| %t        | A horizontal-tab character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| %T        | Equivalent to %H:%M:%S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| %u        | The calendar day of week as a decimal number (1-7), as specified in ISO 8601-1:2019, where Monday is 1. The modified command %Ou produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %U        | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OU produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                        |
| %V        | The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. If the result is a single digit, it is prefixed with 0. The modified command %OV produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                 |
| %w        | The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Ow produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| %W        | The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OW produces the locale's alternative representation.                                                                                                                                                                                                                                                                                                        |
| %x        | The locale's date representation. The modified command %Ex produces the locale's alternate date representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| %X        | The locale's time representation. The modified command %EX produces the locale's alternate time representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| %y        | The last two decimal digits of the year, regardless of the sign of the year. If the result is a single digit, it is prefixed by 0. The modified command %Oy produces the locale's alternative representation. The modified command %Ey produces the locale's alternative representation of offset from %EC (year only).<br>[Example 3:<br>cout << format("{:%C %y}", -1976y);      // prints -20 76<br>— end example]                                                                                                                                                                                    |
| %Y        | The year as a decimal number. If the result is less than four digits, it is left-padded with 0 to four digits. The modified command %EY produces the locale's alternative full year representation.                                                                                                                                                                                                                                                                                                                                                                                                      |
| %z        | The offset from UTC as specified in ISO 8601-1:2019, 5.3.4.1. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %Oz insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type <code>format_error</code> is thrown.                                                                                                                                                                                                                                                 |
| %Z        | The time zone abbreviation. If the time zone abbreviation is not available, an exception of type <code>format_error</code> is thrown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| %%        | A % character.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

- <sup>7</sup> Unless otherwise specified, if the *chrono-specs* is omitted, the chrono object is formatted as if by streaming it to `basic_ostream<charT> os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[Example 4:

```
string s = format("{:=>8}", 42ms); // value of s is "====42ms"
— end example]
```

- 8 For `chrono::duration` the library only provides the following specialization of `enable_nonlocking_formatter_optimization`:

```
template<class Rep, class Period>
constexpr bool enable_nonlocking_formatter_optimization<
 chrono::duration<Rep, Period>> =
 enable_nonlocking_formatter_optimization<Rep>;
```

- 9 For `chrono::zoned_time` the library only provides the following specialization of `enable_nonlocking_formatter_optimization`:

```
template<class Duration>
constexpr bool enable_nonlocking_formatter_optimization<
 chrono::zoned_time<Duration, const std::chrono::time_zone*>> = true;
```

```
template<class Duration, class charT>
struct formatter<chrono::sys_time<Duration>, charT>;
```

- 10 *Remarks:* If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted.

```
template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT>;
```

- 11 *Remarks:* If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is `STATICALLY-WIDEN<charT>("60")`.

```
template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT>;
```

- 12 *Remarks:* If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("TAI")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} -
 (sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

```
template<class Duration, class charT>
struct formatter<chrono::gps_time<Duration>, charT>;
```

- 13 *Remarks:* If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("GPS")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```
sys_time<Duration>{tp.time_since_epoch()} +
 (sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})
```

```
template<class Duration, class charT>
struct formatter<chrono::file_time<Duration>, charT>;
```

- 14 *Remarks:* If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with `clock_cast<system_clock>(t)`, or by a `utc_time` initialized with `clock_cast<utc_clock>(t)`, where `t` is the first argument to format.

```
template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT>;
```

- 15 *Remarks:* If `%Z`, `%z`, or a modified version of `%z` is used, an exception of type `format_error` is thrown.

```
template<class Duration> struct local-time-format-t {
 local_time<Duration> time_; // exposition only
 const string* abbrev_; // exposition only
 const seconds* offset-sec; // exposition only
};
```

```

template<class Duration>
 local-time-format-t<Duration>
 local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
 const seconds* offset_sec = nullptr);
16 Returns: {time, abbrev, offset_sec}.

template<class Duration, class charT>
 struct formatter<chrono::local-time-format-t<Duration>, charT>;
17 Let f be a local-time-format-t<Duration> object passed to formatter::format.
18 Remarks: If the chrono-specs is omitted, the result is equivalent to using %F %T %Z as the chrono-specs.
 If %Z is used, it is replaced with *f.abbrev_ if f.abbrev_ is not a null pointer value. If %Z is used and
 f.abbrev_ is a null pointer value, an exception of type format_error is thrown. If %z (or a modified
 variant of %z) is used, it is formatted with the value of *f.offset_sec if f.offset_sec is not a null
 pointer value. If %z (or a modified variant of %z) is used and f.offset_sec is a null pointer value,
 then an exception of type format_error is thrown.

template<class Duration, class TimeZonePtr, class charT>
 struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
 {
 : formatter<chrono::local-time-format-t<common_type_t<Duration, seconds>>, charT> {
 template<class FormatContext>
 typename FormatContext::iterator
 format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
 };

template<class FormatContext>
 typename FormatContext::iterator
 format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx) const;
19 Effects: Equivalent to:

 sys_info info = tp.get_info();
 return formatter<chrono::local-time-format-t<common_type_t<Duration, seconds>>, charT>::
 format({tp.get_local_time(), &info.abbrev, &info.offset}, ctx);

```

### 30.13 Parsing

[time.parse]

- 1 Each **parse** overload specified in this subclause calls **from\_stream** unqualified, so as to enable argument-dependent lookup (6.5.4). In the following paragraphs, let **is** denote an object of type **basic\_istream<charT, traits>** and let **I** be **basic\_istream<charT, traits>&**, where **charT** and **traits** are template parameters in that context.
- 2 *Recommended practice:* Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by **parse** immovable and preventing stream extraction into an lvalue of such a manipulator type.

```

template<class charT, class Parsable>
 unspecified
 parse(const charT* fmt, Parsable& tp);
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

```

- 3 Let **F** be **fmt** for the first overload and **fmt.c\_str()** for the second overload. Let **traits** be **char\_traits<charT>** for the first overload.

- 4 *Constraints:* The expression

```
from_stream(declval<basic_istream<charT, traits>&>(), F, tp)
```

is well-formed when treated as an unevaluated operand (7.2.3).

- 5 *Returns:* A manipulator such that the expression **is >> parse(fmt, tp)** has type **I**, has value **is**, and calls **from\_stream(is, F, tp)**.

```

template<class charT, class traits, class Alloc, class Parsable>
 unspecified
 parse(const charT* fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev);

```

```
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
```

```
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev);
```

6 Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload.

7 *Constraints:* The expression

```
 from_stream(declval<basic_istream<charT, traits>&>(), F , tp, addressof(abbrev))
```

is well-formed when treated as an unevaluated operand (7.2.3).

8 *Returns:* A manipulator such that the expression `>> parse(fmt, tp, abbrev)` has type `I`, has value `is`, and calls `from_stream(is,  $F$ , tp, addressof(abbrev))`.

```
template<class charT, class Parsable>
 unspecified
```

```
 parse(const charT* fmt, Parsable& tp, minutes& offset);
```

```
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
```

```
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
 minutes& offset);
```

9 Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload. Let `traits` be `char_traits<charT>` and `Alloc` be `allocator<charT>` for the first overload.

10 *Constraints:* The expression

```
 from_stream(declval<basic_istream<charT, traits>&>(),
 F , tp,
 declval<basic_string<charT, traits, Alloc>*>(),
 &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

11 *Returns:* A manipulator such that the expression `>> parse(fmt, tp, offset)` has type `I`, has value `is`, and calls:

```
 from_stream(is,
 F , tp,
 static_cast<basic_string<charT, traits, Alloc>*>(nullptr),
 &offset)
```

```
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
```

```
 parse(const charT* fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

```
template<class charT, class traits, class Alloc, class Parsable>
 unspecified
```

```
 parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
 basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
```

12 Let  $F$  be `fmt` for the first overload and `fmt.c_str()` for the second overload.

13 *Constraints:* The expression

```
 from_stream(declval<basic_istream<charT, traits>&>(),
 F , tp, addressof(abbrev), &offset)
```

is well-formed when treated as an unevaluated operand (7.2.3).

14 *Returns:* A manipulator such that the expression `>> parse(fmt, tp, abbrev, offset)` has type `I`, has value `is`, and calls `from_stream(is,  $F$ , tp, addressof(abbrev), &offset)`.

15 All `from_stream` overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to `basic_istream<>::gcount()`. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a %. Some flags can be modified by `E` or `O`. During parsing each flag interprets characters as parts of date and time types according to Table 134. Some flags can be modified by a width parameter given as a positive decimal integer called out as  $N$  below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 134, except for

whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

- <sup>16</sup> If the type being parsed cannot represent the information that the format flag refers to, `is.setstate(ios_base::failbit)` is called.

[*Example 1*: A `duration` cannot represent a `weekday`. — *end example*]

However, if a flag refers to a “time of day” (e.g., `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is parsed as the time of day elapsed since midnight.

- <sup>17</sup> If the `from_stream` overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, `setstate(ios_base::failbit)` is called on the `basic_istream`.

**Table 134 — Meaning of parse flags** [tab:time.parse.spec]

| Flag            | Parsed value                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>%a</code> | The locale’s full or abbreviated case-insensitive weekday name.                                                                                                                                                                                                                                                                                                                              |
| <code>%A</code> | Equivalent to <code>%a</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <code>%b</code> | The locale’s full or abbreviated case-insensitive month name.                                                                                                                                                                                                                                                                                                                                |
| <code>%B</code> | Equivalent to <code>%b</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <code>%c</code> | The locale’s date and time representation. The modified command <code>%Ec</code> interprets the locale’s alternate date and time representation.                                                                                                                                                                                                                                             |
| <code>%C</code> | The century as a decimal number. The modified command <code>%NC</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%EC</code> interprets the locale’s alternative representation of the century.                                                           |
| <code>%d</code> | The day of the month as a decimal number. The modified command <code>%Nd</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%Od</code> interprets the locale’s alternative representation of the day of the month.                                         |
| <code>%D</code> | Equivalent to <code>%m/%d/%y</code> .                                                                                                                                                                                                                                                                                                                                                        |
| <code>%e</code> | Equivalent to <code>%d</code> and can be modified like <code>%d</code> .                                                                                                                                                                                                                                                                                                                     |
| <code>%F</code> | Equivalent to <code>%Y-%m-%d</code> . If modified with a width <i>N</i> , the width is applied to only <code>%Y</code> .                                                                                                                                                                                                                                                                     |
| <code>%g</code> | The last two decimal digits of the calendar year, as specified in ISO 8601-1:2019 for the week calendar. The modified command <code>%Ng</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.                                                                                            |
| <code>%G</code> | The calendar year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command <code>%NG</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required.                                                                                                       |
| <code>%h</code> | Equivalent to <code>%b</code> .                                                                                                                                                                                                                                                                                                                                                              |
| <code>%H</code> | The hour (24-hour clock) as a decimal number. The modified command <code>%NH</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OH</code> interprets the locale’s alternative representation.                                                             |
| <code>%I</code> | The hour (12-hour clock) as a decimal number. The modified command <code>%NI</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OI</code> interprets the locale’s alternative representation.                                                             |
| <code>%j</code> | If the type being parsed is a specialization of <code>duration</code> , a decimal number of <code>days</code> . Otherwise, the day of the year as a decimal number. January 1 is 1. In either case, the modified command <code>%Nj</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 3. Leading zeroes are permitted but not required. |
| <code>%m</code> | The month as a decimal number. January is 1. The modified command <code>%Nm</code> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%Om</code> interprets the locale’s alternative representation.                                                              |

Table 134 — Meaning of parse flags (continued)

| Flag | Parsed value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| %M   | The minutes as a decimal number. The modified command %NM specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OM interprets the locale's alternative representation.                                                                                                                                                                                                                                                                              |
| %n   | Matches one whitespace character.<br>[Note 1: %n, %t, and a space can be combined to match a wide range of whitespace patterns. For example, "%n " matches one or more whitespace characters, and "%n%t%t" matches one to three whitespace characters. — end note]                                                                                                                                                                                                                                                                                                     |
| %p   | The locale's equivalent of the AM/PM designations associated with a 12-hour clock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| %r   | The locale's 12-hour clock time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| %R   | Equivalent to %H:%M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| %S   | The seconds as a decimal number. The modified command %NS specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %OS interprets the locale's alternative representation. |
| %t   | Matches zero or one whitespace characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| %T   | Equivalent to %H:%M:%S.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| %u   | The calendar day of week as a decimal number (1-7), as specified in ISO 8601-1:2019, where Monday is 1. The modified command %Nu specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                    |
| %U   | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NU specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OU interprets the locale's alternative representation.                                                                                                                                                |
| %V   | The calendar week of year as a decimal number, as specified in ISO 8601-1:2019 for the week calendar. The modified command %NV specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required.                                                                                                                                                                                                                                                                                      |
| %w   | The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Nw specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command %Ow interprets the locale's alternative representation.                                                                                                                                                                                                                                                     |
| %W   | The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command %NW specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OW interprets the locale's alternative representation.                                                                                                                                                |
| %x   | The locale's date representation. The modified command %Ex interprets the locale's alternate date representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| %X   | The locale's time representation. The modified command %EX interprets the locale's alternate time representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 134 — Meaning of parse flags (continued)

| Flag      | Parsed value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>%y</b> | The last two decimal digits of the year, regardless of the sign of the year. If the century is not otherwise specified (e.g., with <b>%C</b> ), values in the range [69, 99] are presumed to refer to the years 1969 to 1999, and values in the range [00, 68] are presumed to refer to the years 2000 to 2068. The modified command <b>%Ny</b> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands <b>%Ey</b> and <b>%Oy</b> interpret the locale's alternative representation.<br>[Example 2:<br>year y;<br>istringstream{"-20 76"} >> parse("%3C %y", y);   // y == -1976y is true<br>— end example] |
| <b>%Y</b> | The year as a decimal number. The modified command <b>%NY</b> specifies the maximum number of characters to read. If <i>N</i> is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command <b>%EY</b> interprets the locale's alternative representation.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>%z</b> | The offset from UTC in the format [+ -]hh[mm]. For example -0430 refers to 4 hours 30 minutes behind UTC, and 04 refers to 4 hours ahead of UTC. The modified commands <b>%Ez</b> and <b>%Oz</b> parse a : between the hours and minutes and render leading zeroes on the hour field optional: [+ -]h[h][:mm]. For example -04:30 refers to 4 hours 30 minutes behind UTC, and 4 refers to 4 hours ahead of UTC.                                                                                                                                                                                                                                                                                                             |
| <b>%Z</b> | The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic character set (5.3.1) that are alphanumeric, or one of '_', '/', '-', or '+'.<br>'_', '/', '-', or '+'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>%%</b> | A % character is extracted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### 30.14 Hash support

[time.hash]

```
template<class Rep, class Period> struct hash<chrono::duration<Rep, Period>>;
```

- 1 The specialization `hash<chrono::duration<Rep, Period>>` is enabled (22.10.19) if and only if `hash<Rep>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<class Clock, class Duration> struct hash<chrono::time_point<Clock, Duration>>;
```

- 2 The specialization `hash<chrono::time_point<Clock, Duration>>` is enabled (22.10.19) if and only if `hash<Duration>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::day>;
template<> struct hash<chrono::month>;
template<> struct hash<chrono::year>;
template<> struct hash<chrono::weekday>;
template<> struct hash<chrono::weekday_indexed>;
template<> struct hash<chrono::weekday_last>;
template<> struct hash<chrono::month_day>;
template<> struct hash<chrono::month_day_last>;
template<> struct hash<chrono::month_weekday>;
template<> struct hash<chrono::month_weekday_last>;
template<> struct hash<chrono::year_month>;
template<> struct hash<chrono::year_month_day>;
template<> struct hash<chrono::year_month_day_last>;
template<> struct hash<chrono::year_month_weekday>;
template<> struct hash<chrono::year_month_weekday_last>;
```

- 3 The specializations are enabled (22.10.19).

[Note 1: All the `hash<Key>` specializations listed above meet the *Cpp17Hash* requirements, even when called on objects `k` of type `Key` such that `k.ok()` is `false`. — end note]

```
template<class Duration, class TimeZonePtr>
 struct hash<chrono::zoned_time<Duration, TimeZonePtr>>;
```

- 4 The specialization `hash<chrono::zoned_time<Duration, TimeZonePtr>>` is enabled ([22.10.19](#)) if and only if `hash<Duration>` is enabled and `hash<TimeZonePtr>` is enabled. The member functions are not guaranteed to be `noexcept`.

```
template<> struct hash<chrono::leap_second>;
```

- 5 The specialization is enabled ([22.10.19](#)).

### 30.15 Header `<ctime>` synopsis

[ctime.syn]

```
#define __STDC_VERSION__ 202311L

#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below
#define TIME_MONOTONIC see below // optional
#define TIME_ACTIVE see below // optional
#define TIME_THREAD_ACTIVE see below // optional

namespace std {
 using size_t = see 17.2.4;
 using clock_t = see below;
 using time_t = see below;

 struct timespec;
 struct tm;

 clock_t clock();
 double difftime(time_t time1, time_t time0);
 time_t mktime(tm* timeptr);
 time_t timegm(tm* timeptr);
 time_t time(time_t* timer);
 int timespec_get(timespec* ts, int base);
 int timespec_getres(timespec* ts, int base);
 tm* gmtime(const time_t* timer);
 tm* gmtime_r(const time_t* timer, tm* buf);
 tm* localtime(const time_t* timer);
 tm* localtime_r(const time_t* timer, tm* buf);
 size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}
```

- <sup>1</sup> The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.<sup>233</sup>
- <sup>2</sup> The functions `gmtime` and `localtime` are not required to avoid data races ([16.4.6.10](#)).

SEE ALSO: ISO/IEC 9899:2024, 7.29

<sup>233</sup> `strftime` supports the C conversion specifiers C, D, e, F, g, G, h, r, R, t, T, u, V, and z, and the modifiers E and O.

# 31 Input/output library [input.output]

## 31.1 General [input.output.general]

- <sup>1</sup> This Clause describes components that C++ programs may use to perform input/output operations.
- <sup>2</sup> The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in [Table 135](#).

**Table 135 — Input/output library summary** [tab:iostreams.summary]

| Subclause                                         | Header                                                                                                                  |

| <a href="#">31.10</a> File streams                | <code>&lt;fstream&gt;</code>                                                                                            |
| <a href="#">31.11</a> Synchronized output streams | <code>&lt;syncstream&gt;</code>                                                                                         |
| <a href="#">31.12</a> File systems                | <code>&lt;filesystem&gt;</code>                                                                                         |
| <a href="#">31.13</a> C library files             | <code>&lt;cstdio&gt;</code> , <code>&lt;ctype&gt;</code>                                                                |

## 31.2 Iostreams requirements [iostreams.requirements]

### 31.2.1 Imbue limitations [iostream.limits.imbue]

- <sup>1</sup> No function described in [Clause 31](#) except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in [Clause 31](#) or as an overriding virtual function of any class declared in [Clause 31](#) calls `imbue`, the behavior is undefined.

### 31.2.2 Types [stream.types]

```
using streamoff = implementation-defined;
```

- <sup>1</sup> The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.<sup>234</sup>

```
using streamsize = implementation-defined;
```

- <sup>2</sup> The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.<sup>235</sup>

### 31.2.3 Positioning type limitations [iostreams.limits.pos]

- <sup>1</sup> The classes of [Clause 31](#) with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.
- <sup>2</sup> [Note 1: For each of the specializations of `char_traits` defined in [27.2.4](#), `state_type` denotes `mbstate_t`, `pos_type` denotes `fpos<mbstate_t>`, and `off_type` denotes `streamoff`. — end note]
- <sup>3</sup> In the classes of [Clause 31](#), a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character container types ([3.10](#)) that meet the requirements for a character on which any of the iostream components can be instantiated.

<sup>234</sup>) Typically `long long`.

<sup>235</sup>) Most places where `streamsize` is used would use `size_t` in C, or `ssize_t` in POSIX.

### 31.2.4 Thread safety

[iostreams.threadsafety]

- <sup>1</sup> Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.10.2) unless otherwise specified (31.4).
- [Note 1: Data races result in undefined behavior (6.10.2). — end note]
- <sup>2</sup> If one thread makes a library call *a* that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call *b* such that this does not result in a data race, then *a*'s write synchronizes with *b*'s read.

## 31.3 Forward declarations

[iostream.forward]

### 31.3.1 Header <iosfwd> synopsis

[iosfwd.syn]

```
namespace std {
 template<class charT> struct char_traits;
 template<> struct char_traits<char>;
 template<> struct char_traits<char8_t>;
 template<> struct char_traits<char16_t>;
 template<> struct char_traits<char32_t>;
 template<> struct char_traits<wchar_t>;

 template<class T> class allocator;

 template<class charT, class traits = char_traits<charT>>
 class basic_ios;
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf;
 template<class charT, class traits = char_traits<charT>>
 class basic_istream;
 template<class charT, class traits = char_traits<charT>>
 class basic_ostream;
 template<class charT, class traits = char_traits<charT>>
 class basic_iostream;

 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>

 class basic_stringstream;

 template<class charT, class traits = char_traits<charT>>
 class basic_spanbuf;
 template<class charT, class traits = char_traits<charT>>
 class basic_ispanstream;
 template<class charT, class traits = char_traits<charT>>
 class basic_ospansstream;
 template<class charT, class traits = char_traits<charT>>
 class basic_spanstream;

 template<class charT, class traits = char_traits<charT>>
 class basic_filebuf;
 template<class charT, class traits = char_traits<charT>>
 class basic_ifstream;
 template<class charT, class traits = char_traits<charT>>
 class basic_ofstream;
 template<class charT, class traits = char_traits<charT>>
 class basic_fstream;

 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf;
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_osyncstream;
```

```

template<class charT, class traits = char_traits<charT>>
 class istreambuf_iterator;
template<class charT, class traits = char_traits<charT>>
 class ostreambuf_iterator;

using ios = basic_ios<char>;
using wios = basic_ios<wchar_t>;

using streambuf = basic_streambuf<char>;
using istream = basic_istream<char>;
using ostream = basic_ostream<char>;
using iostream = basic_iostream<char>;

using stringbuf = basic_stringbuf<char>;
using istringstream = basic_istream<char>;
using ostreamstream = basic_ostream<char>;
using stringstream = basic_stringstream<char>;

using spanbuf = basic_spanbuf<char>;
using ispanstream = basic_ispanstream<char>;
using ospanstream = basic_ostream<char>;
using spanstream = basic_spanstream<char>;

using filebuf = basic_filebuf<char>;
using ifstream = basic_ifstream<char>;
using ofstream = basic_ofstream<char>;
using fstream = basic_fstream<char>;

using syncbuf = basic_syncbuf<char>;
using osyncstream = basic_osyncstream<char>;

using wstreambuf = basic_streambuf<wchar_t>;
using wistream = basic_istream<wchar_t>;
using wostream = basic_ostream<wchar_t>;
using wiostream = basic_iostream<wchar_t>;

using wstringbuf = basic_stringbuf<wchar_t>;
using wistringstream = basic_istream<wchar_t>;
using wostringstream = basic_ostream<wchar_t>;
using wstringstream = basic_stringstream<wchar_t>;

using wspanbuf = basic_spanbuf<wchar_t>;
using wispanstream = basic_ispanstream<wchar_t>;
using wospanstream = basic_ostream<wchar_t>;
using wspanstream = basic_spanstream<wchar_t>;

using wfilebuf = basic_filebuf<wchar_t>;
using wifstream = basic_ifstream<wchar_t>;
using wofstream = basic_ofstream<wchar_t>;
using wfstream = basic_fstream<wchar_t>;

using wsyncbuf = basic_syncbuf<wchar_t>;
using wosyncstream = basic_osyncstream<wchar_t>;

template<class state> class fpos;
using streampos = fpos<char_traits<char>::state_type>;
using wstreampos = fpos<char_traits<wchar_t>::state_type>;
using u8streampos = fpos<char_traits<char8_t>::state_type>;
using u16streampos = fpos<char_traits<char16_t>::state_type>;
using u32streampos = fpos<char_traits<char32_t>::state_type>;
}

```

- <sup>1</sup> Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.<sup>236</sup>

### 31.3.2 Overview

[[iostream.forward.overview](#)]

- <sup>1</sup> The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iostream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.
- <sup>2</sup> The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, `basic_syncbuf`, and `basic_spanbuf`.
- <sup>3</sup> The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istreamstream`, `basic_ifstream`, and `basic_ispanstream`.
- <sup>4</sup> The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostreamstream`, `basic_ofstream`, `basic_osyncstream`, and `basic_ospstream`.
- <sup>5</sup> The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream`, `basic_fstream`, and `basic_spanstream`.
- <sup>6</sup> [Note 1: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (27.2). — end note]
- <sup>7</sup> Other *typedef-names* designate class template specializations for `char` or `wchar_t` types.
- <sup>8</sup> Specializations of the class template `fpos` are used for specifying file position information.  
[Example 1: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — end example]
- <sup>9</sup> [Note 2: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — end note]

## 31.4 Standard iostream objects

[[iostream.objects](#)]

### 31.4.1 Header `<iostream>` synopsis

[[iostream.syn](#)]

```
#include <ios> // see 31.5.1
#include <streambuf> // see 31.6.1
#include <istream> // see 31.7.1
#include <ostream> // see 31.7.2

namespace std {
 extern istream cin;
 extern ostream cout;
 extern ostream cerr;
 extern ostream clog;

 extern wistream wcin;
 extern wostream wcout;
 extern wostream wcerr;
 extern wostream wclog;
}
```

### 31.4.2 Overview

[[iostream.objects.overview](#)]

- <sup>1</sup> In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (31.13.1).
- <sup>2</sup> The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects. The dynamic types of the stream buffers initially associated with these objects are unspecified, but they have the behavior specified for `std::basic_filebuf<char>` or `std::basic_filebuf<wchar_t>`.
- <sup>3</sup> The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.10.3.1) begins execution. The objects are not destroyed during program execution.<sup>237</sup>

<sup>236</sup>) It is the implementation's responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.

<sup>237</sup>) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

<sup>4</sup> *Recommended practice:* If it is possible for them to do so, implementations should initialize the objects earlier than required.

<sup>5</sup> The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration. Each C++ library module (16.4.2.4) in a hosted implementation shall behave as if it contains an interface unit that defines an unexported `ios_base::Init` variable with ordered initialization (6.10.3.3).

[Note 1: As a result, the definition of that variable is appearance-ordered before any declaration following the point of importation of a C++ library module. Whether such a definition exists is unobservable by a program that does not reference any of the standard iostream objects. — end note]

<sup>6</sup> Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILEs`, as specified in the C standard library.

<sup>7</sup> Concurrent access to a synchronized (31.5.2.5) standard iostream object's formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.10.2).

[Note 2: Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — end note]

SEE ALSO: ISO/IEC 9899:2024, 7.23.2

### 31.4.3 Narrow stream objects

[narrow.stream.objects]

```
istream cin;
```

<sup>1</sup> The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

<sup>2</sup> After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

```
ostream cout;
```

<sup>3</sup> The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

```
ostream cerr;
```

<sup>4</sup> The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

<sup>5</sup> After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

```
ostream clog;
```

<sup>6</sup> The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.4.4 Wide stream objects

[wide.stream.objects]

```
wistream wcin;
```

<sup>1</sup> The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

<sup>2</sup> After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

```
wostream wcout;
```

<sup>3</sup> The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

```
wostream wcerr;
```

<sup>4</sup> The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

- 5 After the object `wcerr` is initialized, `wcerr.flags()` & `unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wlog;`

- 6 The object `wlog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

## 31.5 Iostreams base classes

[iostreams.base]

### 31.5.1 Header `<ios>` synopsis

[ios.syn]

```
#include <iosfwd> // see 31.3.1

namespace std {
 // 31.2.2, types
 using streamoff = implementation-defined;
 using streamsize = implementation-defined;
 // 31.5.3, class template fpos
 template<class stateT> class fpos;

 // 31.5.2, class ios_base
 class ios_base;
 // 31.5.4, class template basic_ios
 template<class charT, class traits = char_traits<charT>>
 class basic_ios;

 // 31.5.5, manipulators
 ios_base& boolalpha (ios_base& str);
 ios_base& noboolalpha (ios_base& str);

 ios_base& showbase (ios_base& str);
 ios_base& noshowbase (ios_base& str);

 ios_base& showpoint (ios_base& str);
 ios_base& noshowpoint (ios_base& str);

 ios_base& showpos (ios_base& str);
 ios_base& noshowpos (ios_base& str);

 ios_base& skipws (ios_base& str);
 ios_base& noskipws (ios_base& str);

 ios_base& uppercase (ios_base& str);
 ios_base& nouppercase (ios_base& str);

 ios_base& unitbuf (ios_base& str);
 ios_base& nunitbuf (ios_base& str);

 // 31.5.5.2, adjustfield
 ios_base& internal (ios_base& str);
 ios_base& left (ios_base& str);
 ios_base& right (ios_base& str);

 // 31.5.5.3, basefield
 ios_base& dec (ios_base& str);
 ios_base& hex (ios_base& str);
 ios_base& oct (ios_base& str);

 // 31.5.5.4, floatfield
 ios_base& fixed (ios_base& str);
 ios_base& scientific (ios_base& str);
 ios_base& hexfloat (ios_base& str);
 ios_base& defaultfloat (ios_base& str);
```

```

// 31.5.6, error reporting
enum class io_errc {
 stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}

```

## 31.5.2 Class ios\_base

[ios.base]

### 31.5.2.1 General

[ios.base.general]

```

namespace std {
 class ios_base {
 public:
 class failure; // see below

 // 31.5.2.2.2, fmtflags
 using fmtflags = T1;
 static constexpr fmtflags boolalpha = unspecified;
 static constexpr fmtflags dec = unspecified;
 static constexpr fmtflags fixed = unspecified;
 static constexpr fmtflags hex = unspecified;
 static constexpr fmtflags internal = unspecified;
 static constexpr fmtflags left = unspecified;
 static constexpr fmtflags oct = unspecified;
 static constexpr fmtflags right = unspecified;
 static constexpr fmtflags scientific = unspecified;
 static constexpr fmtflags showbase = unspecified;
 static constexpr fmtflags showpoint = unspecified;
 static constexpr fmtflags showpos = unspecified;
 static constexpr fmtflags skipws = unspecified;
 static constexpr fmtflags unitbuf = unspecified;
 static constexpr fmtflags uppercase = unspecified;
 static constexpr fmtflags adjustfield = see below;
 static constexpr fmtflags basefield = see below;
 static constexpr fmtflags floatfield = see below;

 // 31.5.2.2.3, iostate
 using iostate = T2;
 static constexpr iostate badbit = unspecified;
 static constexpr iostate eofbit = unspecified;
 static constexpr iostate failbit = unspecified;
 static constexpr iostate goodbit = see below;

 // 31.5.2.2.4, openmode
 using openmode = T3;
 static constexpr openmode app = unspecified;
 static constexpr openmode ate = unspecified;
 static constexpr openmode binary = unspecified;
 static constexpr openmode in = unspecified;
 static constexpr openmode noreplace = unspecified;
 static constexpr openmode out = unspecified;
 static constexpr openmode trunc = unspecified;

 // 31.5.2.2.5, seekdir
 using seekdir = T4;
 static constexpr seekdir beg = unspecified;
 static constexpr seekdir cur = unspecified;
 static constexpr seekdir end = unspecified;

 class Init;
 };
}

```

```

// 31.5.2.3, fmtflags state
fmtflags flags() const;
fmtflags flags(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl);
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 31.5.2.4, locales
locale imbue(const locale& loc);
locale getloc() const;

// 31.5.2.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 31.5.2.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
 ios_base();

private:
 static int index; // exposition only
 long* iarray; // exposition only
 void** parray; // exposition only
};
}

```

<sup>1</sup> `ios_base` defines several member types:

- (1.1) — a type `failure`, defined as either a class derived from `system_error` or a synonym for a class derived from `system_error`;
- (1.2) — a class `Init`;
- (1.3) — three bitmask types, `fmtflags`, `iostate`, and `openmode`;
- (1.4) — an enumerated type, `seekdir`.

<sup>2</sup> It maintains several kinds of data:

- (2.1) — state information that reflects the integrity of the stream buffer;
- (2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;
- (2.3) — additional information that is stored by the program for its private use.

<sup>3</sup> [Note 1: For the sake of exposition, the maintained data is presented here as:

- (3.1) — `static int index`, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

- (3.2) — `long* iarray`, points to the first element of an arbitrary-length `long` array maintained for the private use of the program;
- (3.3) — `void** parray`, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

— *end note*]

### 31.5.2.2 Types

[ios.types]

#### 31.5.2.2.1 Class `ios_base::failure`

[ios.failure]

```
namespace std {
 class ios_base::failure : public system_error {
 public:
 explicit failure(const string& msg, const error_code& ec = io_errc::stream);
 explicit failure(const char* msg, const error_code& ec = io_errc::stream);
 };
}
```

- <sup>1</sup> An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

[*Note 1:* When `ios_base::failure` is a synonym for another type, that type needs to provide a nested type `failure` to emulate the injected-class-name. — *end note*]

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the `iostreams` library, to report errors detected during stream buffer operations.

- <sup>2</sup> When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

[*Note 2:* Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`. — *end note*]

```
explicit failure(const string& msg, const error_code& ec = io_errc::stream);
```

- <sup>3</sup> *Effects:* Constructs the base class with `msg` and `ec`.

```
explicit failure(const char* msg, const error_code& ec = io_errc::stream);
```

- <sup>4</sup> *Effects:* Constructs the base class with `msg` and `ec`.

#### 31.5.2.2.2 Type `ios_base::fmtflags`

[ios.fmtflags]

```
using fmtflags = T1;
```

- <sup>1</sup> The type `fmtflags` is a bitmask type (16.3.3.3.3). Setting its elements has the effects indicated in Table 136.

- <sup>2</sup> Type `fmtflags` also defines the constants indicated in Table 137.

#### 31.5.2.2.3 Type `ios_base::iostate`

[ios.iostate]

```
using iostate = T2;
```

- <sup>1</sup> The type `iostate` is a bitmask type (16.3.3.3.3) that contains the elements indicated in Table 138.

- <sup>2</sup> Type `iostate` also defines the constant:

- (2.1) — `goodbit`, the value zero.

#### 31.5.2.2.4 Type `ios_base::openmode`

[ios.openmode]

```
using openmode = T3;
```

- <sup>1</sup> The type `openmode` is a bitmask type (16.3.3.3.3). It contains the elements indicated in Table 139.

#### 31.5.2.2.5 Type `ios_base::seekdir`

[ios.seekdir]

```
using seekdir = T4;
```

- <sup>1</sup> The type `seekdir` is an enumerated type (16.3.3.3.2) that contains the elements indicated in Table 140.

Table 136 — `fmtflags` effects [tab:ios.fmtflags]

| Element                 | Effect(s) if set                                                                                                                                   |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>boolalpha</code>  | insert and extract <code>bool</code> type in alphabetic format                                                                                     |
| <code>dec</code>        | converts integer input or generates integer output in decimal base                                                                                 |
| <code>fixed</code>      | generate floating-point output in fixed-point notation                                                                                             |
| <code>hex</code>        | converts integer input or generates integer output in hexadecimal base                                                                             |
| <code>internal</code>   | adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated |
| <code>left</code>       | adds fill characters on the right (final positions) of certain generated output                                                                    |
| <code>oct</code>        | converts integer input or generates integer output in octal base                                                                                   |
| <code>right</code>      | adds fill characters on the left (initial positions) of certain generated output                                                                   |
| <code>scientific</code> | generates floating-point output in scientific notation                                                                                             |
| <code>showbase</code>   | generates a prefix indicating the numeric base of generated integer output                                                                         |
| <code>showpoint</code>  | generates a decimal-point character unconditionally in generated floating-point output                                                             |
| <code>showpos</code>    | generates a <code>+</code> sign in non-negative generated numeric output                                                                           |
| <code>skipws</code>     | skips leading whitespace before certain input operations                                                                                           |
| <code>unitbuf</code>    | flushes output after each output operation                                                                                                         |
| <code>uppercase</code>  | replaces certain lowercase letters with their uppercase equivalents in generated output                                                            |

Table 137 — `fmtflags` constants [tab:ios.fmtflags.const]

| Constant                 | Allowable values                                               |
|--------------------------|----------------------------------------------------------------|
| <code>adjustfield</code> | <code>left</code>   <code>right</code>   <code>internal</code> |
| <code>basefield</code>   | <code>dec</code>   <code>oct</code>   <code>hex</code>         |
| <code>floatfield</code>  | <code>scientific</code>   <code>fixed</code>                   |

Table 138 — `iostate` effects [tab:ios.iostate]

| Element              | Effect(s) if set                                                                                                                                 |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>badbit</code>  | indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);                                  |
| <code>eofbit</code>  | indicates that an input operation reached the end of an input sequence;                                                                          |
| <code>failbit</code> | indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters. |

Table 139 — `openmode` effects [tab:ios.openmode]

| Element                | Effect(s) if set                                                  |
|------------------------|-------------------------------------------------------------------|
| <code>app</code>       | seek to end before each write                                     |
| <code>ate</code>       | open and seek to end immediately after opening                    |
| <code>binary</code>    | perform input and output in binary mode (as opposed to text mode) |
| <code>in</code>        | open for input                                                    |
| <code>noreplace</code> | open in exclusive mode                                            |
| <code>out</code>       | open for output                                                   |
| <code>trunc</code>     | truncate an existing stream when opening                          |

Table 140 — seekdir effects [tab:ios.seekdir]

| Element | Meaning                                                                                 |
|---------|-----------------------------------------------------------------------------------------|
| beg     | request a seek (for subsequent input or output) relative to the beginning of the stream |
| cur     | request a seek relative to the current position within the sequence                     |
| end     | request a seek relative to the current end of the sequence                              |

**31.5.2.2.6 Class ios\_base::Init**

[ios.init]

```

namespace std {
 class ios_base::Init {
 public:
 Init();
 Init(const Init&) = default;
 ~Init();
 Init& operator=(const Init&) = default;
 };
}

```

- <sup>1</sup> The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

```
Init();
```

- <sup>2</sup> *Effects:* Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

```
~Init();
```

- <sup>3</sup> *Effects:* If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

**31.5.2.3 State functions**

[fmtflags.state]

```
fmtflags flags() const;
```

- <sup>1</sup> *Returns:* The format control information for both input and output.

```
fmtflags flags(fmtflags fmtfl);
```

- <sup>2</sup> *Postconditions:* `fmtfl == flags()`.

- <sup>3</sup> *Returns:* The previous value of `flags()`.

```
fmtflags setf(fmtflags fmtfl);
```

- <sup>4</sup> *Effects:* Sets `fmtfl` in `flags()`.

- <sup>5</sup> *Returns:* The previous value of `flags()`.

```
fmtflags setf(fmtflags fmtfl, fmtflags mask);
```

- <sup>6</sup> *Effects:* Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

- <sup>7</sup> *Returns:* The previous value of `flags()`.

```
void unsetf(fmtflags mask);
```

- <sup>8</sup> *Effects:* Clears `mask` in `flags()`.

```
streamsize precision() const;
```

- <sup>9</sup> *Returns:* The precision to generate on certain output conversions.

```
streamsize precision(streamsize prec);
```

- <sup>10</sup> *Postconditions:* `prec == precision()`.

- <sup>11</sup> *Returns:* The previous value of `precision()`.

```
streamsize width() const;
```

12     *Returns:* The minimum field width (number of characters) to generate on certain output conversions.

```
streamsize width(streamsize wide);
```

13     *Postconditions:* `wide == width()`.

14     *Returns:* The previous value of `width()`.

#### 31.5.2.4 Functions

[ios.base.locales]

```
locale imbue(const locale& loc);
```

1     *Effects:* Calls each registered callback pair (`fn`, `idx`) (31.5.2.7) as `(*fn)(imbue_event, *this, idx)` at such a time that a call to `ios_base::getloc()` from within `fn` returns the new locale value `loc`.

2     *Postconditions:* `loc == getloc()`.

3     *Returns:* The previous value of `getloc()`.

