be imported in short time.

C#

```
DataTable table = Worksheet.ExportDataTable(1, 1,
Worksheet.UsedRange.LastRow, Worksheet.UsedRange.LastColumn,
ExcelExportDataTableOptions.DetectColumnTypes);
//Enable ImportOnSave option along with column header.
workbook.Worksheets[0].ImportDataTable(table, 1, 1, true, true);
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs("Output.xlsx");
```

VB.NET

```
Dim table As DataTable = Worksheet.ExportDataTable(1, 1,
Worksheet.UsedRange.LastRow, Worksheet.UsedRange.LastColumn,
ExcelExportDataTableOptions.DetectColumnTypes)
'Enable ImportOnSave option along with column header.
workbook.Worksheets(0).ImportDataTable(table, 1, 1, True, True)
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs("Output.xlsx")
```

Limitations

- Cannot modify data dynamically
- Styles cannot be applied

- Table style cannot be applied
- Existing sheet data will be lost

Data Validation

Use of BeginUpdate and EndUpdate methods for large blocks of Data Validation greatly improves the performance.

C#

```
// List data validation for entire column
IDataValidation validation = sheet.Range["A3"].EntireColumn.DataValidation;
validation.BeginUpdate();
validation.DataRange = sheet.Range["D1:D56"];
validation.IsEmptyCellAllowed = true;
validation.IsListInFormula = false;
validation.EndUpdate();
```

VB.NET

```
' List data validation for entire column
Dim validation As IDataValidation =
sheet.Range("A3").EntireColumn.DataValidation
validation.BeginUpdate()
validation.DataRange = sheet.Range("D1:D56")
validation.IsEmptyCellAllowed = True
validation.IsListInFormula = False
validation.EndUpdate()
```

Known Exceptions Details

The list of known exceptions thrown in Essential XlsIO is listed below.

ApplicationException

Class	Message	Reason
Workbook	"Workbook was not created from file." + " That is why workbook file not specified." + " You must use SaveAs method instead."	The file name cannot be empty
Worksheet	"Can't deselect all worksheets."	Can't deselect all worksheets
	"Can't find data for MSODrawing"	The value of current mso index cannot greater than array drawings count
	"Sheet is already protected, before use unprotect method"	The property is true the sheet is already protected
	"You cannot use this command on a protected sheet"	The condition is false you cannot use this command on protected sheet

ArgumentException

Class	Message	Reason
Pictures	string cannot be empty.	Valid filename of the image must be provided.
Shape	From center style support only <i>var1 or var2</i>	From center style support only <i>var1 or var2</i>
	strName cannot be null or empty.	String cannot be empty
	strShapeName - string cannot be empty.	String cannot be empty
	The rotation value should be between -3600 and 3600	The rotation value should be between -3600 and 3600
	Name cannot be null or empty	Name of the UserPicture cannot be empty.
	Path cannot be null or empty	Path of the UserPicture cannot be null or empty.
	Path cannot be null or empty	Path of the UserTexture cannot be empty.
	Shape name cannot be null.	Valid name is not found for the shape.
	The specified value is out of range	TextureHorizontalScale must be >= 21475.
	Â The specified value is out of range	TextureOffsetX must be >= 169056.
	Â The specified value is out of range	TextureOffsetY must be >= 169056.
	Â The specified value is out of range	TextureVerticalScale must be >= 21475.
	This method supports only preset textured	Custom gradient texture does not support.
	TransparencyColor	The TransparencyFrom on shape should not be less than 0 and greater than 1.
TextBox	"Reference is not valid	The value of the string index 0 is equal to "=" the reference is not valid
Workbook	"Can't refer to external worksheets"	Cannot refer to external workbook

	"FileName cannot be empty."	The file name cannot be empty
	"fileName"	String cannot be empty
	"name"	String cannot be empty
	"Names array must contain at least one name."	Names array must contain at least one name
	"separator"	String cannot be empty
	"strFileName - string cannot be empty."	String cannot be empty
	"strName - string cannot be empty"	String cannot be empty
	"strSheetName"	String cannot be empty
	"Workbook is protected and password wasn't specified."	Workbook is protected and password wasn't specified
	"Contains invalid characters"	Contains invalid characters
	"FileName cannot be empty."	The file name cannot be empty
	"FileName cannot be empty."	The file name cannot be empty
Worksheet	"arrDataColumns can't be empty"	String cannot be empty
	"Cannot sets formula value in cell that doesn't contain formula"	Cannot sets formula value in cell that doesn't contain formula
	"Can't insert column"	Cannot insert column given condition is false
	"Can't insert row"	Cannot insert row given condition is true
	"cellFormat"	The array extend formats count is not less than cell format index value
	"defaultStyle"	The XF index value is not equal to minimum value of the integer
	"Each range argument should contain a single cell"	Each range argument should contain a single cell
	"FileName cannot be empty."	File name cannot be empty
	"Image Path doesn't exist"	Image path does not exist
	"Ranges do not fit each other"	The Ranges do not fit each other
	"separator"	String cannot be null or empty
	"separator"	String cannot be null or empty

	"strName - string cannot be empty."	String cannot be empty
	"Workbook at least must contains one worksheet. You cannot remove last worksheet.", "sheet"	Workbook at least must contain one worksheet. You cannot remove last worksheet
	"Workbook must contains at least one worksheet. You cannot remove last worksheet.", "sheet"	Workbook must contain at least one worksheet. You cannot remove last worksheet
	"Invalid column index."	The column index is not less than 0 and greater than 0x3fff
	"Invalid row index."	The row index is not less than 0 and greater than 0xfffff
	"separator"	String cannot be empty
	Sheet Name is InValid	Sheet Name is InValid

ArgumentNullException

Class	Message	Reason
Workbook	"Name can't be NULL."	Name can't be NULL
	"separator"	The string cannot be empty
	"styleIndexes"	The style index is not equal to null
	"password"	String cannot be empty
Worksheet	"Conditions"	The condition property is not null and CFERecords property is not equal to null
	"firstColumn"	The column index value is not equal to 0 and greater than book maximum column count
	"password"	The string cannot be empty
	"separator"	String cannot be empty
	"dataSource"	String cannot be empty

ArgumentOutOfRangeException

Class	Message	Reason
PageSetup	Parts array must have only three elements.	The header/footer string should have 3 parts.

	The string is too long. Reduce the number of characters used.	The header/footer value exceeds the characters limit.
	Zoom value must be between 10 and 400 percent.	The zoom value in page setup should be within the given limit.
Shape	BottomRowOffset	The BottomRowOffset should not be less than 0.
	Height	The Height should not be less than 0.
	iColumn1	The column should not be less than 1 and greater than maximum column count.
	iColumn2	The column should not be less than 1 and greater than maximum column count.
	iPixels	The pixels should not be less than 0 and greater than row height.
	Can't be less than zero.	The iPixels should not be less than 0.
	iRow1	The row value should not be less than 1 and greater than maximum row count.
	iRow2	The row value should not be less than 1 and greater than maximum row count.
	LeftColumnOffset	The LeftColumnOffset should not be less than 0.
	RightColumnOffset	The RightColumnOffset should not be less than 0.
	scaleHeight	The ScaleHeight should not be less than 0.
	scaleWidth	The ScaleWidth should not be less than 0.
	TopRowOffset	The TopRowOffset should not be less than 0.
	Value	The Transparency should not be less than 0 and greater than 1.

