

Inducing Infertility by Vaccination

By Craig Paardekoooper

In Kenya, use of a Tetanus vaccine that combined the Tetanus antigen with HCG, caused an immune response that targeted the tetanus antigen AND also targeted HCG. HCG is a hormone that is vital for reproduction, so this vaccine was effective in inducing permanent infertility. It also caused the death and spontaneous abortion of any foetus at the time of immunization.

Please see these links - [WHO Depopulation Program 1](#) | [WHO Depopulation Program 2](#)

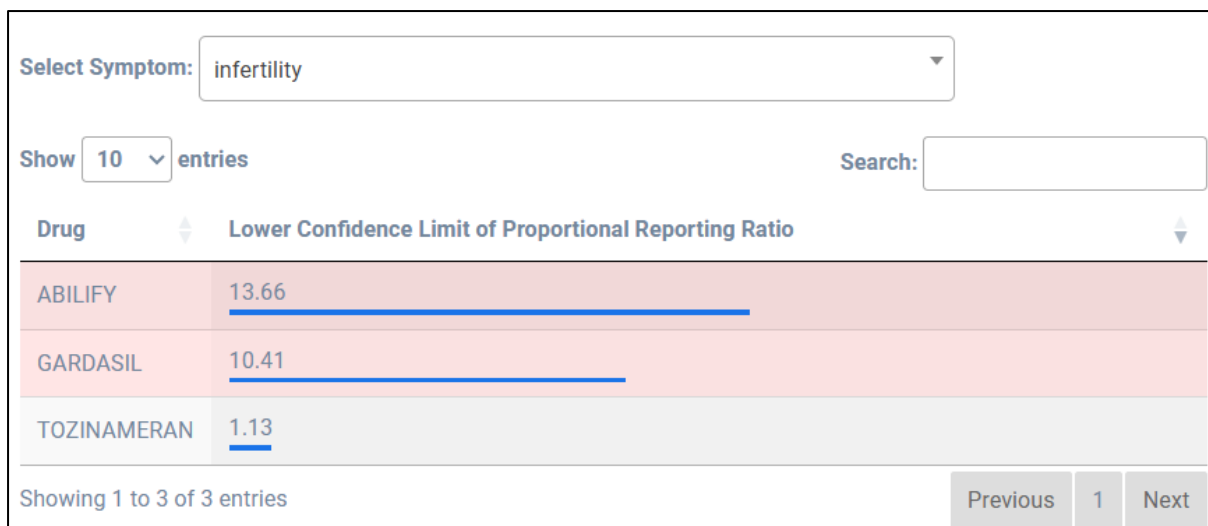

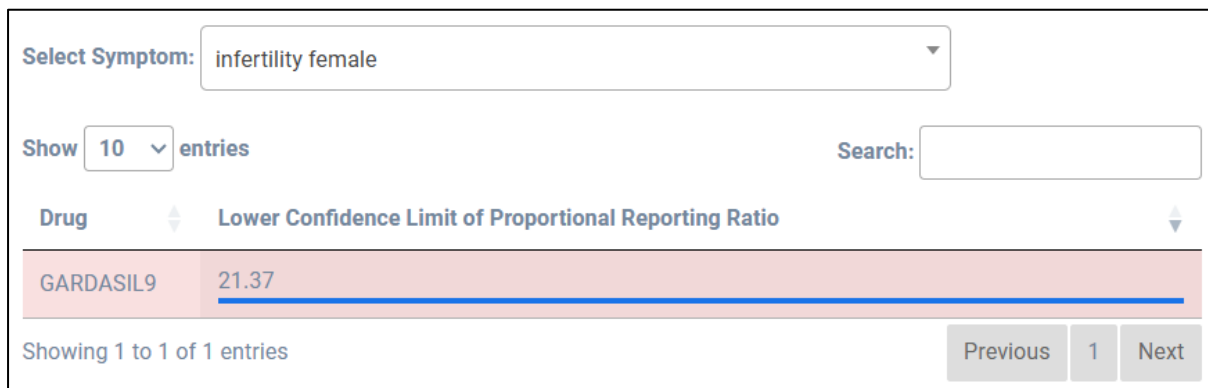

I used the VAERS Safety Signal database to see which vaccines, out of 100 different vaccines, have the highest association with infertility. You can search this database here - [VAERS Safety Signal](#)