```
locale getloc() const;
```

4     *Returns:* If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

#### 31.5.2.5 Static members

[ios.members.static]

```
static bool sync_with_stdio(bool sync = true);
```

1     *Effects:* If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

2     *Returns:* `true` if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

3     *Remarks:* When a standard iostream object `str` is *synchronized* with a standard stdio stream `f`, the effect of inserting a character `c` by

```
 fputc(f, c);
```

is the same as the effect of

```
 str.rdbuf()->sputc(c);
```

for any sequences of characters; the effect of extracting a character `c` by

```
 c = fgetc(f);
```

is the same as the effect of

```
 c = str.rdbuf()->sgetc();
```

for any sequences of characters; and the effect of pushing back a character `c` by

```
 ungetc(c, f);
```

is the same as the effect of

```
 str.rdbuf()->sputbackc(c);
```

for any sequence of characters.<sup>238</sup>

#### 31.5.2.6 Storage functions

[ios.base.storage]

```
static int xalloc();
```

1     *Returns:* `index ++`.

2     *Remarks:* Concurrent access to this function by multiple threads does not result in a data race (6.10.2).

---

238) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.

```
long& iword(int idx);
```

3     *Preconditions:* `idx` is a value obtained by a call to `xalloc`.

4     *Effects:* If `iarray` is a null pointer, allocates an array of `long` of unspecified size and stores a pointer to its first element in `iarray`. The function then extends the array pointed at by `iarray` as necessary to include the element `iarray[idx]`. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object.<sup>239</sup> However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `iword` with the same index yields another reference to the same value. If the function fails<sup>240</sup> and `*this` is a base class subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).

5     *Returns:* On success `iarray[idx]`. On failure, a valid `long&` initialized to 0.

```
void*& pword(int idx);
```

6     *Preconditions:* `idx` is a value obtained by a call to `xalloc`.

7     *Effects:* If `parray` is a null pointer, allocates an array of pointers to `void` of unspecified size and stores a pointer to its first element in `parray`. The function then extends the array pointed at by `parray` as necessary to include the element `parray[idx]`. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to `copyfmt`, calling `pword` with the same index yields another reference to the same value. If the function fails<sup>241</sup> and `*this` is a base class subobject of a `basic_ios<>` object or subobject, the effect is equivalent to calling `basic_ios<>::setstate(badbit)` on the derived object (which may throw `failure`).

8     *Returns:* On success `parray[idx]`. On failure a valid `void*&` initialized to 0.

9     *Remarks:* After a subsequent call to `pword(int)` for the same object, the earlier return value may no longer be valid.

### 31.5.2.7 Callbacks

[ios.base.callback]

```
void register_callback(event_callback fn, int idx);
```

1     *Preconditions:* The function `fn` does not throw exceptions.

2     *Effects:* Registers the pair `(fn, idx)` such that during calls to `imbue()` (31.5.2.4), `copyfmt()`, or `~ios_base()` (31.5.2.8), the function `fn` is called with argument `idx`. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

3     *Remarks:* Identical pairs are not merged. A function registered twice will be called twice.

### 31.5.2.8 Constructors and destructor

[ios.base.cons]

```
ios_base();
```

1     *Effects:* Each `ios_base` member has an indeterminate value after construction. The object's members shall be initialized by calling `basic_ios::init` before the object's first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~ios_base();
```

2     *Effects:* Calls each registered callback pair `(fn, idx)` (31.5.2.7) as `(*fn)(erase_event, *this, idx)` at such time that any `ios_base` member function called from within `fn` has well-defined results. Then, any memory obtained is deallocated.

## 31.5.3 Class template `fpos`

[fpos]

### 31.5.3.1 General

[fpos.general]

```
namespace std {
 template<class stateT> class fpos {
```

239) An implementation is free to implement both the integer array pointed at by `iarray` and the pointer array pointed at by `parray` as sparse data structures, possibly with a one-element cache for each.

240) For example, because it cannot allocate space.

241) For example, because it cannot allocate space.

```

public:
 // 31.5.3.2, members
 stateT state() const;
 void state(stateT);

private:
 stateT st; // exposition only
};
}

```

### 31.5.3.2 Members

[fpos.members]

```
void state(stateT s);
```

1 *Effects:* Assigns `s` to `st`.

```
stateT state() const;
```

2 *Returns:* Current value of `st`.

### 31.5.3.3 Requirements

[fpos.operations]

1 An `fpos` type specifies file position information. It holds a state object whose type is equal to the template parameter `stateT`. Type `stateT` shall meet the *Cpp17DefaultConstructible* (Table 30), *Cpp17CopyConstructible* (Table 32), *Cpp17CopyAssignable* (Table 34), and *Cpp17Destructible* (Table 35) requirements. If `is_trivially_copy_constructible_v<stateT>` is true, then `fpos<stateT>` has a trivial copy constructor. If `is_trivially_copy_assignable_v<stateT>` is true, then `fpos<stateT>` has a trivial copy assignment operator. If `is_trivially_destructible_v<stateT>` is true, then `fpos<stateT>` has a trivial destructor. All specializations of `fpos` meet the *Cpp17DefaultConstructible*, *Cpp17CopyConstructible*, *Cpp17CopyAssignable*, *Cpp17Destructible*, and *Cpp17EqualityComparable* (Table 28) requirements. In addition, the expressions shown in Table 141 are valid and have the indicated semantics. In that table,

- (1.1) — `P` refers to a specialization of `fpos`,
- (1.2) — `p` and `q` refer to values of type `P` or `const P`,
- (1.3) — `p1` and `q1` refer to modifiable lvalues of type `P`,
- (1.4) — `0` refers to type `streamoff`, and
- (1.5) — `o` and `o2` refer to values of type `streamoff` or `const streamoff`.

Table 141 — Position type requirements [tab:fpos.operations]

| Expression                                    | Return type            | Operational semantics             | Assertion/note pre-/post-condition                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------------------------------|------------------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>P(o)</code>                             | <code>P</code>         | converts from <code>offset</code> | <i>Effects:</i> Value-initializes the state object.                                                                                                                                                                                                                                                                                                                                                      |
| <code>P p(o);</code><br><code>P p = o;</code> |                        |                                   | <i>Effects:</i> Value-initializes the state object.<br><i>Postconditions:</i> <code>p == P(o)</code> is true.                                                                                                                                                                                                                                                                                            |
| <code>P()</code>                              | <code>P</code>         | <code>P(0)</code>                 |                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>P p;</code>                             |                        | <code>P p(0);</code>              |                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>0(p)</code>                             | <code>streamoff</code> | converts to <code>offset</code>   | <code>P(0(p)) == p</code>                                                                                                                                                                                                                                                                                                                                                                                |
| <code>p == q</code>                           | <code>bool</code>      |                                   | <i>Remarks:</i> For any two values <code>o</code> and <code>o2</code> , if <code>p</code> is obtained from <code>o</code> converted to <code>P</code> or from a copy of such <code>P</code> value and if <code>q</code> is obtained from <code>o2</code> converted to <code>P</code> or from a copy of such <code>P</code> value, then <code>p == q</code> is true only if <code>o == o2</code> is true. |
| <code>p != q</code>                           | <code>bool</code>      | <code>!(p == q)</code>            |                                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>p + o</code>                            | <code>P</code>         | <code>+ offset</code>             | <i>Remarks:</i> With <code>q1 = p + o;</code> , then: <code>q1 - o == p</code>                                                                                                                                                                                                                                                                                                                           |

Table 141 — Position type requirements (continued)

| Expression           | Return type                   | Operational semantics  | Assertion/note pre-/post-condition                                                                       |
|----------------------|-------------------------------|------------------------|----------------------------------------------------------------------------------------------------------|
| <code>p1 += o</code> | <code>P&amp;</code>           | <code>+=</code> offset | <i>Remarks:</i> With <code>q1 = p1</code> ; before the <code>+=</code> , then: <code>p1 - o == q1</code> |
| <code>p - o</code>   | <code>P</code>                | <code>-</code> offset  | <i>Remarks:</i> With <code>q1 = p - o</code> ;; then: <code>q1 + o == p</code>                           |
| <code>p1 -= o</code> | <code>P&amp;</code>           | <code>-=</code> offset | <i>Remarks:</i> With <code>q1 = p1</code> ; before the <code>-=</code> , then: <code>p1 + o == q1</code> |
| <code>o + p</code>   | convertible to <code>P</code> | <code>p + o</code>     | <code>P(o + p) == p + o</code>                                                                           |
| <code>p - q</code>   | <code>streamoff</code>        | distance               | <code>p == q + (p - q)</code>                                                                            |

- <sup>2</sup> Stream operations that return a value of type `traits::pos_type` return `P(0(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

### 31.5.4 Class template `basic_ios`

[ios]

#### 31.5.4.1 Overview

[ios.overview]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ios : public ios_base {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;

 // 31.5.4.4, flags functions
 explicit operator bool() const;
 bool operator!() const;
 iostate rdstate() const;
 void clear(iostate state = goodbit);
 void setstate(iostate state);
 bool good() const;
 bool eof() const;
 bool fail() const;
 bool bad() const;

 iostate exceptions() const;
 void exceptions(iostate except);

 // 31.5.4.2, constructor/destructor
 explicit basic_ios(basic_streambuf<charT, traits>* sb);
 virtual ~basic_ios();

 // 31.5.4.3, members
 basic_ostream<charT, traits>* tie() const;
 basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

 basic_streambuf<charT, traits>* rdbuf() const;
 basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

 basic_ios& copyfmt(const basic_ios& rhs);

 char_type fill() const;
 char_type fill(char_type ch);

 locale imbue(const locale& loc);
 };
}

```

```

char narrow(char_type c, char dfault) const;
char_type widen(char c) const;

basic_ios(const basic_ios&) = delete;
basic_ios& operator=(const basic_ios&) = delete;

protected:
 basic_ios();
 void init(basic_streambuf<charT, traits>* sb);
 void move(basic_ios& rhs);
 void move(basic_ios&& rhs);
 void swap(basic_ios& rhs) noexcept;
 void set_rdbuf(basic_streambuf<charT, traits>* sb);
};
}

```

#### 31.5.4.2 Constructors

[basic.ios.cons]

```
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

<sup>1</sup> *Effects:* Assigns initial values to its member objects by calling `init(sb)`.

```
basic_ios();
```

<sup>2</sup> *Effects:* Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

<sup>3</sup> *Remarks:* The destructor does not destroy `rdbuf()`.

```
void init(basic_streambuf<charT, traits>* sb);
```

<sup>4</sup> *Postconditions:* The postconditions of this function are indicated in [Table 142](#).

**Table 142** — `basic_ios::init()` effects [tab:basic.ios.cons]

| Element                   | Value                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------|
| <code>rdbuf()</code>      | <code>sb</code>                                                                                |
| <code>tie()</code>        | <code>0</code>                                                                                 |
| <code>rdstate()</code>    | <code>goodbit</code> if <code>sb</code> is not a null pointer, otherwise <code>badbit</code> . |
| <code>exceptions()</code> | <code>goodbit</code>                                                                           |
| <code>flags()</code>      | <code>skipws   dec</code>                                                                      |
| <code>width()</code>      | <code>0</code>                                                                                 |
| <code>precision()</code>  | <code>6</code>                                                                                 |
| <code>fill()</code>       | <code>widen(' ')</code>                                                                        |
| <code>getloc()</code>     | a copy of the value returned by <code>locale()</code>                                          |
| <i>iarray</i>             | a null pointer                                                                                 |
| <i>parray</i>             | a null pointer                                                                                 |

#### 31.5.4.3 Member functions

[basic.ios.members]

```
basic_ostream<charT, traits>* tie() const;
```

<sup>1</sup> *Returns:* An output sequence that is *tied* to (synchronized with) the sequence controlled by the stream buffer.

```
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

<sup>2</sup> *Preconditions:* If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

<sup>3</sup> *Postconditions:* `tiestr == tie()`.

4       *Returns:* The previous value of `tie()`.

```
basic_streambuf<charT, traits>* rdbuf() const;
```

5       *Returns:* A pointer to the `streambuf` associated with the stream.

```
basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);
```

6       *Effects:* Calls `clear()`.

7       *Postconditions:* `sb == rdbuf()`.

8       *Returns:* The previous value of `rdbuf()`.

```
locale imbue(const locale& loc);
```

9       *Effects:* Calls `ios_base::imbue(loc)` (31.5.2.4) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` (31.6.3.3.1).

10      *Returns:* The prior value of `ios_base::imbue()`.

```
char narrow(char_type c, char dfault) const;
```

11      *Returns:* `use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)`.

```
char_type widen(char c) const;
```

12      *Returns:* `use_facet<ctype<char_type>>(getloc()).widen(c)`.

```
char_type fill() const;
```

13      *Returns:* The character used to pad (fill) an output conversion to the specified field width.

```
char_type fill(char_type fillch);
```

14      *Postconditions:* `traits::eq(fillch, fill())`.

15      *Returns:* The previous value of `fill()`.

```
basic_ios& copyfmt(const basic_ios& rhs);
```

16      *Effects:* If `(this == addressof(rhs))` is `true` does nothing. Otherwise assigns to the member objects of `*this` the corresponding member objects of `rhs` as follows:

- (16.1)      — calls each registered callback pair `(fn, idx)` as `(*fn)(erase_event, *this, idx)`;
- (16.2)      — then, assigns to the member objects of `*this` the corresponding member objects of `rhs`, except that
- (16.2.1)     — `rdstate()`, `rdbuf()`, and `exceptions()` are left unchanged;
- (16.2.2)     — the contents of arrays pointed at by `pword` and `iword` are copied, not the pointers themselves;<sup>242</sup> and
- (16.2.3)     — if any newly stored pointer values in `*this` point at objects stored outside the object `rhs` and those objects are destroyed when `rhs` is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
- (16.3)      — then, calls each callback pair that was copied from `rhs` as `(*fn)(copyfmt_event, *this, idx)`;
- (16.4)      — then, calls `exceptions(rhs.exceptions())`.

17      [*Note 1:* The second pass through the callback pairs permits a copied `pword` value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — *end note*]

18      *Postconditions:* The postconditions of this function are indicated in Table 143.

19      *Returns:* `*this`.

```
void move(basic_ios& rhs);
void move(basic_ios&& rhs);
```

20      *Postconditions:* `*this` has the state that `rhs` had before the function call, except that `rdbuf()` returns `nullptr`. `rhs` is in a valid but unspecified state, except that `rhs.rdbuf()` returns the same value as it returned before the function call, and `rhs.tie()` returns `nullptr`.

<sup>242</sup> This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.

Table 143 — `basic_ios::copyfmt()` effects [tab:basic.ios.copyfmt]

| Element                   | Value                         |
|---------------------------|-------------------------------|
| <code>rdbuf()</code>      | <i>unchanged</i>              |
| <code>tie()</code>        | <code>rhs.tie()</code>        |
| <code>rdstate()</code>    | <i>unchanged</i>              |
| <code>exceptions()</code> | <code>rhs.exceptions()</code> |
| <code>flags()</code>      | <code>rhs.flags()</code>      |
| <code>width()</code>      | <code>rhs.width()</code>      |
| <code>precision()</code>  | <code>rhs.precision()</code>  |
| <code>fill()</code>       | <code>rhs.fill()</code>       |
| <code>getloc()</code>     | <code>rhs.getloc()</code>     |

```
void swap(basic_ios& rhs) noexcept;
```

21 *Effects:* The states of `*this` and `rhs` are exchanged, except that `rdbuf()` returns the same value as it returned before the function call, and `rhs.rdbuf()` returns the same value as it returned before the function call.

```
void set_rdbuf(basic_streambuf<charT, traits>* sb);
```

22 *Preconditions:* `sb != nullptr` is true.

23 *Effects:* Associates the `basic_streambuf` object pointed to by `sb` with this stream without calling `clear()`.

24 *Postconditions:* `rdbuf() == sb` is true.

25 *Throws:* Nothing.

#### 31.5.4.4 Flags functions

[iostate.flags]

```
explicit operator bool() const;
```

1 *Returns:* `!fail()`.

```
bool operator!() const;
```

2 *Returns:* `fail()`.

```
iostate rdstate() const;
```

3 *Returns:* The error state of the stream buffer.

```
void clear(iostate state = goodbit);
```

4 *Effects:* If `((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0`, returns. Otherwise, the function throws an object of class `ios_base::failure` (31.5.2.2.1), constructed with implementation-defined argument values.

5 *Postconditions:* If `rdbuf() != 0` then `state == rdstate()`; otherwise `rdstate() == (state | ios_base::badbit)`.

```
void setstate(iostate state);
```

6 *Effects:* Calls `clear(rdstate() | state)` (which may throw `ios_base::failure` (31.5.2.2.1)).

```
bool good() const;
```

7 *Returns:* `rdstate() == 0`.

```
bool eof() const;
```

8 *Returns:* true if eofbit is set in `rdstate()`.

```
bool fail() const;
```

9 *Returns:* true if failbit or badbit is set in `rdstate()`.<sup>243</sup>

<sup>243</sup> Checking `badbit` also for `fail()` is historical practice.

```
bool bad() const;
```

10     *Returns:* true if badbit is set in rdstate().

```
iosstate exceptions() const;
```

11     *Returns:* A mask that determines what elements set in rdstate() cause exceptions to be thrown.

```
void exceptions(iosstate except);
```

12     *Effects:* Calls clear(rdstate()).

13     *Postconditions:* except == exceptions().

### 31.5.5 ios\_base manipulators

[std.ios.manip]

#### 31.5.5.1 fmtflags manipulators

[fmtflags.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

```
ios_base& boolalpha(ios_base& str);
```

2     *Effects:* Calls str.setf(ios\_base::boolalpha).

3     *Returns:* str.

```
ios_base& noboolalpha(ios_base& str);
```

4     *Effects:* Calls str.unsetf(ios\_base::boolalpha).

5     *Returns:* str.

```
ios_base& showbase(ios_base& str);
```

6     *Effects:* Calls str.setf(ios\_base::showbase).

7     *Returns:* str.

```
ios_base& noshowbase(ios_base& str);
```

8     *Effects:* Calls str.unsetf(ios\_base::showbase).

9     *Returns:* str.

```
ios_base& showpoint(ios_base& str);
```

10     *Effects:* Calls str.setf(ios\_base::showpoint).

11     *Returns:* str.

```
ios_base& noshowpoint(ios_base& str);
```

12     *Effects:* Calls str.unsetf(ios\_base::showpoint).

13     *Returns:* str.

```
ios_base& showpos(ios_base& str);
```

14     *Effects:* Calls str.setf(ios\_base::showpos).

15     *Returns:* str.

```
ios_base& noshowpos(ios_base& str);
```

16     *Effects:* Calls str.unsetf(ios\_base::showpos).

17     *Returns:* str.

```
ios_base& skipws(ios_base& str);
```

18     *Effects:* Calls str.setf(ios\_base::skipws).

19     *Returns:* str.

```
ios_base& noskipws(ios_base& str);
```

20     *Effects:* Calls str.unsetf(ios\_base::skipws).

21     *Returns:* str.

```
ios_base& uppercase(ios_base& str);
```

22     *Effects:* Calls `str.setf(ios_base::uppercase)`.

23     *Returns:* `str`.

```
ios_base& nouppercase(ios_base& str);
```

24     *Effects:* Calls `str.unsetf(ios_base::uppercase)`.

25     *Returns:* `str`.

```
ios_base& unitbuf(ios_base& str);
```

26     *Effects:* Calls `str.setf(ios_base::unitbuf)`.

27     *Returns:* `str`.

```
ios_base& nouunitbuf(ios_base& str);
```

28     *Effects:* Calls `str.unsetf(ios_base::unitbuf)`.

29     *Returns:* `str`.

### 31.5.5.2 adjustfield manipulators

[adjustfield.manip]

1 Each function specified in this subclause is a designated addressable function ([16.4.5.2.1](#)).

```
ios_base& internal(ios_base& str);
```

2     *Effects:* Calls `str.setf(ios_base::internal, ios_base::adjustfield)`.

3     *Returns:* `str`.

```
ios_base& left(ios_base& str);
```

4     *Effects:* Calls `str.setf(ios_base::left, ios_base::adjustfield)`.

5     *Returns:* `str`.

```
ios_base& right(ios_base& str);
```

6     *Effects:* Calls `str.setf(ios_base::right, ios_base::adjustfield)`.

7     *Returns:* `str`.

### 31.5.5.3 basefield manipulators

[basefield.manip]

1 Each function specified in this subclause is a designated addressable function ([16.4.5.2.1](#)).

```
ios_base& dec(ios_base& str);
```

2     *Effects:* Calls `str.setf(ios_base::dec, ios_base::basefield)`.

3     *Returns:* `str`.<sup>244</sup>

```
ios_base& hex(ios_base& str);
```

4     *Effects:* Calls `str.setf(ios_base::hex, ios_base::basefield)`.

5     *Returns:* `str`.

```
ios_base& oct(ios_base& str);
```

6     *Effects:* Calls `str.setf(ios_base::oct, ios_base::basefield)`.

7     *Returns:* `str`.

### 31.5.5.4 floatfield manipulators

[floatfield.manip]

1 Each function specified in this subclause is a designated addressable function ([16.4.5.2.1](#)).

```
ios_base& fixed(ios_base& str);
```

2     *Effects:* Calls `str.setf(ios_base::fixed, ios_base::floatfield)`.

3     *Returns:* `str`.

---

<sup>244</sup> The function signature `dec(ios_base&)` can be called by the function signature `basic_ostream& stream::operator<<(ios_base& (*)(ios_base&))` to permit expressions of the form `cout << dec` to change the format flags stored in `cout`.

```
ios_base& scientific(ios_base& str);
```

4     *Effects:* Calls `str.setf(ios_base::scientific, ios_base::floatfield)`.

5     *Returns:* `str`.

```
ios_base& hexfloat(ios_base& str);
```

6     *Effects:* Calls `str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield)`.

7     *Returns:* `str`.

8 [Note 1: `ios_base::hex` cannot be used to specify a hexadecimal floating-point format, because it is not part of `ios_base::floatfield` (Table 137). — end note]

```
ios_base& defaultfloat(ios_base& str);
```

9     *Effects:* Calls `str.unsetf(ios_base::floatfield)`.

10    *Returns:* `str`.

### 31.5.6 Error reporting

[error.reporting]

```
error_code make_error_code(io_errc e) noexcept;
```

1     *Returns:* `error_code(static_cast<int>(e), iostream_category())`.

```
error_condition make_error_condition(io_errc e) noexcept;
```

2     *Returns:* `error_condition(static_cast<int>(e), iostream_category())`.

```
const error_category& iostream_category() noexcept;
```

3     *Returns:* A reference to an object of a type derived from class `error_category`.

4     The object's `default_error_condition` and equivalent virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function shall return a pointer to the string "iostream".

## 31.6 Stream buffers

[stream.buffers]

### 31.6.1 Header <streambuf> synopsis

[streambuf.syn]

```
namespace std {
 // 31.6.3, class template basic_streambuf
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf;
 using streambuf = basic_streambuf<char>;
 using wstreambuf = basic_streambuf<wchar_t>;
}
```

1 The header <streambuf> defines types that control input from and output to *character* sequences.

### 31.6.2 Stream buffer requirements

[streambuf.reqts]

1 Stream buffers can impose various constraints on the sequences they control. Some constraints are:

- (1.1) — The controlled input sequence can be not readable.
  - (1.2) — The controlled output sequence can be not writable.
  - (1.3) — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
  - (1.4) — The controlled sequences can support operations *directly* to or from associated sequences.
  - (1.5) — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.
- 2 Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

- (2.1) — the *beginning pointer*, or lowest element address in the array (called **xbeg** here);
  - (2.2) — the *next pointer*, or next element address that is a current candidate for reading or writing (called **xnext** here);
  - (2.3) — the *end pointer*, or first element address beyond the end of the array (called **xend** here).
- <sup>3</sup> The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:
- (3.1) — If **xnext** is not a null pointer, then **xbeg** and **xend** shall also be non-null pointers into the same **charT** array, as described above; otherwise, **xbeg** and **xend** shall also be null.
  - (3.2) — If **xnext** is not a null pointer and **xnext** < **xend** for an output sequence, then a *write position* is available. In this case, **\*xnext** shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
  - (3.3) — If **xnext** is not a null pointer and **xbeg** < **xnext** for an input sequence, then a *putback position* is available. In this case, **xnext[-1]** shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
  - (3.4) — If **xnext** is not a null pointer and **xnext** < **xend** for an input sequence, then a *read position* is available. In this case, **\*xnext** shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 31.6.3 Class template **basic\_streambuf**

[streambuf]

#### 31.6.3.1 General

[streambuf.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_streambuf {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;

 virtual ~basic_streambuf();

 // 31.6.3.3.1, locales
 locale pubimbue(const locale& loc);
 locale getloc() const;

 // 31.6.3.3.2, buffer and positioning
 basic_streambuf* pubsetbuf(char_type* s, streamsize n);
 pos_type pubseekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 pos_type pubseekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
 int pubsync();

 // get and put areas
 // 31.6.3.3.3, get area
 streamsize in_avail();
 int_type snextc();
 int_type sbumpc();
 int_type sgetc();
 streamsize sgetn(char_type* s, streamsize n);

 // 31.6.3.3.4, putback
 int_type sputbackc(char_type c);
 int_type sungetc();
 };

```

```

// 31.6.3.3.5, put area
int_type sputc(char_type c);
streamsize sputn(const char_type* s, streamsize n);

protected:
 basic_streambuf();
 basic_streambuf(const basic_streambuf& rhs);
 basic_streambuf& operator=(const basic_streambuf& rhs);

 void swap(basic_streambuf& rhs);

// 31.6.3.4.2, get area access
char_type* eback() const;
char_type* gptr() const;
char_type* egptr() const;
void gbump(int n);
void setg(char_type* gbeg, char_type* gnext, char_type* gend);

// 31.6.3.4.3, put area access
char_type* pbase() const;
char_type* pptr() const;
char_type* ep_ptr() const;
void pbump(int n);
void setp(char_type* pbeg, char_type* pend);

// 31.6.3.5, virtual functions
// 31.6.3.5.1, locales
virtual void imbue(const locale& loc);

// 31.6.3.5.2, buffer management and positioning
virtual basic_streambuf* setbuf(char_type* s, streamsize n);
virtual pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
virtual pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
virtual int sync();

// 31.6.3.5.3, get area
virtual streamsize showmanyc();
virtual streamsize xsgetn(char_type* s, streamsize n);
virtual int_type underflow();
virtual int_type uflow();

// 31.6.3.5.4, putback
virtual int_type pbackfail(int_type c = traits::eof());

// 31.6.3.5.5, put area
virtual streamsize xsputn(const char_type* s, streamsize n);
virtual int_type overflow(int_type c = traits::eof());
};
}

```

<sup>1</sup> The class template `basic_streambuf` serves as a base class for deriving various *stream buffers* whose objects each control two *character sequences*:

- (1.1) — a character *input sequence*;
- (1.2) — a character *output sequence*.

### 31.6.3.2 Constructors

[streambuf.cons]

```
basic_streambuf();
```

- 1 *Effects:* Initializes:<sup>245</sup>
- (1.1) — all pointer member objects to null pointers,
  - (1.2) — the `getloc()` member to a copy of the global locale, `locale()`, at the time of construction.
- 2 *Remarks:* Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

```
basic_streambuf(const basic_streambuf& rhs);
```

- 3 *Postconditions:*
- (3.1) — `eback() == rhs.eback()`
  - (3.2) — `gptr() == rhs.gptr()`
  - (3.3) — `egptr() == rhs.egptr()`
  - (3.4) — `pbase() == rhs.pbase()`
  - (3.5) — `pptr() == rhs.pptr()`
  - (3.6) — `epptr() == rhs.epptr()`
  - (3.7) — `getloc() == rhs.getloc()`

```
~basic_streambuf();
```

- 4 *Effects:* None.

### 31.6.3.3 Public member functions

[streambuf.members]

#### 31.6.3.3.1 Locales

[streambuf.locales]

```
locale pubimbue(const locale& loc);
```

- 1 *Effects:* Calls `imbue(loc)`.
- 2 *Postconditions:* `loc == getloc()`.
- 3 *Returns:* Previous value of `getloc()`.

```
locale getloc() const;
```

- 4 *Returns:* If `pubimbue()` has ever been called, then the last value of `loc` supplied, otherwise the current global locale, `locale()`, in effect at the time of construction. If called after `pubimbue()` has been called but before `pubimbue` has returned (i.e., from within the call of `imbue()`) then it returns the previous value.

#### 31.6.3.3.2 Buffer management and positioning

[streambuf.buffer]

```
basic_streambuf* pubsetbuf(char_type* s, streamsize n);
```

- 1 *Returns:* `setbuf(s, n)`.
- ```
pos_type pubseekoff(off_type off, ios_base::seekdir way,
                    ios_base::openmode which
                    = ios_base::in | ios_base::out);
```
- 2 *Returns:* `seekoff(off, way, which)`.
- ```
pos_type pubseekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out);
```
- 3 *Returns:* `seekpos(sp, which)`.
- ```
int pubsync();
```
- 4 *Returns:* `sync()`.

245) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.

31.6.3.3.3 Get area**[streambuf.pub.get]**

streamsize in_avail();

- 1 *Returns:* If a read position is available, returns `egptr() - gptr()`. Otherwise returns `showmanyc()` (31.6.3.5.3).

int_type snextc();

- 2 *Effects:* Calls `sbumpc()`.

- 3 *Returns:* If that function returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns `sgetc()`.

int_type sbumpc();

- 4 *Effects:* If the input sequence read position is not available, returns `uflow()`. Otherwise, returns `traits::to_int_type(*gptr())` and increments the next pointer for the input sequence.

int_type sgetc();

- 5 *Returns:* If the input sequence read position is not available, returns `underflow()`. Otherwise, returns `traits::to_int_type(*gptr())`.

streamsize sgetn(char_type* s, streamsize n);

- 6 *Returns:* `xsgetn(s, n)`.

31.6.3.3.4 Putback**[streambuf.pub.pback]**

int_type sputbackc(char_type c);

- 1 *Effects:* If the input sequence putback position is not available, or if `traits::eq(c, gptr()[-1])` is false, returns `pbackfail(traits::to_int_type(c))`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

int_type sungetc();

- 2 *Effects:* If the input sequence putback position is not available, returns `pbackfail()`. Otherwise, decrements the next pointer for the input sequence and returns `traits::to_int_type(*gptr())`.

31.6.3.3.5 Put area**[streambuf.pub.put]**

int_type sputc(char_type c);

- 1 *Effects:* If the output sequence write position is not available, returns `overflow(traits::to_int_type(c))`. Otherwise, stores `c` at the next pointer for the output sequence, increments the pointer, and returns `traits::to_int_type(c)`.

streamsize sputn(const char_type* s, streamsize n);

- 2 *Returns:* `xspun(s, n)`.

31.6.3.4 Protected member functions**[streambuf.protected]****31.6.3.4.1 Assignment****[streambuf.assign]**

basic_streambuf& operator=(const basic_streambuf& rhs);

- 1 *Postconditions:*

- (1.1) — `eback() == rhs.eback()`
- (1.2) — `gptr() == rhs.gptr()`
- (1.3) — `egptr() == rhs.egptr()`
- (1.4) — `pbase() == rhs.pbase()`
- (1.5) — `pptr() == rhs.pptr()`
- (1.6) — `epptr() == rhs.epptr()`
- (1.7) — `getloc() == rhs.getloc()`

- 2 *Returns:* `*this`.

```
void swap(basic_streambuf& rhs);
```

3 *Effects:* Swaps the data members of `rhs` and `*this`.

31.6.3.4.2 Get area access

[streambuf.get.area]

```
char_type* eback() const;
```

1 *Returns:* The beginning pointer for the input sequence.

```
char_type* gptr() const;
```

2 *Returns:* The next pointer for the input sequence.

```
char_type* egptr() const;
```

3 *Returns:* The end pointer for the input sequence.

```
void gbump(int n);
```

4 *Effects:* Adds `n` to the next pointer for the input sequence.

```
void setg(char_type* gbeg, char_type* gnext, char_type* gend);
```

5 *Preconditions:* `[gbeg, gnext)`, `[gbeg, gend)`, and `[gnext, gend)` are all valid ranges.

6 *Postconditions:* `gbeg == eback()`, `gnext == gptr()`, and `gend == egptr()` are all true.

31.6.3.4.3 Put area access

[streambuf.put.area]

```
char_type* pbase() const;
```

1 *Returns:* The beginning pointer for the output sequence.

```
char_type* pptr() const;
```

2 *Returns:* The next pointer for the output sequence.

```
char_type* epptr() const;
```

3 *Returns:* The end pointer for the output sequence.

```
void pbump(int n);
```

4 *Effects:* Adds `n` to the next pointer for the output sequence.

```
void setp(char_type* pbeg, char_type* pend);
```

5 *Preconditions:* `[pbeg, pend)` is a valid range.

6 *Postconditions:* `pbeg == pbase()`, `pbeg == pptr()`, and `pend == epptr()` are all true.

31.6.3.5 Virtual functions

[streambuf.virtuals]

31.6.3.5.1 Locales

[streambuf.virt.locales]

```
void imbue(const locale&);
```

1 *Effects:* Change any translations based on locale.

2 *Remarks:* Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from `streambuf` can safely cache results of calls to locale functions and to members of facets so obtained.

3 *Default behavior:* Does nothing.

31.6.3.5.2 Buffer management and positioning

[streambuf.virt.buffer]

```
basic_streambuf* setbuf(char_type* s, streamsize n);
```

1 *Effects:* Influences stream buffering in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2.5, 31.10.3.5).

2 *Default behavior:* Does nothing. Returns `this`.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

3 *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2.5, 31.10.3.5).

4 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
                ios_base::openmode which
                = ios_base::in | ios_base::out);
```

5 *Effects:* Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from `basic_streambuf` in this Clause (31.8.2, 31.10.3).

6 *Default behavior:* Returns `pos_type(off_type(-1))`.

```
int sync();
```

7 *Effects:* Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

8 *Returns:* `-1` on failure. What constitutes failure is determined by each derived class (31.10.3.5).

9 *Default behavior:* Returns zero.

31.6.3.5.3 Get area

[`streambuf.virt.get`]

```
streamsize showmanyc();246
```

1 *Returns:* An estimate of the number of characters available in the sequence, or `-1`. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmanyc()` returns `-1`, then calls to `underflow()` or `uflow()` will fail.²⁴⁷

2 *Default behavior:* Returns zero.

3 *Remarks:* Uses `traits::eof()`.

```
streamsize xsgetn(char_type* s, streamsize n);
```

4 *Effects:* Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

5 *Returns:* The number of characters assigned.²⁴⁸

6 *Remarks:* Uses `traits::eof()`.

```
int_type underflow();
```

7 The *pending sequence* of characters is defined as the concatenation of

(7.1) — the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr())`, followed by

(7.2) — some (possibly empty) sequence of characters read from the input sequence.

8 The *result character* is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

9 The *backup sequence* is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr())`.

10 *Effects:* The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr())` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

²⁴⁶) The morphemes of `showmanyc` are “es-how-many-see”, not “show-manic”.

²⁴⁷) `underflow` or `uflow` can fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

²⁴⁸) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xsputn()` by overriding these definitions from the base class.

- 11 If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either
- (11.1) — the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr())` agree with the last `gptr() - eback()` characters of the backup sequence, or
 - (11.2) — the characters in `[gptr() - n, gptr())` agree with the backup sequence (where `n` is the length of the backup sequence).
- 12 *Returns:* `traits::to_int_type(c)`, where `c` is the first *character* of the *pending sequence*, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.
- 13 *Default behavior:* Returns `traits::eof()`.
- 14 *Remarks:* The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`.

`int_type uflow();`

- 15 *Preconditions:* The constraints are the same as for `underflow()`, except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.
- 16 *Default behavior:* Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increments the value of the next pointer for the input sequence.
- 17 *Returns:* `traits::eof()` to indicate failure.

31.6.3.5.4 Putback

[`streambuf.virt.pback`]

`int_type pbackfail(int_type c = traits::eof());`

- 1 The *pending sequence* is defined as for `underflow()`, with the modifications that
- (1.1) — If `traits::eq_int_type(c, traits::eof())` returns `true`, then the input sequence is backed up one character before the pending sequence is determined.
 - (1.2) — If `traits::eq_int_type(c, traits::eof())` returns `false`, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.
- 2 *Postconditions:* On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.
- 3 *Returns:* `traits::eof()` to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.
- 4 Returns some value other than `traits::eof()` to indicate success.
- 5 *Default behavior:* Returns `traits::eof()`.
- 6 *Remarks:* The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[-1])` returns `false`. Other calls shall also satisfy that constraint.

31.6.3.5.5 Put area

[`streambuf.virt.put`]

`streamsize xsputn(const char_type* s, streamsize n);`

- 1 *Effects:* Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes `true` or whether it achieves the same effects by other means.
- 2 *Returns:* The number of characters written.

`int_type overflow(int_type c = traits::eof());`

- 3 *Effects:* Consumes some initial subsequence of the characters of the *pending sequence*. The pending sequence is defined as the concatenation of

- (3.1) — the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by
 - (3.2) — the empty sequence if `traits::eq_int_type(c, traits::eof())` returns `true`, otherwise the sequence consisting of `c`.
- 4 *Preconditions:* Every overriding definition of this virtual function obeys the following constraints:
- (4.1) — The effect of consuming a character on the associated output sequence is specified.²⁴⁹
 - (4.2) — Let `r` be the number of characters in the pending sequence not consumed. If `r` is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.
 - (4.3) — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.
- 5 *Returns:* `traits::eof()` or throws an exception if the function fails.
Otherwise, returns some value other than `traits::eof()` to indicate success.²⁵⁰
- 6 *Default behavior:* Returns `traits::eof()`.
- 7 *Remarks:* The member functions `sputc()` and `sputn()` call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

31.7 Formatting and manipulators

[iostream.format]

31.7.1 Header <istream> synopsis

[istream.syn]

```

namespace std {
    // 31.7.5.2, class template basic_istream
    template<class charT, class traits = char_traits<charT>>
        class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    // 31.7.5.7, class template basic_iostream
    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;

    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    // 31.7.5.5, standard basic_istream manipulators
    template<class charT, class traits>
        basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    // 31.7.5.6, rvalue stream extraction
    template<class Istream, class T>
        Istream&& operator>>(Istream&& is, T&& x);
}

```

31.7.2 Header <ostream> synopsis

[ostream.syn]

```

namespace std {
    // 31.7.6.2, class template basic_ostream
    template<class charT, class traits = char_traits<charT>>
        class basic_ostream;

    using ostream = basic_ostream<char>;
    using wostream = basic_ostream<wchar_t>;

```

249) That is, for each class derived from a specialization of `basic_streambuf` in this Clause (31.8.2, 31.10.3), a specification of how consuming a character affects the associated output sequence is given. There is no requirement on a program-defined class.

250) Typically, `overflow` returns `c` to indicate success, except when `traits::eq_int_type(c, traits::eof())` returns `true`, in which case it returns `traits::not_eof(c)`.