	Weight	The Weight should not be less than 0 and greater than maximum line weight value.
	Width	The Width should not be less than 0.
	iPixels can't be less than zero.	The iPixels should not be less than 0
	Gradient degree is out of range	The gradient range should not be less than -1 and greater than 1.
	Transparency	The Transparency on shape should not be less than 0 and greater than 1.
	TransparencyFrom	The TransparencyFrom value on shape should not be less than 0 and greater than 1.
	TransparencyTo	The TransparencyTo value on shape should not be less than 0 and greater than 1.
Workbook	"ActiveSheetIndex"	The sheet value is not less than 0 and greater than list object count
	"Array cannot contain more than 4 selection records"	Array cannot contain more than 4 selection records
	"DisplayedTab", "Displayed tab must be greater than zero and less than Worksheets count"	Displayed tab must be greater than zero and less than Worksheets count
	"fileName"	The file name cannot be empty
	"fullName"	String cannot be empty
	"index"	Value cannot be less than 0 and greater than Count
	"index", "Index cannot be less than 0 and larger than Palette colors array size."	Index cannot be less than 0 and larger than Palette colors array size
	"index", "Value cannot be less than 0 and greater than Count - 1."	Value cannot be less than 0 and greater than Count - 1
	"iRef"	The reference index value is not less than or equal to extern sheet reference and less than 0;

	"iReferenceIndex", "Value cannot be less than 0 and greater than arrRefs.Count - 1"	Value cannot be less than 0 and greater than arrRefs.Count - 1
	"iStartIndex"	The start index value is not less than stro0 and greater than color count
	"maxCount"	The XF index value is not less than or equal to 0
	"PasswordToOpen", "Password too long. Maximum password length is 15 characters."	Password too long. Maximum password length is 15 characters
	"referenceIndex", "Value cannot be less than 0 and greater than arrRefs.Count - 1"	Value cannot be less than 0 and greater than arrRefs.Count - 1
	"sheetsQuantity", "Quantity of worksheets must be greater than zero."	Quantity of worksheets must be greater than zero
	string.Format("index is {0}, Count is {1}", index, List.Count)	Index value is not less than 0 and not greater than equal to list count
	string.Format("index is {0}, Count is {1}", index, count)	Index value is not less than 0 and not greater than equal to list count
Worksheet	"Apostrophe can't be used as first and/or last character of the worksheet's name."	Apostrophe can't be used as first and/or last character of the worksheet's name
	"Chart index"	Index value is not less than 0 and not greater than equal to list count
	"column index"	The column index value is not equal to 0 and greater than book maximum column count
	"Column", "Column index cannot be larger then 256 or less then one"	Column index cannot be larger than 256 or less than one
	"columnIndex", "Value cannot be less than 0 and greater than 255"	Value cannot be less than 0 and greater than 255
	"count"	The count is not less than 0
	"drawingItemName"	The string name cannot be empty

	"firstColumn"	The column index value is not equal to 0 and greater than book maximum column count
	"firstRow"	The row index value is not equal to 0 and greater than book maximum rows count
	"iColumn can't be less than 1"	iColumn can't be less than 1
	"iColumnCount", "Value cannot be less 1 and greater than max column index"	Value cannot be less 1 and greater than max column index
	"iColumnIndex", "Column index is out of range."	Column index is out of range
	"iColumnIndex", "Value cannot be less 1 and greater than max column index."	Value cannot be less 1 and greater than max column index.
	"iColumnIndex", "Value cannot be less than 1 and greater than m_book.MaxColumnCount."	Value cannot be less than 1 and greater than m_book.MaxColumnCount
	"iCondFmtPos"	The index value is not less than 0
	"iCustomPropertyPos"	Index value is not less than 0 and not greater than equal to list count
	"iDValPos"	The integer value is not less than 0
	"index < 0"	The index value is not less than 0
	"index"	Index value is not less than 0 and not greater than equal to list count
	"index", "Value cannot be less than 0 and greater than Count - 1."	Value cannot be less than 0 and greater than Count - 1
	"iNewIndex"	Index value is not less than 0 and not greater than equal to list count
	"iOldIndex"	Index value is not less than 0 and not greater than equal to list count
	"iRowIndex"	The row index value is not equal to 0 and greater than book maximum rows count
	"iRowIndex", "Value cannot be less 1 and greater than max row index."	Value cannot be less 1 and greater than max row index

"iRowIndex", "Value cannot be less than 1 and greater than m_book.MaxColumnCount."	Value cannot be less than 1 and greater than m_book.MaxColumnCount
"iSTIndex"	The shared string index value is not less than 0 or greater than book inner shared string count
"iStartIndex"	The index value is not less than 0
"Length of the password can't be more than " + DEFMAXPASSWORDLEN	The password length value is greater than default maximum password length
"maxCount"	The index value is not less than or equal to 0
"range"	The range of the row and column is not equal to range of the last column and last row
"rowIndex"	The row index value is not less than 1 and greater than book maximum count
"Standard Row Height"	The standard row height value is not less than 0
"Text value cannot be null or empty"	Text value cannot be null or empty
"Text value cannot be null or empty. First symbol must be '#'"	Text value cannot be null or empty. First symbol must be '#'
"Text value cannot be null or empty. First symbol of formula cannot be '='"	Text value cannot be null or empty. First symbol of formula cannot be '='
"Value cannot be less 1 and greater than max column index."	Value cannot be less 1 and greater than maximum column index
"Value does not valid error string."	Given value does not contains dictionary
"Worksheets collection does not contain specified worksheet."	Worksheets collection does not contain specified worksheet
"Zoom", "Zoom must be in range from 10 till 400."	Zoom must be in range from 10 till 400.
strParentItemName	The string name cannot be empty

	Column value cannot be less than 0 and greater than 255	Value cannot be less than 0 and greater than 255
	End Row Index cannot be greater than max row index	Value cannot be greater than max row index
	firstColumn	The column index value is not equal to 0 and greater than book maximum column count
	firstRow	The row index value is not equal to 0 and greater than book maximum rows count
	Length of the password can't be more than password length	The password length value is greater than default maximum password length
	Row Index value cannot be less than 1 and greater than max row index	The row index value is not equal to 0 and greater than book maximum rows count
	Standard Column Width.	The standard column width value is not less than 0 and greater than default maximum column width
	Value cannot be less 1 and greater than max column index.	Value cannot be less 1 and greater than max column index
	Value cannot be less 1 and greater than max row index.	Value cannot be less 1 and greater than max row index
	Value must be 0 to 3	Value must be 0 to 3
	string.Format("index is {0}, Count is {1}", index, List.Count)	Index value is not less than 0 and not greater than equal to list count

ExcelWorkbookNotSavedException

Class	Message	Reason
Workbook	"Object cannot be disposed." + " Save workbook or set property ThrowNotSavedOnDestroy to false.	Save workbook or set property ThrowNotSavedOnDestroy to false

FileNotFoundException

Class	Message	Reason
Shape	File represents by current path doesn't exist	File represents by current path doesn't exist.

Workbook	"File could not be found. Please verify the file path."	"File could not be found."
	string.Format("File {0} could not be found. Please verify the file path.", filename)	The file name is not there in given file path the exception will throw

InvalidRangeException

Class	Message	Reason
Worksheet	Can't copy to destination range	The destination array formula not separator the cannot copy to destination range

NotSupportedException

Class	Message	Reason
Shape	This property can be set only when Gradient Style is selected.	This property can be set only when Gradient Style is selected.

Worksheet	Name of worksheet must be unique in a workbook	Name of worksheet must be unique in a workbook

FAQ Section

The frequently asked questions in Essential XlsIO are listed below.

How to open an existing XLSX workbook and save it as XLS?

You can open and save an existing .xlsx file to the .xls file by using XlsIO. The following code snippet illustrates this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
//Open an existing Excel 2013 file.
IWorkbook workbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
//Save it as "Excel 97 to 2003" format.
workbook.Version = ExcelVersion.Excel97to2003;
workbook.SaveAs("Output.xls");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
'Open an existing Excel 2013 file.
Dim workbook As IWorkbook = excelEngine.Excel.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
'Save it as "Excel 97 to 2003" format.
workbook.Version = ExcelVersion.Excel97to2003
workbook.SaveAs("Output.xls")
workbook.Close()
excelEngine.Dispose()
```

Note: Workbook must be saved in appropriate version, failing in this leads to file corruption.

How to open an Excel file from Stream?

XlsIO provides support for opening a file that is stored as a stream. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Opening a File from a Stream
FileStream fileStream = new FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite);
IWorkbook workbook = application.Workbooks.Open(fileStream);
workbook.SaveAs("Output.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Opening a File from a Stream
Dim fileStream As New FileStream("Sample.xlsx", FileMode.Open,
FileAccess.Read, FileShare.ReadWrite)
Dim workbook As IWorkbook = application.Workbooks.Open(fileStream)
workbook.SaveAs("Output.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to save a file to stream?

XlsIO provides support to save a workbook to a .NET stream. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenTypeAutomatic);
//Save the workbook to stream.
FileStream fileStream = new FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite, FileShare.ReadWrite);
workbook.SaveAs(fileStream);
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenTypeAutomatic)
'Save the workbook to stream.
Dim fileStream As New FileStream("Output.xlsx", FileMode.Create,
FileAccess.ReadWrite, FileShare.ReadWrite)
workbook.SaveAs(fileStream)
workbook.Close()
excelEngine.Dispose()

```

How to create and open Excel Template files by using XlsIO?