I also used EU Safety Signal database to see which vaccine AND NON-VACCINE drugs, out of 1500 different drugs, have the highest association with infertility. You can search this dataset here - [EU Safety Signal \(All drugs\)](#)

Here are the results from VAERS for 100 different vaccines. The three vaccines with highest association with infertility are all HPV vaccines.

Select Symptom:	Infertility female

And, here are the results from the EU data for 1500 different drugs (including vaccines and non-vaccines)

Gardasil9 and Gardasil, by-the-way, are brand names for the HPV vaccine! And Tozinameran is the brand name for Comirnaty (the Pfizer Covid jab).

I also used the VAERS Safety Signal database to see which vaccines have the highest association with a reduction of HCG. HCG levels are measured in the blood, and in urine. Here are the VAERS results. HPV has the highest association with reduction of this hormone.

Select Symptom: Blood human chorionic gonadotropin negative

It looks like a replay of what they did in Kenya with tetanus.

HPV vaccines are associated with a large decrease in human gonadotropin hormone - just as the tetanus vaccine in Kenya was. Are they combining the antigen with HCG again in order to induce infertility?

Independent investigation needs to be carried out to see if this is the case.

If a woman is pregnant at the time of immunization, then an immune reaction against HCG will also result in a spontaneous abortion. So which vaccines have the strongest association with spontaneous abortion?

Here are the VAERS Safety Signal results for spontaneous abortion.

Select Symptom: Abortion spontaneous

Notice the prominence of HPV, as well as the “Bird Flu” vaccine that is now being pushed.

In the EU Safety Signal database Gardasil is also associated with symptoms of -

- “Spontaneous abortion”
- “Abortion”
- “Abortion induced”
- “Abortion missed”
- “Foetal death”

Select Symptom:

abortion

Intra-uterine death is a clinical term for the death of a foetus in the womb, which is something that would be expected if HCG was being targeted by the immune system. So, which vaccines are associated with the highest rates of intra-uterine death?

Here are the results for the VAERS Safety Signal database.

Select Symptom:	Intra-uterine death
Show 10 entries	Search:
Vaccine	Lower Confidence Limit of Proportional Reporting Ratio
HPV4	12.359486796229232
FLUX(H1N1)	64.84091168923767

The bird flu jab (H1N1) looks like it would be good for contraception or population control, given its high incidence of intrauterine death and spontaneous abortion.

That's why it is so scary that they are giving it to farm animals. [Link](#)

If it has such a level of intra-uterine death then it seems reasonable to assume that it will reduce animal reproduction - leading to mass malnutrition and starvation in many parts of the world. Cattle, sheep, pig and chicken populations would be decimated.

In Africa, the poorest live on small farms with 4 or 5 chickens, perhaps a cow, and a patch of land the size of a typical European garden.

If their chickens and cattle were given the bird flu jab then it is reasonable to assume that the birds may stop laying eggs, or egg production will be greatly reduced. Milk production by cattle would be reduced, and cows would no longer give birth.

So, the impact on these poor families will be malnutrition - no meat, no eggs, no milk, no livestock - after one generation - and impoverishment because they no longer have these products to sell. The devastation of human populations would be acute across entire countries.

Conclusion

The current widespread programs of HPV vaccination (predominantly of school children, without parental consent) and Bird Flu vaccination for animals, raise great concern regarding subsequent infertility. Bird Flu vaccines MUST be independently investigated for their effects on egg production, on livestock reproduction and animal health, to avoid the risk of food-shortages, malnutrition and famine in large areas of the world.