```

// 31.7.6.5, standard basic_ostream manipulators
template<class charT, class traits>
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
template<class charT, class traits>
    basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
template<class charT, class traits>
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

template<class charT, class traits>
    basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
template<class charT, class traits>
    basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
template<class charT, class traits>
    basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

// 31.7.6.6, rvalue stream insertion
template<class Ostream, class T>
    Ostream&& operator<<(Ostream&& os, const T& x);

// 31.7.6.3.5, print functions
template<class... Args>
    void print(ostream& os, format_string<Args...> fmt, Args&&... args);
template<class... Args>
    void println(ostream& os, format_string<Args...> fmt, Args&&... args);
void println(ostream& os);

void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
}

```

31.7.3 Header <iomanip> synopsis

[iomanip.syn]

```

namespace std {
// 31.7.7, standard manipulators

    void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
    void vprint_nonunicode_buffered(FILE* stream, string_view fmt, format_args args);
}

```

31.7.5 Input streams

[input.streams]

31.7.5.1 General

[input.streams.general]

- ¹ The header <istream> defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

31.7.5.2 Class template basic_istream

[istream]

31.7.5.2.1 General

[istream.general]

- ¹ When a function is specified with a type placeholder of *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.9.3) in lieu of *extended-floating-point-type*.

```

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (31.5.4))
        using char_type    = charT;
        using int_type      = traits::int_type;
        using pos_type      = traits::pos_type;
        using off_type      = traits::off_type;
        using traits_type   = traits;

        // 31.7.5.2.2, constructor/destructor
        explicit basic_istream(basic_streambuf<charT, traits>* sb);
        virtual ~basic_istream();

        // 31.7.5.2.4, prefix/suffix
        class sentry;

        // 31.7.5.3, formatted input
        basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
        basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_istream& operator>>(ios_base& (*pf)(ios_base&));

        basic_istream& operator>>(bool& n);
        basic_istream& operator>>(short& n);
        basic_istream& operator>>(unsigned short& n);
        basic_istream& operator>>(int& n);
    };
}

```

```

basic_istream& operator>>(unsigned int& n);
basic_istream& operator>>(long& n);
basic_istream& operator>>(unsigned long& n);
basic_istream& operator>>(long long& n);
basic_istream& operator>>(unsigned long long& n);
basic_istream& operator>>(float& f);
basic_istream& operator>>(double& f);
basic_istream& operator>>(long double& f);
basic_istream& operator>>(extended-floating-point-type& f);

basic_istream& operator>>(void*& p);
basic_istream& operator>>(basic_streambuf<char_type, traits>* sb);

// 31.7.5.4, unformatted input
streamsize gcount() const;
int_type get();
basic_istream& get(char_type& c);
basic_istream& get(char_type* s, streamsize n);
basic_istream& get(char_type* s, streamsize n, char_type delim);
basic_istream& get(basic_streambuf<char_type, traits>& sb);
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

basic_istream& getline(char_type* s, streamsize n);
basic_istream& getline(char_type* s, streamsize n, char_type delim);

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
basic_istream& ignore(streamsize n, char_type delim);
int_type peek();
basic_istream& read (char_type* s, streamsize n);
streamsize readsome(char_type* s, streamsize n);

basic_istream& putback(char_type c);
basic_istream& unget();
int sync();

pos_type tellg();
basic_istream& seekg(pos_type);
basic_istream& seekg(off_type, ios_base::seekdir);

protected:
// 31.7.5.2.2, copy/move constructor
basic_istream(const basic_istream&) = delete;
basic_istream(basic_istream&& rhs);

// 31.7.5.2.3, assignment and swap
basic_istream& operator=(const basic_istream&) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);
};

// 31.7.5.3.3, character extraction templates
template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);

template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT(&)[N]);
}

```

- ² The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
- ³ Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they

obtain (or *extract*) input *characters* by calling `rdbuf()->sbumpc()` or `rdbuf()->sgetc()`. They may use other public members of `istream`.

31.7.5.2.2 Constructors

[istream.cons]

```
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

1 *Effects*: Initializes the base class subobject with `basic_ios::init(sb)` (31.5.4.2).

2 *Postconditions*: `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

3 *Effects*: Default constructs the base class, copies the `gcount()` from `rhs`, calls `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and sets the `gcount()` for `rhs` to 0.

```
virtual ~basic_istream();
```

4 *Remarks*: Does not perform any operations of `rdbuf()`.

31.7.5.2.3 Assignment and swap

[istream.assign]

```
basic_istream& operator=(basic_istream&& rhs);
```

1 *Effects*: Equivalent to `swap(rhs)`.

2 *Returns*: `*this`.

```
void swap(basic_istream& rhs);
```

3 *Effects*: Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

31.7.5.2.4 Class `basic_istream::sentry`

[istream.sentry]

```
namespace std {
    template<class charT, class traits>
    class basic_istream<charT, traits>::sentry {
        bool ok_;
        // exposition only

    public:
        explicit sentry(basic_istream& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}
```

1 The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_istream& is, bool noskipws = false);
```

2 *Effects*: If `is.good()` is false, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely.²⁵¹ If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

3 *Remarks*: The constructor

```
explicit sentry(basic_istream& is, bool noskipws = false)
```

²⁵¹) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

- 4 To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // c is a whitespace character.
```

- 5 If, after any preparation is completed, `is.good()` is `true`, `ok_ != false` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).²⁵²

```
~sentry();
```

- 6 *Effects:* None.

```
explicit operator bool() const;
```

- 7 *Returns:* `ok_`.

31.7.5.3 Formatted input functions

[istream.formatted]

31.7.5.3.1 Common requirements

[istream.formatted.reqmts]

- 1 Each formatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false` when converted to a value of type `bool`, the function returns without attempting to obtain any input. If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

31.7.5.3.2 Arithmetic extractors

[istream.formatted.arithmetic]

```
basic_istream& operator>>(unsigned short& val);
basic_istream& operator>>(unsigned int& val);
basic_istream& operator>>(long& val);
basic_istream& operator>>(unsigned long& val);
basic_istream& operator>>(long long& val);
basic_istream& operator>>(unsigned long long& val);
basic_istream& operator>>(float& val);
basic_istream& operator>>(double& val);
basic_istream& operator>>(long double& val);
basic_istream& operator>>(bool& val);
basic_istream& operator>>(void*& val);
```

- 1 As in the case of the inserters, these extractors depend on the locale's `num_get<>` (28.3.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment, where `state` represents the input function's local error state:

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
use_facet<numget>(loc).get(*this, 0, *this, state, val);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[Note 1: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — end note]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

²⁵²) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

```
basic_istream& operator>>(short& val);
```

- 2 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<short>::min()) {
    state |= ios_base::failbit;
    val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
    state |= ios_base::failbit;
    val = numeric_limits<short>::max();
} else
    val = static_cast<short>(lval);
```

```
basic_istream& operator>>(int& val);
```

- 3 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, state, lval);
if (lval < numeric_limits<int>::min()) {
    state |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    state |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
```

```
basic_istream& operator>>(extended-floating-point-type& val);
```

- 4 If the floating-point conversion rank of *extended-floating-point-type* is not less than or equal to that of long double, then an invocation of the operator function is conditionally supported with implementation-defined semantics.

- 5 Otherwise, let FP be a standard floating-point type:

- (5.1) — if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of float, then FP is float,
- (5.2) — otherwise, if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of double, then FP is double,
- (5.3) — otherwise, FP is long double.

- 6 The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
FP fval;
use_facet<numget>(loc).get(*this, 0, *this, state, fval);
if (fval < -numeric_limits<extended-floating-point-type>::max()) {
    state |= ios_base::failbit;
    val = -numeric_limits<extended-floating-point-type>::max();
} else if (numeric_limits<extended-floating-point-type>::max() < fval) {
    state |= ios_base::failbit;
    val = numeric_limits<extended-floating-point-type>::max();
} else {
    val = static_cast<extended-floating-point-type>(fval);
}
```

[Note 2: When the extended floating-point type has a floating-point conversion rank that is not equal to the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate results. `from_chars` can be used in situations where maximum accuracy is important. — end note]

31.7.5.3.3 `basic_istream::operator>>`

[istream.extractors]

```
basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
```

1 *Effects:* None. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

2 *Returns:* `pf(*this)`.²⁵³

```
basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3 *Effects:* Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

4 *Returns:* `*this`.

```
basic_istream& operator>>(ios_base& (*pf)(ios_base&));
```

5 *Effects:* Calls `pf(*this)`.²⁵⁴ This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

6 *Returns:* `*this`.

```
template<class charT, class traits, size_t N>
```

```
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
```

7 *Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. After a `sentry` object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

8 Characters are extracted and stored until any of the following occurs:

- (8.1) — `n - 1` characters are stored;
- (8.2) — end of file occurs on the input sequence;
- (8.3) — letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, c)` is true.

9 `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.

10 If the function extracted no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

11 *Returns:* `in`.

```
template<class charT, class traits>
```

```
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
```

12 *Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. A character is extracted from `in`, if one is available, and stored in `c`. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

13 *Returns:* `in`.

```
basic_istream& operator>>(basic_streambuf<charT, traits>* sb);
```

14 *Effects:* Behaves as an unformatted input function (31.7.5.4). If `sb` is null, calls `setstate(failbit)`, which may throw `ios_base::failure` (31.5.4.4). After a `sentry` object is constructed, extracts characters from `*this` and inserts them in the output sequence controlled by `sb`. Characters are extracted and inserted until any of the following occurs:

- (14.1) — end-of-file occurs on the input sequence;
- (14.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (14.3) — an exception occurs (in which case the exception is caught).

15 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

16 *Returns:* `*this`.

²⁵³ See, for example, the function signature `ws(basic_istream&)` (31.7.5.5).

²⁵⁴ See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

31.7.5.4 Unformatted input functions

[istream.unformatted]

- ¹ Each unformatted input function begins execution by constructing an object of type `ios_base::iostate`, termed the local error state, and initializing it to `ios_base::goodbit`. It then creates an object of class `sentry` with the default argument `noskipws` (second) argument `true`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. Otherwise, if the `sentry` constructor exits by throwing an exception or if the `sentry` object produces `false`, when converted to a value of type `bool`, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using `charT()`) in the first location of the array. If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then `ios_base::eofbit` is set in the local error state and the input function stops trying to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is set in the local error state, `*this`'s error state is set to the local error state, and the exception is rethrown if `(exceptions() & badbit) != 0`. If no exception has been thrown it stores the number of characters extracted in a member object. After extraction is done, the input function calls `setstate`, which sets `*this`'s error state to the local error state, and may throw an exception. In any event the `sentry` object is destroyed before leaving the unformatted input function.

```
streamsize gcount() const;
```

- ² *Effects:* None. This member function does not behave as an unformatted input function (as described above).

- ³ *Returns:* The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns `numeric_limits<streamsize>::max()`.

```
int_type get();
```

- ⁴ *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character `c`, if one is available. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

- ⁵ *Returns:* `c` if available, otherwise `traits::eof()`.

```
basic_istream& get(char_type& c);
```

- ⁶ *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts a character, if one is available, and assigns it to `c`.²⁵⁵ Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

- ⁷ *Returns:* `*this`.

```
basic_istream& get(char_type* s, streamsize n, char_type delim);
```

- ⁸ *Effects:* Behaves as an unformatted input function (as described above). After constructing a `sentry` object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`.²⁵⁶ Characters are extracted and stored until any of the following occurs:

- (8.1) — `n` is less than one or `n - 1` characters are stored;
- (8.2) — end-of-file occurs on the input sequence;
- (8.3) — `traits::eq(c, delim)` for the next available input character `c` (in which case `c` is not extracted).

- ⁹ If the function stores no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called. In any case, if `n` is greater than zero it then stores a null character into the next successive location of the array.

- ¹⁰ *Returns:* `*this`.

```
basic_istream& get(char_type* s, streamsize n);
```

- ¹¹ *Effects:* Calls `get(s, n, widen('\'n\''))`.

- ¹² *Returns:* Value returned by the call.

²⁵⁵) Note that this function is not overloaded on types `signed char` and `unsigned char`.

²⁵⁶) Note that this function is not overloaded on types `signed char` and `unsigned char`.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);
```

13 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and inserts them in the output sequence controlled by **sb**. Characters are extracted and inserted until any of the following occurs:

- (13.1) — end-of-file occurs on the input sequence;
- (13.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- (13.3) — `traits::eq(c, delim)` for the next available input character **c** (in which case **c** is not extracted);
- (13.4) — an exception occurs (in which case, the exception is caught but not rethrown).

14 If the function inserts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

15 *Returns:* `*this`.

```
basic_istream& get(basic_streambuf<char_type, traits>& sb);
```

16 *Effects:* Calls `get(sb, widen('\n'))`.

17 *Returns:* Value returned by the call.

```
basic_istream& getline(char_type* s, streamsize n, char_type delim);
```

18 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and stores them into successive locations of an array whose first element is designated by **s**.²⁵⁷ Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence;
2. `traits::eq(c, delim)` for the next available input character **c** (in which case the input character is extracted but not stored);²⁵⁸
3. **n** is less than one or **n** - 1 characters are stored (in which case the function calls `setstate(failbit)`).

19 These conditions are tested in the order shown.²⁵⁹

20 If the function extracts no characters, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.²⁶⁰

21 In any case, if **n** is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

22 *Returns:* `*this`.

23 [Example 1:

```
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";    // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;                          // Don't include newline in count
        }
    }
}
```

257) Note that this function is not overloaded on types **signed char** and **unsigned char**.

258) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.

259) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

260) This implies an empty input line will not cause `failbit` to be set.

```

        cout << "Line " << ++line_number;
    }
    cout << " (" << count << " chars): " << buffer << endl;
}
}
— end example]

```

```
basic_istream& getline(char_type* s, streamsize n);
```

24 *Returns:* `getline(s, n, widen('\n'))`.

```
basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
```

25 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, extracts characters and discards them. Characters are extracted until any of the following occurs:

- (25.1) — `n != numeric_limits<streamsize>::max()` (17.3.5) and `n` characters have been extracted so far;
- (25.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate eofbit`), which may throw `ios_base::failure` (31.5.4.4);
- (25.3) — `traits::eq_int_type(traits::to_int_type(c), delim)` for the next available input character `c` (in which case `c` is extracted).

[Note 1: The last condition will never occur if `traits::eq_int_type(delim, traits::eof())`. — end note]

26 *Returns:* `*this`.

```
basic_istream& ignore(streamsize n, char_type delim);
```

27 *Constraints:* `is_same_v<char_type, char>` is true.

28 *Effects:* Equivalent to: `return ignore(n, traits::to_int_type(delim));`

```
int_type peek();
```

29 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, reads but does not extract the current input character.

30 *Returns:* `traits::eof()` if `good()` is false. Otherwise, returns `rdbuf()->sgetc()`.

```
basic_istream& read(char_type* s, streamsize n);
```

31 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`.²⁶¹ Characters are extracted and stored until either of the following occurs:

- (31.1) — `n` characters are stored;
- (31.2) — end-of-file occurs on the input sequence (in which case the function calls `setstate(failbit | eofbit)`), which may throw `ios_base::failure` (31.5.4.4)).

32 *Returns:* `*this`.

```
streamsize readsome(char_type* s, streamsize n);
```

33 *Effects:* Behaves as an unformatted input function (as described above). After constructing a **sentry** object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by `s`. If `rdbuf()->in_avail() == -1`, calls `setstate(eofbit)` (which may throw `ios_base::failure` (31.5.4.4)), and extracts no characters;

- (33.1) — If `rdbuf()->in_avail() == 0`, extracts no characters
- (33.2) — If `rdbuf()->in_avail() > 0`, extracts `min(rdbuf()->in_avail(), n)`.

34 *Returns:* The number of characters extracted.

261) Note that this function is not overloaded on types `signed char` and `unsigned char`.

```
basic_istream& putback(char_type c);
```

35 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sputbackc(c)`. If `rdbuf()` is null, or if `sputbackc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[Note 2: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

36 *Returns:* `*this`.

```
basic_istream& unget();
```

37 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`. After constructing a `sentry` object, if `!good()` calls `setstate(failbit)` which may throw an exception, and return. If `rdbuf()` is not null, calls `rdbuf()->sungetc()`. If `rdbuf()` is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[Note 3: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

38 *Returns:* `*this`.

```
int sync();
```

39 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `rdbuf()` is a null pointer, returns -1. Otherwise, calls `rdbuf()->pubsync()` and, if that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)), and returns -1. Otherwise, returns zero.

```
pos_type tellg();
```

40 *Effects:* Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

41 *Returns:* After constructing a `sentry` object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, in)`.

```
basic_istream& seekg(pos_type pos);
```

42 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

43 *Returns:* `*this`.

```
basic_istream& seekg(off_type off, ios_base::seekdir dir);
```

44 *Effects:* Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

45 *Returns:* `*this`.

31.7.5.5 Standard `basic_istream` manipulators

[istream.manip]

- ¹ Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
    basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
```

- 2 *Effects:* Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a `sentry` object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (31.7.5.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

- 3 *Returns:* `is`.

31.7.5.6 Rvalue stream extraction

[istream.rvalue]

```
template<class Istream, class T>
    Istream&& operator>>(Istream&& is, T&& x);
```

- 1 *Constraints:* The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand (7.2.3) and `Istream` is publicly and unambiguously derived from `ios_base`.

- 2 *Effects:* Equivalent to:

```
is >> std::forward<T>(x);
return std::move(is);
```

31.7.5.7 Class template basic_iostream

[iostreamclass]

31.7.5.7.1 General

[iostreamclass.general]

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
    : public basic_istream<charT, traits>,
      public basic_ostream<charT, traits> {
    public:
        using char_type    = charT;
        using int_type      = traits::int_type;
        using pos_type      = traits::pos_type;
        using off_type      = traits::off_type;
        using traits_type   = traits;

        // 31.7.5.7.2, constructor
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 31.7.5.7.3, destructor
        virtual ~basic_iostream();

    protected:
        // 31.7.5.7.2, constructor
        basic_iostream(const basic_iostream&) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 31.7.5.7.4, assignment and swap
        basic_iostream& operator=(const basic_iostream&) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    };
}
```

- 1 The class template `basic_iostream` inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.5.7.2 Constructors

[iostream.cons]

```
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

- 1 *Effects:* Initializes the base class subobjects with `basic_istream<charT, traits>(sb)` (31.7.5.2) and `basic_ostream<charT, traits>(sb)` (31.7.6.2).

- 2 *Postconditions:* `rdbuf() == sb` and `gcount() == 0`.

```
basic_istream(basic_istream&& rhs);
```

- ³ *Effects:* Move constructs from the rvalue *rhs* by constructing the `basic_istream` base class with `std::move(rhs)`.

31.7.5.7.3 Destructor

[istream.dest]

```
virtual ~basic_istream();
```

- ¹ *Remarks:* Does not perform any operations on `rdbuf()`.

31.7.5.7.4 Assignment and swap

[istream.assign]

```
basic_istream& operator=(basic_istream&& rhs);
```

- ¹ *Effects:* Equivalent to `swap(rhs)`.

```
void swap(basic_istream& rhs);
```

- ² *Effects:* Calls `basic_istream<charT, traits>::swap(rhs)`.

31.7.6 Output streams

[output.streams]

31.7.6.1 General

[output.streams.general]

- ¹ The header `<ostream>` defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

31.7.6.2 Class template `basic_ostream`

[ostream]

31.7.6.2.1 General

[ostream.general]

- ¹ When a function has a parameter type *extended-floating-point-type*, the implementation provides overloads for all cv-unqualified extended floating-point types (6.9.3).

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (31.5.4))
        using char_type    = charT;
        using int_type      = traits::int_type;
        using pos_type      = traits::pos_type;
        using off_type      = traits::off_type;
        using traits_type   = traits;

        // 31.7.6.2.2, constructor/destructor
        explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
        virtual ~basic_ostream();

        // 31.7.6.2.4, prefix/suffix
        class sentry;

        // 31.7.6.3, formatted output
        basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
        basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_ostream& operator<<(ios_base& (*pf)(ios_base&));

        basic_ostream& operator<<(bool n);
        basic_ostream& operator<<(short n);
        basic_ostream& operator<<(unsigned short n);
        basic_ostream& operator<<(int n);
        basic_ostream& operator<<(unsigned int n);
        basic_ostream& operator<<(long n);
        basic_ostream& operator<<(unsigned long n);
        basic_ostream& operator<<(long long n);
        basic_ostream& operator<<(unsigned long long n);
        basic_ostream& operator<<(float f);
        basic_ostream& operator<<(double f);
        basic_ostream& operator<<(long double f);
```

```

basic_ostream& operator<<(extended-floating-point-type f);

basic_ostream& operator<<(const void* p);

```

- ² The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
- ³ Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or *insert*) output *characters* by actions equivalent to calling `rddbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rddbuf()` except `overflow()`, `xspn()`, and `sync()`.
- ⁴ If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.
- ⁵ [Note 1: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers. — end note]

31.7.6.2.2 Constructors

[ostream.cons]

```
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

- ¹ *Effects*: Initializes the base class subobject with `basic_ios<charT, traits>::init(sb)` (31.5.4.2).
- ² *Postconditions*: `rddbuf() == sb`.

```
basic_ostream(basic_ostream&& rhs);
```

- ³ *Effects*: Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class and calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class.

```
virtual ~basic_ostream();
```

- ⁴ *Remarks*: Does not perform any operations on `rddbuf()`.

31.7.6.2.3 Assignment and swap

[ostream.assign]

```
basic_ostream& operator=(basic_ostream&& rhs);
```

- ¹ *Effects*: Equivalent to `swap(rhs)`.
- ² *Returns*: `*this`.

```
void swap(basic_ostream& rhs);
```

- ³ *Effects*: Calls `basic_ios<charT, traits>::swap(rhs)`.

31.7.6.2.4 Class `basic_ostream::sentry`

[ostream.sentry]

```

namespace std {
    template<class charT, class traits>
    class basic_ostream<charT, traits>::sentry {
        bool ok_;           // exposition only

    public:
        explicit sentry(basic_ostream& os);
        ~sentry();
        explicit operator bool() const { return ok_; }

        sentry(const sentry&) = delete;
        sentry& operator=(const sentry&) = delete;
    };
}

```

- ¹ The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```
explicit sentry(basic_ostream& os);
```

- ² If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.²⁶²

- ³ If, after any preparation is completed, `os.good()` is true, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).²⁶³

```
~sentry();
```

- ⁴ If `(os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good()` is true, calls `os.rdbuf()->pubsync()`. If that function returns `-1` or exits via an exception, sets `badbit` in `os.rdstate()` without propagating an exception.

```
explicit operator bool() const;
```

- ⁵ *Effects:* Returns `ok_`.

31.7.6.2.5 Seek members

[ostream.seek]

- ¹ Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```
pos_type tellp();
```

- ² *Returns:* If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```
basic_ostream& seekp(pos_type pos);
```

- ³ *Effects:* If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- ⁴ *Returns:* `*this`.

```
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

- ⁵ *Effects:* If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

- ⁶ *Returns:* `*this`.

31.7.6.3 Formatted output functions

[ostream.formatted]

31.7.6.3.1 Common requirements

[ostream.formatted.reqmts]

- ¹ Each formatted output function begins execution by constructing an object of class `sentry`. If that object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`,

²⁶²) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

²⁶³) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

which can throw an exception. If an exception is thrown during output, then `ios_base::badbit` is set²⁶⁴ in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.

- ² The descriptions of the individual formatted output functions describe how they perform output and do not mention the `sentry` object.
- ³ If a formatted output function of a stream `os` determines padding, it does so as follows. Given a `charT` character sequence `seq` where `charT` is the character container type of the stream, if the length of `seq` is less than `os.width()`, then enough copies of `os.fill()` are added to this sequence as necessary to pad to a width of `os.width()` characters. If `(os.flags() & ios_base::adjustfield) == ios_base::left` is `true`, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

31.7.6.3.2 Arithmetic inserters

[ostream.inserters.arithmetic]

```
basic_ostream& operator<<(bool val);
basic_ostream& operator<<(short val);
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);
```

- ¹ *Effects:* The classes `num_get<>` and `num_put<>` handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued locale value to perform numeric formatting. When `val` is of type `bool`, `long`, `unsigned long`, `long long`, `unsigned long long`, `double`, `long double`, or `const void*`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(), val).failed();
```

When `val` is of type `short` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(),
    baseflags == ios_base::oct || baseflags == ios_base::hex
    ? static_cast<long>(static_cast<unsigned short>(val))
    : static_cast<long>(val)).failed();
```

When `val` is of type `int` the formatting conversion occurs as if it performed the following code fragment:

```
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(),
    baseflags == ios_base::oct || baseflags == ios_base::hex
    ? static_cast<long>(static_cast<unsigned int>(val))
    : static_cast<long>(val)).failed();
```

When `val` is of type `unsigned short` or `unsigned int` the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(), static_cast<unsigned long>(val)).failed();
```

When `val` is of type `float` the formatting conversion occurs as if it performed the following code fragment:

²⁶⁴) This is done without causing an `ios_base::failure` to be thrown.

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(), static_cast<double>(val)).failed();
```

2 The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<>`. It bypasses `ostreams` and uses `streambufs` directly. Class `locale` relies on these types as its interface to `iostreams`, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

3 *Returns:* `*this`.

```
basic_ostream& operator<<(const volatile void* p);
```

4 *Effects:* Equivalent to: `return operator<<(const_cast<const void*>(p));`

```
basic_ostream& operator<<(extended-floating-point-type val);
```

5 *Effects:* If the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(), static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of *extended-floating-point-type* is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```
bool failed = use_facet<num_put<charT, ostreambuf_iterator<charT, traits>>>(
    getloc()).put(*this, *this, fill(), static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

6 *Returns:* `*this`.

31.7.6.3.3 `basic_ostream::operator<<` [ostream.inserters]

```
basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
```

1 *Effects:* None. Does not behave as a formatted output function (as described in 31.7.6.3.1).

2 *Returns:* `pf(*this)`.²⁶⁵

```
basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

3 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

4 *Returns:* `*this`.²⁶⁶

```
basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
```

5 *Effects:* Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

6 *Returns:* `*this`.

```
basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);
```

7 *Effects:* Behaves as an unformatted output function (31.7.6.4). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

8 Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

(8.1) — end-of-file occurs on the input sequence;

(8.2) — inserting in the output sequence fails (in which case the character to be inserted is not extracted);

²⁶⁵ See, for example, the function signature `endl(basic_ostream&)` (31.7.6.5).

²⁶⁶ See, for example, the function signature `dec(ios_base&)` (31.5.5.3).

(8.3) — an exception occurs while getting a character from `sb`.

9 If the function inserts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)). If an exception was thrown while extracting a character, the function sets `failbit` in the error state, and if `failbit` is set in `exceptions()` the caught exception is rethrown.

10 *Returns:* `*this`.

```
basic_ostream& operator<<(nullptr_t);
```

11 *Effects:* Equivalent to:

```
return *this << s;
```

where `s` is an implementation-defined NTCTS (3.36).

31.7.6.3.4 Character inserter function templates

[ostream.inserters.character]

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
// specialization
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
```

1 *Effects:* Behaves as a formatted output function (31.7.6.3.1) of `out`. Constructs a character sequence `seq`. If `c` has type `char` and the character container type of the stream is not `char`, then `seq` consists of `out.widen(c)`; otherwise `seq` consists of `c`. Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `os.width(0)`.

2 *Returns:* `out`.

```
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
```

3 *Preconditions:* `s` is not a null pointer.

4 *Effects:* Behaves like a formatted inserter (as described in 31.7.6.3.1) of `out`. Creates a character sequence `seq` of `n` characters starting at `s`, each widened using `out.widen()` (31.5.4.3), where `n` is the number that would be computed as if by:

(4.1) — `traits::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const charT*`, and also for the overload where the first argument is of type `basic_ostream<char, traits>&` and the second is of type `const char*`,

(4.2) — `char_traits<char>::length(s)` for the overload where the first argument is of type `basic_ostream<charT, traits>&` and the second is of type `const char*`.

Determines padding for `seq` as described in 31.7.6.3.1. Inserts `seq` into `out`. Calls `width(0)`.

5 *Returns:* `out`.

31.7.6.3.5 Print

[ostream.formatted.print]

```
template<class... Args>
    void print(ostream& os, format_string<Args...> fmt, Args&&... args);
```

1 *Effects:* If the ordinary literal encoding (5.3.1) is UTF-8, equivalent to:

```
vprint_unicode(os, fmt.str, make_format_args(args...));
```

Otherwise, equivalent to:

```
vprint_nonunicode(os, fmt.str, make_format_args(args...));
```

```
template<class... Args>
    void println(ostream& os, format_string<Args...> fmt, Args&&... args);
```

2 *Effects:* Equivalent to:

```

    print(os, "{}\n", format(os.getloc(), fmt, std::forward<Args>(args)...));

void println(ostream& os);
3    Effects: Equivalent to:
    print(os, "\n");

```

```

void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);

```

- 4 *Effects:* Behaves as a formatted output function (31.7.6.3.1) of `os`, except that:
- (4.1) — failure to generate output is reported as specified below, and
 - (4.2) — any exception thrown by the call to `vformat` is propagated without regard to the value of `os.exceptions()` and without turning on `ios_base::badbit` in the error state of `os`.

After constructing a `sentry` object, the function initializes a variable with automatic storage duration via

- ```

 string out = vformat(os.getloc(), fmt, args);

```
- (4.3) — If the function is `vprint_unicode` and `os` is a stream that refers to a terminal that is capable of displaying Unicode only via a native Unicode API, which is determined in an implementation-defined manner, flushes `os` and then writes `out` to the terminal using the native Unicode API; if `out` contains invalid code units, the behavior is undefined. Then establishes an observable checkpoint (4.1.2).
  - (4.4) — Otherwise inserts the character sequence `[out.begin(), out.end())` into `os`.

If writing to the terminal or inserting into `os` fails, calls `os.setstate(ios_base::badbit)` (which may throw `ios_base::failure`).

- 5 *Recommended practice:* For `vprint_unicode`, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

#### 31.7.6.4 Unformatted output functions [ostream.unformatted]

- 1 Each unformatted output function begins execution by constructing an object of class `sentry`. If that object returns `true`, while converting to a value of type `bool`, the function endeavors to generate the requested output. If an exception is thrown during output, then `ios_base::badbit` is set<sup>267</sup> in `*this`'s error state. If `(exceptions() & badbit) != 0` then the exception is rethrown. In any case, the unformatted output function ends by destroying the `sentry` object, then, if no exception was thrown, returning the value specified for the unformatted output function.

```

basic_ostream& put(char_type c);

```

- 2 *Effects:* Behaves as an unformatted output function (as described above). After constructing a `sentry` object, inserts the character `c`, if possible.<sup>268</sup>
- 3 Otherwise, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).
- 4 *Returns:* `*this`.

```

basic_ostream& write(const char_type* s, streamsize n);

```

- 5 *Effects:* Behaves as an unformatted output function (as described above). After constructing a `sentry` object, obtains characters to insert from successive locations of an array whose first element is designated by `s`.<sup>269</sup> Characters are inserted until either of the following occurs:
- (5.1) — `n` characters are inserted;
  - (5.2) — inserting in the output sequence fails (in which case the function calls `setstate(badbit)`, which may throw `ios_base::failure` (31.5.4.4)).
- 6 *Returns:* `*this`.

<sup>267</sup>) This is done without causing an `ios_base::failure` to be thrown.

<sup>268</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

<sup>269</sup>) Note that this function is not overloaded on types `signed char` and `unsigned char`.

```
basic_ostream& flush();
```

7 *Effects:* Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a `sentry` object. If that object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)). Otherwise, if the `sentry` object returns `false`, does nothing.

8 *Returns:* `*this`.

### 31.7.6.5 Standard `basic_ostream` manipulators [ostream.manip]

1 Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```
template<class charT, class traits>
basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

2 *Effects:* Calls `os.put(os.widen('\n'))`, then `os.flush()`.

3 *Returns:* `os`.

```
template<class charT, class traits>
basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

4 *Effects:* Inserts a null character into the output sequence: calls `os.put(charT())`.

5 *Returns:* `os`.

```
template<class charT, class traits>
basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

6 *Effects:* Calls `os.flush()`.

7 *Returns:* `os`.

```
template<class charT, class traits>
basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
```

8 *Effects:* If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

[Note 1: To work around the issue that the `Allocator` template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its *emit-on-sync* flag. — end note]

9 *Returns:* `os`.

```
template<class charT, class traits>
basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
```

10 *Effects:* If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

11 *Returns:* `os`.

```
template<class charT, class traits>
basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
```

12 *Effects:* Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, behaves as an unformatted output function (31.7.6.4) of `os`. After constructing a `sentry` object, calls `buf->emit()`. If that call returns `false`, calls `os.setstate(ios_base::badbit)`.

13 *Returns:* `os`.

### 31.7.6.6 Rvalue stream insertion [ostream.rvalue]

```
template<class Ostream, class T>
Ostream&& operator<<(Ostream&& os, const T& x);
```

1 *Constraints:* The expression `os << x` is well-formed when treated as an unevaluated operand and `Ostream` is publicly and unambiguously derived from `ios_base`.

2 *Effects:* As if by: `os << x`;

3 *Returns:* `std::move(os)`.

### 31.7.7 Standard manipulators

[std.manip]

1 The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

*unspecified* `resetiosflags(ios_base::fmtflags mask);`

2 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:<sup>270</sup>

```
void f(ios_base& str, ios_base::fmtflags mask) {
 // reset specified flags
 str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setiosflags(ios_base::fmtflags mask);`

3 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```
void f(ios_base& str, ios_base::fmtflags mask) {
 // set specified flags
 str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setbase(int base);`

4 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```
void f(ios_base& str, int base) {
 // set basefield
 str.setf(base == 8 ? ios_base::oct :
 base == 10 ? ios_base::dec :
 base == 16 ? ios_base::hex :
 ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setfill(char_type c);`

5 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

<sup>270</sup>) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

```

template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
 // set fill character
 str.fill(c);
}

```

The expression `out << setfill(c)` has type `basic_ostream<charT, traits>&` and value `out`.

*unspecified* `setprecision(int n);`

- 6 *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setprecision(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setprecision(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```

void f(ios_base& str, int n) {
 // set precision
 str.precision(n);
}

```

The expression `out << setprecision(n)` has type `basic_ostream<charT, traits>&` and value `out`.  
The expression `in >> setprecision(n)` has type `basic_istream<charT, traits>&` and value `in`.

*unspecified* `setw(int n);`

- 7 *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream<charT, traits>` then the expression `out << setw(n)` behaves as if it called `f(out, n)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setw(n)` behaves as if it called `f(in, n)`, where the function `f` is defined as:

```

void f(ios_base& str, int n) {
 // set width
 str.width(n);
}

```

The expression `out << setw(n)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setw(n)` has type `basic_istream<charT, traits>&` and value `in`.

### 31.7.8 Extended manipulators

[ext.manip]

- 1 The header `<iomanip>` defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

```

template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);

```

- 2 *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 27).

- 3 *Effects:* The expression `in >> get_money(mon, intl)` described below behaves as a formatted input function (31.7.5.3.1).

- 4 *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_money(mon, intl)` behaves as if it called `f(in, mon, intl)`, where the function `f` is defined as:

```

template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
 using Iter = istreambuf_iterator<charT, traits>;
 using MoneyGet = money_get<charT, Iter>;

 ios_base::iostate err = ios_base::goodbit;
 const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());

 mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);

 if (ios_base::goodbit != err)
 str.setstate(err);
}

```

The expression in `>> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value in.

```
template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
```

5     *Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 27).

6     *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_money(mon, intl)` behaves as a formatted output function (31.7.6.3.1) that calls `f(out, mon, intl)`, where the function `f` is defined as:

```
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
 using Iter = ostreambuf_iterator<charT, traits>;
 using MoneyPut = money_put<charT, Iter>;

 const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
 const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);

 if (end.failed())
 str.setstate(ios_base::badbit);
}
```

The expression `out << put_money(mon, intl)` has type `basic_ostream<charT, traits>&` and value `out`.

```
template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
```

7     *Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt))` is a valid range.

8     *Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, tm* tmb, const charT* fmt) {
 using Iter = istreambuf_iterator<charT, traits>;
 using TimeGet = time_get<charT, Iter>;

 ios_base::iostate err = ios_base::goodbit;
 const TimeGet& tg = use_facet<TimeGet>(str.getloc());

 tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
 fmt, fmt + traits::length(fmt));

 if (err != ios_base::goodbit)
 str.setstate(err);
}
```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value in.

```
template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);
```

9     *Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt))` is a valid range.

10    *Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const tm* tmb, const charT* fmt) {
 using Iter = ostreambuf_iterator<charT, traits>;
 using TimePut = time_put<charT, Iter>;

 const TimePut& tp = use_facet<TimePut>(str.getloc());
```

```

const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
 fmt, fmt + traits::length(fmt));

if (end.failed())
 str.setstate(ios_base::badbit);
}

```

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

### 31.7.9 Quoted manipulators

[quoted.manip]

- <sup>1</sup> [Note 1: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — end note]

```

template<class charT>
 unspecified quoted(const charT* s, charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits, class Allocator>
 unspecified quoted(const basic_string<charT, traits, Allocator>& s,
 charT delim = charT('\"'), charT escape = charT('\\'));
template<class charT, class traits>
 unspecified quoted(basic_string_view<charT, traits> s,
 charT delim = charT('\"'), charT escape = charT('\\'));

```

- <sup>2</sup> *Returns:* An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (31.7.6.3.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

- (2.1) — `delim`.
- (2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
- (2.3) — `delim`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 31.7.6.3.1, `seq` is inserted as if by calling `out.rdbuf()->sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```

template<class charT, class traits, class Allocator>
 unspecified quoted(basic_string<charT, traits, Allocator>& s,
 charT delim = charT('\"'), charT escape = charT('\\'));

```

- <sup>3</sup> *Returns:* An object of unspecified type such that:

- (3.1) — If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `operator>>(basic_istream<charT, traits>&, charT&)` (31.7.5.3.3) which may throw `ios_base::failure` (31.5.2.2.1):
  - (3.1.1) — If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
    - (3.1.1.1) — Turn off the `skipws` flag.
    - (3.1.1.2) — `s.clear()`
    - (3.1.1.3) — Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
    - (3.1.1.4) — Discard the final `delim` character.
    - (3.1.1.5) — Restore the `skipws` flag to its original value.
  - (3.1.2) — Otherwise, `in >> s`.

- (3.2) — If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the `quoted` function.
- (3.3) — The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.
- (3.4) — The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

### 31.7.10 Print functions

[print.fun]

```
template<class... Args>
void print(format_string<Args...> fmt, Args&&... args);
```

1 *Effects:* Equivalent to:

```
print(stdout, fmt, std::forward<Args>(args)...);
```

```
template<class... Args>
void print(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

2 *Effects:* Let `locksafe` be `(enable_nonlocking_formatter_optimization<remove_cvref_t<Args>>&& ...)`. If the ordinary literal encoding (5.3.1) is UTF-8, equivalent to:

```
locksafe
? vprint_unicode(stream, fmt.str, make_format_args(args...))
: vprint_unicode_buffered(stream, fmt.str, make_format_args(args...));
```

Otherwise, equivalent to:

```
locksafe
? vprint_nonunicode(stream, fmt.str, make_format_args(args...))
: vprint_nonunicode_buffered(stream, fmt.str, make_format_args(args...));
```

```
template<class... Args>
void println(format_string<Args...> fmt, Args&&... args);
```

3 *Effects:* Equivalent to:

```
println(stdout, fmt, std::forward<Args>(args)...);
```

```
void println();
```

4 *Effects:* Equivalent to:

```
println(stdout);
```

```
template<class... Args>
void println(FILE* stream, format_string<Args...> fmt, Args&&... args);
```

5 *Effects:* Equivalent to:

```
print(stream, dynamic_format(string(fmt.get()) + '\n'), std::forward<Args>(args)...);
```

```
void println(FILE* stream);
```

6 *Effects:* Equivalent to:

```
print(stream, "\n");
```

```
void vprint_unicode(string_view fmt, format_args args);
```

7 *Effects:* Equivalent to:

```
vprint_unicode(stdout, fmt, args);
```

```
void vprint_unicode_buffered(FILE* stream, string_view fmt, format_args args);
```

8 *Effects:* Equivalent to:

```
string out = vformat(fmt, args);
vprint_unicode(stream, "{}", make_format_args(out));
```

```
void vprint_unicode(FILE* stream, string_view fmt, format_args args);
```

9     *Preconditions:* **stream** is a valid pointer to an output C stream.