Creating Excel Template Files

Excel template files (XLT or XLTX) can be created in XlsIO by saving a file as **Template** using **ExcelSaveType** enumeration. The following code snippet illustrates this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Save as XLT.
workbook.Version = ExcelVersion.Excel97to2003;
workbook.SaveAs("XLTFFile.xlt", ExcelSaveType.SaveAsTemplate);
//Save as XLTX.
workbook.Version = ExcelVersion.Excel2007;
workbook.SaveAs("XLTXFile.xltx", ExcelSaveType.SaveAsTemplate);
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Save as XLT.
workbook.Version = ExcelVersion.Excel97to2003
workbook.SaveAs("XLTFFile.xlt", ExcelSaveType.SaveAsTemplate)
'Save as XLTX.
workbook.Version = ExcelVersion.Excel2007
workbook.SaveAs("XLTXFile.xltx", ExcelSaveType.SaveAsTemplate)
workbook.Close()
excelEngine.Dispose()
```

Opening Excel Template Files

In XlsIO, an Excel template file is opened in the same way, as excel workbook (.xls and .xlsx) is opened. The following code snippet illustrates this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Open Excel Template.
IWorkbook workbook = application.Workbooks.Open("Sample.xltx",
ExcelOpenType.Automatic);
workbook.SaveAs("Output.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Open Excel Template.
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xltx",
ExcelOpenType.Automatic)
workbook.SaveAs("Output.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to open an Excel 2013 Macro Enabled Template?

You can open and save an Excel 2013 Macro Enabled Template to XLSM (Excel 2013 Macro Enabled Document) format. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Open an existing XLTM file.
IWorkbook workbook = application.Workbooks.Open("Sample.xlsm",
ExcelOpenType.Automatic);
//Save the file as XLSM.
workbook.SaveAs("Output.xlsm");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Open an existing XLTM file.
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsm",
ExcelOpenType.Automatic)
'Save the file as XLSM.
workbook.SaveAs("Output.xlsm")
workbook.Close()
excelEngine.Dispose()

```

How to change the grid line color of the Excel sheet?

In Essential XlsIO, you can change the grid line color of the worksheet using **GridLineColor** property. The below code snippet illustrate this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//To change the grid line color using ExcelKnownColors
worksheet.GridLineColor = ExcelKnownColors.Blue;

```

```
workbook.SaveAs("GridLineColor.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'To change the grid line color using ExcelKnownColors
worksheet.GridLineColor = ExcelKnownColors.Blue
workbook.SaveAs("GridLineColor.xlsx")
workbook.Close()
excelEngine.Dispose()
```

How to copy and paste the values of the cells that contain only formulas?

You can copy and paste the values of the cell which contain only formula using CopyTo method by specifying the ExcelCopyRangeOptions as None. The following code snippet illustrates this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Assigning formula to a cell
worksheet.Range["A3"].Formula="SUM(1+1)";
IRange sourceRange = worksheet.Range["A3"];
IRange destinationRange = worksheet.Range["B1"];
//Copy and paste the values using ExcelCopyRangeOption
sourceRange.CopyTo(destinationRange, ExcelCopyRangeOptions.None);
workbook.SaveAs("Output.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Assigning formula to a cell
worksheet.Range("A3").Formula = "SUM(1+1)"
Dim sourceRange As IRange = worksheet.Range("A3")
Dim destinationRange As IRange = worksheet.Range("B1")
'Copy and paste the values using ExcelCopyRangeOption
sourceRange.CopyTo(destinationRange, ExcelCopyRangeOptions.None)
workbook.SaveAs("Output.xlsx")
workbook.Close()
excelEngine.Dispose()
```

How to copy a range from one workbook to another?

You can copy the range from source workbook to the destination workbook through CopyTo method.

The following code snippet illustrates this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook sourceWorkbook = application.Workbooks.Open("SourceWorkbook.xlsx",
ExcelOpenType.Automatic);
IWorkbook destinationWorkbook =
application.Workbooks.Open("DestinationWorkbook.xlsx",
ExcelOpenType.Automatic);
IWorksheet SourceWorksheet = SourceWorkbook.Worksheets[0];
//The first worksheet object in the worksheets collection in the Destination
Workbook is accessed.
IWorksheet DestinationWorksheet = DestinationWorkbook.Worksheets[0];
//Assigning an object to the range of cells (90 rows) both for source and
destination.
IRange sourceRange = SourceWorksheet.Range[1, 1, 90, 100];
IRange destinationRange = DestinationWorksheet.Range[1, 1, 90, 100];
//Copying (90 rows) from Source to Destination worksheet.
sourceRange.CopyTo(destinationRange);
destinationWorkbook.SaveAs("CopyingRange.xlsx");
destinationWorkbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As ExcelEngine = New ExcelEngine
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim sourceWorkbook As
IWorkbook = application.Workbooks.Open("SourceWorkbook.xlsx",
ExcelOpenType.Automatic)
Dim destinationWorkbook As IWorkbook =
application.Workbooks.Open("DestinationWorkbook.xlsx",
ExcelOpenType.Automatic)
'The first worksheet object in the worksheets collection in the Source
Workbook is accessed.
Dim SourceWorksheet As Syncfusion.XlsIO.IWorksheet =
SourceWorkbook.Worksheets(0)
'The first worksheet object in the worksheets collection in the Destination
Workbook is accessed.
Dim DestinationWorksheet As Syncfusion.XlsIO.IWorksheet =
DestinationWorkbook.Worksheets(0)
'Assigning an object to the range of cells (90 rows) both for source and
destination.
Dim sourceRange As Syncfusion.XlsIO.IRange = SourceWorksheet.Range(1, 1, 90,
100)
Dim destinationRange As Syncfusion.XlsIO.IRange =
DestinationWorksheet.Range(1, 1, 90, 100)
'Copying (90 rows) from Source to Destination worksheet.
sourceRange.CopyTo(destinationRange)
destinationWorkbook.SaveAs("CopyingRange.xlsx")
destinationWorkbook.Close()
```

```
excelEngine.Dispose()
```

How to merge several excel files from more than one workbook to a single file?

You can merge several excel files from more than one work book to a single file. The following code snippet illustrates this.

C#

```
//Loads the all template document from Data folder.
string[] files = Directory.GetFiles(@"../../Data/");
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
//Create empty Excel workbook instance with one empty worksheet
IWorkbook workbook = application.Workbooks.Create(1);
//Enumerates all the workbook files from the data folder and clone and merge
it into new workbook.
foreach (string file in files)
{
    //Loads the all template document from data folder.
    FileStream inputStream = new FileStream(file, FileMode.Open,
    FileAccess.Read);
    //Opens the template workbook from stream
    IWorkbook tempWorkbook = application.Workbooks.Open(inputStream);
    //Disposes the stream
    inputStream.Dispose();
    //Cloning all workbook's worksheets
    workbook.Worksheets.AddCopy(tempWorkbook.Worksheets);
}
//removing the first empty worksheet
workbook.Worksheets.Remove(0);
workbook.SaveAs("MergingFiles.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
'Loads the all template document from data folder.
Dim files As String() = Directory.GetFiles("../../Data/")
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
'Create empty Excel workbook instance with one empty worksheet
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Enumerates all the workbook files from the data folder and clone and merge
it into new workbook.
For Each file As String In files
    'Loads the all template document from data folder.
    Dim inputStream As New FileStream(file, FileMode.Open, FileAccess.Read)
    'Opens the template workbook from stream
    Dim tempWorkbook As IWorkbook = application.Workbooks.Open(inputStream)
    'Disposes the stream
    inputStream.Dispose()
    'Cloning all workbook's worksheets
    workbook.Worksheets.AddCopy(tempWorkbook.Worksheets)
```

Next

```
'removing the first empty worksheet
workbook.Worksheets.Remove(0)
workbook.SaveAs("MergingFiles.xlsx")
workbook.Close()
excelEngine.Dispose()
```

How to ignore the green error marker in worksheets?

When there exists data that are of different formats, the error marker appears in cells. In XlsIO You can ignore this by using **IgnoreErrorOptions** property. The following code snippet illustrate this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Ignore Error Options.
worksheet.Range["B3"].IgnoreErrorOptions = ExcelIgnoreError.All;
workbook.SaveAs("IgnoreGreenError.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Ignore Error Options.
worksheet.Range("B3").IgnoreErrorOptions = ExcelIgnoreError.All
workbook.SaveAs("IgnoreGreenError.xlsx")
workbook.Close()
excelEngine.Dispose()
```

How to protect certain cells in a worksheet?