10    *Effects:* Locks **stream**. Let **out** denote the character representation of formatting arguments provided by **args** formatted according to specifications given in **fmt**.

(10.1)    — If **stream** refers to a terminal that is capable of displaying Unicode only via a native Unicode API, flushes **stream** and then writes **out** to the terminal using the native Unicode API; if **out** contains invalid code units, the behavior is undefined. Then establishes an observable checkpoint (4.1.2).

(10.2)    — Otherwise writes **out** to **stream** unchanged.

Unconditionally unlocks **stream** on function exit.

SEE ALSO: ISO/IEC 9899:2024, 7.23.2.

[*Note 1:* On Windows the native Unicode API is `WriteConsoleW` and **stream** referring to a terminal means that `GetConsoleMode(_get_osfhandle(_fileno(stream)), ...)` returns nonzero. — *end note*]

11    *Throws:* Any exception thrown by the call to `vformat` (28.5.3). `system_error` if writing to the terminal or **stream** fails. May throw `bad_alloc`.

12    *Recommended practice:* If invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion.

```
void vprint_nonunicode(string_view fmt, format_args args);
```

13    *Effects:* Equivalent to:

```
 vprint_nonunicode(stdout, fmt, args);
```

```
void vprint_nonunicode_buffered(FILE* stream, string_view fmt, format_args args);
```

14    *Effects:* Equivalent to:

```
 string out = vformat(fmt, args);
 vprint_nonunicode(stream, "{}", make_format_args(out));
```

```
void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);
```

15    *Preconditions:* **stream** is a valid pointer to an output C stream.

16    *Effects:* While holding the lock on **stream**, writes the character representation of formatting arguments provided by **args** formatted according to specifications given in **fmt** to **stream**.

17    *Throws:* Any exception thrown by the call to `vformat` (28.5.3). `system_error` if writing to **stream** fails. May throw `bad_alloc`.

## 31.8 String-based streams

[string.streams]

### 31.8.1 Header <sstream> synopsis

[sstream.syn]

```
namespace std {
 // 31.8.2, class template basic_stringbuf
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_stringbuf;

 template<class charT, class traits, class Allocator>
 void swap(basic_stringbuf<charT, traits, Allocator>& x,
 basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

 using stringbuf = basic_stringbuf<char>;
 using wstringbuf = basic_stringbuf<wchar_t>;

 // 31.8.3, class template basic_istreamstream
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_istreamstream;

 template<class charT, class traits, class Allocator>
 void swap(basic_istreamstream<charT, traits, Allocator>& x,
 basic_istreamstream<charT, traits, Allocator>& y);
```

```

using istringstream = basic_istringstream<char>;
using wistringstream = basic_istringstream<wchar_t>;

// 31.8.4, class template basic_ostringstream
template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_ostringstream;

template<class charT, class traits, class Allocator>
 void swap(basic_ostringstream<charT, traits, Allocator>& x,
 basic_ostringstream<charT, traits, Allocator>& y);

using ostringstream = basic_ostringstream<char>;
using wostringstream = basic_ostringstream<wchar_t>;

// 31.8.5, class template basic_stringstream
template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_stringstream;

template<class charT, class traits, class Allocator>
 void swap(basic_stringstream<charT, traits, Allocator>& x,
 basic_stringstream<charT, traits, Allocator>& y);

using stringstream = basic_stringstream<char>;
using wstringstream = basic_stringstream<wchar_t>;
}

```

- <sup>1</sup> The header <sstream> defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 27.4.

## 31.8.2 Class template `basic_stringbuf`

[stringbuf]

### 31.8.2.1 General

[stringbuf.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_stringbuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 // 31.8.2.2, constructors
 basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {}
 explicit basic_stringbuf(ios_base::openmode which);
 explicit basic_stringbuf(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
 explicit basic_stringbuf(const Allocator& a)
 : basic_stringbuf(ios_base::in | ios_base::out, a) {}
 basic_stringbuf(ios_base::openmode which, const Allocator& a);
 explicit basic_stringbuf(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
 template<class SAlloc>
 basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_stringbuf(s, ios_base::in | ios_base::out, a) {}
 template<class SAlloc>
 basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
 };
 };

```

```

template<class SAlloc>
 explicit basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
template<class T>
 explicit basic_stringbuf(const T& t,
 ios_base::openmode which = ios_base::in | ios_base::out);
template<class T>
 basic_stringbuf(const T& t, const Allocator& a);
template<class T>
 basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);
basic_stringbuf(const basic_stringbuf&) = delete;
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

// 31.8.2.3, assignment and swap
basic_stringbuf& operator=(const basic_stringbuf&) = delete;
basic_stringbuf& operator=(basic_stringbuf&& rhs);
void swap(basic_stringbuf& rhs) noexcept(see below);

// 31.8.2.4, getters and setters
allocator_type get_allocator() const noexcept;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
 basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
 void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
 void str(const T& t);

protected:
// 31.8.2.5, overridden virtual functions
int_type underflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow(int_type c = traits::eof()) override;
basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;

private:
 ios_base::openmode mode; // exposition only
 basic_string<charT, traits, Allocator> buf; // exposition only
 void init_buf_ptrs(); // exposition only
};
}

```

<sup>1</sup> The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary *characters*. The sequence can be initialized from, or made available as, an object of class `basic_string`.

<sup>2</sup> For the sake of exposition, the maintained data and internal pointer initialization is presented here as:

(2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

- (2.2) — `basic_string<charT, traits, Allocator> buf` contains the underlying character sequence.
- (2.3) — `init-buf-ptrs()` sets the base class' get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to `buf` accordingly.

### 31.8.2.2 Constructors

[stringbuf.cons]

```
explicit basic_stringbuf(ios_base::openmode which);
```

- 1 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), and *mode* with *which*. It is implementation-defined whether the sequence pointers (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) are initialized to null pointers.

- 2 *Postconditions:* `str().empty()` is true.

```
explicit basic_stringbuf(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

- 3 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), *mode* with *which*, and *buf* with *s*, then calls `init-buf-ptrs()`.

```
basic_stringbuf(ios_base::openmode which, const Allocator& a);
```

- 4 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), *mode* with *which*, and *buf* with *a*, then calls `init-buf-ptrs()`.

- 5 *Postconditions:* `str().empty()` is true.

```
explicit basic_stringbuf(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

- 6 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), *mode* with *which*, and *buf* with `std::move(s)`, then calls `init-buf-ptrs()`.

```
template<class SAlloc>
basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
```

- 7 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), *mode* with *which*, and *buf* with `{s,a}`, then calls `init-buf-ptrs()`.

```
template<class SAlloc>
explicit basic_stringbuf(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

- 8 *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

- 9 *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), *mode* with *which*, and *buf* with *s*, then calls `init-buf-ptrs()`.

```
template<class T>
explicit basic_stringbuf(const T& t, ios_base::openmode which = ios_base::in | ios_base::out);
template<class T>
basic_stringbuf(const T& t, const Allocator& a);
template<class T>
basic_stringbuf(const T& t, ios_base::openmode which, const Allocator& a);
```

- 10 Let *which* be `ios_base::in | ios_base::out` for the overload with no parameter *which*, and *a* be `Allocator()` for the overload with no parameter *a*.

- 11 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- 12 *Effects:* Creates a variable *sv* as if by `basic_string_view<charT, traits> sv = t`, then value-initializes the base class, initializes *mode* with *which*, and direct-non-list-initializes *buf* with *sv*, *a*, then calls `init-buf-ptrs()`.

```
basic_stringbuf(basic_stringbuf&& rhs);
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

13 *Effects:* Copy constructs the base class from `rhs` and initializes `mode` with `rhs.mode`. In the first form `buf` is initialized from `std::move(rhs).str()`. In the second form `buf` is initialized from `{std::move(rhs).str(), a}`. It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had.

14 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- (14.1) — `str() == rhs_p.str()`
- (14.2) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- (14.3) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- (14.4) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- (14.5) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- (14.6) — `if (eback()) eback() != rhs_a.eback()`
- (14.7) — `if (gptr()) gptr() != rhs_a.gptr()`
- (14.8) — `if (egptr()) egptr() != rhs_a.egptr()`
- (14.9) — `if (pbase()) pbase() != rhs_a.pbase()`
- (14.10) — `if (pptr()) pptr() != rhs_a.pptr()`
- (14.11) — `if (epptr()) epptr() != rhs_a.epptr()`
- (14.12) — `getloc() == rhs_p.getloc()`
- (14.13) — `rhs` is empty but usable, as if `std::move(rhs).str()` was called.

### 31.8.2.3 Assignment and swap

[stringbuf.assign]

```
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

1 *Effects:* After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 31.8.2.2).

2 *Returns:* `*this`.

```
void swap(basic_stringbuf& rhs) noexcept(see below);
```

3 *Preconditions:* `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `get_allocator() == rhs.get_allocator()` is true.

4 *Effects:* Exchanges the state of `*this` and `rhs`.

5 *Remarks:* The exception specification is equivalent to:

```
allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
 basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));
```

6 *Effects:* Equivalent to `x.swap(y)`.

### 31.8.2.4 Member functions

[stringbuf.members]

1 The member functions getting the underlying character sequence all refer to a `high_mark` value, where `high_mark` represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the `basic_stringbuf` passing a `basic_string` argument, or by calling one of the `str` member functions passing a `basic_string` as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new `basic_string`).

```
void init_buf_ptrs();
```

2 *Effects:* Initializes the input and output sequences from `buf` according to `mode`.

3 *Postconditions:*

(3.1) — If `ios_base::out` is set in *mode*, `pbase()` points to `buf.front()` and `eptr() >= pbase() + buf.size()` is true;

(3.1.1) — in addition, if `ios_base::ate` is set in *mode*, `pptr() == pbase() + buf.size()` is true,

(3.1.2) — otherwise `pptr() == pbase()` is true.

(3.2) — If `ios_base::in` is set in *mode*, `eback()` points to `buf.front()`, and `(gptr() == eback() && egptr() == eback() + buf.size())` is true.

4 [Note 1: For efficiency reasons, stream buffer operations can violate invariants of `buf` while it is held encapsulated in the `basic_stringbuf`, e.g., by writing to characters in the range `[buf.data() + buf.size(), buf.data() + buf.capacity())`. All operations retrieving a `basic_string` from `buf` ensure that the `basic_string` invariants hold on the returned value. — end note]

`allocator_type get_allocator() const noexcept;`

5 *Returns:* `buf.get_allocator()`.

`basic_string<charT, traits, Allocator> str() const &;`

6 *Effects:* Equivalent to:

`return basic_string<charT, traits, Allocator>(view(), get_allocator());`

`template<class SAlloc>`

`basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;`

7 *Constraints:* `SAlloc` is a type that qualifies as an allocator (23.2.2.2).

8 *Effects:* Equivalent to:

`return basic_string<charT, traits, SAlloc>(view(), sa);`

`basic_string<charT, traits, Allocator> str() &&;`

9 *Postconditions:* The underlying character sequence `buf` is empty and `pbase()`, `pptr()`, `eptr()`, `eback()`, `gptr()`, and `egptr()` are initialized as if by calling *init-buf-ptrs()* with an empty `buf`.

10 *Returns:* A `basic_string<charT, traits, Allocator>` object move constructed from the `basic_stringbuf`'s underlying character sequence in `buf`. This can be achieved by first adjusting `buf` to have the same content as `view()`.

`basic_string_view<charT, traits> view() const noexcept;`

11 Let `sv` be `basic_string_view<charT, traits>`.

12 *Returns:* A `sv` object referring to the `basic_stringbuf`'s underlying character sequence in `buf`:

(12.1) — If `ios_base::out` is set in *mode*, then `sv(pbase(), high_mark - pbase())` is returned.

(12.2) — Otherwise, if `ios_base::in` is set in *mode*, then `sv(eback(), egptr() - eback())` is returned.

(12.3) — Otherwise, `sv()` is returned.

13 [Note 2: Using the returned `sv` object after destruction or invalidation of the character sequence underlying *this* is undefined behavior, unless `sv.empty()` is true. — end note]

`void str(const basic_string<charT, traits, Allocator>& s);`

14 *Effects:* Equivalent to:

`buf = s;`  
`init-buf-ptrs();`

`template<class SAlloc>`

`void str(const basic_string<charT, traits, SAlloc>& s);`

15 *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

16 *Effects:* Equivalent to:

`buf = s;`  
`init-buf-ptrs();`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

17 *Effects:* Equivalent to:

```
 buf = std::move(s);
 init_buf_ptrs();
```

```
template<class T>
void str(const T& t);
```

18 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

19 *Effects:* Equivalent to:

```
 basic_string_view<charT, traits> sv = t;
 buf = sv;
 init_buf_ptrs();
```

### 31.8.2.5 Overridden virtual functions

[stringbuf.virtuals]

```
int_type underflow() override;
```

1 *Returns:* If the input sequence has a read position available, returns `traits::to_int_type(*gptr())`. Otherwise, returns `traits::eof()`. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

```
int_type pbackfail(int_type c = traits::eof()) override;
```

2 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(2.1) — If `traits::eq_int_type(c, traits::eof())` returns false and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns true, assigns `gptr() - 1` to `gptr()`.

Returns: `c`.

(2.2) — If `traits::eq_int_type(c, traits::eof())` returns false and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns `c` to `*--gptr()`.

Returns: `c`.

(2.3) — If `traits::eq_int_type(c, traits::eof())` returns true and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.

Returns: `traits::not_eof(c)`.

3 *Returns:* As specified above, or `traits::eof()` to indicate failure.

4 *Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```
int_type overflow(int_type c = traits::eof()) override;
```

5 *Effects:* Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

(5.1) — If `traits::eq_int_type(c, traits::eof())` returns false and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.

Signals success by returning `c`.

(5.2) — If `traits::eq_int_type(c, traits::eof())` returns true, there is no character to append.

Signals success by returning a value other than `traits::eof()`.

6 *Returns:* As specified above, or `traits::eof()` to indicate failure.

7 *Remarks:* The function can alter the number of write positions available as a result of any call.

8 The function can make a write position available only if `ios_base::out` is set in *mode*. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If `ios_base::in` is set in *mode*, the function alters the read end pointer `egptr()` to point just past the new write position.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

- 9 *Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 144.

Table 144 — seekoff positioning [tab:stringbuf.seekoff.pos]

| Conditions                                                                                                                                                             | Result                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <code>ios_base::in</code> is set in which                                                                                                                              | positions the input sequence                      |
| <code>ios_base::out</code> is set in which                                                                                                                             | positions the output sequence                     |
| both <code>ios_base::in</code> and <code>ios_base::out</code> are set in which and either<br><code>way == ios_base::beg</code> or<br><code>way == ios_base::end</code> | positions both the input and the output sequences |
| Otherwise                                                                                                                                                              | the positioning operation fails.                  |

- 10 For a sequence to be positioned, the function determines `newoff` as indicated in Table 145. If the sequence's next pointer (either `gptr()` or `pptr()`) is a null pointer and `newoff` is nonzero, the positioning operation fails.

Table 145 — newoff values [tab:stringbuf.seekoff.newoff]

| Condition                         | newoff Value                                                                         |
|-----------------------------------|--------------------------------------------------------------------------------------|
| <code>way == ios_base::beg</code> | 0                                                                                    |
| <code>way == ios_base::cur</code> | the next pointer minus the beginning pointer ( <code>xnext - xbeg</code> ).          |
| <code>way == ios_base::end</code> | the high mark pointer minus the beginning pointer ( <code>high_mark - xbeg</code> ). |

- 11 If  $(\text{newoff} + \text{off}) < 0$ , or if `newoff + off` refers to an uninitialized character (31.8.2.4), the positioning operation fails. Otherwise, the function assigns `xbeg + newoff + off` to the next pointer `xnext`.
- 12 *Returns:* `pos_type(newoff)`, constructed from the resultant offset `newoff` (of type `off_type`), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is `pos_type(off_type(-1))`.

```
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

- 13 *Effects:* Equivalent to `seekoff(off_type(sp), ios_base::beg, which)`.
- 14 *Returns:* `sp` to indicate success, or `pos_type(off_type(-1))` to indicate failure.

```
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

- 15 *Effects:* implementation-defined, except that `setbuf(0, 0)` has no effect.

- 16 *Returns:* `this`.

### 31.8.3 Class template `basic_istream`

[istreamream]

#### 31.8.3.1 General

[istreamream.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_istream : public basic_istream<charT, traits> {
 public:
 using char_type = charT;
```

```

using int_type = traits::int_type;
using pos_type = traits::pos_type;
using off_type = traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;

// 31.8.3.2, constructors
basic_istreamstream() : basic_istreamstream(ios_base::in) {}
explicit basic_istreamstream(ios_base::openmode which);
explicit basic_istreamstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in);
basic_istreamstream(ios_base::openmode which, const Allocator& a);
explicit basic_istreamstream(
 const basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in);
template<class SAlloc>
 basic_istreamstream(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_istreamstream(s, ios_base::in, a) {}
template<class SAlloc>
 basic_istreamstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
template<class SAlloc>
 explicit basic_istreamstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in);
template<class T>
 explicit basic_istreamstream(const T& t, ios_base::openmode which = ios_base::in);
template<class T>
 basic_istreamstream(const T& t, const Allocator& a);
template<class T>
 basic_istreamstream(const T& t, ios_base::openmode which, const Allocator& a);
basic_istreamstream(const basic_istreamstream&) = delete;
basic_istreamstream(basic_istreamstream&& rhs);

basic_istreamstream& operator=(const basic_istreamstream&) = delete;
basic_istreamstream& operator=(basic_istreamstream&& rhs);

// 31.8.3.3, swap
void swap(basic_istreamstream& rhs);

// 31.8.3.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
 basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
 void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
 void str(const T& t);

private:
 basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};
}

```

- <sup>1</sup> The class `basic_istream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

### 31.8.3.2 Constructors

[istreamstream.cons]

```
explicit basic_istream(ios_base::openmode which);
```

- <sup>1</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (31.8.2.2).

```
explicit basic_istream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::in);
```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (31.8.2.2).

```
basic_istream(ios_base::openmode which, const Allocator& a);
```

- <sup>3</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a)` (31.8.2.2).

```
explicit basic_istream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::in);
```

- <sup>4</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::in)` (31.8.2.2).

```
template<class SAlloc>
basic_istream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
```

- <sup>5</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in, a)` (31.8.2.2).

```
template<class SAlloc>
explicit basic_istream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::in);
```

- <sup>6</sup> *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

- <sup>7</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in)` (31.8.2.2).

```
template<class T>
explicit basic_istream(const T& t, ios_base::openmode which = ios_base::in);
template<class T>
basic_istream(const T& t, const Allocator& a);
template<class T>
basic_istream(const T& t, ios_base::openmode which, const Allocator& a);
```

- <sup>8</sup> Let `which` be `ios_base::in` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

- <sup>9</sup> *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- <sup>10</sup> *Effects:* Initializes the base class with `addressof(sb)`, and direct-non-list-initializes `sb` with `t`, which | `ios_base::in`, `a`.

```
basic_istream(basic_istream&& rhs);
```

- 11 *Effects:* Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

### 31.8.3.3 Swap

[istream.swap]

```
void swap(basic_istream& rhs);
```

- 1 *Effects:* Equivalent to:

```
 basic_istream<charT, traits>::swap(rhs);
 sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_istream<charT, traits, Allocator>& x,
 basic_istream<charT, traits, Allocator>& y);
```

- 2 *Effects:* Equivalent to `x.swap(y)`.

### 31.8.3.4 Member functions

[istream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

- 1 *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

- 2 *Effects:* Equivalent to: `return rdbuf()->str();`

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

- 3 *Effects:* Equivalent to: `return rdbuf()->str(sa);`

```
basic_string<charT, traits, Allocator> str() &&;
```

- 4 *Effects:* Equivalent to: `return std::move(*rdbuf()).str();`

```
basic_string_view<charT, traits> view() const noexcept;
```

- 5 *Effects:* Equivalent to: `return rdbuf()->view();`

```
void str(const basic_string<charT, traits, Allocator>& s);
```

- 6 *Effects:* Equivalent to: `rdbuf()->str(s);`

```
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

- 7 *Effects:* Equivalent to: `rdbuf()->str(s);`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

- 8 *Effects:* Equivalent to: `rdbuf()->str(std::move(s));`

```
template<class T>
void str(const T& t);
```

- 9 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- 10 *Effects:* Equivalent to: `rdbuf()->str(t);`

## 31.8.4 Class template `basic_ostringstream`

[ostream]

### 31.8.4.1 General

[ostream.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_ostringstream : public basic_ostream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
```

```

using off_type = traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;

// 31.8.4.2, constructors
basic_ostringstream() : basic_ostringstream(ios_base::out) {}
explicit basic_ostringstream(ios_base::openmode which);
explicit basic_ostringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out);
basic_ostringstream(ios_base::openmode which, const Allocator& a);
explicit basic_ostringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out);
template<class SAlloc>
 basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_ostringstream(s, ios_base::out, a) {}
template<class SAlloc>
 basic_ostringstream(
 const basic_string<charT, traits, SAlloc>&& s,
 ios_base::openmode which, const Allocator& a);
template<class SAlloc>

 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out);
template<class T>
 explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
template<class T>
 basic_ostringstream(const T& t, const Allocator& a);
template<class T>
 basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);
basic_ostringstream(const basic_ostringstream&) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

basic_ostringstream& operator=(const basic_ostringstream&) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);

// 31.8.4.3, swap
void swap(basic_ostringstream& rhs);

// 31.8.4.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
 basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
 void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
 void str(const T& t);

private:
 basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};
}

```

- <sup>1</sup> The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `stringbuf` object.

### 31.8.4.2 Constructors

[`ostringstream.cons`]

```
explicit basic_ostringstream(ios_base::openmode which);
```

- <sup>1</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out)` (31.8.2.2).

```
explicit basic_ostringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out);
```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

```
basic_ostringstream(ios_base::openmode which, const Allocator& a);
```

- <sup>3</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a)` (31.8.2.2).

```
explicit basic_ostringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out);
```

- <sup>4</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out)` (31.8.2.2).

```
template<class SAlloc>
basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
```

- <sup>5</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a)` (31.8.2.2).

```
template<class SAlloc>
explicit basic_ostringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out);
```

- <sup>6</sup> *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

- <sup>7</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

```
template<class T>
explicit basic_ostringstream(const T& t, ios_base::openmode which = ios_base::out);
template<class T>
basic_ostringstream(const T& t, const Allocator& a);
template<class T>
basic_ostringstream(const T& t, ios_base::openmode which, const Allocator& a);
```

- <sup>8</sup> Let `which` be `ios_base::out` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

- <sup>9</sup> *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- <sup>10</sup> *Effects:* Initializes the base class with `addressof(sb)`, and direct-non-list-initializes `sb` with `t`, `which | ios_base::out`, `a`.

```
basic_ostringstream(basic_ostringstream&& rhs);
```

- 11 *Effects:* Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

#### 31.8.4.3 Swap

[ostream.swap]

```
void swap(basic_ostringstream& rhs);
```

- 1 *Effects:* Equivalent to:

```
 basic_ostream<charT, traits>::swap(rhs);
 sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
 basic_ostringstream<charT, traits, Allocator>& y);
```

- 2 *Effects:* Equivalent to `x.swap(y)`.

#### 31.8.4.4 Member functions

[ostream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

- 1 *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

- 2 *Effects:* Equivalent to: `return rdbuf()->str();`

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

- 3 *Effects:* Equivalent to: `return rdbuf()->str(sa);`

```
basic_string<charT, traits, Allocator> str() &&;
```

- 4 *Effects:* Equivalent to: `return std::move(*rdbuf()).str();`

```
basic_string_view<charT, traits> view() const noexcept;
```

- 5 *Effects:* Equivalent to: `return rdbuf()->view();`

```
void str(const basic_string<charT, traits, Allocator>& s);
```

- 6 *Effects:* Equivalent to: `rdbuf()->str(s);`

```
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

- 7 *Effects:* Equivalent to: `rdbuf()->str(s);`

```
void str(basic_string<charT, traits, Allocator>&& s);
```

- 8 *Effects:* Equivalent to: `rdbuf()->str(std::move(s));`

```
template<class T>
void str(const T& t);
```

- 9 *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- 10 *Effects:* Equivalent to: `rdbuf()->str(t);`

### 31.8.5 Class template `basic_stringstream`

[stringstream]

#### 31.8.5.1 General

[stringstream.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_stringstream : public basic_istream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
```

```

using off_type = traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;

// 31.8.5.2, constructors
basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {}
explicit basic_stringstream(ios_base::openmode which);
explicit basic_stringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
basic_stringstream(ios_base::openmode which, const Allocator& a);
explicit basic_stringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
template<class SAlloc>
 basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s, const Allocator& a)
 : basic_stringstream(s, ios_base::out | ios_base::in, a) {}
template<class SAlloc>
 basic_stringstream(
 const basic_string<charT, traits, SAlloc>&& s,
 ios_base::openmode which, const Allocator& a);
template<class SAlloc>
 explicit basic_stringstream(
 const basic_string<charT, traits, SAlloc>&& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
 explicit basic_stringstream(const T& t,
 ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
 basic_stringstream(const T& t, const Allocator& a);
template<class T>
 basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);
basic_stringstream(const basic_stringstream&) = delete;
basic_stringstream(basic_stringstream&& rhs);

basic_stringstream& operator=(const basic_stringstream&) = delete;
basic_stringstream& operator=(basic_stringstream&& rhs);

// 31.8.5.3, swap
void swap(basic_stringstream& rhs);

// 31.8.5.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
 basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;

void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
 void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
template<class T>
 void str(const T& t);

private:
 basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};
}

```

- <sup>1</sup> The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

(1.1) — `sb`, the `stringbuf` object.

### 31.8.5.2 Constructors

[`stringstream.cons`]

```
explicit basic_stringstream(ios_base::openmode which);
```

- <sup>1</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

```
explicit basic_stringstream(
 const basic_string<charT, traits, Allocator>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)`.

```
basic_stringstream(ios_base::openmode which, const Allocator& a);
```

- <sup>3</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)` (31.8.2.2).

```
explicit basic_stringstream(
 basic_string<charT, traits, Allocator>&& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
```

- <sup>4</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)` (31.8.2.2).

```
template<class SAlloc>
basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which, const Allocator& a);
```

- <sup>5</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2).

```
template<class SAlloc>
explicit basic_stringstream(
 const basic_string<charT, traits, SAlloc>& s,
 ios_base::openmode which = ios_base::out | ios_base::in);
```

- <sup>6</sup> *Constraints:* `is_same_v<SAlloc, Allocator>` is false.

- <sup>7</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)` (31.8.2.2).

```
template<class T>
explicit basic_stringstream(const T& t, ios_base::openmode which = ios_base::out | ios_base::in);
template<class T>
basic_stringstream(const T& t, const Allocator& a);
template<class T>
basic_stringstream(const T& t, ios_base::openmode which, const Allocator& a);
```

- <sup>8</sup> Let `which` be `ios_base::out | ios_base::in` for the overload with no parameter `which`, and `a` be `Allocator()` for the overload with no parameter `a`.

- <sup>9</sup> *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

- <sup>10</sup> *Effects:* Initializes the base class with `addressof(sb)`, and direct-non-list-initializes `sb` with `t`, `which`, `a`.

```
basic_stringstream(basic_stringstream&& rhs);
```

- <sup>11</sup> *Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

**31.8.5.3 Swap**

[stringstream.swap]

```
void swap(basic_stringstream& rhs);
```

1     *Effects:* Equivalent to:

```
 basic_iostream<charT, traits>::swap(rhs);
 sb.swap(rhs.sb);
```

```
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
 basic_stringstream<charT, traits, Allocator>& y);
```

2     *Effects:* Equivalent to `x.swap(y)`.

**31.8.5.4 Member functions**

[stringstream.members]

```
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

1     *Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```
basic_string<charT, traits, Allocator> str() const &;
```

2     *Effects:* Equivalent to: `return rdbuf()->str()`;

```
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

3     *Effects:* Equivalent to: `return rdbuf()->str(sa)`;

```
basic_string<charT, traits, Allocator> str() &&;
```

4     *Effects:* Equivalent to: `return std::move(*rdbuf()).str()`;

```
basic_string_view<charT, traits> view() const noexcept;
```

5     *Effects:* Equivalent to: `return rdbuf()->view()`;

```
void str(const basic_string<charT, traits, Allocator>& s);
```

6     *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

7     *Effects:* Equivalent to: `rdbuf()->str(s)`;

```
void str(basic_string<charT, traits, Allocator>&& s);
```

8     *Effects:* Equivalent to: `rdbuf()->str(std::move(s))`;

```
template<class T>
void str(const T& t);
```

9     *Constraints:* `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

10    *Effects:* Equivalent to: `rdbuf()->str(t)`;

**31.9 Span-based streams**

[span.streams]

**31.9.1 Overview**

[span.streams.overview]

1    The header `<spanstream>` defines class templates and types that associate stream buffers with objects whose types are specializations of `span` as described in 23.7.2.2.

[*Note 1:* A user of these classes is responsible for ensuring that the character sequence represented by the given `span` outlives the use of the sequence by objects of the classes in 31.9. Using multiple `basic_spanbuf` objects referring to overlapping underlying sequences from different threads, where at least one `basic_spanbuf` object is used for writing to the sequence, results in a data race. — *end note*]

**31.9.2 Header `<spanstream>` synopsis**

[spanstream.syn]

```
namespace std {
 // 31.9.3, class template basic_spanbuf
 template<class charT, class traits = char_traits<charT>>
 class basic_spanbuf;
```

```

template<class charT, class traits>
 void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

using spanbuf = basic_spanbuf<char>;
using wspanbuf = basic_spanbuf<wchar_t>;

// 31.9.4, class template basic_ispanstream
template<class charT, class traits = char_traits<charT>>
 class basic_ispanstream;

template<class charT, class traits>
 void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

using ispanstream = basic_ispanstream<char>;
using wspanstream = basic_ispanstream<wchar_t>;

// 31.9.5, class template basic_ostream
template<class charT, class traits = char_traits<charT>>
 class basic_ostream;

template<class charT, class traits>
 void swap(basic_ostream<charT, traits>& x, basic_ostream<charT, traits>& y);

using ostream = basic_ostream<char>;
using wostream = basic_ostream<wchar_t>;

// 31.9.6, class template basic_spanstream
template<class charT, class traits = char_traits<charT>>
 class basic_spanstream;

template<class charT, class traits>
 void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

using spanstream = basic_spanstream<char>;
using wspanstream = basic_spanstream<wchar_t>;
}

```

### 31.9.3 Class template basic\_spanbuf

[spanbuf]

#### 31.9.3.1 General

[spanbuf.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_spanbuf
 : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;

 // 31.9.3.2, constructors
 basic_spanbuf() : basic_spanbuf(ios_base::in | ios_base::out) {}
 explicit basic_spanbuf(ios_base::openmode which)
 : basic_spanbuf(std::span<charT>(), which) {}
 explicit basic_spanbuf(std::span<charT> s,
 ios_base::openmode which = ios_base::in | ios_base::out);
 basic_spanbuf(const basic_spanbuf&) = delete;
 basic_spanbuf(basic_spanbuf&& rhs);

 // 31.9.3.3, assignment and swap
 basic_spanbuf& operator=(const basic_spanbuf&) = delete;
 basic_spanbuf& operator=(basic_spanbuf&& rhs);
 void swap(basic_spanbuf& rhs);
 };
 };
}

```

```

// 31.9.3.4, member functions
std::span<charT> span() const noexcept;
void span(std::span<charT> s) noexcept;

protected:
// 31.9.3.5, overridden virtual functions
basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
 ios_base::openmode which = ios_base::in | ios_base::out) override;

private:
 ios_base::openmode mode; // exposition only
 std::span<charT> buf; // exposition only
};
}

```

<sup>1</sup> The class template `basic_spanbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class `span<charT>`.

<sup>2</sup> For the sake of exposition, the maintained data is presented here as:

(2.1) — `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

(2.2) — `std::span<charT> buf` is the view to the underlying character sequence.

### 31.9.3.2 Constructors

[spanbuf.cons]

```
explicit basic_spanbuf(std::span<charT> s,
 ios_base::openmode which = ios_base::in | ios_base::out);
```

<sup>1</sup> *Effects:* Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with `which`. Initializes the internal pointers as if calling `span(s)`.

```
basic_spanbuf(basic_spanbuf&& rhs);
```

<sup>2</sup> *Effects:* Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns true after the move.

<sup>3</sup> *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction.

(3.1) — `span().data() == rhs_p.span().data()`

(3.2) — `span().size() == rhs_p.span().size()`

(3.3) — `eback() == rhs_p.eback()`

(3.4) — `gptr() == rhs_p.gptr()`

(3.5) — `egptr() == rhs_p.egptr()`

(3.6) — `pbase() == rhs_p.pbase()`

(3.7) — `pptr() == rhs_p.pptr()`

(3.8) — `epptr() == rhs_p.epptr()`

(3.9) — `getloc() == rhs_p.getloc()`

### 31.9.3.3 Assignment and swap

[spanbuf.assign]

```
basic_spanbuf& operator=(basic_spanbuf&& rhs);
```

<sup>1</sup> *Effects:* Equivalent to:

```

 basic_spanbuf tmp{std::move(rhs)};
 this->swap(tmp);
 return *this;

```

```
void swap(basic_spanbuf& rhs);
```

2 *Effects:* Equivalent to:

```
 basic_streambuf<charT, traits>::swap(rhs);
 std::swap(mode, rhs.mode);
 std::swap(buf, rhs.buf);
```

```
template<class charT, class traits>
```

```
 void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);
```

3 *Effects:* Equivalent to `x.swap(y)`.

### 31.9.3.4 Member functions

[spanbuf.members]

```
std::span<charT> span() const noexcept;
```

1 *Returns:* If `ios_base::out` is set in *mode*, returns `std::span<charT>(pbase(), pptr())`, otherwise returns *buf*.

[Note 1: In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`. — end note]

```
void span(std::span<charT> s) noexcept;
```

2 *Effects:* *buf* = *s*. Initializes the input and output sequences according to *mode*.

3 *Postconditions:*

- (3.1) — If `ios_base::out` is set in *mode*, `pbase() == s.data() && epptr() == pbase() + s.size()` is true;
- (3.1.1) — in addition, if `ios_base::ate` is set in *mode*, `pptr() == pbase() + s.size()` is true,
- (3.1.2) — otherwise `pptr() == pbase()` is true.
- (3.2) — If `ios_base::in` is set in *mode*, `eback() == s.data() && gptra() == eback() && egptra() == eback() + s.size()` is true.

### 31.9.3.5 Overridden virtual functions

[spanbuf.virtuals]

1 [Note 1: Because the underlying buffer is of fixed size, neither `overflow`, `underflow`, nor `pbackfail` can provide useful behavior. — end note]

```
pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which = ios_base::in | ios_base::out) override;
```

2 *Effects:* Alters the stream position within one or both of the controlled sequences, if possible, as follows:

- (2.1) — If `ios_base::in` is set in *which*, positions the input sequence; *xnext* is `gptra()`, *xbeg* is `eback()`.
- (2.2) — If `ios_base::out` is set in *which*, positions the output sequence; *xnext* is `pptra()`, *xbeg* is `pbase()`.

3 If both `ios_base::in` and `ios_base::out` are set in *which* and *way* is `ios_base::cur`, the positioning operation fails.

4 For a sequence to be positioned, if its next pointer *xnext* (either `gptra()` or `pptra()`) is a null pointer and the new offset *newoff* as computed below is nonzero, the positioning operation fails. Otherwise, the function determines *baseoff* as a value of type *off\_type* as follows:

- (4.1) — 0 when *way* is `ios_base::beg`;
- (4.2) — `(pptra() - pbase())` for the output sequence, or `(gptra() - eback())` for the input sequence when *way* is `ios_base::cur`;
- (4.3) — when *way* is `ios_base::end` :
  - (4.3.1) — `(pptra() - pbase())` if `ios_base::out` is set in *mode* and `ios_base::in` is not set in *mode*,
  - (4.3.2) — `buf.size()` otherwise.

5 If *baseoff* + *off* would overflow, or if *baseoff* + *off* is less than zero, or if *baseoff* + *off* is greater than `buf.size()`, the positioning operation fails. Otherwise, the function computes

```
 off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer `xnext`.

6 *Returns:* `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

`pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;`

7 *Effects:* Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

`basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;`

8 *Effects:* Equivalent to:

```
this->span(std::span<charT>(s, n));
return this;
```

### 31.9.4 Class template `basic_ispanstream`

[`ispanstream`]

#### 31.9.4.1 General

[`ispanstream.general`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ispanstream
 : public basic_istream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;

 // 31.9.4.2, constructors
 explicit basic_ispanstream(std::span<charT> s,
 ios_base::openmode which = ios_base::in);
 basic_ispanstream(const basic_ispanstream&) = delete;
 basic_ispanstream(basic_ispanstream&& rhs);
 template<class ROS> explicit basic_ispanstream(ROS&& s);

 basic_ispanstream& operator=(const basic_ispanstream&) = delete;
 basic_ispanstream& operator=(basic_ispanstream&& rhs);

 // 31.9.4.3, swap
 void swap(basic_ispanstream& rhs);

 // 31.9.4.4, member functions
 basic_spanbuf<charT, traits>* rdbuf() const noexcept;

 std::span<const charT> span() const noexcept;
 void span(std::span<charT> s) noexcept;
 template<class ROS> void span(ROS&& s) noexcept;

 private:
 basic_spanbuf<charT, traits> sb; // exposition only
 };
}
```

1 [Note 1: Constructing an `ispanstream` from a *string-literal* includes the termination character `'\0'` in the underlying `spanbuf`. — end note]

#### 31.9.4.2 Constructors

[`ispanstream.cons`]

```
explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);
```

1 *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::in)` (31.9.3.2).

```
basic_ispanstream(basic_ispanstream&& rhs);
```

- 2 *Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

```
template<class ROS> explicit basic_ispanstream(ROS&& s)
```

- 3 *Constraints:* ROS models `ranges::borrowed_range`. `!convertible_to<ROS, std::span<charT>>` && `convertible_to<ROS, std::span<charT const>>` is true.

- 4 *Effects:* Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to:

```
basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))
```

### 31.9.4.3 Swap

[ispanstream.swap]

```
void swap(basic_ispanstream& rhs);
```

- 1 *Effects:* Equivalent to:

```
basic_istream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
```

```
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);
```

- 2 *Effects:* Equivalent to `x.swap(y)`.

### 31.9.4.4 Member functions

[ispanstream.members]

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

- 1 *Effects:* Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<const charT> span() const noexcept;
```

- 2 *Effects:* Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

- 3 *Effects:* Equivalent to `rdbuf()->span(s)`.

```
template<class ROS> void span(ROS&& s) noexcept;
```

- 4 *Constraints:* ROS models `ranges::borrowed_range`. (`!convertible_to<ROS, std::span<charT>>`) && `convertible_to<ROS, std::span<const charT>>` is true.

- 5 *Effects:* Let `sp` be `std::span<const charT>(std::forward<ROS>(s))`. Equivalent to:

```
this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()));
```

## 31.9.5 Class template basic\_ostream

[ostream]

### 31.9.5.1 General

[ostream.general]

```
namespace std {
```

```
template<class charT, class traits = char_traits<charT>>
```

```
class basic_ostream
```

```
: public basic_ostream<charT, traits> {
```

```
public:
```

```
using char_type = charT;
```

```
using int_type = traits::int_type;
```

```
using pos_type = traits::pos_type;
```

```
using off_type = traits::off_type;
```

```
using traits_type = traits;
```

```
// 31.9.5.2, constructors
```

```
explicit basic_ostream(std::span<charT> s,
```

```
ios_base::openmode which = ios_base::out);
```

```
basic_ostream(const basic_ostream&) = delete;
```

```
basic_ostream(basic_ostream&& rhs);
```

```

basic_ostream& operator=(const basic_ostream&) = delete;
basic_ostream& operator=(basic_ostream&& rhs);

// 31.9.5.3, swap
void swap(basic_ostream& rhs);

// 31.9.5.4, member functions
basic_spanbuf<charT, traits>* rdbuf() const noexcept;

std::span<charT> span() const noexcept;
void span(std::span<charT> s) noexcept;

private:
 basic_spanbuf<charT, traits> sb; // exposition only
};
}

```

### 31.9.5.2 Constructors [ostream.cons]

```

explicit basic_ostream(std::span<charT> s,
 ios_base::openmode which = ios_base::out);

```

- 1 *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::out)` (31.9.3.2).

```

basic_ostream(basic_ostream&& rhs) noexcept;

```

- 2 *Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

### 31.9.5.3 Swap [ostream.swap]

```

void swap(basic_ostream& rhs);

```

- 1 *Effects:* Equivalent to:
- ```

    basic_ostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

```

```

template<class charT, class traits>
void swap(basic_ostream<charT, traits>& x, basic_ostream<charT, traits>& y);

```

- 2 *Effects:* Equivalent to `x.swap(y)`.

31.9.5.4 Member functions [ostream.members]

```

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

```

- 1 *Effects:* Equivalent to:
- ```

 return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

```

```

std::span<charT> span() const noexcept;

```

- 2 *Effects:* Equivalent to: `return rdbuf()->span();`

```

void span(std::span<charT> s) noexcept;

```

- 3 *Effects:* Equivalent to `rdbuf()->span(s)`.

## 31.9.6 Class template `basic_spanstream` [spanstream]

### 31.9.6.1 General [spanstream.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_spanstream
 : public basic_istream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;

```

```

using pos_type = traits::pos_type;
using off_type = traits::off_type;
using traits_type = traits;

// 31.9.6.2, constructors
explicit basic_spanstream(std::span<charT> s,
 ios_base::openmode which = ios_base::out | ios_base::in);
basic_spanstream(const basic_spanstream&) = delete;
basic_spanstream(basic_spanstream&& rhs);

basic_spanstream& operator=(const basic_spanstream&) = delete;
basic_spanstream& operator=(basic_spanstream&& rhs);

// 31.9.6.3, swap
void swap(basic_spanstream& rhs);

// 31.9.6.4, members
basic_spanbuf<charT, traits>* rdbuf() const noexcept;

std::span<charT> span() const noexcept;
void span(std::span<charT> s) noexcept;

private:
 basic_spanbuf<charT, traits> sb; // exposition only
};
}

```

### 31.9.6.2 Constructors

[spanstream.cons]

```

explicit basic_spanstream(std::span<charT> s,
 ios_base::openmode which = ios_base::out | ios_base::in);

```

- 1 *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which)` (31.9.3.2).

```

basic_spanstream(basic_spanstream&& rhs);

```

- 2 *Effects:* Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

### 31.9.6.3 Swap

[spanstream.swap]

```

void swap(basic_spanstream& rhs);

```

- 1 *Effects:* Equivalent to:
- ```

    basic_iostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

```

```

template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

```

- 2 *Effects:* Equivalent to `x.swap(y)`.

31.9.6.4 Member functions

[spanstream.members]

```

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

```

- 1 *Effects:* Equivalent to:
- ```

 return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

```

```

std::span<charT> span() const noexcept;

```

- 2 *Effects:* Equivalent to: `return rdbuf()->span();`

```

void span(std::span<charT> s) noexcept;

```

- 3 *Effects:* Equivalent to `rdbuf()->span(s)`.

## 31.10 File-based streams

[file.streams]

### 31.10.1 Header <fstream> synopsis

[fstream.syn]

```

namespace std {
 // 31.10.3, class template basic_filebuf
 template<class charT, class traits = char_traits<charT>>
 class basic_filebuf;

 template<class charT, class traits>
 void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

 using filebuf = basic_filebuf<char>;
 using wfilebuf = basic_filebuf<wchar_t>;

 // 31.10.4, class template basic_ifstream
 template<class charT, class traits = char_traits<charT>>
 class basic_ifstream;

 template<class charT, class traits>
 void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

 using ifstream = basic_ifstream<char>;
 using wifstream = basic_ifstream<wchar_t>;

 // 31.10.5, class template basic_ofstream
 template<class charT, class traits = char_traits<charT>>
 class basic_ofstream;

 template<class charT, class traits>
 void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

 using ofstream = basic_ofstream<char>;
 using wofstream = basic_ofstream<wchar_t>;

 // 31.10.6, class template basic_fstream
 template<class charT, class traits = char_traits<charT>>
 class basic_fstream;

 template<class charT, class traits>
 void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

 using fstream = basic_fstream<char>;
 using wfstream = basic_fstream<wchar_t>;
}

```

<sup>1</sup> The header <fstream> defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

<sup>2</sup> [Note 1: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. — end note]

<sup>3</sup> In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` (31.12.6) is not `char`.

[Note 2: These functions enable class `path` support for systems with a wide native path character type, such as `wchar_t`. — end note]

### 31.10.2 Native handles

[file.native]

<sup>1</sup> Several classes described in 31.10 have a member `native_handle_type`.

<sup>2</sup> The type `native_handle_type` represents a platform-specific *native handle* to a file. It is trivially copyable and models `semiregular`.

[Note 1: For operating systems based on POSIX, `native_handle_type` is `int`. For Windows-based operating systems, `native_handle_type` is `HANDLE`. — end note]

31.10.3 Class template `basic_filebuf`

[filebuf]

## 31.10.3.1 General

[filebuf.general]

```

namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_filebuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;
 using native_handle_type = implementation-defined; // see 31.10.2

 // 31.10.3.2, constructors/destructor
 basic_filebuf();
 basic_filebuf(const basic_filebuf&) = delete;
 basic_filebuf(basic_filebuf&& rhs);
 virtual ~basic_filebuf();

 // 31.10.3.3, assignment and swap
 basic_filebuf& operator=(const basic_filebuf&) = delete;
 basic_filebuf& operator=(basic_filebuf&& rhs);
 void swap(basic_filebuf& rhs);

 // 31.10.3.4, members
 bool is_open() const;
 basic_filebuf* open(const char* s, ios_base::openmode mode);
 basic_filebuf* open(const filesystem::path::value_type* s,
 ios_base::openmode mode); // wide systems only; see 31.10.1
 basic_filebuf* open(const string& s, ios_base::openmode mode);
 basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
 basic_filebuf* close();
 native_handle_type native_handle() const noexcept;

 protected:
 // 31.10.3.5, overridden virtual functions
 streamsize showmanyc() override;
 int_type underflow() override;
 int_type uflow() override;
 int_type pbackfail(int_type c = traits::eof()) override;
 int_type overflow (int_type c = traits::eof()) override;

 basic_streambuf<charT, traits>* setbuf(char_type* s, streamsize n) override;

 pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which = ios_base::in | ios_base::out) override;
 pos_type seekpos(pos_type sp,
 ios_base::openmode which = ios_base::in | ios_base::out) override;

 int sync() override;
 void imbue(const locale& loc) override;
 };
}

```

- <sup>1</sup> The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.
- <sup>2</sup> The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library `FILEs`.
- <sup>3</sup> In particular:
  - (3.1) — If the file is not open for reading the input sequence cannot be read.
  - (3.2) — If the file is not open for writing the output sequence cannot be written.

- (3.3) — A joint file position is maintained for both the input sequence and the output sequence.
- 4 An instance of `basic_filebuf` behaves as described in 31.10.3 provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.
- 5 The file associated with a `basic_filebuf` has an associated value of type `native_handle_type`, called the native handle (31.10.2) of that file. This native handle can be obtained by calling the member function `native_handle`.
- 6 For any opened `basic_filebuf` `f`, the native handle returned by `f.native_handle()` is invalidated when `f.close()` is called, or `f` is destroyed.
- 7 In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```
const codecvt<charT, char, typename traits::state_type>& a_codecvt =
 use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

### 31.10.3.2 Constructors

[filebuf.cons]

```
basic_filebuf();
```

- 1 *Effects:* Initializes the base class with `basic_streambuf<charT, traits>()` (31.6.3.2).

- 2 *Postconditions:* `is_open() == false`.

```
basic_filebuf(basic_filebuf&& rhs);
```

- 3 *Effects:* It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The openmode, locale and any other state of `rhs` is also copied.

- 4 *Postconditions:* Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- (4.1) — `is_open() == rhs_p.is_open()`
- (4.2) — `rhs_a.is_open() == false`
- (4.3) — `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- (4.4) — `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- (4.5) — `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- (4.6) — `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- (4.7) — `if (eback()) eback() != rhs_a.eback()`
- (4.8) — `if (gptr()) gptr() != rhs_a.gptr()`
- (4.9) — `if (egptr()) egptr() != rhs_a.egptr()`
- (4.10) — `if (pbase()) pbase() != rhs_a.pbase()`
- (4.11) — `if (pptr()) pptr() != rhs_a.pptr()`
- (4.12) — `if (epptr()) epptr() != rhs_a.epptr()`

```
virtual ~basic_filebuf();
```

- 5 *Effects:* Calls `close()`. If an exception occurs during the destruction of the object, including the call to `close()`, the exception is caught but not rethrown (see 16.4.6.14).

### 31.10.3.3 Assignment and swap

[filebuf.assign]

```
basic_filebuf& operator=(basic_filebuf&& rhs);
```

- 1 *Effects:* Calls `close()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (see 31.10.3.2).

- 2 *Returns:* `*this`.

```
void swap(basic_filebuf& rhs);
```

3 *Effects:* Exchanges the state of *\*this* and *rhs*.

```
template<class charT, class traits>
```

```
void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);
```

4 *Effects:* Equivalent to *x.swap(y)*.

### 31.10.3.4 Member functions

[filebuf.members]

```
bool is_open() const;
```

1 *Returns:* **true** if a previous call to **open** succeeded (returned a non-null value) and there has been no intervening call to **close**.

```
basic_filebuf* open(const char* s, ios_base::openmode mode);
```

```
basic_filebuf* open(const filesystem::path::value_type* s,
ios_base::openmode mode); // wide systems only; see 31.10.1
```

2 *Preconditions:* *s* points to an NTCTS (3.36).

3 *Effects:* If **is\_open()** **!= false**, returns a null pointer. Otherwise, initializes the **filebuf** as required. It then opens the file to which *s* resolves, if possible, as if by a call to **fopen** with the second argument determined from *mode* & *~ios\_base::ate* as indicated in Table 146. If *mode* is not some combination of flags shown in the table then the open fails.

Table 146 — File open modes [tab:filebuf.open.modes]

| binary | ios_base flag combination |     |       |     |           | stdio equivalent |
|--------|---------------------------|-----|-------|-----|-----------|------------------|
|        | in                        | out | trunc | app | noreplace |                  |
|        |                           | +   |       |     |           | "w"              |
|        |                           | +   |       |     | +         | "wx"             |
|        |                           | +   | +     |     |           | "w"              |
|        |                           | +   | +     |     | +         | "wx"             |
|        |                           | +   |       | +   |           | "a"              |
|        |                           |     |       | +   |           | "a"              |
|        | +                         |     |       |     |           | "r"              |
|        | +                         | +   |       |     |           | "r+"             |
|        | +                         | +   | +     |     |           | "w+"             |
|        | +                         | +   | +     |     | +         | "w+x"            |
|        | +                         | +   |       | +   |           | "a+"             |
|        | +                         |     |       | +   |           | "a+"             |
| +      |                           | +   |       |     |           | "wb"             |
| +      |                           | +   |       |     | +         | "wbx"            |
| +      |                           | +   | +     |     |           | "wb"             |
| +      |                           | +   | +     |     | +         | "wbx"            |
| +      |                           | +   |       | +   |           | "ab"             |
| +      |                           |     |       | +   |           | "ab"             |
| +      | +                         |     |       |     |           | "rb"             |
| +      | +                         | +   |       |     |           | "r+b"            |
| +      | +                         | +   | +     |     |           | "w+b"            |
| +      | +                         | +   | +     |     | +         | "w+bx"           |
| +      | +                         | +   |       | +   |           | "a+b"            |
| +      | +                         |     |       | +   |           | "a+b"            |

4 If the open operation succeeds and *ios\_base::ate* is set in *mode*, positions the file to the end (as if by calling **fseek(file, 0, SEEK\_END)**, where *file* is the pointer returned by calling **fopen**).<sup>271</sup>

5 If the repositioning operation fails, calls **close()** and returns a null pointer to indicate failure.

<sup>271</sup> The macro **SEEK\_END** is defined, and the function signatures **fopen(const char\*, const char\*)** and **fseek(FILE\*, long, int)** are declared, in **<cstdio>** (31.13.1).

6 *Returns:* `this` if successful, a null pointer otherwise.

```
basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
```

7 *Returns:* `open(s.c_str(), mode)`;

```
basic_filebuf* close();
```

8 *Effects:* If `is_open() == false`, returns a null pointer. If a put area exists, calls `overflow(trait::eof())` to flush characters. If the last virtual member function called on `*this` (between `underflow`, `overflow`, `seekoff`, and `seekpos`) was `overflow` then calls `a_codecvt.unshift` (possibly several times) to determine a termination sequence, inserts those characters and calls `overflow(trait::eof())` again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling `fclose(file)`). If any of the calls made by the function, including `fclose`, fails, `close` fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

9 *Postconditions:* `is_open() == false`.

10 *Returns:* `this` on success, a null pointer otherwise.

```
native_handle_type native_handle() const noexcept;
```

11 *Preconditions:* `is_open()` is true.

12 *Returns:* The native handle associated with `*this`.

### 31.10.3.5 Overridden virtual functions

[filebuf.virtuals]

```
streamsize showmanyc() override;
```

1 *Effects:* Behaves the same as `basic_streambuf::showmanyc()` (31.6.3.5).

2 *Remarks:* An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

```
int_type underflow() override;
```

3 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::underflow()`, with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (`extern_buf`) and then as if by doing:

```
char extern_buf[XSIZE];
const char* extern_end;
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
 a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
 intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (`fpos_t`) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

```
int_type uflow() override;
```

4 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

```
int_type pbackfail(int_type c = trait::eof()) override;
```

5 *Effects:* Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

- (5.1) — If `trait::eq_int_type(c, trait::eof())` returns false and if the function makes a putback position available and if `trait::eq(to_char_type(c), gptr()[-1])` returns true, decrements the next pointer for the input sequence, `gptr()`.

Returns: `c`.

- (5.2) — If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.

Returns: `c`.

- (5.3) — If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.

Returns: `traits::not_eof(c)`.

6 *Returns:* As specified above, or `traits::eof()` to indicate failure.

7 *Remarks:* If `is_open() == false`, the function always fails.

8 The function does not put back a character directly to the input sequence.

9 If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

`int_type overflow(int_type c = traits::eof()) override;`

- 10 *Effects:* Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```
charT* b = pbase();
charT* p = pptr();
const charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
 a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

- (10.1) — If `r == codecvt_base::error` then fail.
- (10.2) — If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.
- (10.3) — If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).
- (10.4) — Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end` (`xbuf` isn't large enough) then increase `XSIZE` and repeat from the beginning.

Then establishes an observable checkpoint (4.1.2).

- 11 *Returns:* `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

`basic_streambuf* setbuf(char_type* s, streamsize n) override;`

- 12 *Effects:* If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.

```
pos_type seekoff(off_type off, ios_base::seekdir way,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

- 13 *Effects:* Let `width` denote `a_codecvt.encoding()`. If `is_open() == false`, or `off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call `fseek(file, width * off, whence)`, otherwise call `fseek(file, 0, whence)`.

- 14 *Returns:* A newly constructed `pos_type` object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns `pos_type(off_type(-1))`.

- 15 *Remarks:* “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if `width` is less than zero then

call `a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end)` and output the resulting unshift sequence. The function determines one of three values for the argument `whence`, of type `int`, as indicated in [Table 147](#).

**Table 147 — seekoff effects** [tab:filebuf.seekoff]

| way                         | Value                 | stdio Equivalent |
|-----------------------------|-----------------------|------------------|
| <code>basic_ios::beg</code> | <code>SEEK_SET</code> |                  |
| <code>basic_ios::cur</code> | <code>SEEK_CUR</code> |                  |
| <code>basic_ios::end</code> | <code>SEEK_END</code> |                  |

```
pos_type seekpos(pos_type sp,
 ios_base::openmode which
 = ios_base::in | ios_base::out) override;
```

16 Alters the file position, if possible, to correspond to the position stored in `sp` (as described below). Altering the file position performs as follows:

1. if `(om & ios_base::out) != 0`, then update the output sequence and write any unshift sequence;
2. set the file position to `sp` as if by a call to `fsetpos`;
3. if `(om & ios_base::in) != 0`, then update the input sequence;

where `om` is the open mode passed to the last call to `open()`. The operation fails if `is_open()` returns `false`.

17 If `sp` is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If `sp` has not been obtained by a previous successful call to one of the positioning functions (`seekoff` or `seekpos`) on the same file the effects are undefined.

18 *Returns:* `sp` on success. Otherwise returns `pos_type(off_type(-1))`.

```
int sync() override;
```

19 *Effects:* If a put area exists, calls `filebuf::overflow` to write the characters to the file, then flushes the file as if by calling `fflush(file)`. If a get area exists, the effect is implementation-defined.

```
void imbue(const locale& loc) override;
```

20 *Preconditions:* If the file is not positioned at its beginning and the encoding of the current locale as determined by `a_codecvt.encoding()` is state-dependent ([28.3.4.2.5.3](#)) then that facet is the same as the corresponding facet of `loc`.

21 *Effects:* Causes characters inserted or extracted after this call to be converted according to `loc` until another call of `imbue`.

22 *Remarks:* This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

### 31.10.4 Class template `basic_ifstream`

[`ifstream`]

#### 31.10.4.1 General

[`ifstream.general`]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_ifstream : public basic_istream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;
 using native_handle_type = basic_filebuf<charT, traits>::native_handle_type;

 // 31.10.4.2, constructors
 basic_ifstream();
```

```

explicit basic_ifstream(const char* s,
 ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
explicit basic_ifstream(const string& s,
 ios_base::openmode mode = ios_base::in);
template<class T>
 explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
basic_ifstream(const basic_ifstream&) = delete;
basic_ifstream(basic_ifstream&& rhs);

basic_ifstream& operator=(const basic_ifstream&) = delete;
basic_ifstream& operator=(basic_ifstream&& rhs);

// 31.10.4.3, swap
void swap(basic_ifstream& rhs);

// 31.10.4.4, members
basic_filebuf<charT, traits>* rdbuf() const;
native_handle_type native_handle() const noexcept;

bool is_open() const;
void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};
}

```

- <sup>1</sup> The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the filebuf object.

### 31.10.4.2 Constructors

[ifstream.cons]

`basic_ifstream();`

- <sup>1</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.3.2).

```

explicit basic_ifstream(const char* s,
 ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.3.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_ifstream(const string& s,
 ios_base::openmode mode = ios_base::in);

```

- <sup>3</sup> *Effects:* Equivalent to `basic_ifstream(s.c_str(), mode)`.

```

template<class T>
 explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);

```

- <sup>4</sup> *Constraints:* `is_same_v<T, filesystem::path>` is true.

- <sup>5</sup> *Effects:* Equivalent to `basic_ifstream(s.c_str(), mode)`.

```
basic_ifstream(basic_ifstream&& rhs);
```

- 6 *Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_ifstream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

### 31.10.4.3 Swap

[ifstream.swap]

```
void swap(basic_ifstream& rhs);
```

- 1 *Effects:* Exchanges the state of `*this` and `rhs` by calling `basic_ifstream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
```

```
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);
```

- 2 *Effects:* Equivalent to `x.swap(y)`.

### 31.10.4.4 Member functions

[ifstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

- 1 *Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
native_handle_type native_handle() const noexcept;
```

- 2 *Effects:* Equivalent to: `return rdbuf()->native_handle();`

```
bool is_open() const;
```

- 3 *Returns:* `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::in);
```

```
void open(const filesystem::path::value_type* s,
ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
```

- 4 *Effects:* Calls `rdbuf()->open(s, mode | ios_base::in)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::in);
```

```
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
```

- 5 *Effects:* Calls `open(s.c_str(), mode)`.

```
void close();
```

- 6 *Effects:* Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

## 31.10.5 Class template `basic_ofstream`

[ofstream]

### 31.10.5.1 General

[ofstream.general]

```
namespace std {
```

```
template<class charT, class traits = char_traits<charT>>
```

```
class basic_ofstream : public basic_ostream<charT, traits> {
```

```
public:
```

```
using char_type = charT;
```

```
using int_type = traits::int_type;
```

```
using pos_type = traits::pos_type;
```

```
using off_type = traits::off_type;
```

```
using traits_type = traits;
```

```
using native_handle_type = basic_filebuf<charT, traits>::native_handle_type;
```

```
// 31.10.5.2, constructors
```

```
basic_ofstream();
```

```
explicit basic_ofstream(const char* s,
ios_base::openmode mode = ios_base::out);
```

```
explicit basic_ofstream(const filesystem::path::value_type* s, // wide systems only; see 31.10.1
ios_base::openmode mode = ios_base::out);
```

```
explicit basic_ofstream(const string& s,
ios_base::openmode mode = ios_base::out);
```

```

template<class T>
 explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
basic_ofstream(const basic_ofstream&) = delete;
basic_ofstream(basic_ofstream&& rhs);

basic_ofstream& operator=(const basic_ofstream&) = delete;
basic_ofstream& operator=(basic_ofstream&& rhs);

// 31.10.5.3, swap
void swap(basic_ofstream& rhs);

// 31.10.5.4, members
basic_filebuf<charT, traits>* rdbuf() const;
native_handle_type native_handle() const noexcept;

bool is_open() const;
void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

```

- <sup>1</sup> The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the filebuf object.

### 31.10.5.2 Constructors

[ofstream.cons]

```
basic_ofstream();
```

- <sup>1</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.3.2).

```

explicit basic_ofstream(const char* s,
 ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1

```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.3.2), then calls `rdbuf()->open(s, mode | ios_base::out)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_ofstream(const string& s,
 ios_base::openmode mode = ios_base::out);
```

- <sup>3</sup> *Effects:* Equivalent to `basic_ofstream(s.c_str(), mode)`.

```

template<class T>
 explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);

```

- <sup>4</sup> *Constraints:* `is_same_v<T, filesystem::path>` is true.

- <sup>5</sup> *Effects:* Equivalent to `basic_ofstream(s.c_str(), mode)`.

```
basic_ofstream(basic_ofstream&& rhs);
```

- <sup>6</sup> *Effects:* Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

## 31.10.5.3 Swap

[ofstream.swap]

```
void swap(basic_ofstream& rhs);
```

- 1 *Effects:* Exchanges the state of *\*this* and *rhs* by calling `basic_ofstream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```
template<class charT, class traits>
void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

- 2 *Effects:* Equivalent to `x.swap(y)`.

## 31.10.5.4 Member functions

[ofstream.members]

```
basic_filebuf<charT, traits>* rdbuf() const;
```

- 1 *Returns:* `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```
native_handle_type native_handle() const noexcept;
```

- 2 *Effects:* Equivalent to: `return rdbuf()->native_handle();`

```
bool is_open() const;
```

- 3 *Returns:* `rdbuf()->is_open()`.

```
void open(const char* s, ios_base::openmode mode = ios_base::out);
```

```
void open(const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1
```

- 4 *Effects:* Calls `rdbuf()->open(s, mode | ios_base::out)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void close();
```

- 5 *Effects:* Calls `rdbuf()->close()` and, if that function fails (returns a null pointer), calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```
void open(const string& s, ios_base::openmode mode = ios_base::out);
```

```
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
```

- 6 *Effects:* Calls `open(s.c_str(), mode)`.

## 31.10.6 Class template basic\_fstream

[fstream]

## 31.10.6.1 General

[fstream.general]

```
namespace std {
 template<class charT, class traits = char_traits<charT>>
 class basic_fstream : public basic_iostream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;
 using native_handle_type = basic_filebuf<charT, traits>::native_handle_type;

 // 31.10.6.2, constructors
 basic_fstream();
 explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 explicit basic_fstream(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
 explicit basic_fstream(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 };
}
```

```

template<class T>
 explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
 basic_fstream(const basic_fstream&) = delete;
 basic_fstream(basic_fstream&& rhs);

 basic_fstream& operator=(const basic_fstream&) = delete;
 basic_fstream& operator=(basic_fstream&& rhs);

 // 31.10.6.3, swap
 void swap(basic_fstream& rhs);

 // 31.10.6.4, members
 basic_filebuf<charT, traits>* rdbuf() const;
 native_handle_type native_handle() const noexcept;

 bool is_open() const;
 void open(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 void open(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
 void open(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 void open(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
 void close();

private:
 basic_filebuf<charT, traits> sb; // exposition only
};

```

- <sup>1</sup> The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `basic_filebuf` object.

### 31.10.6.2 Constructors

[fstream.cons]

```
basic_fstream();
```

- <sup>1</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`.

```

explicit basic_fstream(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
explicit basic_fstream(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1

```

- <sup>2</sup> *Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```

explicit basic_fstream(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);

```

- <sup>3</sup> *Effects:* Equivalent to `basic_fstream(s.c_str(), mode)`.

```

template<class T>
 explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);
4 Constraints: is_same_v<T, filesystem::path> is true.
5 Effects: Equivalent to basic_fstream(s.c_str(), mode).

basic_fstream(basic_fstream&& rhs);
6 Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_
 istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

```

### 31.10.6.3 Swap

[fstream.swap]

```

void swap(basic_fstream& rhs);
1 Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs)
 and sb.swap(rhs.sb).

template<class charT, class traits>
 void swap(basic_fstream<charT, traits>& x,
 basic_fstream<charT, traits>& y);
2 Effects: Equivalent to x.swap(y).

```

### 31.10.6.4 Member functions

[fstream.members]

```

basic_filebuf<charT, traits>* rdbuf() const;
1 Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

native_handle_type native_handle() const noexcept;
2 Effects: Equivalent to: return rdbuf()->native_handle();

bool is_open() const;
3 Returns: rdbuf()->is_open().

void open(
 const char* s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path::value_type* s,
 ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 31.10.1
4 Effects: Calls rdbuf()->open(s, mode). If that function does not return a null pointer calls clear(),
 otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(
 const string& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
void open(
 const filesystem::path& s,
 ios_base::openmode mode = ios_base::in | ios_base::out);
5 Effects: Calls open(s.c_str(), mode).

void close();
6 Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit)
 (which may throw ios_base::failure) (31.5.4.4).

```

## 31.11 Synchronized output streams

[syncstream]

### 31.11.1 Header <syncstream> synopsis

[syncstream.syn]

```

#include <ostream> // see 31.7.2

namespace std {
 // 31.11.2, class template basic_syncbuf
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf;

```

```

// 31.11.2.6, specialized algorithms
template<class charT, class traits, class Allocator>
 void swap(basic_syncbuf<charT, traits, Allocator>&,
 basic_syncbuf<charT, traits, Allocator>&);

using syncbuf = basic_syncbuf<char>;
using wsyncbuf = basic_syncbuf<wchar_t>;

// 31.11.3, class template basic_osyncstream
template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_osyncstream;

using ostream = basic_osyncstream<char>;
using wostream = basic_osyncstream<wchar_t>;
}

```

- <sup>1</sup> The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

### 31.11.2 Class template basic\_syncbuf

[syncstream.syncbuf]

#### 31.11.2.1 Overview

[syncstream.syncbuf.overview]

```

namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_syncbuf : public basic_streambuf<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;
 using allocator_type = Allocator;

 using streambuf_type = basic_streambuf<charT, traits>;

 // 31.11.2.2, construction and destruction
 basic_syncbuf()
 : basic_syncbuf(nullptr) {}
 explicit basic_syncbuf(streambuf_type* obuf)
 : basic_syncbuf(obuf, Allocator()) {}
 basic_syncbuf(streambuf_type*, const Allocator&);
 basic_syncbuf(basic_syncbuf&&);
 ~basic_syncbuf();

 // 31.11.2.3, assignment and swap
 basic_syncbuf& operator=(basic_syncbuf&&);
 void swap(basic_syncbuf&);

 // 31.11.2.4, member functions
 bool emit();
 streambuf_type* get_wrapped() const noexcept;
 allocator_type get_allocator() const noexcept;
 void set_emit_on_sync(bool) noexcept;

 protected:
 // 31.11.2.5, overridden virtual functions
 int sync() override;

 private:
 streambuf_type* wrapped; // exposition only
 bool emit_on_sync{}; // exposition only
 };
}

```

- <sup>1</sup> Class template basic\_syncbuf stores character data written to it, known as the associated output, into internal buffers allocated using the object's allocator. The associated output is transferred to the wrapped

stream buffer object *\*wrapped* when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

### 31.11.2.2 Construction and destruction

[syncstream.syncbuf.cons]

```
basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
```

1 *Effects:* Sets *wrapped* to *obuf*.

2 *Postconditions:* `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

3 *Throws:* Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

4 *Remarks:* A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

```
basic_syncbuf(basic_syncbuf&& other);
```

5 *Postconditions:* The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in *\*this* afterwards. `other.pbase() == other.pptr()` and `other.get_wrapped() == nullptr` are true.

6 *Remarks:* This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

```
~basic_syncbuf();
```

7 *Effects:* Calls `emit()`.

8 *Throws:* Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 31.11.2.3 Assignment and swap

[syncstream.syncbuf.assign]

```
basic_syncbuf& operator=(basic_syncbuf&& rhs);
```

1 *Effects:* Calls `emit()` then move assigns from `rhs`. After the move assignment *\*this* has the observable state it would have had if it had been move constructed from `rhs` (31.11.2.2).

2 *Postconditions:*

(2.1) — `rhs.get_wrapped() == nullptr` is true.

(2.2) — `this->get_allocator() == rhs.get_allocator()` is true when  
`allocator_traits<Allocator>::propagate_on_container_move_assignment::value`  
is true; otherwise, the allocator is unchanged.

3 *Returns:* *\*this*.

4 *Remarks:* This assignment operator disassociates `rhs` from its wrapped stream buffer, ensuring destruction of `rhs` produces no output.

```
void swap(basic_syncbuf& other);
```

5 *Preconditions:* Either `allocator_traits<Allocator>::propagate_on_container_swap::value` is true or `this->get_allocator() == other.get_allocator()` is true.

6 *Effects:* Exchanges the state of *\*this* and `other`.

### 31.11.2.4 Member functions

[syncstream.syncbuf.members]

```
bool emit();
```

1 *Effects:* Atomically transfers the associated output of *\*this* to the stream buffer *\*wrapped*, so that it appears in the output stream as a contiguous sequence of characters. `wrapped->pubsync()` is called if and only if a call was made to `sync()` since the most recent call to `emit()`, if any.

2 *Synchronization:* All `emit()` calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.10.2.2), where each `emit()` call synchronizes with subsequent `emit()` calls in that total order.

3 *Postconditions:* On success, the associated output is empty.

4 *Returns:* `true` if all of the following conditions hold; otherwise `false`:

(4.1) — *wrapped* == `nullptr` is `false`.

(4.2) — All of the characters in the associated output were successfully transferred.

(4.3) — The call to *wrapped*→`pubsync()` (if any) succeeded.

5 *Remarks:* May call member functions of *wrapped* while holding a lock uniquely associated with *wrapped*.

```
streambuf_type* get_wrapped() const noexcept;
```

6 *Returns:* *wrapped*.

```
allocator_type get_allocator() const noexcept;
```

7 *Returns:* A copy of the allocator that was set in the constructor or assignment operator.

```
void set_emit_on_sync(bool b) noexcept;
```

8 *Effects:* *emit-on-sync* = `b`.

### 31.11.2.5 Overridden virtual functions

[syncstream.syncbuf.virtuals]

```
int sync() override;
```

1 *Effects:* Records that the wrapped stream buffer is to be flushed. Then, if *emit-on-sync* is `true`, calls `emit()`.

[Note 1: If *emit-on-sync* is `false`, the actual flush is delayed until a call to `emit()`. — end note]

2 *Returns:* If `emit()` was called and returned `false`, returns `-1`; otherwise `0`.

### 31.11.2.6 Specialized algorithms

[syncstream.syncbuf.special]

```
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
 basic_syncbuf<charT, traits, Allocator>& b);
```

1 *Effects:* Equivalent to `a.swap(b)`.

## 31.11.3 Class template `basic_osyncstream`

[syncstream.osyncstream]

### 31.11.3.1 Overview

[syncstream.osyncstream.overview]

```
namespace std {
 template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
 class basic_osyncstream : public basic_ostream<charT, traits> {
 public:
 using char_type = charT;
 using int_type = traits::int_type;
 using pos_type = traits::pos_type;
 using off_type = traits::off_type;
 using traits_type = traits;

 using allocator_type = Allocator;
 using streambuf_type = basic_streambuf<charT, traits>;
 using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

 // 31.11.3.2, construction and destruction
 basic_osyncstream(streambuf_type*, const Allocator&);
 explicit basic_osyncstream(streambuf_type* obuf)
 : basic_osyncstream(obuf, Allocator()) {}
 basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator)
 : basic_osyncstream(os.rdbuf(), allocator) {}
 explicit basic_osyncstream(basic_ostream<charT, traits>& os)
 : basic_osyncstream(os, Allocator()) {}
 basic_osyncstream(basic_osyncstream&&) noexcept;
 ~basic_osyncstream();
 };
}
```

```

// assignment
basic_osyncstream& operator=(basic_osyncstream&&);

// 31.11.3.3, member functions
void emit();
streambuf_type* get_wrapped() const noexcept;
syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }

private:
 syncbuf_type sb; // exposition only
};
}

```

<sup>1</sup> Allocator shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

<sup>2</sup> [Example 1: A named variable can be used within a block statement for streaming.

```

{
 osyncstream bout(cout);
 bout << "Hello, ";
 bout << "World!";
 bout << endl; // flush is noted
 bout << "and more!\n";
} // characters are transferred and cout is flushed

```

— end example]

<sup>3</sup> [Example 2: A temporary object can be used for streaming within a single statement.

```
osyncstream(cout) << "Hello, " << "World!" << '\n';
```

In this example, cout is not flushed. — end example]

### 31.11.3.2 Construction and destruction

[syncstream.osyncstream.cons]

```
basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
```

<sup>1</sup> *Effects:* Initializes *sb* from *buf* and *allocator*. Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))`.

<sup>2</sup> [Note 1: The member functions of the provided stream buffer can be called from `emit()` while a lock is held, which might result in a deadlock if used incautiously. — end note]

<sup>3</sup> *Postconditions:* `get_wrapped() == buf` is true.

```
basic_osyncstream(basic_osyncstream&& other) noexcept;
```

<sup>4</sup> *Effects:* Move constructs the base class and *sb* from the corresponding subobjects of *other*, and calls `basic_ostream<charT, traits>::set_rdbuf(addressof(sb))`.

<sup>5</sup> *Postconditions:* The value returned by `get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. `nullptr == other.get_wrapped()` is true.

### 31.11.3.3 Member functions

[syncstream.osyncstream.members]

```
void emit();
```

<sup>1</sup> *Effects:* Behaves as an unformatted output function (31.7.6.4). After constructing a `sentry` object, calls `sb.emit()`. If that call returns `false`, calls `setstate(ios_base::badbit)`.

<sup>2</sup> [Example 1: A flush on a `basic_osyncstream` does not flush immediately:

```

{
 osyncstream bout(cout);
 bout << "Hello," << '\n'; // no flush
 bout.emit(); // characters transferred; cout not flushed
 bout << "World!" << endl; // flush noted; cout not flushed
 bout.emit(); // characters transferred; cout flushed
 bout << "Greetings." << '\n'; // no flush
} // characters transferred; cout not flushed

```

— end example]

3 [Example 2: The function `emit()` can be used to handle exceptions from operations on the underlying stream.