All the cells in an Excel worksheet have a **Locked** property, which determines if the cell will be editable. When a worksheet is protected, all the cells in the worksheet get locked, by default.

However, there is often a need to protect only certain cells in a worksheet. In this scenario, you need to protect a worksheet, and set the **IsLocked** property as false for the cells that need to be made editable.

The following code snippet illustrate this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
```

```

IWorksheet worksheet = workbook.Worksheets[0];
//Sample data
worksheet.Range["A1:K20"].Text = "Locked";
//A1:A10 will not be protected, hence it is editable.
worksheet.Range["A1:A10"].CellStyle.Locked = false;
worksheet.Range["A1:A10"].Text = "UnLocked";
worksheet.Protect("syncfusion", ExcelSheetProtection.All);
workbook.SaveAs("ProtectCells.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Sample data
worksheet.Range("A1:K20").Text = "Locked"
'A1:A10 will not be protected.
worksheet.Range("A1:A10").CellStyle.Locked = False
worksheet.Range("A1:A10").Text = "UnLocked"
worksheet.Protect("syncfusion", ExcelSheetProtection.All)
workbook.SaveAs("ProtectCells.xlsx")
workbook.Close()
excelEngine.Dispose()

```

Note: Locking/Unlocking cells in an unprotected worksheet has no effect.

How to set a line break inside a cell?

In order to set a line break inside a cell, you have to enable Text Wrapping for the cell, and then break the text. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Save the line break inside the cell
worksheet.Range["A1"].CellStyle.WrapText = true;
worksheet.Range["A1"].Text = String.Format("Hello\nworld");
workbook.SaveAs("LineBreak.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)

```

```

Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Save the line break inside the cell
worksheet.Range("A1").CellStyle.WrapText = True
worksheet.Range("A1").Text = String.Format("Hello" & vbLf & "world")
workbook.SaveAs("LineBreak.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to set or format a Header/Footer?

Script commands are used to set header/ footer formatting. The following code snippet illustrate this. For more information on formatting the string, see [Inserting and Formatting Text in Headers and Footers](#)

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Format the header
worksheet.PageSetup.CenterHeader = @"&"Gothic,bold"&"Center Header Text";
workbook.SaveAs("HeaderFormat.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Format the header
worksheet.PageSetup.CenterHeader = "&"Gothic,bold"&"Center Header Text"
workbook.SaveAs("HeaderFormat.xlsx")
workbook.Close()
excelEngine.Dispose()

```

Note: Go to “View -> Page Layout” option to view the header and footer in Microsoft Excel.

How to set print titles?

Printing Title Rows

XlsIO allows to designate row header to repeat on all pages of a printed workbook using **PrintTitleRows** property. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Print Rows 1 to 3 on every printed page.

```

```
worksheet.PageSetup.PrintTitleRows = "$A$1:$IV$3";
workbook.SaveAs ("TitleRows.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Print Rows 1 to 3 on every printed page.
worksheet.PageSetup.PrintTitleRows = "$A$1:$IV$3"
workbook.SaveAs ("TitleRows.xlsx")
workbook.Close()
excelEngine.Dispose()
```

Printing Title Columns

XlsIO allows to designate column header to repeat on all pages of a printed workbook using **PrintTitleColumns** property. The following code illustrates printing Title Columns.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Print Columns 1 to 3 on every printed page.
worksheet.PageSetup.PrintTitleColumns = "$A$1:$C$65536";
workbook.SaveAs ("TitleColumns.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Print Columns 1 to 3 on every printed page.
worksheet.PageSetup.PrintTitleColumns = "$A$1:$C$65536"
workbook.SaveAs ("TitleColumns.xlsx")
workbook.Close()
excelEngine.Dispose()
```

For information on Print settings, refer to section [Page Setup Settings](#).

How to unfreeze the rows and columns in XlsIO?

You can unfreeze rows and columns in XlsIO by using the RemovePanes method. The following code snippet illustrates this.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Freeze the panes.
worksheet.Range[8, 1].FreezePanes();
//Unfreeze the panes
worksheet.RemovePanes();
workbook.SaveAs("Unfreeze.xlsx");
workbook.Close();
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Freeze the panes.
worksheet.Range(8, 1).FreezePanes()
'Unfreeze the panes
worksheet.RemovePanes()
workbook.SaveAs("Unfreeze.xlsx")
workbook.Close()
excelEngine.Dispose()
```

What is the maximum range of Rows and Columns?

XlsIO has support below worksheet size for Excel 97 to 2003, Excel 2007 and later versions.

- **Excel 97 to 2003(.xls format)** – 65,536 by 256 rows and columns.
- **Excel 2007 and Later versions(.xlsx format)** – 1,048,576 by 16,384 rows and columns

The above specification is the worksheet size of Excel. For more information, see [Excel specifications and limits](#)

How to use Named Ranges with XlsIO?

A named range can be added to worksheet or workbook based on the required scope, the following code snippet illustrate this. For more information, see [Named Range](#)

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
```

```

IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Adding named range to the workbook
IName workbookName = workbook.Names.Add("WorkBookName");
workbookName.RefersToRange = worksheet.Range["I8"];
//Looping through the Named Ranges in a workbook.
foreach (IName workbookName in workbook.Names)
{
    MessageBox.Show(workbookName.Name.ToString());
}
//Adding named range to the worksheet
IName worksheetName = worksheet.Names.Add("WorkSheetName");
worksheetName.RefersToRange = worksheet.Range["J8"];
//Looping through the Named Ranges in a worksheet.
foreach (IName name in worksheet.Names)
{
    MessageBox.Show(name.Name.ToString());
}
workbook.SaveAs("NamedRange.Xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Adding named range to the workbook
Dim workbookName__1 As IName = workbook.Names.Add("WorkBookName")
workbookName__1.RefersToRange = worksheet.Range("I8")
'Looping through the Named Ranges in a workbook.
For Each workbookName__2 As IName In workbook.Names
    MessageBox.Show(workbookName__2.Name.ToString())
Next
'Adding named range to the worksheet
Dim worksheetName__3 As IName = worksheet.Names.Add("WorkSheetName")
worksheetName__3.RefersToRange = worksheet.Range("J8")
'Looping through the Named Ranges in a worksheet.
For Each worksheetName__4 As IName In worksheet.Names
    MessageBox.Show(worksheetName__4.Name.ToString())
Next
workbook.SaveAs("NamedRange.Xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to add chart labels to scatter points?

The following code illustrates adding chart labels to the scatter points of the chart.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;

```

```

IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Get the chart from the charts collection
IChart chart = worksheet.Charts[0];
//Get the first series from the Series collection
IChartSerie serieOne = chart.Series[0];
//Set the Series name to the Data Labels through Data Points
serieOne.DataPoints[0].DataLabels.IsSeriesName = true;
//Set the Value to the Data Labels through Data Points
serieOne.DataPoints[0].DataLabels.IsValue = true;
workbook.SaveAs("ChartLabels.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Get the chart from the charts collection
Dim chart As IChart = worksheet.Charts(0)
'Get the first series from the Series collection
Dim serieOne As IChartSerie = chart.Series(0)
'Set the Series name to the Data Labels through Data Points
serieOne.DataPoints(0).DataLabels.IsSeriesName = True
'Set the Value to the Data Labels through Data Points
serieOne.DataPoints(0).DataLabels.IsValue = True
workbook.SaveAs("ChartLabels.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to create a Chart with a discontinuous range?

The following code example illustrates creating a chart with discontinuous data ranges.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Entering the data for the chart.
worksheet.Range["A1"].Text = "Texas books Unit sales";
worksheet.Range["A1:D1"].Merge();
worksheet.Range["A1"].CellStyle.Font.Bold = true;
worksheet.Range["B2"].Text = "Jan";
worksheet.Range["C2"].Text = "Feb";
worksheet.Range["D2"].Text = "Mar";
worksheet.Range["A3"].Text = "Austin";
worksheet.Range["A4"].Text = "Dallas";
worksheet.Range["A5"].Text = "Houston";
worksheet.Range["A6"].Text = "San Antonio";

```

```

worksheet.Range["B3"].Number = 53.75;
worksheet.Range["B4"].Number = 52.85;
worksheet.Range["B5"].Number = 59.77;
worksheet.Range["B6"].Number = 96.15;
worksheet.Range["C3"].Number = 79.79;
worksheet.Range["C4"].Number = 59.22;
worksheet.Range["C5"].Number = 10.09;
worksheet.Range["C6"].Number = 73.02;
worksheet.Range["D3"].Number = 26.72;
worksheet.Range["D4"].Number = 33.71;
worksheet.Range["D5"].Number = 45.81;
worksheet.Range["D6"].Number = 12.17;
worksheet.Range["F1"].Number = 26.72;
worksheet.Range["F2"].Number = 33.71;
worksheet.Range["F3"].Number = 45.81;
worksheet.Range["F4"].Number = 12.17;
//Discontinuous range.
IRanges rangesOne = worksheet.CreateRangesCollection();
rangesOne.Add(worksheet.Range["B3:B6"]);
rangesOne.Add(worksheet.Range["F1:F2"]);
IRanges rangesTwo = worksheet.CreateRangesCollection();
rangesTwo.Add(worksheet.Range["D3:D6"]);
rangesTwo.Add(worksheet.Range["F3:F4"]);
//Adding a New (Embedded chart) to the Worksheet.
IChartShape shape = worksheet.Charts.Add();
shape.PrimaryCategoryAxis.Title = "City";
shape.PrimaryValueAxis.Title = "Sales (in Dollars)";
shape.ChartTitle = "Texas Books Unit Sales";
//Setting the Series Names in a Legend.
IChartSerie serieOne = shape.Series.Add();
serieOne.Name = "Jan";
serieOne.Values = rangesOne;
IChartSerie serieTwo = shape.Series.Add();
serieTwo.Name = "March";
serieTwo.Values = rangesTwo;
//Setting the (Rows & Columns) Property for the Embedded chart.
shape.BottomRow = 40;
shape.TopRow = 10;
shape.LeftColumn = 3;
shape.RightColumn = 15;
workbook.SaveAs("DiscontinuousRange.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Entering the data for the chart.
worksheet.Range("A1").Text = "Texas books Unit sales"
worksheet.Range("A1:D1").Merge()
worksheet.Range("A1").CellStyle.Font.Bold = True
worksheet.Range("B2").Text = "Jan"

```

```

worksheet.Range("C2").Text = "Feb"
worksheet.Range("D2").Text = "Mar"
worksheet.Range("A3").Text = "Austin"
worksheet.Range("A4").Text = "Dallas"
worksheet.Range("A5").Text = "Houston"
worksheet.Range("A6").Text = "San Antonio"
worksheet.Range("B3").Number = 53.75
worksheet.Range("B4").Number = 52.85
worksheet.Range("B5").Number = 59.77
worksheet.Range("B6").Number = 96.15
worksheet.Range("C3").Number = 79.79
worksheet.Range("C4").Number = 59.22
worksheet.Range("C5").Number = 10.09
worksheet.Range("C6").Number = 73.02
worksheet.Range("D3").Number = 26.72
worksheet.Range("D4").Number = 33.71
worksheet.Range("D5").Number = 45.81
worksheet.Range("D6").Number = 12.17
worksheet.Range("F1").Number = 26.72
worksheet.Range("F2").Number = 33.71
worksheet.Range("F3").Number = 45.81
worksheet.Range("F4").Number = 12.17
'Discontinuous range.
Dim rangesOne As IRanges = worksheet.CreateRangesCollection()
rangesOne.Add(worksheet.Range("B3:B6"))
rangesOne.Add(worksheet.Range("F1:F2"))
Dim rangesTwo As IRanges = worksheet.CreateRangesCollection()
rangesTwo.Add(worksheet.Range("D3:D6"))
rangesTwo.Add(worksheet.Range("F3:F4"))
'Adding a New (Embedded chart) to the Worksheet.
Dim shape As IChartShape = worksheet.Charts.Add()
shape.PrimaryCategoryAxis.Title = "City"
shape.PrimaryValueAxis.Title = "Sales (in Dollars)"
shape.ChartTitle = "Texas Books Unit Sales"
'Setting the Series Names in a Legend.
Dim serieOne As IChartSerie = shape.Series.Add()
serieOne.Name = "Jan"
serieOne.Values = rangesOne
Dim serieTwo As IChartSerie = shape.Series.Add()
serieTwo.Name = "March"
serieTwo.Values = rangesTwo
'Setting the (Rows & Columns) Property for the Embedded chart.
shape.BottomRow = 40
shape.TopRow = 10
shape.LeftColumn = 3
shape.RightColumn = 15
workbook.SaveAs("DiscontinuousRange.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to define discontinuous ranges?

You can define a discontinuous range by adding different ranges to the Range collection. The following code example illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Create Range collection.
IRanges rangeCollection = worksheet.CreateRangesCollection();
//Add different ranges to the Range collection.
rangeCollection.Add(worksheet.Range["D2:D3"]);
rangeCollection.Add(worksheet.Range["D10:D11"]);
rangeCollection.Text = "Welcome";
workbook.SaveAs("DiscontinuousRange.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Create Range collection.
Dim range As IRanges = worksheet.CreateRangesCollection()
'Add different ranges to the Range collection.
range.Add(worksheet.Range("D2:D3"))
range.Add(worksheet.Range("D10:D11"))
range.Text = "Welcome"
workbook.SaveAs("DiscontinuousRange.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to format text within a cell?

In Essential XlsIO, You can use the rich text formatting option to format the text within a cell. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Create(1);
IWorksheet worksheet = workbook.Worksheets[0];
//Insert Rich Text.
IRange range = worksheet.Range["A1"];
range.Text = "RichText";
IRichTextString richText = range.RichText;
//Formatting first 4 characters.
IFont redFont = workbook.CreateFont();
redFont.Bold = true;
redFont.Italic = true;
redFont.RGBColor = Color.Red;
richText.SetFont(0, 3, redFont);
//Formatting last 4 characters.
IFont blueFont = workbook.CreateFont();

```

```

blueFont.Bold = true;
blueFont.Italic = true;
blueFont.RGBColor = Color.Blue;
richText.SetFont(4, 7, blueFont);
workbook.SaveAs("FormattingText.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Insert Rich Text.
Dim range As IRange = worksheet.Range("A1")
range.Text = "RichText"
Dim richText As IRichTextString = range.RichText
'Formatting first 4 characters.
Dim redFont As IFont = workbook.CreateFont()
redFont.Bold = True
redFont.Italic = True
redFont.RGBColor = Color.Red
richText.SetFont(0, 3, redFont)
'Formatting last 4 characters.
Dim blueFont As IFont = workbook.CreateFont()
blueFont.Bold = True
blueFont.Italic = True
blueFont.RGBColor = Color.Blue
richText.SetFont(4, 7, blueFont)
workbook.SaveAs("FormattingText.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to hide the summary rows and columns using XlsIO?

You can hide the summary rows and columns by using the **IsSummaryRowBelow** and **IsSummaryColumnRight** properties. The following code snippet illustrates this.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2013;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Hide the summary rows at the bottom.
worksheet.PageSetup.IsSummaryRowBelow = false;
//Hide the summary columns to the right.
worksheet.PageSetup.IsSummaryColumnRight = false;
workbook.SaveAs("SuppressRowsColumns.xlsx");
workbook.Close();
excelEngine.Dispose();

```

VB.NET

```

Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim worksheet As IWorksheet = workbook.Worksheets(0)
'Hide the summary rows at the bottom.
worksheet.PageSetup.IsSummaryRowBelow = False
'Suppress the summary columns to the right.
worksheet.PageSetup.IsSummaryColumnRight = False
workbook.SaveAs("SuppressRowsColumns.xlsx")
workbook.Close()
excelEngine.Dispose()

```

How to zip files using the Syncfusion.Compression.Zip namespace?