```
{
 ostream bout(cout);
 bout << "Hello, " << "World!" << '\n';
 try {
 bout.emit();
 } catch (...) {
 // handle exception
 }
}
```

— end example]

`streambuf_type* get_wrapped() const noexcept;`

4 Returns: `sb.get_wrapped()`.

5 [Example 3: Obtaining the wrapped stream buffer with `get_wrapped()` allows wrapping it again with an `ostream`. For example,

```
{
 ostream bout1(cout);
 bout1 << "Hello, ";
 {
 ostream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';
 }
 bout1 << "World!" << '\n';
}
```

produces the *uninterleaved* output

```
Goodbye, Planet!
Hello, World!
```

— end example]

## 31.12 File systems

[filesystems]

### 31.12.1 General

[fs.general]

1 Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and directories.

2 A *file system* is a collection of files and their attributes.

3 A *file* is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.

4 A *directory* is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The *parent directory* of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2) in the given directory. The *parent directory* of other types of files is a directory containing a directory entry for the file under discussion.

5 A *link* is an object that associates a filename with a file. Several links can associate names with the same file. A *hard link* is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

[Note 1: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note]

A *symbolic link* is a type of file with the property that when the file is encountered during pathname resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

[Note 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

### 31.12.2 Conformance

[fs.conformance]

#### 31.12.2.1 General

[fs.conformance.general]

1 Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

**31.12.2.2 POSIX conformance**

[fs.conform.9945]

- <sup>1</sup> Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.  
[*Note 1*: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — *end note*]

- <sup>2</sup> Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 31.12.5.

[*Note 2*: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — *end note*]

- <sup>3</sup> Implementations are not required to provide behavior that is not supported by a particular file system.

[*Example 1*: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — *end example*]

**31.12.2.3 Operating system dependent behavior conformance**

[fs.conform.os]

- <sup>1</sup> Behavior that is specified as being *operating system dependent* is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.
- <sup>2</sup> It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

**31.12.2.4 File system race behavior**

[fs.race.behavior]

- <sup>1</sup> A *file system race* is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.
- <sup>2</sup> If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, *Preconditions*: is not specified for the function.

[*Note 1*: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — *end note*]

**31.12.3 Requirements**

[fs.req]

- <sup>1</sup> Throughout subclause 31.12, `char`, `wchar_t`, `char8_t`, `char16_t`, and `char32_t` are collectively called *encoded character types*.
- <sup>2</sup> Functions with template parameters named `EcharT` shall not participate in overload resolution unless `EcharT` is one of the encoded character types.
- <sup>3</sup> Template parameters named `InputIterator` shall meet the *Cpp17InputIterator* requirements (24.3.5.3) and shall have a value type that is one of the encoded character types.
- <sup>4</sup> [*Note 1*: Use of an encoded character type implies an associated character set and encoding. Since `signed char` and `unsigned char` have no implied character set and encoding, they are not included as permitted types. — *end note*]
- <sup>5</sup> Template parameters named `Allocator` shall meet the *Cpp17Allocator* requirements (16.4.4.6.1).

**31.12.4 Header <filesystem> synopsis**

[fs.filesystem.syn]

```
#include <compare> // see 17.12.1

namespace std::filesystem {
 // 31.12.6, paths
 class path;

 // 31.12.6.8, path non-member functions

path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);
}

```

```

namespace std {
 // 31.12.6.9, formatting support
 template<class charT> struct formatter<filesystem::path, charT>;

 // 31.12.6.10, hash support
 template<class T> struct hash;
 template<> struct hash<filesystem::path>;
}

namespace std::ranges {
 template<>
 inline constexpr bool enable_borrowed_range<filesystem::directory_iterator> = true;
 template<>
 inline constexpr bool enable_borrowed_range<filesystem::recursive_directory_iterator> = true;

 template<>
 inline constexpr bool enable_view<filesystem::directory_iterator> = true;
 template<>
 inline constexpr bool enable_view<filesystem::recursive_directory_iterator> = true;
}

```

- <sup>1</sup> Implementations should ensure that the resolution and range of `file_time_type` reflect the operating system dependent resolution and range of file time values.

### 31.12.5 Error reporting

[fs.err.report]

- <sup>1</sup> Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an `error_code`.

[Note 1: This supports two common use cases:

- (1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.
  - (1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.
- end note]

- <sup>2</sup> Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor's `error_code` argument is set as appropriate for the specific operating system dependent error.
- (2.2) — Failure to allocate storage is reported by throwing an exception as described in 16.4.6.14.
- (2.3) — Destructors throw nothing.

- <sup>3</sup> Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

- (3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

### 31.12.6 Class path

[fs.class.path]

#### 31.12.6.1 General

[fs.class.path.general]

- <sup>1</sup> An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.
- <sup>2</sup> [Note 1: Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]

- <sup>3</sup> A *path* is a sequence of elements that identify the location of a file within a filesystem. The elements are the *root-name<sub>opt</sub>*, *root-directory<sub>opt</sub>*, and an optional sequence of *filenames* (31.12.6.2). The maximum number of elements in the sequence is operating system dependent (31.12.2.3).
- <sup>4</sup> An *absolute path* is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A *relative path* is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.
- [Note 2: Pathnames “.” and “..” are relative paths. — end note]
- <sup>5</sup> A *pathname* is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (31.12.6.2) or according to an operating system dependent *native pathname format* accepted by the host operating system.
- <sup>6</sup> *Pathname resolution* is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

[Example 1: For POSIX-based operating systems, this mechanism is specified in POSIX, section 4.12, Pathname resolution. — end example]

```
namespace std::filesystem {
 class path {
 public:
 using value_type = see below;
 using string_type = basic_string<value_type>;
 static constexpr value_type preferred_separator = see below;

 // 31.12.8.1, enumeration format
 enum format;

 // 31.12.6.5.1, constructors and destructor
 path() noexcept;
 path(const path& p);
 path(path&& p) noexcept;
 path(string_type&& source, format fmt = auto_format);
 template<class Source>

iterator end() const;

// 31.12.6.7, path inserter and extractor
template<class charT, class traits>
 friend basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const path& p);
template<class charT, class traits>
 friend basic_istream<charT, traits>&
 operator>>(basic_istream<charT, traits>& is, path& p);
};
}

```

<sup>7</sup> `value_type` is a *typedef-name* for the operating system dependent encoded character type used to represent pathnames.

<sup>8</sup> The value of the `preferred_separator` member is the operating system dependent *preferred-separator* character (31.12.6.2).

<sup>9</sup> [Example 2: For POSIX-based operating systems, `value_type` is `char` and `preferred_separator` is the slash character (`'/'`). For Windows-based operating systems, `value_type` is `wchar_t` and `preferred_separator` is the backslash character (`L'\\'`). — end example]

### 31.12.6.2 Generic pathname format

[fs.path.generic]

*pathname:*

*root-name*<sub>opt</sub> *root-directory*<sub>opt</sub> *relative-path*

*root-name:*

operating system dependent sequences of characters  
implementation-defined sequences of characters

*root-directory*:  
*directory-separator*

*relative-path*:  
*filename*  
*filename directory-separator relative-path*  
 an empty path

*filename*:  
 non-empty sequence of characters other than *directory-separator* characters

*directory-separator*:  
*preferred-separator directory-separator<sub>opt</sub>*  
*fallback-separator directory-separator<sub>opt</sub>*

*preferred-separator*:  
 operating system dependent directory separator character

*fallback-separator*:  
 /, if *preferred-separator* is not /

- <sup>1</sup> A *filename* is the name of a file. The *dot* and *dot-dot* filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

- (1.1) — The permitted characters.

[*Example 1*: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — *end example*]

[*Note 1*: Wider portability can be achieved by limiting *filename* characters to the POSIX Portable Filename Character Set:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
 a b c d e f g h i j k l m n o p q r s t u v w x y z  
 0 1 2 3 4 5 6 7 8 9 . \_ - — *end note*]

- (1.2) — The maximum permitted length.

- (1.3) — Filenames that are not permitted.

- (1.4) — Filenames that have special meaning.

- (1.5) — Case awareness and sensitivity during path resolution.

- (1.6) — Special rules that may apply to file types other than regular files, such as directories.

- <sup>2</sup> Except in a *root-name*, multiple successive *directory-separator* characters are considered to be the same as one *directory-separator* character.

- <sup>3</sup> The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to *root-directory* is implementation-defined. Specific filenames may have special meanings for a particular operating system.

- <sup>4</sup> A *root-name* identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent *root-names*, at least one implementation-defined *root-name* is required.

[*Note 2*: Many operating systems define a name beginning with two *directory-separator* characters as a *root-name* that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a *root-name* identifying a specific device such as a disk drive. — *end note*]

- <sup>5</sup> If a *root-name* is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

[*Note 3*: On a POSIX-like operating system, it is impossible to have a *root-name* and a *relative-path* without an intervening *root-directory* element. — *end note*]

- <sup>6</sup> *Normalization* of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the *root-name* with a *preferred-separator*.
3. Replace each *directory-separator* with a *preferred-separator*.

[*Note 4*: The generic pathname grammar defines *directory-separator* as one or more slashes and *preferred-separators*. — *end note*]

4. Remove each dot filename and any immediately following *directory-separator*.

5. As long as any appear, remove a non-dot-dot filename immediately followed by a *directory-separator* and a dot-dot filename, along with any immediately following *directory-separator*.
6. If there is a *root-directory*, remove all dot-dot filenames and any *directory-separators* immediately following them.

[Note 5: These dot-dot filenames attempt to refer to nonexistent parent directories. — end note]

7. If the last filename is dot-dot, remove any trailing *directory-separator*.

8. If the path is empty, add a dot.

The result of normalization is a path in *normal form*, which is said to be *normalized*.

### 31.12.6.3 Conversions

[fs.path.cvt]

#### 31.12.6.3.1 Argument format conversions

[fs.path.fmt.cvt]

- <sup>1</sup> [Note 1: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

- (1.1) — The generic format is acceptable as a native path.
- (1.2) — There is no need to distinguish between native format and generic format in function arguments.
- (1.3) — Paths for regular files and paths for directories share the same syntax.

— end note]

- <sup>2</sup> Several functions are defined to accept *detected-format* arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

- <sup>3</sup> [Note 2: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. It is possible that an implementation for an operating system where disambiguation is needed distinguishes between the formats. — end note]

- <sup>4</sup> Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let  $G(n)$  and  $N(g)$  in a mathematical sense be the implementation's functions that convert native-to-generic and generic-to-native formats respectively. If  $g=G(n)$  for some  $n$ , then  $G(N(g))=g$ ; if  $n=N(g)$  for some  $g$ , then  $N(G(n))=n$ .

[Note 3: Neither  $G$  nor  $N$  need be invertible. — end note]

- <sup>5</sup> If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a *directory-separator*, otherwise it shall be treated as a path to a regular file.

- <sup>6</sup> [Note 4: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]

- <sup>7</sup> When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function ( $G$  or  $N$ ).

- <sup>8</sup> When the (new) value  $p$  of one representation of a path is derived from the representation of that or another path, a value  $q$  is chosen for the other representation. The value  $q$  converts to  $p$  (by  $G$  or  $N$  as appropriate) if any such value does so;  $q$  is otherwise unspecified.

[Note 5: If  $q$  is the result of converting any path at all, it is the result of converting  $p$ . — end note]

#### 31.12.6.3.2 Type and encoding conversions

[fs.path.type.cvt]

- <sup>1</sup> The *native encoding* of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The *native encoding* for wide character strings is the implementation-defined execution wide-character set encoding (16.3.3.3.4).

- <sup>2</sup> For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

- (2.1) — **char**: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.

[*Note 1:* For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by the current locale encoding and the Windows `AreFileApisANSI` function. — *end note*]

[*Note 2:* This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error-prone. — *end note*]

- (2.2) — `wchar_t`: The encoding is the native wide encoding. The method of conversion is unspecified.

[*Note 3:* For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed. — *end note*]

- (2.3) — `char8_t`: The encoding is UTF-8. The method of conversion is unspecified.

- (2.4) — `char16_t`: The encoding is UTF-16. The method of conversion is unspecified.

- (2.5) — `char32_t`: The encoding is UTF-32. The method of conversion is unspecified.

- <sup>3</sup> If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`.

#### 31.12.6.4 Requirements

[fs.path.req]

- <sup>1</sup> In addition to the requirements (31.12.3), function template parameters named `Source` shall be one of:

- (1.1) — `basic_string<EcharT, traits, Allocator>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end())`.

- (1.2) — `basic_string_view<EcharT, traits>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end())`.

- (1.3) — A type meeting the *Cpp17InputIterator* requirements that iterates over an NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.

- (1.4) — A character array that after array-to-pointer decay results in a pointer to the start of an NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.

- <sup>2</sup> Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either

- (2.1) — `Source` is a specialization of `basic_string` or `basic_string_view`, or

- (2.2) — the *qualified-id* `iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly `const` encoded character type (13.10.3).

- <sup>3</sup> [*Note 1:* See path conversions (31.12.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding. — *end note*]

- <sup>4</sup> Arguments of type `Source` shall not be null pointers.

#### 31.12.6.5 Members

[fs.path.member]

##### 31.12.6.5.1 Constructors

[fs.path.construct]

`path()` `noexcept`;

- <sup>1</sup> *Postconditions:* `empty()` is `true`.

`path(const path& p);`

`path(path&& p) noexcept;`

- <sup>2</sup> *Effects:* Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.

```
path(string_type&& source, format fmt = auto_format);
```

- 3 *Effects:* Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (31.12.6.3.1), converting format if required (31.12.6.3.1). `source` is left in a valid but unspecified state.

```
template<class Source>
 path(const Source& source, format fmt = auto_format);
template<class InputIterator>
 path(InputIterator first, InputIterator last, format fmt = auto_format);
```

- 4 *Effects:* Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last)`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

```
template<class Source>
 path(const Source& source, const locale& loc, format fmt = auto_format);
template<class InputIterator>
 path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
```

- 5 *Mandates:* The value type of `Source` and `InputIterator` is `char`.

- 6 *Effects:* Let `s` be the effective range of `source` or the range `[first, last)`, after converting the encoding as follows:

- (6.1) — If `value_type` is `wchar_t`, converts to the native wide encoding (31.12.6.3.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
- (6.2) — Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

- 7 Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

[*Example 1:* A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (31.12.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — *end example*]

### 31.12.6.5.2 Assignments

[`fs.path.assign`]

```
path& operator=(const path& p);
```

- 1 *Effects:* If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`.

- 2 *Returns:* `*this`.

```
path& operator=(path&& p) noexcept;
```

- 3 *Effects:* If `*this` and `p` are the same object, has no effect. Otherwise, sets both respective pathnames of `*this` to the respective pathnames of `p`. `p` is left in a valid but unspecified state.

[*Note 1:* A valid implementation is `swap(p)`. — *end note*]

- 4 *Returns:* `*this`.

```
path& operator=(string_type&& source);
path& assign(string_type&& source);
```

5     *Effects:* Sets the pathname in the detected-format of `source` to the original value of `source`. `source` is left in a valid but unspecified state.

6     *Returns:* `*this`.

```
template<class Source>
 path& operator=(const Source& source);
template<class Source>
 path& assign(const Source& source);
template<class InputIterator>
 path& assign(InputIterator first, InputIterator last);
```

7     *Effects:* Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last)`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and sets the pathname in that format to `s`.

8     *Returns:* `*this`.

### 31.12.6.5.3 Appends

[fs.path.append]

1     The append operations use `operator/=` to denote their semantic effect of appending *preferred-separator* when needed.

```
path& operator/=(const path& p);
```

2     *Effects:* If `p.is_absolute()` || (`p.has_root_name()` && `p.root_name() != root_name()`), then `operator=(p)`.

3     Otherwise, modifies `*this` as if by these steps:

- (3.1) — If `p.has_root_directory()`, then removes any root directory and relative path from the generic format pathname. Otherwise, if `!has_root_directory()` && `is_absolute()` is true or if `has_filename()` is true, then appends `path::preferred_separator` to the generic format pathname.
- (3.2) — Then appends the native format pathname of `p`, omitting any *root-name* from its generic format pathname, to the native format pathname.

4     [*Example 1:* Even if `//host` is interpreted as a *root-name*, both of the paths `path("//host")/"foo"` and `path("//host/")/"foo"` equal `"//host/foo"` (although the former might use backslash as the preferred separator).

Expression examples:

```
// On POSIX,
path("foo") /= path(""); // yields path("foo/")
path("foo") /= path("/bar"); // yields path("/bar")

// On Windows,
path("foo") /= path(""); // yields path("foo\\")
path("foo") /= path("/bar"); // yields path("/bar")
path("foo") /= path("c:/bar"); // yields path("c:/bar")
path("foo") /= path("c:"); // yields path("c:")
path("c:") /= path(""); // yields path("c:")
path("c:foo") /= path("/bar"); // yields path("c:/bar")
path("c:foo") /= path("c:bar"); // yields path("c:foo\\bar")

— end example]
```

5     *Returns:* `*this`.

```
template<class Source>
 path& operator/=(const Source& source);
template<class Source>
 path& append(const Source& source);
```

6     *Effects:* Equivalent to: `return operator/=(path(source));`

```
template<class InputIterator>
path& append(InputIterator first, InputIterator last);
```

7     *Effects:* Equivalent to: `return operator+=(path(first, last));`

#### 31.12.6.5.4 Concatenation

[fs.path.concat]

```
path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& operator+=(const Source& x);
template<class Source>
path& concat(const Source& x);
```

1     *Effects:* Appends `path(x).native()` to the pathname in the native format.

[*Note 1:* This directly manipulates the value of `native()`, which is not necessarily portable between operating systems. — *end note*]

2     *Returns:* `*this`.

```
path& operator+=(value_type x);
template<class EcharT>
path& operator+=(EcharT x);
```

3     *Effects:* Equivalent to: `return *this += basic_string_view(&x, 1);`

```
template<class InputIterator>
path& concat(InputIterator first, InputIterator last);
```

4     *Effects:* Equivalent to: `return *this += path(first, last);`

#### 31.12.6.5.5 Modifiers

[fs.path.modifiers]

```
void clear() noexcept;
```

1     *Postconditions:* `empty()` is true.

```
path& make_preferred();
```

2     *Effects:* Each *directory-separator* of the pathname in the generic format is converted to *preferred-separator*.

3     *Returns:* `*this`.

4     [*Example 1:*

```
path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';
```

On an operating system where *preferred-separator* is a slash, the output is:

```
"foo/bar"
"foo/bar"
```

On an operating system where *preferred-separator* is a backslash, the output is:

```
"foo/bar"
"foo\bar"
```

— *end example*]

```
path& remove_filename();
```

5     *Effects:* Remove the generic format pathname of `filename()` from the generic format pathname.

6     *Postconditions:* `!has_filename()`.

7     *Returns:* `*this`.

8     [*Example 2:*

```
path("foo/bar").remove_filename(); // yields "foo/"
path("foo/").remove_filename(); // yields "foo/"
```

```

 path("/foo").remove_filename(); // yields "/"
 path("/").remove_filename(); // yields "/"
— end example]

```

```

path& replace_filename(const path& replacement);

```

9 *Effects:* Equivalent to:

```

 remove_filename();
 operator/=(replacement);

```

10 *Returns:* *\*this*.

11 *[Example 3:*

```

 path("/foo").replace_filename("bar"); // yields "/bar" on POSIX
 path("/").replace_filename("bar"); // yields "/bar" on POSIX
— end example]

```

```

path& replace_extension(const path& replacement = path());

```

12 *Effects:*

(12.1) — Any existing `extension()` (31.12.6.5.9) is removed from the pathname in the generic format, then

(12.2) — If `replacement` is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then

(12.3) — `operator+=(replacement);`.

13 *Returns:* *\*this*.

```

void swap(path& rhs) noexcept;

```

14 *Effects:* Swaps the contents (in all formats) of the two paths.

15 *Complexity:* Constant time.

### 31.12.6.5.6 Native format observers

[fs.path.native.obs]

1 The string returned by all native format observers is in the native pathname format (31.12.6).

```

const string_type& native() const noexcept;

```

2 *Returns:* The pathname in the native format.

```

const value_type* c_str() const noexcept;

```

3 *Effects:* Equivalent to: `return native().c_str();`

```

operator string_type() const;

```

4 *Returns:* `native()`.

```

template<class EcharT, class traits = char_traits<EcharT>, class Allocator = allocator<EcharT>>
 basic_string<EcharT, traits, Allocator> string(const Allocator& a = Allocator()) const;

```

5 *Returns:* `native()`.

6 *Remarks:* All memory allocation, including for the return value, shall be performed by `a`. Conversion, if any, is specified by 31.12.6.3.

```

std::string native_encoded_string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;

```

7 *Returns:* `native()`.

8 *Remarks:* Conversion, if any, is performed as specified by 31.12.6.3.

```

std::string display_string() const;

```

9 *Returns:* `std::format("{ }", *this)`.

[*Note 1*: The returned string is suitable for use with formatting (28.5.5) and print functions (31.7.10). — *end note*]

### 31.12.6.5.7 Generic format observers

[fs.path.generic.obs]

<sup>1</sup> Generic format observer functions return strings formatted according to the generic pathname format (31.12.6.2). A single slash ('/') character is used as the *directory-separator*.

<sup>2</sup> [*Example 1*: On an operating system that uses backslash as its *preferred-separator*,

```
path("foo\\bar").generic_string()
```

returns "foo/bar". — *end example*]

```
template<class EcharT, class traits = char_traits<EcharT>, class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator> generic_string(const Allocator& a = Allocator()) const;
```

<sup>3</sup> *Returns*: The pathname in the generic format.

<sup>4</sup> *Remarks*: All memory allocation, including for the return value, shall be performed by **a**. Conversion, if any, is specified by 31.12.6.3.

```
std::string generic_native_encoded_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;
```

<sup>5</sup> *Returns*: The pathname in the generic format.

<sup>6</sup> *Remarks*: Conversion, if any, is specified by 31.12.6.3.

```
std::string generic_display_string() const;
```

<sup>7</sup> *Returns*: `std::format("{:g}", *this)`.

[*Note 1*: The returned string is suitable for use with formatting (28.5.5) and print functions (31.7.10). — *end note*]

### 31.12.6.5.8 Compare

[fs.path.compare]

```
int compare(const path& p) const noexcept;
```

<sup>1</sup> *Returns*:

- (1.1) — Let `rootNameComparison` be the result of `this->root_name().native().compare(p.root_name().native())`. If `rootNameComparison` is not 0, `rootNameComparison`.
- (1.2) — Otherwise, if `!this->has_root_directory()` and `p.has_root_directory()`, a value less than 0.
- (1.3) — Otherwise, if `this->has_root_directory()` and `!p.has_root_directory()`, a value greater than 0.
- (1.4) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically less than `native()` for the elements of `p.relative_path()`, a value less than 0.
- (1.5) — Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically greater than `native()` for the elements of `p.relative_path()`, a value greater than 0.
- (1.6) — Otherwise, 0.

```
int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;
```

<sup>2</sup> *Effects*: Equivalent to: `return compare(path(s));`

### 31.12.6.5.9 Decomposition

[fs.path.decompose]

```
path root_name() const;
```

<sup>1</sup> *Returns*: *root-name*, if the pathname in the generic format includes *root-name*, otherwise `path()`.

```

path root_directory() const;
2 Returns: root-directory, if the pathname in the generic format includes root-directory, otherwise path().

path root_path() const;
3 Returns: root_name() / root_directory().

path relative_path() const;
4 Returns: A path composed from the pathname in the generic format, if empty() is false, beginning
 with the first filename after root_path(). Otherwise, path().

path parent_path() const;
5 Returns: *this if has_relative_path() is false, otherwise a path whose generic format pathname
 is the longest prefix of the generic format pathname of *this that produces one fewer element in its
 iteration.

path filename() const;
6 Returns: relative_path().empty() ? path() : *--end().
7 [Example 1:
 path("/foo/bar.txt").filename(); // yields "bar.txt"
 path("/foo/bar").filename(); // yields "bar"
 path("/foo/bar/").filename(); // yields ""
 path("/").filename(); // yields ""
 path("//host").filename(); // yields ""
 path(".").filename(); // yields "."
 path("..").filename(); // yields ".."
 — end example]

path stem() const;
8 Returns: Let f be the generic format pathname of filename(). Returns a path whose pathname in
 the generic format is
(8.1) — f, if it contains no periods other than a leading period or consists solely of one or two periods;
(8.2) — otherwise, the prefix of f ending before its last period.
9 [Example 2:
 std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
 path p = "foo.bar.baz.tar";
 for (; !p.extension().empty(); p = p.stem())
 std::cout << p.extension() << '\n';
 // outputs: .tar
 // .baz
 // .bar
 — end example]

path extension() const;
10 Returns: A path whose pathname in the generic format is the suffix of filename() not included in
 stem().
11 [Example 3:
 path("/foo/bar.txt").extension(); // yields ".txt" and stem() is "bar"
 path("/foo/bar").extension(); // yields "" and stem() is "bar"
 path("/foo/.profile").extension(); // yields "" and stem() is ".profile"
 path(".bar").extension(); // yields "" and stem() is ".bar"
 path("..bar").extension(); // yields ".bar" and stem() is "."
 — end example]

12 [Note 1: The period is included in the return value so that it is possible to distinguish between no extension
 and an empty extension. — end note]
13 [Note 2: On non-POSIX operating systems, for a path p, it is possible that p.stem() + p.extension() ==
 p.filename() is false, even though the generic format pathnames are the same. — end note]

```

## 31.12.6.5.10 Query

[fs.path.query]

```

bool empty() const noexcept;
1 Returns: true if the pathname in the generic format is empty, otherwise false.

bool has_root_path() const;
2 Returns: !root_path().empty().

bool has_root_name() const;
3 Returns: !root_name().empty().

bool has_root_directory() const;
4 Returns: !root_directory().empty().

bool has_relative_path() const;
5 Returns: !relative_path().empty().

bool has_parent_path() const;
6 Returns: !parent_path().empty().

bool has_filename() const;
7 Returns: !filename().empty().

bool has_stem() const;
8 Returns: !stem().empty().

bool has_extension() const;
9 Returns: !extension().empty().

bool is_absolute() const;
10 Returns: true if the pathname in the native format contains an absolute path (31.12.6), otherwise
 false.
11 [Example 1: path("/").is_absolute() is true for POSIX-based operating systems, and false for Windows-
 based operating systems. — end example]

bool is_relative() const;
12 Returns: !is_absolute().

```

## 31.12.6.5.11 Generation

[fs.path.gen]

```

path lexically_normal() const;
1 Returns: A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname
 in the generic format of *this.
2 [Example 1:
 assert(path("foo/./bar/..").lexically_normal() == "foo/");
 assert(path("foo/././bar/..").lexically_normal() == "foo/");
 The above assertions will succeed. On Windows, the returned path's directory-separator characters will be
 backslashes rather than slashes, but that does not affect path equality. — end example]

path lexically_relative(const path& base) const;
3 Effects: If:
(3.1) — root_name() != base.root_name() is true, or
(3.2) — is_absolute() != base.is_absolute() is true, or
(3.3) — !has_root_directory() && base.has_root_directory() is true, or
(3.4) — any filename in relative_path() or base.relative_path() can be interpreted as a root-name,
 returns path().

```

[Note 1: On a POSIX implementation, no *filename* in a *relative-path* is acceptable as a *root-name*. — end note]

Determines the first mismatched element of *\*this* and *base* as if by:

```
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
```

Then,

(3.5) — if *a* == *end()* and *b* == *base.end()*, returns *path(".")*; otherwise

(3.6) — let *n* be the number of *filename* elements in [*b*, *base.end()*) that are not dot or dot-dot or empty, minus the number that are dot-dot. If *n* < 0, returns *path()*; otherwise

(3.7) — if *n* == 0 and (*a* == *end()* || *a* -> empty()), returns *path(".")*; otherwise

(3.8) — returns an object of class *path* that is default-constructed, followed by

(3.8.1) — application of *operator/=(path(".."))* *n* times, and then

(3.8.2) — application of *operator/=* for each element in [*a*, *end()*).

4 *Returns: \*this* made relative to *base*. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) *\*this* or *base*.

5 [Example 2:

```
assert(path("/a/d").lexically_relative("/a/b/c") == "../d");
assert(path("/a/b/c").lexically_relative("/a/d") == "../b/c");
assert(path("a/b/c").lexically_relative("a") == "b/c");
assert(path("a/b/c").lexically_relative("a/b/c/x/y") == "../..");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b").lexically_relative("c/d") == "../..a/b");
```

The above assertions will succeed. On Windows, the returned path's *directory-separator* characters will be backslashes rather than slashes, but that does not affect *path* equality. — end example]

6 [Note 2: If symlink following semantics are desired, use the operational function *relative()*. — end note]

7 [Note 3: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply *lexically\_normal()* to *\*this*, *base*, or both. — end note]

```
path lexically_proximate(const path& base) const;
```

8 *Returns:* If the value of *lexically\_relative(base)* is not an empty path, return it. Otherwise return *\*this*.

9 [Note 4: If symlink following semantics are desired, use the operational function *proximate()*. — end note]

10 [Note 5: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply *lexically\_normal()* to *\*this*, *base*, or both. — end note]

### 31.12.6.6 Iterators

[fs.path.itr]

1 Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).

2 A *path::iterator* is a constant iterator meeting all the requirements of a bidirectional iterator (24.3.5.6) except that, for dereferenceable iterators *a* and *b* of type *path::iterator* with *a* == *b*, there is no requirement that *\*a* and *\*b* are bound to the same object. Its *value\_type* is *path*.

3 Calling any non-const member function of a *path* object invalidates all iterators referring to elements of that object.

4 For the elements of the pathname in the generic format, the forward traversal order is as follows:

(4.1) — The *root-name* element, if present.

(4.2) — The *root-directory* element, if present.

[Note 1: It is possible that the use of the generic format is needed to ensure correct lexicographical comparison. — end note]

(4.3) — Each successive *filename* element, if present.

(4.4) — An empty element, if a trailing non-root *directory-separator* is present.

5 The backward traversal order is the reverse of forward traversal.

```
iterator begin() const;
```

6 *Returns:* An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

```
iterator end() const;
```

7 *Returns:* The end iterator.

### 31.12.6.7 Inserter and extractor

[fs.path.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
```

1 *Effects:* Equivalent to `os << quoted(p.string<charT, traits>())`.

[Note 1: The `quoted` function is described in 31.7.9. — end note]

2 *Returns:* `os`.

```
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
```

3 *Effects:* Equivalent to:

```
 basic_string<charT, traits> tmp;
 is >> quoted(tmp);
 p = tmp;
```

4 *Returns:* `is`.

### 31.12.6.8 Non-member functions

[fs.path.nonmember]

```
void swap(path& lhs, path& rhs) noexcept;
```

1 *Effects:* Equivalent to `lhs.swap(rhs)`.

```
size_t hash_value(const path& p) noexcept;
```

2 *Returns:* A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_value(p2)`.

```
friend bool operator==(const path& lhs, const path& rhs) noexcept;
```

3 *Returns:* `lhs.compare(rhs) == 0`.

4 [Note 1: Path equality and path equivalence have different semantics.

(4.1) — Equality is determined by the `path` non-member `operator==`, which considers the two paths' lexical representations only.

[Example 1: `path("foo") == "bar"` is never `true`. — end example]

(4.2) — Equivalence is determined by the `equivalent()` non-member function, which determines if two paths resolve (31.12.6) to the same file system entity.

[Example 2: `equivalent("foo", "bar")` will be `true` when both paths resolve to the same file. — end example]

— end note]

```
friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
```

5 *Returns:* `lhs.compare(rhs) <=> 0`.

```
friend path operator/(const path& lhs, const path& rhs);
```

6 *Effects:* Equivalent to: `return path(lhs) /= rhs;`

### 31.12.6.9 Formatting support

[fs.path.fmtr]

#### 31.12.6.9.1 Formatting support overview

[fs.path.fmtr.general]

```
namespace std {
template<class charT> struct formatter<filesystem::path, charT> {
 constexpr void set_debug_format();
```

```
constexpr typename basic_format_parse_context<charT>::iterator
 parse(basic_format_parse_context<charT>& ctx);

template<class FormatContext>
 typename FormatContext::iterator
 format(const filesystem::path& path, FormatContext& ctx) const;
};
}
```

### 31.12.6.9.2 Formatting support functions

[fs.path.fmtr.funcs]

- <sup>1</sup> Formatting of paths uses formatting specifiers of the form

*path-format-spec*:  
*fill-and-align*<sub>opt</sub> *width*<sub>opt</sub> *?opt* *g*<sub>opt</sub>

where the productions *fill-and-align* and *width* are described in 28.5.2. If the *?opt* option is used then the path is formatted as an escaped string (28.5.6.5).

```
constexpr void set_debug_format();
```

- <sup>2</sup> *Effects*: Modifies the state of the formatter to be as if the *path-format-spec* parsed by the last call to *parse* contained the *?opt* option.

```
constexpr typename basic_format_parse_context<charT>::iterator
 parse(basic_format_parse_context<charT>& ctx);
```

- <sup>3</sup> *Effects*: Parses the format specifier as a *path-format-spec* and stores the parsed specifiers in *\*this*.

- <sup>4</sup> *Returns*: An iterator past the end of the *path-format-spec*.

```
template<class FormatContext>
 typename FormatContext::iterator
 format(const filesystem::path& p, FormatContext& ctx) const;
```

- <sup>5</sup> *Effects*: Let *s* be *p.generic\_string<filesystem::path::value\_type>()* if the *g* option is used, otherwise *p.native()*. Writes *s* into *ctx.out()*, adjusted according to the *path-format-spec*. If *charT* is *char*, *path::value\_type* is *wchar\_t*, and the literal encoding is UTF-8, then the escaped path is transcoded from the native encoding for wide character strings to UTF-8 with maximal subparts of ill-formed subsequences substituted with U+FFFD REPLACEMENT CHARACTER per the Unicode Standard, Chapter 3.9 U+FFFD Substitution in Conversion. If *charT* and *path::value\_type* are the same then no transcoding is performed. Otherwise, transcoding is implementation-defined.

- <sup>6</sup> *Returns*: An iterator past the end of the output range.

### 31.12.6.10 Hash support

[fs.path.hash]

```
template<> struct hash<filesystem::path>;
```

- <sup>1</sup> For an object *p* of type *filesystem::path*, *hash<filesystem::path>()*(*p*) evaluates to the same result as *filesystem::hash\_value(p)*.

## 31.12.7 Class filesystem\_error

[fs.class.filesystem.error]

### 31.12.7.1 General

[fs.class.filesystem.error.general]

```
namespace std::filesystem {
 class filesystem_error : public system_error {
 public:
 filesystem_error(const string& what_arg, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, error_code ec);
 filesystem_error(const string& what_arg,
 const path& p1, const path& p2, error_code ec);

 const path& path1() const noexcept;
 const path& path2() const noexcept;
 const char* what() const noexcept override;
 };
}
```

- <sup>1</sup> The class `filesystem_error` defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

### 31.12.7.2 Members

[fs.filesystem.error.members]

- <sup>1</sup> Constructors are provided that store zero, one, or two paths associated with an error.

```
filesystem_error(const string& what_arg, error_code ec);
```

<sup>2</sup> *Postconditions:*

- (2.1) — `code() == ec` is true,
- (2.2) — `path1().empty()` is true,
- (2.3) — `path2().empty()` is true, and
- (2.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos` is true.

```
filesystem_error(const string& what_arg, const path& p1, error_code ec);
```

<sup>3</sup> *Postconditions:*

- (3.1) — `code() == ec` is true,
- (3.2) — `path1()` returns a reference to the stored copy of `p1`,
- (3.3) — `path2().empty()` is true, and
- (3.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos` is true.

```
filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);
```

<sup>4</sup> *Postconditions:*

- (4.1) — `code() == ec`,
- (4.2) — `path1()` returns a reference to the stored copy of `p1`,
- (4.3) — `path2()` returns a reference to the stored copy of `p2`, and
- (4.4) — `string_view(what()).find(what_arg.c_str()) != string_view::npos`.

```
const path& path1() const noexcept;
```

- <sup>5</sup> *Returns:* A reference to the copy of `p1` stored by the constructor, or, if none, an empty path.

```
const path& path2() const noexcept;
```

- <sup>6</sup> *Returns:* A reference to the copy of `p2` stored by the constructor, or, if none, an empty path.

```
const char* what() const noexcept override;
```

- <sup>7</sup> *Returns:* An NTBS that incorporates the `what_arg` argument supplied to the constructor. The exact format is unspecified. Implementations should include the `system_error::what()` string and the pathnames of `path1` and `path2` in the native format in the returned string.

### 31.12.8 Enumerations

[fs.enum]

#### 31.12.8.1 Enum `path::format`

[fs.enum.path.format]

- <sup>1</sup> This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 148.

#### 31.12.8.2 Enum class `file_type`

[fs.enum.file.type]

- <sup>1</sup> This enum class specifies constants used to identify file types, with the meanings listed in Table 149. The values of the constants are distinct.

#### 31.12.8.3 Enum class `copy_options`

[fs.enum.copy.opts]

- <sup>1</sup> The enum class type `copy_options` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 150. The constant `none` represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

Table 148 — Enum `path::format` [tab:fs.enum.path.format]

| Name                        | Meaning                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>native_format</code>  | The native pathname format.                                                                                                                                                                                                                                                                                                                                     |
| <code>generic_format</code> | The generic pathname format.                                                                                                                                                                                                                                                                                                                                    |
| <code>auto_format</code>    | The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format.<br><i>Recommended practice:</i> For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way. |

Table 149 — Enum class `file_type` [tab:fs.enum.file.type]

| Constant                            | Meaning                                                                                                                                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>none</code>                   | The type of the file has not been determined or an error occurred while trying to determine the type.                                                                                                                                             |
| <code>not_found</code>              | Pseudo-type indicating the file was not found.<br>[ <i>Note 1:</i> The file not being found is not considered an error while determining the type of a file. — <i>end note</i> ]                                                                  |
| <code>regular</code>                | Regular file                                                                                                                                                                                                                                      |
| <code>directory</code>              | Directory file                                                                                                                                                                                                                                    |
| <code>symlink</code>                | Symbolic link file                                                                                                                                                                                                                                |
| <code>block</code>                  | Block special file                                                                                                                                                                                                                                |
| <code>character</code>              | Character special file                                                                                                                                                                                                                            |
| <code>fifo</code>                   | FIFO or pipe file                                                                                                                                                                                                                                 |
| <code>socket</code>                 | Socket file                                                                                                                                                                                                                                       |
| <code>implementation-defined</code> | Implementations that support file systems having file types in addition to the above <code>file_type</code> types shall supply implementation-defined <code>file_type</code> constants to separately identify each of those additional file types |
| <code>unknown</code>                | The file exists but the type cannot be determined                                                                                                                                                                                                 |

#### 31.12.8.4 Enum class `perms` [fs.enum.perms]

- <sup>1</sup> The enum class type `perms` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 151.

#### 31.12.8.5 Enum class `perm_options` [fs.enum.perm.opts]

- <sup>1</sup> The enum class type `perm_options` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 152. The bitmask constants are bitmask elements. In Table 152 `perm` denotes a value of type `perms` passed to `permissions`.

#### 31.12.8.6 Enum class `directory_options` [fs.enum.dir.opts]

- <sup>1</sup> The enum class type `directory_options` is a bitmask type (16.3.3.3.3) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 153. The constant `none` represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

### 31.12.9 Class `file_status` [fs.class.file.status]

#### 31.12.9.1 General [fs.class.file.status.general]

```
namespace std::filesystem {
 class file_status {
 public:
 // 31.12.9.2, constructors and destructor
 file_status() noexcept : file_status(file_type::none) {}
 explicit file_status(file_type ft,
 perms prms = perms::unknown) noexcept;
```

Table 150 — Enum class `copy_options` [tab:fs.enum.copy.opts]

| Option group controlling <code>copy_file</code> function effects for existing target files |                                                                                                                                                    |
|--------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Constant                                                                                   | Meaning                                                                                                                                            |
| <code>none</code>                                                                          | (Default) Error; file already exists.                                                                                                              |
| <code>skip_existing</code>                                                                 | Do not overwrite existing file, do not report an error.                                                                                            |
| <code>overwrite_existing</code>                                                            | Overwrite the existing file.                                                                                                                       |
| <code>update_existing</code>                                                               | Overwrite the existing file if it is older than the replacement file.                                                                              |
| Option group controlling copy function effects for subdirectories                          |                                                                                                                                                    |
| Constant                                                                                   | Meaning                                                                                                                                            |
| <code>none</code>                                                                          | (Default) Do not copy subdirectories.                                                                                                              |
| <code>recursive</code>                                                                     | Recursively copy subdirectories and their contents.                                                                                                |
| Option group controlling copy function effects for symbolic links                          |                                                                                                                                                    |
| Constant                                                                                   | Meaning                                                                                                                                            |
| <code>none</code>                                                                          | (Default) Follow symbolic links.                                                                                                                   |
| <code>copy_symlinks</code>                                                                 | Copy symbolic links as symbolic links rather than copying the files that they point to.                                                            |
| <code>skip_symlinks</code>                                                                 | Ignore symbolic links.                                                                                                                             |
| Option group controlling copy function effects for choosing the form of copying            |                                                                                                                                                    |
| Constant                                                                                   | Meaning                                                                                                                                            |
| <code>none</code>                                                                          | (Default) Copy content.                                                                                                                            |
| <code>directories_only</code>                                                              | Copy directory structure only, do not copy non-directory files.                                                                                    |
| <code>create_symlinks</code>                                                               | Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory. |
| <code>create_hard_links</code>                                                             | Make hard links instead of copies of files.                                                                                                        |

```

file_status(const file_status&) noexcept = default;
file_status(file_status&&) noexcept = default;
~file_status();

// assignments
file_status& operator=(const file_status&) noexcept = default;
file_status& operator=(file_status&&) noexcept = default;

// 31.12.9.4, modifiers
void type(file_type ft) noexcept;
void permissions(perms prms) noexcept;

// 31.12.9.3, observers
file_type type() const noexcept;
perms permissions() const noexcept;

friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept
{ return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
};

```

<sup>1</sup> An object of type `file_status` stores information about the type and permissions of a file.

### 31.12.9.2 Constructors

[fs.file.status.cons]

```
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

<sup>1</sup> *Postconditions:* `type() == ft` and `permissions() == prms`.

Table 151 — Enum class perms [tab:fs.enum.perms]

| Name         | Value<br>(octal) | POSIX<br>macro | Definition or notes                                                                                            |

| set_uid      | 04000            | S_ISUID        | Set-user-ID on execution                                                                                       |
| set_gid      | 02000            | S_ISGID        | Set-group-ID on execution                                                                                      |
| sticky_bit   | 01000            | S_ISVTX        | Operating system dependent.                                                                                    |
| mask         | 07777            |                | all   set_uid   set_gid   sticky_bit                                                                           |
| unknown      | 0xFFFF           |                | The permissions are not known, such as when a file_status object is created without specifying the permissions |

Table 152 — Enum class perm\_options [tab:fs.enum.perm.opts]

| Name     | Meaning                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| replace  | permissions shall replace the file's permission bits with perm                                                                              |
| add      | permissions shall replace the file's permission bits with the bitwise OR of perm and the file's current permission bits.                    |
| remove   | permissions shall replace the file's permission bits with the bitwise AND of the complement of perm and the file's current permission bits. |
| nofollow | permissions shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.            |

Table 153 — Enum class directory\_options [tab:fs.enum.dir.opts]

| Name                     | Meaning                                                            |
|--------------------------|--------------------------------------------------------------------|
| none                     | (Default) Skip directory symlinks, permission denied is an error.  |
| follow_directory_symlink | Follow rather than skip directory symlinks.                        |
| skip_permission_denied   | Skip directories that would otherwise result in permission denied. |

**31.12.9.3 Observers**

[fs.file.status.obs]

```
file_type type() const noexcept;
```

- 1 *Returns:* The value of `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.