You can compress the file using Syncfusion.Compression.Zip namespace. The following code illustrate this.

C#

```

using Syncfusion.Compression.Zip;
ZipArchive zipArchive = new Syncfusion.Compression.Zip.ZipArchive();
zipArchive.DefaultCompressionLevel =
Syncfusion.Compression.CompressionLevel.Best;
//Add the file you want to zip.
zipArchive.AddFile("SampleFile.cs");
//Zip file name and location.
zipArchive.Save("SyncfusionCompressFileSample.zip");
zipArchive.Close();

```

VB.NET

```

Imports Syncfusion.Compression.Zip
Dim zipArchive As ZipArchive = New Syncfusion.Compression.Zip.ZipArchive()
zipArchive.DefaultCompressionLevel =
Syncfusion.Compression.CompressionLevel.Best
'Add the file you want to zip.
zipArchive.AddFile("SampleFile.cs")
'Zip file name and location.
zipArchive.Save("SyncfusionCompressFileSample.zip")
zipArchive.Close()

```

Tips: You can use CompressionLevel to reduce the size of the file.

For compressing directories, you can make use of the **AddDirectory** method which adds an empty directory file to a ZipArchive. If you want to add all the files inside the directory, then you should manually add these files by using the **AddItem** method.

The following code snippet illustrate how to add the file from the local drive.

C#

```

string fileName = @"SampleFile.cs";
ZipArchive zipArchive = new Syncfusion.Compression.Zip.ZipArchive();

```

```
zipArchive.DefaultCompressionLevel = CompressionLevel.Best;
Stream stream = new FileStream(fileName, FileMode.Open, FileAccess.Read);
FileAttributes attributes = File.GetAttributes(fileName);
ZipArchiveItem item = new ZipArchiveItem(zipArchive, "SampleFile.cs",
stream, true, attributes);
zipArchive.AddItem(item);
zipArchive.Save(@"SyncfusionCompressFileSample.zip");
zipArchive.Close();
```

VB.NET

```
Dim fileName As String = "SampleFile.cs"
Dim zipArchive As ZipArchive = New Syncfusion.Compression.Zip.ZipArchive()
zipArchive.DefaultCompressionLevel = CompressionLevel.Best
Dim stream As Stream = New FileStream(fileName, FileMode.Open,
FileAccess.Read)
Dim attributes As FileAttributes = File.GetAttributes(fileName)
Dim item As New ZipArchiveItem(zipArchive, "SampleFile.cs", stream, True,
attributes)
zipArchive.AddItem(item)
zipArchive.Save("SyncfusionCompressFileSample.zip")
zipArchive.Close()
```

How to zip all the files in subfolders using the Syncfusion.Compression.Zip namespace?

You can compress and decompress the files with our Compression library. The following code snippet illustrates this.

C#

```
using Syncfusion.Compression.Zip;
class Program
{
    private static List<DirectoryInfo> arrOfItems = new List<DirectoryInfo>();
    private static ZipArchive zipArchive = new ZipArchive();
    private static string folderPath = @"..\..\ZipFiles";
    private static void SubFoldersFiles(string path)
    {
        DirectoryInfo dInfo = new DirectoryInfo(path);
        foreach (DirectoryInfo d in dInfo.GetDirectories())
        {
            SubFoldersFiles(d.FullName);
            arrOfItems.Add(d);
        }
    }
    // Zip and save the file.
    private static void ZipAndSave()
    {
        SubFoldersFiles(folderPath);
        if (Directory.Exists(folderPath))
        {
            AddRootFiles();
            AddSubFoldersFiles();
            // Saving zipped file.
            zipArchive.Save(@"..\..\UnzippedFile.zip");
            zipArchive.Close();
        }
    }
}
```

```

Console.WriteLine("Files Zipped successfully!");
}
}
private static void AddRootFiles()
{
    string fileName = "";
    foreach (string rootFiles in Directory.GetFiles(folderPath))
    {
        //Creating the stream from file
        FileStream stream = new FileStream(rootFiles, FileMode.Open,
        FileAccess.ReadWrite);
        //Getting the File Name alone and ignoring the directory path
        fileName = Path.GetFileName(rootFiles);
        FileAttributes attribute = File.GetAttributes(rootFiles);
        zipArchive.AddItem(fileName, stream, false, attribute);
    }
}
private static void AddSubFoldersFiles()
{
    foreach (DirectoryInfo dInfo in arrOfItems)
    {
        FileInfo[] fInfo = dInfo.GetFiles();
        string mainDirectoryPath = Path.GetFullPath(folderPath);
        foreach (FileInfo file in fInfo)
        {
            //Get the File name with its current folder and ignoring the Main Directory
            string fileName = file.FullName.Replace(mainDirectoryPath, "");
            //Read the file stream by its Full name
            FileStream stream = new FileStream(file.FullName, FileMode.Open,
            FileAccess.ReadWrite);
            FileAttributes attributes = File.GetAttributes(file.FullName);
            //Add the item to the zip Archive
            zipArchive.AddItem(fileName, stream, true, attributes);
        }
    }
}
//Unzipping the Folder
private static void UnZipFiles()
{
    ZipArchive zip = new ZipArchive();
    string path = @"..\..\UnZippedFile";
    zip.Open(@"..\..\UnZippedFile.zip");
    if (!Directory.Exists(path))
    Directory.CreateDirectory(path);
    //Saving the contents of zip file to disk.
    for (int i = 0; i < zip.Count; i++)
    {
        ZipArchiveItem item = zip[i];
        string itemName = path + item.ItemName;
        //checking whether the item is root file
        if (itemName.Contains("/"))
        {
            itemName = itemName.Replace("/", "\\");
        }
        //Check whether the Directory is present or not
        if (!Directory.Exists(itemName) || itemName.Contains("\\\\"))
        {

```

```

int index = itemName.LastIndexOf("\\");
string directoryPath = itemName.Remove(index, itemName.Length - index);
Directory.CreateDirectory(directoryPath);
}
FileStream fileStream = new FileStream(itemName, FileMode.OpenOrCreate,
FileAccess.ReadWrite);
MemoryStream memoryStream = item.DataStream as MemoryStream;
memoryStream.WriteTo(fileStream);
fileStream.Flush();
fileStream.Close();
}
Console.WriteLine("File has been Unzipped");
}
static void Main(string[] args)
{
ZipAndSave();
UnZipFiles();
}
}

```

VB.NET

```

How to protect the zip files with password using Syncfusion.Compression.Base?

Password is used for protecting files which needs more security. This can be achieved by using various encryption algorithms. The compressed zip files can be protected using encryption algorithms with password as a key for that algorithm.

Syncfusion.Compression.Base supports AES-128 bits, AES-192 bits, AES-256 bits and ZipCrypto encryption algorithms. These encryption algorithms are available under the enumeration **EncryptionAlgorithm**.

The following complete code snippet explains how to protect a zip file with password using AES-256 bits encryption algorithm.

C#

```
using Syncfusion.Compression.Zip;
class Program
{
    static void Main(string[] args)
    {
        //Initialize ZipArchive
        ZipArchive zipArchive = new ZipArchive();
        //Add files into ZipArchive
        zipArchive.AddFile("../Data/Template1.txt");
        zipArchive.AddFile("../Data/Template2.txt");
        zipArchive.AddFile("../Data/Template3.txt");
        //Protect the ZipArchive with password
        zipArchive.Protect("password", EncryptionAlgorithm.AES256);
        //Save the ZipArchive
        zipArchive.Save("WithPassword256Bit.zip");
    }
}
```

VB.NET

```
Imports Syncfusion.Compression.Zip
Module Module1
    Sub Main()
        'Initialize ZipArchive
        Dim zipArchive As ZipArchive = New ZipArchive
        'Add files into ZipArchive
        zipArchive.AddFile("../Data/Template1.txt")
        zipArchive.AddFile("../Data/Template2.txt")
        zipArchive.AddFile("../Data/Template3.txt")
        'Protect the ZipArchive with password
        zipArchive.Protect("password", EncryptionAlgorithm.AES256)
        'Save the ZipArchive
        zipArchive.Save("WithPassword256Bit.zip")
    End Sub
End Module
```

How to un-protect the zip files using Syncfusion.Compression.Base?

The following complete code snippet explains how to unprotect the zip file.

C#

```

using Syncfusion.Compression.Zip;
using System.IO;
class Program
{
    static void Main(string[] args)
    {
        //Initailize ZipArchive
        ZipArchive zipArchive = new ZipArchive();
        //Load the zip file into ZipArchive
        zipArchive.Open(new FileStream("../Data/Protected.zip", FileMode.Open),
            false, "password");
        //Unprotect the ZipArchive
        zipArchive.UnProtect();
        //Save the ZipArchive
        zipArchive.Save("WithOutPassword.zip");
    }
}

```

VB.NET

```

Imports Syncfusion.Compression.Zip
Imports System.IO
Module Module1
    Sub Main()
        'Initailize ZipArchive
        Dim zipArchive As ZipArchive = New ZipArchive
        'Load the zip file into ZipArchive
        zipArchive.Open(New FileStream("../Data/Protected.zip", FileMode.Open),
            False, "password")
        'Unprotect the ZipArchive
        zipArchive.UnProtect()
        'Save the ZipArchive
        zipArchive.Save("WithOutPassword.zip")
    End Sub
End Module

```

Does Essential XlsIO provide support for Client Profile?

Yes, Essential XlsIO provides support for Client Profile. In order to use Essential XlsIO in an application (which targeted to Client Profile), the user should include the following assemblies.

- Syncfusion.Core.dll
- Syncfusion.Compression.Base.dll
- Syncfusion.XlsIO.ClientProfile.dll

Note: Syncfusion.Core is no longer needed from 13.2 version onwards.

How to resolve the “File does not contain workbook stream” error in Syncfusion.XlsIO.Base.dll?

XlsIO does not support files generated prior to 97-2003 version. Hence the exception "File does not contain workbook stream" occurs. This can be checked in prior with the below code snippet.

C#

```

ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;

```

```
//To check whether the file is supported
var isSupported = application.IsSupported("Sample.xls");
excelEngine.Dispose();
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
'To check whether the file is supported
Dim isSupported = application.IsSupported("Sample.xls")
excelEngine.Dispose()
```

Note: This method is available from 12.4 version onwards.

How to resolve "Excel cannot open the file 'filename.xlsx' because the file format for the file extension is not valid. Verify that the file has not been corrupted and that the file extension matches the format of the file" error?

This error occurs when there is a mismatch between the file format and its extension. The default workbook creation version in XlsIO is Excel97-2003 (.xls). The application version set to the required version should match its file format during save, as in the below code.

C#

```
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
//Set application version
application.DefaultVersion = ExcelVersion.Excel2013;
//Do some manipulation
//Do some manipulation
//Workbook is saved in Excel2013 format
workbook.SaveAs("Sample.xlsx");
```

VB.NET

```
Dim excelEngine As New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
'Set application version
application.DefaultVersion = ExcelVersion.Excel2013
'Do some manipulation
'Do some manipulation
'Workbook is saved in Excel2013 format
workbook.SaveAs("Sample.xlsx")
```

If the application version is ignored, then the workbook version should be set properly during creation and save.

- To save a workbook in Excel2003 format, set the workbook version to Excel97to2003 and save the file with extension '.xls' i.e. binary file format.
- To save a workbook in Excel 2007 and above formats, set the workbook version to Excel2007 and above and save the file with extension '.xlsx' i.e. open XML file format.

These are represented in the below code snippet.

C#

```
workbook.Version = ExcelVersion.Excel97to2003;
workbook.SaveAs ("Sample.xls");
workbook.Version = ExcelVersion.Excel2013;
workbook.SaveAs ("Sample.xlsx");
```

VB.NET

```
workbook.Version = ExcelVersion.Excel97to2003
workbook.SaveAs ("Sample.xls")
workbook.Version = ExcelVersion.Excel2013
workbook.SaveAs ("Sample.xlsx")
```

What happens when an Excel file containing uninstalled fonts is converted to PDF/Image?

When the fonts used in particular Excel document are not installed in the machine, the desired characters will be missing in the PDF/Image conversion. However, XlsIO comes up with a font substitution method through **SubstituteFontEventHandler** event. This will enable user to specify alternate font name to render the characters in the specified alternate font. Otherwise, Microsoft Sans Serif is used as the default one.

Note: Due to this font substitution, there might be a slight difference with the rendered text in the generated PDF/Image files during Excel to PDF/Image conversion.

The following code snippet shows how to use font substitution in Excel to PDF conversion using XlsIO.

C#

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    IWorkbook workbook = application.Workbooks.Open("Sample.xlsx");
    //Initializes the SubstituteFont event to perform font substitution during Excel to PDF conversion
    application.SubstituteFont += new
        SubstituteFontEventHandler(SubstituteFont);
    ExcelToPdfConverter converter = new ExcelToPdfConverter(workbook);
    PdfDocument pdf = converter.Convert();
    Stream stream = File.Create("Output.pdf");
    pdf.Save(stream);
}

private static void SubstituteFont(object sender, SubstituteFontEventArgs
args)
{
    //Sets the alternate font when a specified font is not installed in the production environment
    if (args.OriginalFontName == "Wingdings Regular")
        args.AlternateFontName = "Bauhaus 93";
    else
        args.AlternateFontName = "Times New Roman";
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
```

```

Dim application As IApplication = excelEngine.Excel
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx")
'Initializes the SubstituteFont event to perform font substitution during
Excel to PDF conversion
AddHandler application.SubstituteFont, AddressOf SubstituteFont
Dim converter As ExcelToPdfConverter = New ExcelToPdfConverter(workbook)
Dim pdf As PdfDocument = converter.Convert()
Dim stream As Stream = File.Create("Output.pdf")
pdf.Save(stream)
End Using
Private Shared Sub SubstituteFont(ByVal sender As Object, ByVal args As
SubstituteFontEventArgs)
'Sets the alternate font when a specified font is not installed in the
production environment.
If args.OriginalFontName = "Wingdings Regular" Then
args.AlternateFontName = "Bauhaus 93"
Else
args.AlternateFontName = "Times New Roman"
End If
End Sub

```

How to avoid exception when adding worksheets with same name

Microsoft Excel throws exception when adding worksheet with existing worksheet name in a workbook and XlsIO does the same. But in some case, if you want to add worksheets with the same name using XlsIO then you can avoid the exception in XlsIO by setting IApplication IgnoreSheetNameException property as true.