```
perms permissions() const noexcept;
```

- 2 *Returns:* The value of `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

**31.12.9.4 Modifiers**

[fs.file.status.mods]

```
void type(file_type ft) noexcept;
```

- 1 *Postconditions:* `type() == ft`.

```
void permissions(perms prms) noexcept;
```

- 2 *Postconditions:* `permissions() == prms`.

**31.12.10 Class directory\_entry**

[fs.class.directory.entry]

**31.12.10.1 General**

[fs.class.directory.entry.general]

```
namespace std::filesystem {
 class directory_entry {
 public:
 // 31.12.10.2, constructors and destructor
 directory_entry() noexcept = default;
 directory_entry(const directory_entry&) = default;
 directory_entry(directory_entry&&) noexcept = default;
 explicit directory_entry(const filesystem::path& p);
 directory_entry(const filesystem::path& p, error_code& ec);
 ~directory_entry();

 // assignments
 directory_entry& operator=(const directory_entry&) = default;
 directory_entry& operator=(directory_entry&&) noexcept = default;

 // 31.12.10.3, modifiers
 void assign(const filesystem::path& p);
 void assign(const filesystem::path& p, error_code& ec);
 void replace_filename(const filesystem::path& p);
 void replace_filename(const filesystem::path& p, error_code& ec);
 void refresh();
 void refresh(error_code& ec) noexcept;

 // 31.12.10.4, observers
 const filesystem::path& path() const noexcept;
 operator const filesystem::path&() const noexcept;
 bool exists() const;
 bool exists(error_code& ec) const noexcept;
 bool is_block_file() const;
 bool is_block_file(error_code& ec) const noexcept;
 bool is_character_file() const;
 bool is_character_file(error_code& ec) const noexcept;
 bool is_directory() const;
 bool is_directory(error_code& ec) const noexcept;
 bool is_fifo() const;
 bool is_fifo(error_code& ec) const noexcept;
 bool is_other() const;
 bool is_other(error_code& ec) const noexcept;
 bool is_regular_file() const;
 bool is_regular_file(error_code& ec) const noexcept;
 bool is_socket() const;
 bool is_socket(error_code& ec) const noexcept;
```

```

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
file_status status() const;
file_status status(error_code& ec) const noexcept;
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;

bool operator==(const directory_entry& rhs) const noexcept;
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

// 31.12.10.5, inserter
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

private:
 filesystem::path path-object; // exposition only
};
}

```

- 1 A `directory_entry` object stores a `path` object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.
- 2 Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by `directory_entry` observer functions (31.12.13). Such stored file attribute values are said to be *cached*.
- 3 [Note 1: `directory_iterator` can cache already available attribute values directly into a `directory_entry` object without the cost of a call to `refresh()`. — end note]
- 4 [Example 1:

```

using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto&& x : directory_iterator("."))
{
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto&& x : directory_iterator("."))
{
 lengthy_function(x.path()); // cache becomes stale
 x.refresh();
 std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching. — end example]

### 31.12.10.2 Constructors

[fs.dir.entry.cons]

```

explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);

```

- 1 *Effects:* Calls `refresh()` or `refresh(ec)`, respectively.
- 2 *Postconditions:* `path() == p` if no error occurs, otherwise `path() == filesystem::path()`.

3 *Throws:* As specified in 31.12.5.

### 31.12.10.3 Modifiers

[fs.dir.entry.mods]

```
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

1 *Effects:* Equivalent to *path-object* = p, then refresh() or refresh(ec), respectively. If an error occurs, the values of any cached attributes are unspecified.

2 *Throws:* As specified in 31.12.5.

```
void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);
```

3 *Effects:* Equivalent to *path-object*.replace\_filename(p), then refresh() or refresh(ec), respectively. If an error occurs, the values of any cached attributes are unspecified.

4 *Throws:* As specified in 31.12.5.

```
void refresh();
void refresh(error_code& ec) noexcept;
```

5 *Effects:* Stores the current values of any cached attributes of the file p resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.

6 *Throws:* As specified in 31.12.5.

7 [Note 1: Implementations of `directory_iterator` (31.12.11) are prohibited from directly or indirectly calling the `refresh` function as described in 31.12.11.1. — end note]

### 31.12.10.4 Observers

[fs.dir.entry.obs]

1 Unqualified function names in the *Returns:* elements of the `directory_entry` observers described below refer to members of the `std::filesystem` namespace.

```
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
```

2 *Returns:* *path-object*.

```
bool exists() const;
bool exists(error_code& ec) const noexcept;
```

3 *Returns:* `exists(this->status())` or `exists(this->status(ec))`, respectively.

4 *Throws:* As specified in 31.12.5.

```
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
```

5 *Returns:* `is_block_file(this->status())` or `is_block_file(this->status(ec))`, respectively.

6 *Throws:* As specified in 31.12.5.

```
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
```

7 *Returns:* `is_character_file(this->status())` or `is_character_file(this->status(ec))`, respectively.

8 *Throws:* As specified in 31.12.5.

```
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
```

9 *Returns:* `is_directory(this->status())` or `is_directory(this->status(ec))`, respectively.

10 *Throws:* As specified in 31.12.5.

```
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
```

11 *Returns:* `is_fifo(this->status())` or `is_fifo(this->status(ec))`, respectively.

12 *Throws:* As specified in 31.12.5.

```

bool is_other() const;
bool is_other(error_code& ec) const noexcept;
13 Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.
14 Throws: As specified in 31.12.5.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
15 Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.
16 Throws: As specified in 31.12.5.

bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
17 Returns: is_socket(this->status()) or is_socket(this->status(ec)), respectively.
18 Throws: As specified in 31.12.5.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
19 Returns: is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.
20 Throws: As specified in 31.12.5.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
21 Returns: If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.
22 Throws: As specified in 31.12.5.

uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
23 Returns: If cached, the hard link count attribute value. Otherwise, hard_link_count(path()) or hard_link_count(path(), ec), respectively.
24 Throws: As specified in 31.12.5.

file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
25 Returns: If cached, the last write time attribute value. Otherwise, last_write_time(path()) or last_write_time(path(), ec), respectively.
26 Throws: As specified in 31.12.5.

file_status status() const;
file_status status(error_code& ec) const noexcept;
27 Returns: If cached, the status attribute value. Otherwise, status(path()) or status(path(), ec), respectively.
28 Throws: As specified in 31.12.5.

file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
29 Returns: If cached, the symlink status attribute value. Otherwise, symlink_status(path()) or symlink_status(path(), ec), respectively.
30 Throws: As specified in 31.12.5.

bool operator==(const directory_entry& rhs) const noexcept;
31 Returns: path-object == rhs.path-object.

```

```
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
```

32 *Returns: path-object <=> rhs.path-object.*

### 31.12.10.5 Inserter

[fs.dir.entry.io]

```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);
```

1 *Effects:* Equivalent to: `return os << d.path();`

## 31.12.11 Class `directory_iterator`

[fs.class.directory.iterator]

### 31.12.11.1 General

[fs.class.directory.iterator.general]

- 1 An object of type `directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the path and any cached attribute values (31.12.10) for each file in a directory or in an implementation-defined directory-like file type.

[Note 1: For iteration into subdirectories, see class `recursive_directory_iterator` (31.12.12). — end note]

```
namespace std::filesystem {
class directory_iterator {
public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;

 // 31.12.11.2, member functions
 directory_iterator() noexcept;
 explicit directory_iterator(const path& p);
 directory_iterator(const path& p, directory_options options);
 directory_iterator(const path& p, error_code& ec);
 directory_iterator(const path& p, directory_options options,
 error_code& ec);
 directory_iterator(const directory_iterator& rhs);
 directory_iterator(directory_iterator&& rhs) noexcept;
 ~directory_iterator();

 directory_iterator& operator=(const directory_iterator& rhs);
 directory_iterator& operator=(directory_iterator&& rhs) noexcept;

 const directory_entry& operator*() const;
 const directory_entry* operator->() const;
 directory_iterator& operator++();
 directory_iterator& increment(error_code& ec);

 bool operator==(default_sentinel_t) const noexcept {
 return *this == directory_iterator();
 }

 // other members as required by 24.3.5.3, input iterators
};
```

- 2 `directory_iterator` meets the *Cpp17InputIterator* requirements (24.3.5.3).

- 3 If an iterator of type `directory_iterator` reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The `directory_iterator` default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

- 4 The end iterator is not dereferenceable.

- 5 Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

- <sup>6</sup> The result of calling the `path()` member of the `directory_entry` object obtained by dereferencing a `directory_iterator` is a reference to a `path` object composed of the directory argument from which the iterator was constructed with the filename of the directory entry appended as if by `operator/=`.
- <sup>7</sup> Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.
- <sup>8</sup> The order of directory entries obtained by dereferencing successive increments of a `directory_iterator` is unspecified.
- <sup>9</sup> Constructors and non-const `directory_iterator` member functions store the values of any cached attributes (31.12.10) in the `directory_entry` element returned by `operator*`. `directory_iterator` member functions shall not directly or indirectly call any `directory_entry` refresh function.
- [Note 2: The exact mechanism for storing cached attribute values is not exposed to users. — end note]
- <sup>10</sup> [Note 3: A path obtained by dereferencing a directory iterator might not actually exist; it could be a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries might invalidate symbolic links that are being followed. — end note]
- <sup>11</sup> [Note 4: If a file is removed from or added to a directory after the construction of a `directory_iterator` for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX `readdir`. — end note]

### 31.12.11.2 Members

[fs.dir.itr.members]

`directory_iterator()` noexcept;

- <sup>1</sup> *Effects:* Constructs the end iterator.

```
explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);
```

- <sup>2</sup> *Effects:* For the directory that `p` resolves to, constructs an iterator for the first element in a sequence of `directory_entry` elements representing the files in the directory, if any; otherwise the end iterator. However, if

(`options & directory_options::skip_permission_denied`) != `directory_options::none`

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

- <sup>3</sup> *Throws:* As specified in 31.12.5.

- <sup>4</sup> [Note 1: To iterate over the current directory, use `directory_iterator(".")` rather than `directory_iterator("")`. — end note]

```
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
```

- <sup>5</sup> *Postconditions:* `*this` has the original value of `rhs`.

```
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
```

- <sup>6</sup> *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

- <sup>7</sup> *Postconditions:* `*this` has the original value of `rhs`.

- <sup>8</sup> *Returns:* `*this`.

```
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);
```

- <sup>9</sup> *Effects:* As specified for the prefix increment operation of Input iterators (24.3.5.3).

- <sup>10</sup> *Returns:* `*this`.

- <sup>11</sup> *Throws:* As specified in 31.12.5.

### 31.12.11.3 Non-member functions

[fs.dir.itr.nonmembers]

- <sup>1</sup> These functions enable range access for `directory_iterator`.

```
directory_iterator begin(directory_iterator iter) noexcept;
```

2 *Returns:* iter.

```
directory_iterator end(directory_iterator) noexcept;
```

3 *Returns:* directory\_iterator().

### 31.12.12 Class recursive\_directory\_iterator

[fs.class.rec.dir.itr]

#### 31.12.12.1 General

[fs.class.rec.dir.itr.general]

1 An object of type recursive\_directory\_iterator provides an iterator for a sequence of directory\_entry elements representing the files in a directory or in an implementation-defined directory-like file type, and its subdirectories.

```
namespace std::filesystem {
 class recursive_directory_iterator {
 public:
 using iterator_category = input_iterator_tag;
 using value_type = directory_entry;
 using difference_type = ptrdiff_t;
 using pointer = const directory_entry*;
 using reference = const directory_entry&;

 // 31.12.12.2, constructors and destructor
 recursive_directory_iterator() noexcept;
 explicit recursive_directory_iterator(const path& p);
 recursive_directory_iterator(const path& p, directory_options options);
 recursive_directory_iterator(const path& p, directory_options options,
 error_code& ec);
 recursive_directory_iterator(const path& p, error_code& ec);
 recursive_directory_iterator(const recursive_directory_iterator& rhs);
 recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
 ~recursive_directory_iterator();

 // 31.12.12.2, observers
 directory_options options() const;
 int depth() const;
 bool recursion_pending() const;

 const directory_entry& operator*() const;
 const directory_entry* operator->() const;

 // 31.12.12.2, modifiers
 recursive_directory_iterator&
 operator=(const recursive_directory_iterator& rhs);
 recursive_directory_iterator&
 operator=(recursive_directory_iterator&& rhs) noexcept;

 recursive_directory_iterator& operator++();
 recursive_directory_iterator& increment(error_code& ec);

 void pop();
 void pop(error_code& ec);
 void disable_recursion_pending();

 bool operator==(default_sentinel_t) const noexcept {
 return *this == recursive_directory_iterator();
 }

 // other members as required by 24.3.5.3, input iterators
 };
}
```

2 Calling options, depth, recursion\_pending, pop or disable\_recursion\_pending on an iterator that is not dereferenceable results in undefined behavior.

3 The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.

4 [Note 1: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable. — end note]

### 31.12.12.2 Members

[fs.rec.dir.itr.members]

`recursive_directory_iterator()` noexcept;

1 *Effects:* Constructs the end iterator.

`explicit recursive_directory_iterator(const path& p);`

`recursive_directory_iterator(const path& p, directory_options options);`

`recursive_directory_iterator(const path& p, directory_options options, error_code& ec);`

`recursive_directory_iterator(const path& p, error_code& ec);`

2 *Effects:* Constructs an iterator representing the first entry in the directory to which `p` resolves, if any; otherwise, the end iterator. However, if

`(options & directory_options::skip_permission_denied) != directory_options::none`

and construction encounters an error indicating that permission to access `p` is denied, constructs the end iterator and does not report an error.

3 *Postconditions:* `options() == options` for the signatures with a `directory_options` argument, otherwise `options() == directory_options::none`.

4 *Throws:* As specified in 31.12.5.

5 [Note 1: Use `recursive_directory_iterator(".")` rather than `recursive_directory_iterator("")` to iterate over the current directory. — end note]

6 [Note 2: By default, `recursive_directory_iterator` does not follow directory symlinks. To follow directory symlinks, specify `options` as `directory_options::follow_directory_symlink`. — end note]

`recursive_directory_iterator(const recursive_directory_iterator& rhs);`

7 *Postconditions:*

(7.1) — `options() == rhs.options()`

(7.2) — `depth() == rhs.depth()`

(7.3) — `recursion_pending() == rhs.recursion_pending()`

`recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;`

8 *Postconditions:* `options()`, `depth()`, and `recursion_pending()` have the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

`recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);`

9 *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

10 *Postconditions:*

(10.1) — `options() == rhs.options()`

(10.2) — `depth() == rhs.depth()`

(10.3) — `recursion_pending() == rhs.recursion_pending()`

11 *Returns:* `*this`.

`recursive_directory_iterator& operator=(recursive_directory_iterator&& rhs) noexcept;`

12 *Effects:* If `*this` and `rhs` are the same object, the member has no effect.

13 *Postconditions:* `options()`, `depth()`, and `recursion_pending()` have the values that `rhs.options()`, `rhs.depth()`, and `rhs.recursion_pending()`, respectively, had before the function call.

14 *Returns:* `*this`.

`directory_options options() const;`

15 *Returns:* The value of the argument passed to the constructor for the `options` parameter, if present, otherwise `directory_options::none`.

16 *Throws:* Nothing.

`int depth() const;`

17 *Returns:* The current depth of the directory tree being traversed.

[*Note 3:* The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. — *end note*]

18 *Throws:* Nothing.

`bool recursion_pending() const;`

19 *Returns:* `true` if `disable_recursion_pending()` has not been called subsequent to the prior construction or increment operation, otherwise `false`.

20 *Throws:* Nothing.

`recursive_directory_iterator& operator++();`

`recursive_directory_iterator& increment(error_code& ec);`

21 *Effects:* As specified for the prefix increment operation of Input iterators (24.3.5.3), except that:

(21.1) — If there are no more entries at the current depth, then if `depth() != 0` iteration over the parent directory resumes; otherwise `*this = recursive_directory_iterator()`.

(21.2) — Otherwise if

`recursion_pending() && is_directory((*this)->status()) &&`  
`(!is_symlink((*this)->symlink_status()) ||`  
`(options() & directory_options::follow_directory_symlink) != directory_options::none)`

then either directory `(*this)->path()` is recursively iterated into or, if

`(options() & directory_options::skip_permission_denied) != directory_options::none`

and an error occurs indicating that permission to access directory `(*this)->path()` is denied, then directory `(*this)->path()` is treated as an empty directory and no error is reported.

22 *Returns:* `*this`.

23 *Throws:* As specified in 31.12.5.

`void pop();`

`void pop(error_code& ec);`

24 *Effects:* If `depth() == 0`, set `*this` to `recursive_directory_iterator()`. Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

25 *Throws:* As specified in 31.12.5.

26 *Remarks:* Any copies of the previous value of `*this` are no longer required to be dereferenceable nor to be in the domain of `==`.

`void disable_recursion_pending();`

27 *Postconditions:* `recursion_pending() == false`.

28 [*Note 4:* `disable_recursion_pending()` is used to prevent unwanted recursion into a directory. — *end note*]

### 31.12.12.3 Non-member functions

[fs.rec.dir.itr.nonmembers]

1 These functions enable use of `recursive_directory_iterator` with range-based `for` statements.

`recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;`

2 *Returns:* `iter`.

`recursive_directory_iterator end(recursive_directory_iterator) noexcept;`

3 *Returns:* `recursive_directory_iterator()`.

### 31.12.13 Filesystem operation functions

[fs.op.funcs]

#### 31.12.13.1 General

[fs.op.funcs.general]

1 Filesystem operation functions query or modify files, including directories, in external storage.

<sup>2</sup> [Note 1: Because hardware failures, network failures, file system races (31.12.2.4), and many other kinds of errors occur frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can encounter an error; see 31.12.5. — end note]

### 31.12.13.2 Absolute

[fs.op.absolute]

```
path filesystem::absolute(const path& p);
path filesystem::absolute(const path& p, error_code& ec);
```

<sup>1</sup> *Effects:* Composes an absolute path referencing the same file system location as `p` according to the operating system (31.12.2.3).

<sup>2</sup> *Returns:* The composed path. The signature with argument `ec` returns `path()` if an error occurs.

<sup>3</sup> [Note 1: For the returned path, `rp`, `rp.is_absolute()` is `true` unless an error occurs. — end note]

<sup>4</sup> *Throws:* As specified in 31.12.5.

<sup>5</sup> [Note 2: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider `canonical` (31.12.13.3). — end note]

<sup>6</sup> [Note 3: Implementations are strongly encouraged to not query secondary storage, and not consider `!exists(p)` an error. — end note]

<sup>7</sup> [Example 1: For POSIX-based operating systems, `absolute(p)` is simply `current_path()/p`. For Windows-based operating systems, `absolute` might have the same semantics as `GetFullPathNameW`. — end example]

### 31.12.13.3 Canonical

[fs.op.canonical]

```
path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);
```

<sup>1</sup> *Effects:* Converts `p` to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

<sup>2</sup> *Returns:* A path that refers to the same file system object as `absolute(p)`. The signature with argument `ec` returns `path()` if an error occurs.

<sup>3</sup> *Throws:* As specified in 31.12.5.

<sup>4</sup> *Remarks:* `!exists(p)` is an error.

### 31.12.13.4 Copy

[fs.op.copy]

```
void filesystem::copy(const path& from, const path& to);
```

<sup>1</sup> *Effects:* Equivalent to `copy(from, to, copy_options::none)`.

```
void filesystem::copy(const path& from, const path& to, error_code& ec);
```

<sup>2</sup> *Effects:* Equivalent to `copy(from, to, copy_options::none, ec)`.

```
void filesystem::copy(const path& from, const path& to, copy_options options);
```

```
void filesystem::copy(const path& from, const path& to, copy_options options,
 error_code& ec);
```

<sup>3</sup> *Preconditions:* At most one element from each option group (31.12.8.3) is set in `options`.

<sup>4</sup> *Effects:* Before the first use of `f` and `t`:

- (4.1) — If
- ```
(options & copy_options::create_symlinks) != copy_options::none ||
(options & copy_options::skip_symlinks) != copy_options::none
```
- then `auto f = symlink_status(from)` and if needed `auto t = symlink_status(to)`.
- (4.2) — Otherwise, if
- ```
(options & copy_options::copy_symlinks) != copy_options::none
```
- then `auto f = symlink_status(from)` and if needed `auto t = status(to)`.
- (4.3) — Otherwise, `auto f = status(from)` and if needed `auto t = status(to)`.

Effects are then as follows:

- (4.4) — If `f.type()` or `t.type()` is an implementation-defined file type (31.12.8.2), then the effects are implementation-defined.
  - (4.5) — Otherwise, an error is reported as specified in 31.12.5 if
    - (4.5.1) — `exists(f)` is false, or
    - (4.5.2) — `equivalent(from, to)` is true, or
    - (4.5.3) — `is_other(f) || is_other(t)` is true, or
    - (4.5.4) — `is_directory(f) && is_regular_file(t)` is true.
  - (4.6) — Otherwise, if `is_symlink(f)`, then:
    - (4.6.1) — If `(options & copy_options::skip_symlinks) != copy_options::none` then return.
    - (4.6.2) — Otherwise if
      - `!exists(t) && (options & copy_options::copy_symlinks) != copy_options::none`
      - then `copy_symlink(from, to)`.
    - (4.6.3) — Otherwise report an error as specified in 31.12.5.
  - (4.7) — Otherwise, if `is_regular_file(f)`, then:
    - (4.7.1) — If `(options & copy_options::directories_only) != copy_options::none`, then return.
    - (4.7.2) — Otherwise, if `(options & copy_options::create_symlinks) != copy_options::none`, then create a symbolic link to the source file.
    - (4.7.3) — Otherwise, if `(options & copy_options::create_hard_links) != copy_options::none`, then create a hard link to the source file.
    - (4.7.4) — Otherwise, if `is_directory(t)`, then `copy_file(from, to/from.filename(), options)`.
    - (4.7.5) — Otherwise, `copy_file(from, to, options)`.
  - (4.8) — Otherwise, if
    - `is_directory(f) &&`
    - `(options & copy_options::create_symlinks) != copy_options::none`
    - then report an error with an `error_code` argument equal to `make_error_code(errc::is_a_directory)`.
  - (4.9) — Otherwise, if
    - `is_directory(f) &&`
    - `((options & copy_options::recursive) != copy_options::none ||`
    - `options == copy_options::none)`
    - then:
      - (4.9.1) — If `exists(t)` is false, then `create_directory(to, from)`.
      - (4.9.2) — Then, iterate over the files in `from`, as if by
        - `for (const directory_entry& x : directory_iterator(from))`
        - `copy(x.path(), to/x.path().filename(),`
        - `options | copy_options::in-recursive-copy);`
      - where *in-recursive-copy* is a bitmask element of `copy_options` that is not one of the elements in 31.12.8.3.
  - (4.10) — Otherwise, for the signature with argument `ec`, `ec.clear()`.
  - (4.11) — Otherwise, no effects.
- 5 *Throws:* As specified in 31.12.5.
- 6 *Remarks:* For the signature with argument `ec`, any library functions called by the implementation shall have an `error_code` argument if applicable.
- 7 *Example 1:* Given this directory structure:
- ```
/dir1
  file1
```

```

file2
dir2
  file3

```

Calling `copy("/dir1", "/dir3")` would result in:

```

/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2

```

Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive)` would result in:

```

/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
  dir2
    file3

```

— end example]

31.12.13.5 Copy file

[fs.op.copy.file]

```

bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);

```

1 *Returns:* `copy_file(from, to, copy_options::none)` or
`copy_file(from, to, copy_options::none, ec)`, respectively.

2 *Throws:* As specified in 31.12.5.

```

bool filesystem::copy_file(const path& from, const path& to, copy_options options);
bool filesystem::copy_file(const path& from, const path& to, copy_options options,
    error_code& ec);

```

3 *Preconditions:* At most one element from each option group (31.12.8.3) is set in `options`.

4 *Effects:* As follows:

- (4.1) — Report an error as specified in 31.12.5 if
 - (4.1.1) — `is_regular_file(from)` is false, or
 - (4.1.2) — `exists(to)` is true and `is_regular_file(to)` is false, or
 - (4.1.3) — `exists(to)` is true and `equivalent(from, to)` is true, or
 - (4.1.4) — `exists(to)` is true and

```

          (options & (copy_options::skip_existing |
              copy_options::overwrite_existing |
              copy_options::update_existing)) == copy_options::none
          
```
- (4.2) — Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if
 - (4.2.1) — `exists(to)` is false, or
 - (4.2.2) — `(options & copy_options::overwrite_existing) != copy_options::none`, or
 - (4.2.3) — `(options & copy_options::update_existing) != copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function (31.12.13.26).
- (4.3) — Otherwise, no effects.

5 *Returns:* **true** if the from file was copied, otherwise **false**. The signature with argument **ec** returns **false** if an error occurs.

6 *Throws:* As specified in 31.12.5.

7 *Complexity:* At most one direct or indirect invocation of **status(to)**.

31.12.13.6 Copy symlink

[fs.op.copy.symlink]

```
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink,
                             error_code& ec) noexcept;
```

1 *Effects:* Equivalent to *function*(*read_symlink*(existing_symlink), new_symlink) or *function*(*read_symlink*(existing_symlink, ec), new_symlink, ec), respectively, where in each case *function* is *create_symlink* or *create_directory_symlink* as appropriate.

2 *Throws:* As specified in 31.12.5.

31.12.13.7 Create directories

[fs.op.create.directories]

```
bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);
```

1 *Effects:* Calls *create_directory* for each element of **p** that does not exist.

2 *Returns:* **true** if a new directory was created for the directory **p** resolves to, otherwise **false**.

3 *Throws:* As specified in 31.12.5.

4 *Complexity:* $\mathcal{O}(n)$ where n is the number of elements of **p**.

31.12.13.8 Create directory

[fs.op.create.directory]

```
bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;
```

1 *Effects:* Creates the directory **p** resolves to, as if by POSIX *mkdir* with a second argument of **static_cast<int>(perms::all)**. If *mkdir* fails because **p** resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

2 *Returns:* **true** if a new directory was created, otherwise **false**.

3 *Throws:* As specified in 31.12.5.

```
bool filesystem::create_directory(const path& p, const path& existing_p);
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

4 *Effects:* Creates the directory **p** resolves to, with attributes copied from directory **existing_p**. The set of attributes copied is operating system dependent. If *mkdir* fails because **p** resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[Note 1: For POSIX-based operating systems, the attributes are those copied by native API *stat*(existing_p.c_str(), &attributes_stat) followed by *mkdir*(p.c_str(), attributes_stat.st_mode). For Windows-based operating systems, the attributes are those copied by native API *CreateDirectoryExW*(existing_p.c_str(), p.c_str(), 0). —end note]

5 *Returns:* **true** if a new directory was created with attributes copied from directory **existing_p**, otherwise **false**.

6 *Throws:* As specified in 31.12.5.

31.12.13.9 Create directory symlink

[fs.op.create.dir.symlink]

```
void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink,
                                         error_code& ec) noexcept;
```

1 *Effects:* Establishes the postcondition, as if by POSIX *symlink*.

2 *Postconditions:* **new_symlink** resolves to a symbolic link file that contains an unspecified representation of **to**.

3 *Throws:* As specified in 31.12.5.

4 [Note 1: Some operating systems require symlink creation to identify that the link is to a directory. Thus, `create_symlink` (instead of `create_directory_symlink`) cannot be used reliably to create directory symlinks. — end note]

5 [Note 2: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]

31.12.13.10 Create hard link

[fs.op.create.hard.lk]

```
void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link,
                                error_code& ec) noexcept;
```

1 *Effects:* Establishes the postcondition, as if by POSIX `link`.

2 *Postconditions:*

(2.1) — `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`

(2.2) — The contents of the file or directory `to` resolves to are unchanged.

3 *Throws:* As specified in 31.12.5.

4 [Note 1: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — end note]

31.12.13.11 Create symlink

[fs.op.create.symlink]

```
void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
                                error_code& ec) noexcept;
```

1 *Effects:* Establishes the postcondition, as if by POSIX `symlink`.

2 *Postconditions:* `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

3 *Throws:* As specified in 31.12.5.

4 [Note 1: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]

31.12.13.12 Current path

[fs.op.current.path]

```
path filesystem::current_path();
path filesystem::current_path(error_code& ec);
```

1 *Returns:* The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd`. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws:* As specified in 31.12.5.

3 *Remarks:* The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

4 [Note 1: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

```
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

5 *Effects:* Establishes the postcondition, as if by POSIX `chdir`.

6 *Postconditions:* `equivalent(p, current_path())`.

7 *Throws:* As specified in 31.12.5.

8 [Note 2: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

31.12.13.13 Equivalent**[fs.op.equivalent]**

```
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

1 Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.

[*Note 1*: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat` for the two paths, having equal `st_dev` values and equal `st_ino` values. — *end note*]

2 *Returns*: `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

4 *Remarks*: `!exists(p1) || !exists(p2)` is an error.

31.12.13.14 Exists**[fs.op.exists]**

```
bool filesystem::exists(file_status s) noexcept;
```

1 *Returns*: `status_known(s) && s.type() != file_type::not_found`.

```
bool filesystem::exists(const path& p);
bool filesystem::exists(const path& p, error_code& ec) noexcept;
```

2 Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.

3 *Effects*: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.

4 *Returns*: `exists(s)`.

5 *Throws*: As specified in 31.12.5.

31.12.13.15 File size**[fs.op.file.size]**

```
uintmax_t filesystem::file_size(const path& p);
uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;
```

1 *Effects*: If `exists(p)` is `false`, an error is reported (31.12.5).

2 *Returns*:

(2.1) — If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat`.

(2.2) — Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.16 Hard link count**[fs.op.hard.lk.ct]**

```
uintmax_t filesystem::hard_link_count(const path& p);
uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;
```

1 *Returns*: The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

2 *Throws*: As specified in 31.12.5.

31.12.13.17 Is block file**[fs.op.is.block.file]**

```
bool filesystem::is_block_file(file_status s) noexcept;
```

1 *Returns*: `s.type() == file_type::block`.

```
bool filesystem::is_block_file(const path& p);
bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;
```

2 *Returns*: `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws*: As specified in 31.12.5.

31.12.13.18 Is character file**[fs.op.is.char.file]**

```
bool filesystem::is_character_file(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::character`.

```
bool filesystem::is_character_file(const path& p);
```

```
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in [31.12.5](#).

31.12.13.19 Is directory**[fs.op.is.directory]**

```
bool filesystem::is_directory(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::directory`.

```
bool filesystem::is_directory(const path& p);
```

```
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in [31.12.5](#).

31.12.13.20 Is empty**[fs.op.is.empty]**

```
bool filesystem::is_empty(const path& p);
```

```
bool filesystem::is_empty(const path& p, error_code& ec);
```

1 *Effects:*

(1.1) — Determine `file_status s`, as if by `status(p)` or `status(p, ec)`, respectively.

(1.2) — For the signature with argument `ec`, return `false` if an error occurred.

(1.3) — Otherwise, if `is_directory(s)`:

(1.3.1) — Create a variable `itr`, as if by `directory_iterator itr(p)` or `directory_iterator itr(p, ec)`, respectively.

(1.3.2) — For the signature with argument `ec`, return `false` if an error occurred.

(1.3.3) — Otherwise, return `itr == directory_iterator()`.

(1.4) — Otherwise:

(1.4.1) — Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.

(1.4.2) — For the signature with argument `ec`, return `false` if an error occurred.

(1.4.3) — Otherwise, return `sz == 0`.

2 *Throws:* As specified in [31.12.5](#).

31.12.13.21 Is fifo**[fs.op.is.fifo]**

```
bool filesystem::is_fifo(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::fifo`.

```
bool filesystem::is_fifo(const path& p);
```

```
bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in [31.12.5](#).

31.12.13.22 Is other**[fs.op.is.other]**

```
bool filesystem::is_other(file_status s) noexcept;
```

1 *Returns:* `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s)`.

```
bool filesystem::is_other(const path& p);
bool filesystem::is_other(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in 31.12.5.

31.12.13.23 Is regular file

[fs.op.is.regular.file]

```
bool filesystem::is_regular_file(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::regular`.

```
bool filesystem::is_regular_file(const path& p);
```

2 *Returns:* `is_regular_file(status(p))`.

3 *Throws:* `filesystem_error` if `status(p)` would throw `filesystem_error`.

```
bool filesystem::is_regular_file(const path& p, error_code& ec) noexcept;
```

4 *Effects:* Sets `ec` as if by `status(p, ec)`.

[Note 1: `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — end note]

5 *Returns:* `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

31.12.13.24 Is socket

[fs.op.is.socket]

```
bool filesystem::is_socket(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::socket`.

```
bool filesystem::is_socket(const path& p);
```

```
bool filesystem::is_socket(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in 31.12.5.

31.12.13.25 Is symlink

[fs.op.is.symlink]

```
bool filesystem::is_symlink(file_status s) noexcept;
```

1 *Returns:* `s.type() == file_type::symlink`.

```
bool filesystem::is_symlink(const path& p);
```

```
bool filesystem::is_symlink(const path& p, error_code& ec) noexcept;
```

2 *Returns:* `is_symlink(symlink_status(p))` or `is_symlink(symlink_status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

3 *Throws:* As specified in 31.12.5.

31.12.13.26 Last write time

[fs.op.last.write.time]

```
file_time_type filesystem::last_write_time(const path& p);
```

```
file_time_type filesystem::last_write_time(const path& p, error_code& ec) noexcept;
```

1 *Returns:* The time of last data modification of `p`, determined as if by the value of the POSIX `stat` class member `st_mtime` obtained as if by POSIX `stat`. The signature with argument `ec` returns `file_time_type::min()` if an error occurs.

2 *Throws:* As specified in 31.12.5.

```
void filesystem::last_write_time(const path& p, file_time_type new_time);
```

```
void filesystem::last_write_time(const path& p, file_time_type new_time,
                                error_code& ec) noexcept;
```

3 *Effects:* Sets the time of last data modification of the file resolved to by `p` to `new_time`, as if by POSIX `futimens`.

4 *Throws:* As specified in 31.12.5.

5 [Note 1: A postcondition of `last_write_time(p) == new_time` is not specified because it does not necessarily hold for file systems with coarse time granularity. — end note]

31.12.13.27 Permissions

[fs.op.permissions]

```
void filesystem::permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void filesystem::permissions(const path& p, perms prms, error_code& ec) noexcept;
void filesystem::permissions(const path& p, perms prms, perm_options opts, error_code& ec);
```

1 *Preconditions:* Exactly one of the `perm_options` constants `replace`, `add`, or `remove` is present in `opts`.

2 *Effects:* Applies the action specified by `opts` to the file `p` resolves to, or to file `p` itself if `p` is a symbolic link and `perm_options::nofollow` is set in `opts`. The action is applied as if by POSIX `fchmodat`.

3 [Note 1: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. — end note]

4 *Throws:* As specified in 31.12.5.

5 *Remarks:* The second signature behaves as if it had an additional parameter `perm_options opts` with an argument of `perm_options::replace`.

31.12.13.28 Proximate

[fs.op.proximate]

```
path filesystem::proximate(const path& p, error_code& ec);
```

1 *Returns:* `proximate(p, current_path(), ec)`.

2 *Throws:* As specified in 31.12.5.

```
path filesystem::proximate(const path& p, const path& base = current_path());
path filesystem::proximate(const path& p, const path& base, error_code& ec);
```

3 *Returns:* For the first form:

```
    weakly_canonical(p).lexically_proximate(weakly_canonical(base));
```

For the second form:

```
    weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4 *Throws:* As specified in 31.12.5.

31.12.13.29 Read symlink

[fs.op.read.symlink]

```
path filesystem::read_symlink(const path& p);
path filesystem::read_symlink(const path& p, error_code& ec);
```

1 *Returns:* If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.

2 *Throws:* As specified in 31.12.5.

[Note 1: It is an error if `p` does not resolve to a symbolic link. — end note]

31.12.13.30 Relative

[fs.op.relative]

```
path filesystem::relative(const path& p, error_code& ec);
```

1 *Returns:* `relative(p, current_path(), ec)`.

2 *Throws:* As specified in 31.12.5.

```
path filesystem::relative(const path& p, const path& base = current_path());
path filesystem::relative(const path& p, const path& base, error_code& ec);
```

3 *Returns:* For the first form:

```
    weakly_canonical(p).lexically_relative(weakly_canonical(base));
```

For the second form:

```
    weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
```

or `path()` at the first error occurrence, if any.

4 *Throws:* As specified in 31.12.5.

31.12.13.31 Remove**[fs.op.remove]**

```
bool filesystem::remove(const path& p);
bool filesystem::remove(const path& p, error_code& ec) noexcept;
```

1 *Effects:* If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove`.

[*Note 1:* A symbolic link is itself removed, rather than the file it resolves to. — *end note*]

2 *Postconditions:* `exists(symlink_status(p))` is `false`.

3 *Returns:* `true` if a file `p` has been removed and `false` otherwise.

[*Note 2:* Absence of a file `p` is not an error. — *end note*]

4 *Throws:* As specified in 31.12.5.

31.12.13.32 Remove all**[fs.op.remove.all]**

```
uintmax_t filesystem::remove_all(const path& p);
uintmax_t filesystem::remove_all(const path& p, error_code& ec);
```

1 *Effects:* Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove`.

[*Note 1:* A symbolic link is itself removed, rather than the file it resolves to. — *end note*]

2 *Postconditions:* `exists(symlink_status(p))` is `false`.

3 *Returns:* The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

4 *Throws:* As specified in 31.12.5.

31.12.13.33 Rename**[fs.op.rename]**

```
void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

1 *Effects:* Renames `old_p` to `new_p`, as if by POSIX `rename`.

[*Note 1:*

(1.1) — If `old_p` and `new_p` resolve to the same existing file, no action is taken.

(1.2) — Otherwise, the rename can include the following effects:

(1.2.1) — if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,

(1.2.2) — if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but might be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to. — *end note*]

2 *Throws:* As specified in 31.12.5.