The following code snippet shows how to add two worksheets with same name in a workbook.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Set IgnoreSheetNameException property as true
    application.IgnoreSheetNameException = true;
    //Create worksheets with same name
    IWorksheet sheet_1 = workbook.Worksheets.Create("Sheet");
    IWorksheet sheet_2 = workbook.Worksheets.Create("Sheet");
    string fileName = "Output.xlsx";
    workbook.SaveAs(fileName);
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2013
Dim workbook As IWorkbook = application.Workbooks.Create(1)
'Set IgnoreSheetNameException property as true
application.IgnoreSheetNameException = true
'Create worksheets with same name
Dim sheet_1 As IWorksheet = workbook.Worksheets.Create("Sheet")

```

```
Dim sheet_2 As IWorksheet = workbook.Worksheets.Create("Sheet")
Dim fileName As String = "Output.xlsx"
workbook.SaveAs(fileName)
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Set IgnoreSheetNameException property as true
    application.IgnoreSheetNameException = true;
    //Create worksheets with same name
    IWorksheet sheet_1 = workbook.Worksheets.Create("Sheet");
    IWorksheet sheet_2 = workbook.Worksheets.Create("Sheet");
    //Initializes FileSavePicker
    FileSavePicker savePicker = new FileSavePicker();
    savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
    savePicker.SuggestedFileName = "Output";
    savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xlsx"
});
    //Creates a storage file from FileSavePicker
    StorageFile storageFile = await savePicker.PickSaveFileAsync();
    //Saves changes to the specified storage file
    await workbook.SaveAsAsync(storageFile);
}
```

ASP.NET CORE

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
    //Set IgnoreSheetNameException property as true
    application.IgnoreSheetNameException = true;
    //Create worksheets with same name
    IWorksheet sheet_1 = workbook.Worksheets.Create("Sheet");
    IWorksheet sheet_2 = workbook.Worksheets.Create("Sheet");
    //Saving the workbook as stream
    FileStream file = new FileStream("Output.xlsx", FileMode.Create,
    FileAccess.ReadWrite);
    workbook.SaveAs(file);
    file.Dispose();
}
```

XAMARIN

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Excel2013;
    IWorkbook workbook = application.Workbooks.Create(1);
```

```

//Set IgnoreSheetNameException property as true
application.IgnoreSheetNameException = true;
//Create worksheets with same name
IWorksheet sheet_1 = workbook.Worksheets.Create("Sheet");
IWorksheet sheet_2 = workbook.Worksheets.Create("Sheet");
//Saving the workbook as stream
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
stream.Position = 0;
//Save the document as file and view the saved document
//The operation in SaveAndView under Xamarin varies between Windows Phone,
//Android and iOS platforms. Please refer xlsio/xamarin section for respective
//code samples.
if (Device.OS == TargetPlatform.WinPhone || Device.OS ==

}
else
{
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("Output.xlsx", "application/msexcel", stream);
}
}

```

How to change data point label color of a Waterfall chart

The following code snippet shows how to change data point label color of a Waterfall chart.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Excel2016;
IWorkbook workbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic);
IWorksheet sheet = workbook.Worksheets[0];
//Accessing first chart in the sheet
IChartShape chart = sheet.Charts[0];
//Changing first data point label color
chart.Series[0].DataPoints[0].DataLabels.IsValue = true;
chart.Series[0].DataPoints[0].DataLabels.RGBColor = Color.Green;
workbook.SaveAs("Waterfall.xlsx");
}

```

VB.NET

```

Using excelEngine As ExcelEngine = New ExcelEngine()
Dim application As IApplication = excelEngine.Excel
application.DefaultVersion = ExcelVersion.Excel2016
Dim workbook As IWorkbook = application.Workbooks.Open("Sample.xlsx",
ExcelOpenType.Automatic)
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Create a chart
Dim chart As IChartShape = sheet.Charts(0)

```

```
'Changing first data point label color
chart.Series(0).DataPoints(0).DataLabels.IsValue = true
chart.Series(0).DataPoints(0).DataLabels.RGBColor = Color.Green
workbook.SaveAs("Waterfall.xlsx")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{

How to check whether an Excel document contains macro?

You can check whether the Excel document contains macro using **IWorkbook.HasMacro** property. The value true indicates that the Excel document has a Vba project.

The following code illustrates how to check whether an Excel document contains macro using XlsIO.

C#

```

using (ExcelEngine excelEngine = new ExcelEngine())
{

```

```
// Instantiate the excel application object.
IApplication application = excelEngine.Excel;
// Opening a workbook
IWorkbook workbook = application.Workbooks.Open("Test.xls");
IWorksheet sheet = workbook.Worksheets[0];
//Check macro exist
bool IsMacroEnabled = workbook.HasMacros;
//Save the workbook
workbook.SaveAs("Output.xls");
}
```

VB.NET

```
Using excelEngine As ExcelEngine = New ExcelEngine()
'Instantiate the excel application object.
Dim application As IApplication = excelEngine.Excel
'Opening a Workbook
Dim workbook As IWorkbook = application.Workbooks.Open("Test.xls")
Dim sheet As IWorksheet = workbook.Worksheets(0)
'Check macro exist
Dim IsMacroEnabled As Boolean = workbook.HasMacros
'Save the workbook
workbook.SaveAs("Output.xls")
End Using
```

UWP

```
using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//Instantiates the File Picker
FileOpenPicker openPicker = new FileOpenPicker();
openPicker.SuggestedStartLocation = PickerLocationId.Desktop;
openPicker.FileTypeFilter.Add(".xlsm");
openPicker.FileTypeFilter.Add(".xltn");
openPicker.FileTypeFilter.Add(".xls");
StorageFile file = await openPicker.PickSingleFileAsync();
//Opening a workbook with a worksheet
IWorkbook workbook = await application.Workbooks.OpenAsync(file,
ExcelOpenType.Automatic);
IWorksheet worksheet = workbook.Worksheets[0];
//Check macro exist
bool IsMacroEnabled = workbook.HasMacros;
// Save the Workbook
StorageFile storageFile;
if
(! (Windows.Foundation.Metadata.ApiInformation.IsTypePresent("Windows.Phone.UI.Input.HardwareButtons")))
{
FileSavePicker savePicker = new FileSavePicker();
savePicker.SuggestedStartLocation = PickerLocationId.Desktop;
savePicker.SuggestedFileName = "Output";
savePicker.FileTypeChoices.Add("Excel Files", new List<string>() { ".xls"
});
storageFile = await savePicker.PickSaveFileAsync();
}
}
```

```

else
{
StorageFolder local = Windows.Storage.ApplicationData.Current.LocalFolder;
storageFile = await local.CreateFileAsync("Output.xls",
CreationCollisionOption.ReplaceExisting);
}
//Saving the workbook
await workbook.SaveAsAsync(storageFile);
// Launch the saved file
await Windows.System.Launcher.LaunchFileAsync(storageFile);
}

```

ASP.NET CORE

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
//Instantiate the excel application object.
IApplication application = excelEngine.Excel;
//Opening form module existing workbook
FileStream input = new FileStream(DataPathBase + "Test.xls", FileMode.Open,
FileAccess.ReadWrite);
IWorkbook workbook = application.Workbooks.Open(input);
IWorksheet sheet = workbook.Worksheets[0];
//Check macro exist
bool IsMacroEnabled = workbook.HasMacros;
// Save the workbook
FileStream output = new FileStream("Output.xls", FileMode.Create,
FileAccess.ReadWrite);
workbook.SaveAs(output);
input.Close();
output.Close();
}

```

XAMARIN

```

using (ExcelEngine excelEngine = new ExcelEngine())
{
IApplication application = excelEngine.Excel;
//"App" is the class of Portable project
Assembly assembly = typeof(App).GetTypeInfo().Assembly;
Stream inputStream = assembly.GetManifestResourceStream("App.Test.xls");
//Opening the workbook
IWorkbook workbook = application.Workbooks.Open(inputStream);
IWorksheet worksheet = workbook.Worksheets[0];
//Check macro exist
bool IsMacroEnabled = workbook.HasMacros;
//Saving as Excel without macros
MemoryStream stream = new MemoryStream();
workbook.SaveAs(stream);
//Save the stream into XLSX file
Xamarin.Forms.DependencyService.Get<ISave>().SaveAndView("sample.xls",
"application/msexcel", stream);
}

```

Does XlsIO support password protected macro in the Excel documents?

Yes. XlsIO preserves the password protection for the macro in the Excel documents for resaving process. But, it does not have support for remove and modify the password.

Does XlsIO support Excel files with macros that are digitally signed?

Yes. XlsIO preserves the digital signature from the macro-enabled Excel document. But, it does not have support for remove and modify the signatures.