31.12.13.34 Resize file**[fs.op.resize.file]**

```
void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

1 *Effects:* Causes the size that would be returned by `file_size(p)` to be equal to `new_size`, as if by POSIX `truncate`.

2 *Throws:* As specified in 31.12.5.

31.12.13.35 Space**[fs.op.space]**

```
space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;
```

1 *Returns:* An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frsize` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.

2 *Throws:* As specified in 31.12.5.

3 *Remarks:* The value of member `space_info::available` is operating system dependent.

[*Note 1:* `available` might be less than `free`. — *end note*]

31.12.13.36 Status

[fs.op.status]

```
file_status filesystem::status(const path& p);
```

1 *Effects:* As if by:

```
    error_code ec;
    file_status result = status(p, ec);
    if (result.type() == file_type::none)
        throw filesystem_error(implementation-supplied-message, p, ec);
    return result;
```

2 *Returns:* See above.

3 *Throws:* `filesystem_error`.

[*Note 1:* `result` values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown. — *end note*]

```
file_status filesystem::status(const path& p, error_code& ec) noexcept;
```

4 *Effects:* If possible, determines the attributes of the file `p` resolves to, as if by using POSIX `stat` to obtain a POSIX `struct stat`. If, during attribute determination, the underlying file system API reports an error, sets `ec` to indicate the specific error reported. Otherwise, `ec.clear()`.

[*Note 2:* This allows users to inspect the specifics of underlying API errors even when the value returned by `status` is not `file_status(file_type::none)`. — *end note*]

5 Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

6 *Returns:*

(6.1) — If `ec != error_code()`:

(6.1.1) — If the specific error indicates that `p` cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.

(6.1.2) — Otherwise, if the specific error indicates that `p` can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.

(6.1.3) — Otherwise, returns `file_status(file_type::none)`.

[*Note 3:* These semantics distinguish between `p` being known not to exist, `p` existing but not being able to determine its attributes, and there being an error that prevents even knowing if `p` exists. These distinctions are important to some use cases. — *end note*]

(6.2) — Otherwise,

(6.2.1) — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.

[*Note 4:* `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory. — *end note*]

(6.2.2) — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.

[*Note 5:* `file_type::directory` implies that calling `directory_iterator(p)` would succeed. — *end note*]

(6.2.3) — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.

(6.2.4) — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.

(6.2.5) — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.

- (6.2.6) — Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.
- (6.2.7) — Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns `file_status(file_type::A, prms)`, where *A* is the constant for the implementation-defined file type.
- (6.2.8) — Otherwise, returns `file_status(file_type::unknown, prms)`.
- 7 *Remarks:* If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

31.12.13.37 Status known**[fs.op.status.known]**

```
bool filesystem::status_known(file_status s) noexcept;
```

- 1 *Returns:* `s.type() != file_type::none`.

31.12.13.38 Symlink status**[fs.op.symlink.status]**

```
file_status filesystem::symlink_status(const path& p);
file_status filesystem::symlink_status(const path& p, error_code& ec) noexcept;
```

- 1 *Effects:* Same as `status`, above, except that the attributes of `p` are determined as if by using POSIX `lstat` to obtain a POSIX struct `stat`.
- 2 Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained struct `stat` to the type `perms`.
- 3 *Returns:* Same as `status`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`. The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.
- 4 *Throws:* As specified in 31.12.5.
- 5 *Remarks:* Pathname resolution terminates if `p` names a symbolic link.

31.12.13.39 Temporary directory path**[fs.op.temp.dir.path]**

```
path filesystem::temp_directory_path();
path filesystem::temp_directory_path(error_code& ec);
```

- 1 Let `p` be an unspecified directory path suitable for temporary files.
- 2 *Effects:* If `exists(p)` is `false` or `is_directory(p)` is `false`, an error is reported (31.12.5).
- 3 *Returns:* The path `p`. The signature with argument `ec` returns `path()` if an error occurs.
- 4 *Throws:* As specified in 31.12.5.
- 5 [Example 1: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list `TMPDIR`, `TMP`, `TEMP`, `TEMPDIR`, or if none of these are found, `"/tmp"`.
For Windows-based operating systems, an implementation might return the path reported by the Windows `GetTempPath` API function. — end example]

31.12.13.40 Weakly canonical**[fs.op.weakly.canonical]**

```
path filesystem::weakly_canonical(const path& p);
path filesystem::weakly_canonical(const path& p, error_code& ec);
```

- 1 *Effects:* Using `status(p)` or `status(p, ec)`, respectively, to determine existence, return a path composed by `operator/=` from the result of calling `canonical` with a path argument composed of the leading elements of `p` that exist, if any, followed by the elements of `p` that do not exist, if any. For the first form, `canonical` is called without an `error_code` argument. For the second form, `canonical` is called with `ec` as an `error_code` argument, and `path()` is returned at the first error occurrence, if any.
- 2 *Postconditions:* The returned path is in normal form (31.12.6.2).
- 3 *Returns:* `p` with symlinks resolved and the result normalized (31.12.6.2).
- 4 *Throws:* As specified in 31.12.5.

- ¹ The contents and meaning of the header `<cstdio>` are the same as the C standard library header `<stdio.h>`.
- ² The return from each function call that delivers data to the host environment to be written to a file (SEE ALSO: ISO/IEC 9899:2024, 7.23.3) is an observable checkpoint (4.1.2).
- ³ When the input item for the `%p` conversion of the `fscanf` function (or equivalent) is one that can be produced from more than one pointer value (6.9.5), the pointer that results is an unspecified choice among all those values that would result in the program having defined behavior. If no such value exists, the behavior is undefined.
- ⁴ Calls to the function `tmpnam` with an argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to `tmpnam` with an argument that is a null pointer value.

¹ The contents and meaning of the header `<inttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

- (1.1) — The header `<inttypes>` includes the header `<cstdint>` (17.4.1) instead of `<stdint.h>`, and
- (1.2) — if and only if the type `intmax_t` designates an extended integer type (6.9.3), the following function signatures are added:

```

constexpr intmax_t abs(intmax_t);
constexpr imaxdiv_t div(intmax_t, intmax_t);

```

which shall have the same semantics as the function signatures `constexpr intmax_t imaxabs(intmax_t)` and `constexpr imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

SEE ALSO: ISO/IEC 9899:2024, 7.8

- ² Each of the **PRI** macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1. Each of the **SCN** macros listed in this subclause is defined if and only if the implementation defines the corresponding *typedef-name* in 17.4.1 and has a suitable **fscanf** length modifier for the type. Each of the **PRIB** macros listed in this subclause is defined if and only if **fprintf** supports the **B** conversion specifier.

32 Concurrency support library [thread]

32.1 General [thread.general]

- ¹ The following subclauses describe components to create and manage threads (6.10.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in Table 154.

Table 154 — Concurrency support library summary [tab:thread.summary]

Subclause	Header
32.2	Requirements
32.3	Stop tokens <stop_token>
32.4	Threads <thread>
32.5	Atomic operations <atomic>, <stdatomic.h>
32.6	Mutual exclusion <mutex>, <shared_mutex>
32.7	Condition variables <condition_variable>
32.8	Semaphores <semaphore>
32.9	Coordination types <latch>, <barrier>
32.10	Futures <future>
32.11	Safe reclamation <rcu>, <hazard_pointer>

32.2 Requirements [thread.req]

32.2.1 Template parameter names [thread.req.paramname]

- ¹ Throughout this Clause, the names of template parameters are used to express type requirements. `Predicate` is a function object type (22.10). Let `pred` denote an lvalue of type `Predicate`. Then the expression `pred()` shall be well-formed and the type `decltype(pred())` shall model *boolean-testable* (18.5.2). The return value of `pred()`, converted to `bool`, yields `true` if the corresponding test condition is satisfied, and `false` otherwise. If a template parameter is named `Clock`, the corresponding template argument shall be a type `C` that meets the *Cpp17Clock* requirements (30.3); the program is ill-formed if `is_clock_v<C>` is `false`.

32.2.2 Exceptions [thread.req.exception]

- ¹ Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.8). Such exceptions are thrown if any of the function's error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.4.6.14.

[Example 1: Consider a function in this Clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — end example]

- ² The `error_code` reported by such an exception's `code()` member function compares equal to one of the conditions specified in the function's error condition element.

32.2.3 Native handles [thread.req.native]

- ¹ Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined.

[Note 1: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — end note]

32.2.4 Timing specifications

[thread.req.timing]

- ¹ Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in [Clause 30](#).
- ² Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration D_i . Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration D_m . The delay durations may vary from timeout to timeout, but in all cases shorter is better.
- ³ The functions whose names end in `_for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.²⁷² Given a duration argument D_t , the real-time duration of the timeout is $D_t + D_i + D_m$.
- ⁴ The functions whose names end in `_until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument C_t , the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time C_a during the timeout, the behavior should be as follows:
 - (4.1) — If $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.
 - (4.2) — If $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

[Note 1: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — end note]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between C_t and the time point of the call to the `_until` function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

- ⁵ [Note 2: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality. — end note]
- ⁶ The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the *native resolution*.
- ⁷ Implementation-provided clocks that are used for these functions meet the *Cpp17TrivialClock* requirements ([30.3](#)).
- ⁸ A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as *timeout-related exceptions*.

[Note 3: Instantiations of clock, time point and duration types supplied by the implementation as specified in [30.7](#) do not throw exceptions. — end note]

32.2.5 Requirements for *Cpp17Lockable* types

[thread.req.lockable]

32.2.5.1 General

[thread.req.lockable.general]

- ¹ An *execution agent* is an entity such as a thread that may perform work in parallel with other execution agents.

[Note 1: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — end note]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.
- ² [Note 2: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — end note]

²⁷²) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.

- ³ The standard library templates `unique_lock` (32.6.5.4), `shared_lock` (32.6.5.5), `scoped_lock` (32.6.5.3), `lock_guard` (32.6.5.2), `lock`, `try_lock` (32.6.6), and `condition_variable_any` (32.7.5) all operate on user-supplied lockable objects. The *Cpp17BasicLockable* requirements, the *Cpp17Lockable* requirements, the *Cpp17TimedLockable* requirements, the *Cpp17SharedLockable* requirements, and the *Cpp17SharedTimedLockable* requirements list the requirements imposed by these library types in order to acquire or release ownership of a lock by a given execution agent.

[Note 3: The nature of any lock ownership and any synchronization it entails are not part of these requirements. — end note]

- ⁴ A lock on an object `m` is said to be

- (4.1) — a *non-shared lock* if it is acquired by a call to `lock`, `try_lock`, `try_lock_for`, or `try_lock_until` on `m`, or
- (4.2) — a *shared lock* if it is acquired by a call to `lock_shared`, `try_lock_shared`, `try_lock_shared_for`, or `try_lock_shared_until` on `m`.

[Note 4: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions. — end note]

32.2.5.2 *Cpp17BasicLockable* requirements

[thread.req.lockable.basic]

- ¹ A type `L` meets the *Cpp17BasicLockable* requirements if the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.lock()`

- ² *Effects*: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.unlock()`

- ³ *Preconditions*: The current execution agent holds a non-shared lock on `m`.

- ⁴ *Effects*: Releases a non-shared lock on `m` held by the current execution agent.

- ⁵ *Throws*: Nothing.

32.2.5.3 *Cpp17Lockable* requirements

[thread.req.lockable.req]

- ¹ A type `L` meets the *Cpp17Lockable* requirements if it meets the *Cpp17BasicLockable* requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

`m.try_lock()`

- ² *Effects*: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- ³ *Return type*: `bool`.

- ⁴ *Returns*: `true` if the lock was acquired, otherwise `false`.

32.2.5.4 *Cpp17TimedLockable* requirements

[thread.req.lockable.timed]

- ¹ A type `L` meets the *Cpp17TimedLockable* requirements if it meets the *Cpp17Lockable* requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of a specialization of `duration` (30.5), and `abs_time` denotes a value of a specialization of `time_point` (30.6)).

`m.try_lock_for(rel_time)`

- ² *Effects*: Attempts to acquire a lock for the current execution agent within the relative timeout (32.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

- ³ *Return type*: `bool`.

- ⁴ *Returns*: `true` if the lock was acquired, otherwise `false`.

`m.try_lock_until(abs_time)`

- 5 *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (32.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

6 *Return type:* `bool`.

7 *Returns:* `true` if the lock was acquired, otherwise `false`.

32.2.5.5 *Cpp17SharedLockable* requirements [thread.req.lockable.shared]

- 1 A type `L` meets the *Cpp17SharedLockable* requirements if the following expressions are well-formed, have the specified semantics, and the expression `m.try_lock_shared()` has type `bool` (`m` denotes a value of type `L`):

`m.lock_shared()`

- 2 *Effects:* Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

`m.try_lock_shared()`

- 3 *Effects:* Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

4 *Returns:* `true` if the lock was acquired, `false` otherwise.

`m.unlock_shared()`

- 5 *Preconditions:* The current execution agent holds a shared lock on `m`.

6 *Effects:* Releases a shared lock on `m` held by the current execution agent.

7 *Throws:* Nothing.

32.2.5.6 *Cpp17SharedTimedLockable* requirements [thread.req.lockable.shared.timed]

- 1 A type `L` meets the *Cpp17SharedTimedLockable* requirements if it meets the *Cpp17SharedLockable* requirements, and the following expressions are well-formed, have type `bool`, and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of a specialization of `chrono::duration`, and `abs_time` denotes a value of a specialization of `chrono::time_point`).

`m.try_lock_shared_for(rel_time)`

- 2 *Effects:* Attempts to acquire a lock for the current execution agent within the relative timeout (32.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

3 *Returns:* `true` if the lock was acquired, `false` otherwise.

`m.try_lock_shared_until(abs_time)`

- 4 *Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (32.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

5 *Returns:* `true` if the lock was acquired, `false` otherwise.

32.3 Stop tokens [thread.stoptoken]

32.3.1 Introduction [thread.stoptoken.intro]

- 1 Subclause 32.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a *stop request*.
- 2 The concepts *stoppable-source*, *stoppable_token*, and *stoppable-callback-for* specify the required syntax and semantics of shared access to a *stop state*. Any object modeling *stoppable-source*, *stoppable_token*, or *stoppable-callback-for* that refers to the same stop state is an *associated stoppable-source*, *stoppable_token*, or *stoppable-callback-for*, respectively.

- ³ An object of a type that models `stoppable_token` can be passed to an operation that can either
- (3.1) — actively poll the token to check if there has been a stop request, or
 - (3.2) — register a callback that will be called in the event that a stop request is made.

A stop request made via an object whose type models *stoppable-source* will be visible to all associated `stoppable_token` and *stoppable-source* objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

- ⁴ Callbacks registered via an object whose type models *stoppable-callback-for* are called when a stop request is first made by any associated *stoppable-source* object.
- ⁵ The types `stop_source` and `stop_token` and the class template `stop_callback` implement the semantics of shared ownership of a stop state. The last remaining owner of the stop state automatically releases the resources associated with the stop state.
- ⁶ An object of type `inplace_stop_source` is the sole owner of its stop state. An object of type `inplace_stop_token` or of a specialization of the class template `inplace_stop_callback` does not participate in ownership of its associated stop state.

[Note 1: They are for use when all uses of the associated token and callback objects are known to nest within the lifetime of the `inplace_stop_source` object. — end note]

32.3.2 Header `<stop_token>` synopsis

[thread.stoptoken.syn]

```
namespace std {
    // 32.3.3, stop token concepts
    template<class CallbackFn, class Token, class Initializer = CallbackFn>
        concept stoppable-callback-for = see below;           // exposition only

    template<class Token>
        concept stoppable_token = see below;

    template<class Token>
        concept unstoppable_token = see below;

    template<class Source>
        concept stoppable-source = see below;                 // exposition only

    // 32.3.4, class stop_token
    class stop_token;

    // 32.3.5, class stop_source
    class stop_source;

    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};

    // 32.3.6, class template stop_callback
    template<class Callback>
        class stop_callback;

    // 32.3.7, class never_stop_token
    class never_stop_token;

    class inplace_stop_token;

    // 32.3.9, class inplace_stop_source
    class inplace_stop_source;

    // 32.3.10, class template inplace_stop_callback
    template<class CallbackFn>
        class inplace_stop_callback;
```

```

template<class T, class CallbackFn>
    using stop_callback_for_t = T::template callback_type<CallbackFn>;
}

```

32.3.3 Stop token concepts

[stoptoken.concepts]

- ¹ The exposition-only *stoppable-callback-for* concept checks for a callback compatible with a given Token type.

```

template<class CallbackFn, class Token, class Initializer = CallbackFn>
    concept stoppable-callback-for =                // exposition only
        invocable<CallbackFn> &&
        constructible_from<CallbackFn, Initializer> &&
        requires { typename stop_callback_for_t<Token, CallbackFn>; } &&
        constructible_from<stop_callback_for_t<Token, CallbackFn>, const Token&, Initializer>;

```

- ² Let *t* and *u* be distinct, valid objects of type Token that reference the same logical stop state; let *init* be an expression such that `same_as<decltype(init), Initializer>` is true; and let SCB denote the type `stop_callback_for_t<Token, CallbackFn>`.

- ³ The concept *stoppable-callback-for*<CallbackFn, Token, Initializer> is modeled only if:

- (3.1) — The following concepts are modeled:
 - (3.1.1) — `constructible_from<SCB, Token, Initializer>`
 - (3.1.2) — `constructible_from<SCB, Token&, Initializer>`
 - (3.1.3) — `constructible_from<SCB, const Token, Initializer>`
- (3.2) — An object of type SCB has an associated callback function of type CallbackFn. Let *scb* be an object of type SCB and let *callback_fn* denote *scb*'s associated callback function. Direct-non-list-initializing *scb* from arguments *t* and *init* shall execute a *stoppable callback registration* as follows:
 - (3.2.1) — If *t.stop_possible()* is true:
 - (3.2.1.1) — *callback_fn* shall be direct-initialized with *init*.
 - (3.2.1.2) — Construction of *scb* shall only throw exceptions thrown by the initialization of *callback_fn* from *init*.
 - (3.2.1.3) — The callback invocation `std::forward<CallbackFn>(callback_fn)()` shall be registered with *t*'s associated stop state as follows:
 - (3.2.1.3) — If *t.stop_requested()* evaluates to false at the time of registration, the callback invocation is added to the stop state's list of callbacks such that `std::forward<CallbackFn>(callback_fn)()` is evaluated if a stop request is made on the stop state.
 - (3.2.1.3) — Otherwise, `std::forward<CallbackFn>(callback_fn)()` shall be immediately evaluated on the thread executing *scb*'s constructor, and the callback invocation shall not be added to the list of callback invocations.
 - If the callback invocation was added to stop state's list of callbacks, *scb* shall be associated with the stop state.

[Note 1: If *t.stop_possible()* is false, there is no requirement that the initialization of *scb* causes the initialization of *callback_fn*. — end note]
- (3.3) — Destruction of *scb* shall execute a *stoppable callback deregistration* as follows (in order):
 - (3.3.1) — If the constructor of *scb* did not register a callback invocation with *t*'s stop state, then the stoppable callback deregistration shall have no effect other than destroying *callback_fn* if it was constructed.
 - (3.3.2) — Otherwise, the invocation of *callback_fn* shall be removed from the associated stop state.
 - (3.3.3) — If *callback_fn* is concurrently executing on another thread, then the stoppable callback deregistration shall block (3.6) until the invocation of *callback_fn* returns such that the return from the invocation of *callback_fn* strongly happens before (6.10.2.2) the destruction of *callback_fn*.
 - (3.3.4) — If *callback_fn* is executing on the current thread, then the destructor shall not block waiting for the return from the invocation of *callback_fn*.

(3.3.5) — A stoppable callback deregistration shall not block on the completion of the invocation of some other callback registered with the same logical stop state.

(3.3.6) — The stoppable callback deregistration shall destroy `callback_fn`.

- 4 The `stoppable_token` concept checks for the basic interface of a stop token that is copyable and allows polling to see if stop has been requested and also whether a stop request is possible. The `unstoppable_token` concept checks for a `stoppable_token` type that does not allow stopping.

```
template<template<class> class>
    struct check-type-alias-exists;                                // exposition only

template<class Token>
    concept stoppable_token =
        requires (const Token tok) {
            typename check-type-alias-exists<Token::template callback_type>;
            { tok.stop_requested() } noexcept -> same_as<bool>;
            { tok.stop_possible() } noexcept -> same_as<bool>;
            { Token(tok) } noexcept;                                // see implicit expression variations (18.2)
        } &&
        copyable<Token> &&
        equality_comparable<Token>;

template<class Token>
    concept unstoppable_token =
        stoppable_token<Token> &&
        requires (const Token tok) {
            requires bool_constant<(!tok.stop_possible())>::value;
        };
};
```

- 5 An object whose type models `stoppable_token` has at most one associated logical stop state. A `stoppable_token` object with no associated stop state is said to be *disengaged*.

- 6 Let SP be an evaluation of `t.stop_possible()` that is false, and let SR be an evaluation of `t.stop_requested()` that is true.

- 7 The type `Token` models `stoppable_token` only if:

- (7.1) — Any evaluation of `u.stop_possible()` or `u.stop_requested()` that happens after (6.10.2.2) SP is false.
- (7.2) — Any evaluation of `u.stop_possible()` or `u.stop_requested()` that happens after SR is true.
- (7.3) — For any types `CallbackFn` and `Initializer` such that *stoppable-callback-for*<`CallbackFn`, `Token`, `Initializer`> is satisfied, *stoppable-callback-for*<`CallbackFn`, `Token`, `Initializer`> is modeled.
- (7.4) — If `t` is disengaged, evaluations of `t.stop_possible()` and `t.stop_requested()` are false.
- (7.5) — If `t` and `u` reference the same stop state, or if both `t` and `u` are disengaged, `t == u` is true; otherwise, it is false.

- 8 An object whose type models the exposition-only *stoppable-source* concept can be queried whether stop has been requested (`stop_requested`) and whether stop is possible (`stop_possible`). It is a factory for associated stop tokens (`get_token`), and a stop request can be made on it (`request_stop`). It maintains a list of registered stop callback invocations that it executes when a stop request is first made.

```
template<class Source>
    concept stoppable-source =                                     // exposition only
        requires (Source& src, const Source csrc) {              // see implicit expression variations (18.2)
            { csrc.get_token() } -> stoppable_token;
            { csrc.stop_possible() } noexcept -> same_as<bool>;
            { csrc.stop_requested() } noexcept -> same_as<bool>;
            { src.request_stop() } -> same_as<bool>;
        } &&
        copyable<Source> &&
        equality_comparable<Source>;
};
```

- 9 An object whose type models *stoppable-source* has at most one associated logical stop state. If it has no associated stop state, it is said to be disengaged. Let `s` be an object whose type models *stoppable-source* and that is disengaged. `s.stop_possible()` and `s.stop_requested()` shall be false.

- ¹⁰ Let `t` be an object whose type models *stoppable-source*. If `t` is disengaged, `t.get_token()` shall return a disengaged stop token; otherwise, it shall return a stop token that is associated with the stop state of `t`.
- ¹¹ Calls to the member functions `request_stop`, `stop_requested`, and `stop_possible` and similarly named member functions on associated `stoppable_token` objects do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stoppable_token` or *stoppable-source* object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.
- ¹² If the *stoppable-source* is disengaged, `request_stop` shall have no effect and return `false`. Otherwise, it shall execute a *stop request operation* on the associated stop state. A stop request operation determines whether the stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request shall happen atomically, as-if by a read-modify-write operation (6.10.2.2). If the request was made, the stop state's registered callback invocations shall be synchronously executed. If an invocation of a callback exits via an exception then `terminate` shall be invoked (14.6.2).

[Note 2: No constraint is placed on the order in which the callback invocations are executed. — end note]

`request_stop` shall return `true` if a stop request was made, and `false` otherwise. After a call to `request_stop` either a call to `stop_possible` shall return `false` or a call to `stop_requested` shall return `true`.

[Note 3: A stop request includes notifying all condition variables of type `condition_variable_any` temporarily registered during an interruptible wait (32.7.5.3). — end note]

32.3.4 Class `stop_token`

[stoptoken]

32.3.4.1 General

[stoptoken.general]

- ¹ The class `stop_token` models the concept `stoppable_token`. It shares ownership of its stop state, if any, with its associated `stop_source` object (32.3.5) and any `stop_token` objects to which it compares equal.

```
namespace std {
    class stop_token {
    public:
        template<class CallbackFn>
            using callback_type = stop_callback<CallbackFn>;

        stop_token() noexcept = default;

        // 32.3.4.2, member functions
        void swap(stop_token&) noexcept;

        bool stop_requested() const noexcept;
        bool stop_possible() const noexcept;

        bool operator==(const stop_token& rhs) noexcept = default;

    private:
        shared_ptr<unspecified> stop-state;           // exposition only
    };
}
```

- ² *stop-state* refers to the `stop_token`'s associated stop state. A `stop_token` object is disengaged when *stop-state* is empty.

32.3.4.2 Member functions

[stoptoken.mem]

```
void swap(stop_token& rhs) noexcept;
```

- ¹ *Effects:* Equivalent to:

```
stop-state.swap(rhs.stop-state);
```

```
bool stop_requested() const noexcept;
```

- ² *Returns:* `true` if *stop-state* refers to a stop state that has received a stop request; otherwise, `false`.

```
bool stop_possible() const noexcept;
```

- ³ *Returns:* `false` if

- (3.1) — ***this** is disengaged, or
- (3.2) — a stop request was not made and there are no associated `stop_source` objects; otherwise, `true`.

32.3.5 Class `stop_source`

[stopsource]

32.3.5.1 General

[stopsource.general]

```
namespace std {
    class stop_source {
    public:
        // 32.3.5.2, constructors, copy, and assignment
        stop_source();
        explicit stop_source(nostopstate_t) noexcept {}

        // 32.3.5.3, member functions
        void swap(stop_source&) noexcept;

        stop_token get_token() const noexcept;
        bool stop_possible() const noexcept;
        bool stop_requested() const noexcept;
        bool request_stop() noexcept;

        bool operator==(const stop_source& rhs) noexcept = default;

    private:
        shared_ptr<unspecified> stop-state;           // exposition only
    };
}
```

- ¹ *stop-state* refers to the `stop_source`'s associated stop state. A `stop_source` object is disengaged when *stop-state* is empty.
- ² `stop_source` models *stoppable-source*, copyable, equality_comparable, and swappable.

32.3.5.2 Constructors, copy, and assignment

[stopsource.cons]

`stop_source();`

- ¹ *Effects*: Initializes *stop-state* with a pointer to a new stop state.
- ² *Postconditions*: `stop_possible()` is `true` and `stop_requested()` is `false`.
- ³ *Throws*: `bad_alloc` if memory cannot be allocated for the stop state.

32.3.5.3 Member functions

[stopsource.mem]

`void swap(stop_source& rhs) noexcept;`

- ¹ *Effects*: Equivalent to:
- ```
stop-state.swap(rhs.stop-state);
```

`stop_token get_token() const noexcept;`

- <sup>2</sup> *Returns*: `stop_token()` if `stop_possible()` is `false`; otherwise a new associated `stop_token` object; i.e., its *stop-state* member is equal to the *stop-state* member of **\*this**.

`bool stop_possible() const noexcept;`

- <sup>3</sup> *Returns*: *stop-state* != `nullptr`.

`bool stop_requested() const noexcept;`

- <sup>4</sup> *Returns*: `true` if *stop-state* refers to a stop state that has received a stop request; otherwise, `false`.

`bool request_stop() noexcept;`

- <sup>5</sup> *Effects*: Executes a stop request operation (32.3.3) on the associated stop state, if any.

### 32.3.6 Class template `stop_callback`

[stopcallback]

#### 32.3.6.1 General

[stopcallback.general]

```

1 namespace std {
 template<class CallbackFn>
 class stop_callback {
 public:
 using callback_type = CallbackFn;

 // 32.3.6.2, constructors and destructor
 template<class Initializer>
 explicit stop_callback(const stop_token& st, Initializer&& init)
 noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
 template<class Initializer>
 explicit stop_callback(stop_token&& st, Initializer&& init)
 noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
 ~stop_callback();

 stop_callback(const stop_callback&) = delete;
 stop_callback(stop_callback&&) = delete;
 stop_callback& operator=(const stop_callback&) = delete;
 stop_callback& operator=(stop_callback&&) = delete;

 private:
 CallbackFn callback-fn; // exposition only
 };

 template<class CallbackFn>
 stop_callback(stop_token, CallbackFn) -> stop_callback<CallbackFn>;
}

```

<sup>2</sup> *Mandates:* `stop_callback` is instantiated with an argument for the template parameter `CallbackFn` that satisfies both invocable and destructible.

<sup>3</sup> *Remarks:* For a type `Initializer`, if *stoppable-callback-for*<`CallbackFn`, `stop_token`, `Initializer`> is satisfied, then *stoppable-callback-for*<`CallbackFn`, `stop_token`, `Initializer`> is modeled. The exposition-only *callback-fn* member is the associated callback function (32.3.3) of `stop_callback<CallbackFn>` objects.

#### 32.3.6.2 Constructors and destructor

[stopcallback.cons]

```

template<class Initializer>
explicit stop_callback(const stop_token& st, Initializer&& init)
 noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);

template<class Initializer>
explicit stop_callback(stop_token&& st, Initializer&& init)
 noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);

```

<sup>1</sup> *Constraints:* `CallbackFn` and `Initializer` satisfy *constructible\_from*<`CallbackFn`, `Initializer`>.

<sup>2</sup> *Effects:* Initializes *callback-fn* with `std::forward<Initializer>(init)` and executes a stoppable callback registration (32.3.3). If a callback is registered with `st`'s shared stop state, then `*this` acquires shared ownership of that stop state.

```
~stop_callback();
```

<sup>3</sup> *Effects:* Executes a stoppable callback deregistration (32.3.3) and releases ownership of the stop state, if any.

### 32.3.7 Class `never_stop_token`

[stoptoken.never]

<sup>1</sup> The class `never_stop_token` models the *unstoppable\_token* concept. It provides a stop token interface, but also provides static information that a stop is never possible nor requested.

```

namespace std {
 class never_stop_token {
 struct callback-type { // exposition only
 explicit callback-type(never_stop_token, auto&&) noexcept {}
 };
 public:
 template<class>
 using callback_type = callback-type;

 static constexpr bool stop_requested() noexcept { return false; }
 static constexpr bool stop_possible() noexcept { return false; }

 bool operator==(const never_stop_token&) const = default;
 };
}

```

### 32.3.8 Class `inplace_stop_token`

[stoptoken.inplace]

#### 32.3.8.1 General

[stoptoken.inplace.general]

- <sup>1</sup> The class `inplace_stop_token` models the concept `stoppable_token`. It references the stop state of its associated `inplace_stop_source` object (32.3.9), if any.

```

namespace std {
 class inplace_stop_token {
 public:
 template<class CallbackFn>
 using callback_type = inplace_stop_callback<CallbackFn>;

 inplace_stop_token() = default;
 bool operator==(const inplace_stop_token&) const = default;

 // 32.3.8.2, member functions
 bool stop_requested() const noexcept;
 bool stop_possible() const noexcept;
 void swap(inplace_stop_token&) noexcept;

 private:
 const inplace_stop_source* stop-source = nullptr; // exposition only
 };
}

```

#### 32.3.8.2 Member functions

[stoptoken.inplace.mem]

`void swap(inplace_stop_token& rhs) noexcept;`

- <sup>1</sup> *Effects:* Exchanges the values of *stop-source* and *rhs.stop-source*.

`bool stop_requested() const noexcept;`

- <sup>2</sup> *Effects:* Equivalent to:

```
return stop-source != nullptr && stop-source->stop_requested();
```

- <sup>3</sup> [Note 1: As specified in 6.8.4, the behavior of `stop_requested` is undefined unless the call strongly happens before the start of the destructor of the associated `inplace_stop_source` object, if any. — end note]

`stop_possible() const noexcept;`

- <sup>4</sup> *Returns:* *stop-source* != nullptr.

- <sup>5</sup> [Note 2: As specified in 6.8.6.1, the behavior of `stop_possible` is implementation-defined unless the call strongly happens before the end of the storage duration of the associated `inplace_stop_source` object, if any. — end note]

### 32.3.9 Class `inplace_stop_source`

[stopsource.inplace]

#### 32.3.9.1 General

[stopsource.inplace.general]

- <sup>1</sup> The class `inplace_stop_source` models *stoppable-source*.

```

namespace std {
 class inplace_stop_source {
 public:
 // 32.3.9.2, constructors
 constexpr inplace_stop_source() noexcept;

 inplace_stop_source(inplace_stop_source&&) = delete;
 inplace_stop_source(const inplace_stop_source&) = delete;
 inplace_stop_source& operator=(inplace_stop_source&&) = delete;
 inplace_stop_source& operator=(const inplace_stop_source&) = delete;
 ~inplace_stop_source();

 // 32.3.9.3, stop handling
 constexpr inplace_stop_token get_token() const noexcept;
 static constexpr bool stop_possible() noexcept { return true; }
 bool stop_requested() const noexcept;
 bool request_stop() noexcept;
 };
}

```

### 32.3.9.2 Constructors

[stopsource.inplace.cons]

```
constexpr inplace_stop_source() noexcept;
```

1 *Effects:* Initializes a new stop state inside *\*this*.

2 *Postconditions:* `stop_requested()` is false.

### 32.3.9.3 Member functions

[stopsource.inplace.mem]

```
constexpr inplace_stop_token get_token() const noexcept;
```

1 *Returns:* A new associated `inplace_stop_token` object whose *stop-source* member is equal to *this*.

```
bool stop_requested() const noexcept;
```

2 *Returns:* true if the stop state inside *\*this* has received a stop request; otherwise, false.

```
bool request_stop() noexcept;
```

3 *Effects:* Executes a stop request operation (32.3.3).

4 *Postconditions:* `stop_requested()` is true.

## 32.3.10 Class template `inplace_stop_callback`

[stopcallback.inplace]

### 32.3.10.1 General

[stopcallback.inplace.general]

```

namespace std {
 template<class CallbackFn>
 class inplace_stop_callback {
 public:
 using callback_type = CallbackFn;

 // 32.3.10.2, constructors and destructor
 template<class Initializer>
 explicit inplace_stop_callback(inplace_stop_token st, Initializer&& init)
 noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);
 ~inplace_stop_callback();

 inplace_stop_callback(inplace_stop_callback&&) = delete;
 inplace_stop_callback(const inplace_stop_callback&) = delete;
 inplace_stop_callback& operator=(inplace_stop_callback&&) = delete;
 inplace_stop_callback& operator=(const inplace_stop_callback&) = delete;

 private:
 CallbackFn callback_fn; // exposition only
 };
}

```

```

template<class CallbackFn>
 inplace_stop_callback(inplace_stop_token, CallbackFn)
 -> inplace_stop_callback<CallbackFn>;
}

```

<sup>1</sup> *Mandates:* CallbackFn satisfies both invocable and destructible.

<sup>2</sup> *Remarks:* For a type Initializer, if

```
stoppable-callback-for<CallbackFn, inplace_stop_token, Initializer>
```

is satisfied, then

```
stoppable-callback-for<CallbackFn, inplace_stop_token, Initializer>
```

is modeled. For an `inplace_stop_callback<CallbackFn>` object, the exposition-only *callback-fn* member is its associated callback function (32.3.3).

### 32.3.10.2 Constructors and destructor

[stopcallback.inplace.cons]

```

template<class Initializer>
 explicit inplace_stop_callback(inplace_stop_token st, Initializer&& init)
 noexcept(is_nothrow_constructible_v<CallbackFn, Initializer>);

```

<sup>1</sup> *Constraints:* `constructible_from<CallbackFn, Initializer>` is satisfied.

<sup>2</sup> *Effects:* Initializes *callback-fn* with `std::forward<Initializer>(init)` and executes a stoppable callback registration (32.3.3).

```
~inplace_stop_callback();
```

<sup>3</sup> *Effects:* Executes a stoppable callback deregistration (32.3.3).

## 32.4 Threads

[thread.threads]

### 32.4.1 General

[thread.threads.general]

<sup>1</sup> 32.4 describes components that can be used to create and manage threads.

[Note 1: These threads are intended to map one-to-one with operating system threads. — end note]

### 32.4.2 Header <thread> synopsis

[thread.syn]

```

#include <compare> // see 17.12.1

namespace std {
 // 32.4.3, class thread
 class thread;

 void swap(thread& x, thread& y) noexcept;

 // 32.4.4, class jthread
 class jthread;

 // 32.4.5, namespace this_thread
 namespace this_thread {
 thread::id get_id() noexcept;

 void yield() noexcept;
 template<class Clock, class Duration>
 void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
 template<class Rep, class Period>
 void sleep_for(const chrono::duration<Rep, Period>& rel_time);
 }
}

```

### 32.4.3 Class thread

[thread.thread.class]

#### 32.4.3.1 General

[thread.thread.class.general]

<sup>1</sup> The class `thread` provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A

**thread** object uniquely represents a particular thread of execution. That representation may be transferred to other **thread** objects in such a way that no two **thread** objects simultaneously represent the same thread of execution. A thread of execution is *detached* when no **thread** object represents that thread. Objects of class **thread** can be in a state that does not represent a thread of execution.

[*Note 1*: A **thread** object does not represent a thread of execution after default construction, after being moved from, or after a successful call to **detach** or **join**. — *end note*]

```
namespace std {
 class thread {
 public:
 // 32.4.3.3, class thread::id
 class id;

 // 32.4.3.2, thread attributes
 template<same_as<char> T>
 class name_hint;
 template<class T>
 name_hint(const T*) -> name_hint<T>;
 template<class T>
 name_hint(basic_string<T>) -> name_hint<T>;
 class stack_size_hint;

 using native_handle_type = implementation-defined; // see 32.2.3

 // construct/copy/destroy
 thread() noexcept;
 template<class... Args>
 explicit thread(Args&&... args);
 ~thread();
 thread(const thread&) = delete;
 thread(thread&&) noexcept;
 thread& operator=(const thread&) = delete;
 thread& operator=(thread&&) noexcept;

 // 32.4.3.7, members
 void swap(thread&) noexcept;
 bool joinable() const noexcept;
 void join();
 void detach();
 id get_id() const noexcept;
 native_handle_type native_handle(); // see 32.2.3

 // static members
 static unsigned int hardware_concurrency() noexcept;
 };
}
```

### 32.4.3.2 Thread attributes

[thread.attributes]

#### 32.4.3.2.1 General

[thread.attributes.general]

- <sup>1</sup> *Thread attributes* can be used to define additional implementation-defined behaviors on a **thread** or **jthread** object.
- <sup>2</sup> The set of *thread attribute types* contains **thread::name\_hint**, **thread::stack\_size\_hint**, and an implementation-defined set of additional thread-attributes.
- <sup>3</sup> When an object of a thread attribute type is passed to a **thread** or **jthread** constructor, it may affect the new thread's behavior.

#### 32.4.3.2.2 Class **thread::name\_hint**

[thread.attributes.hint]

```
namespace std {
 template<same_as<char> T>
 class thread::name_hint {
 public:
 constexpr explicit name_hint(basic_string_view<T> n) noexcept;
```

```

 name_hint(name_hint&&) = delete;
 name_hint(const name_hint&) = delete;

private:
 basic_string_view<T> name; // exposition only
};
}

```

- <sup>1</sup> The `name_hint` thread attribute can be used to set the name of a thread for debugging purposes or platform-specific display mechanisms.

*Recommended practice:* Implementations should not store the value of the `name_hint` attribute in the `thread` or `jthread` object.

*Recommended practice:* `name` is interpreted as a string in the associated character encoding of `T` (Table 12).

```
constexpr explicit name_hint(basic_string_view<T> n) noexcept;
```

- <sup>2</sup> *Effects:* Initializes `name` with `n`.

### 32.4.3.2.3 Class `thread::stack_size_hint` [thread.attributes.size]

```

namespace std {
 class thread::stack_size_hint {
 public:
 constexpr explicit stack_size_hint(size_t s) noexcept;

 private:
 size_t size; // exposition only
 };
}

```

- <sup>1</sup> `stack_size_hint` can be used to configure a desired size in bytes for platform-specific storage required for a thread.

[Note 1: Such storage is typically used for variables with automatic storage duration. — end note]

- <sup>2</sup> The stack size set by the implementation may be adjusted up or down to meet platform-specific requirements.
- <sup>3</sup> If `size` is zero, the thread attribute is ignored.

```
constexpr explicit stack_size_hint(size_t s) noexcept;
```

- <sup>4</sup> *Effects:* Initializes `size` with `s`.

### 32.4.3.3 Class `thread::id` [thread.thread.id]

```

namespace std {
 class thread::id {
 public:
 id() noexcept;

 bool operator==(thread::id x, thread::id y) noexcept;
 strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

 template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& out, thread::id id);

 template<class charT> struct formatter<thread::id, charT>;

 // hash support
 template<class T> struct hash;
 template<> struct hash<thread::id>;
 };
}

```

- <sup>1</sup> An object of type `thread::id` provides a unique identifier for each thread of execution and a single distinct value for all `thread` objects that do not represent a thread of execution (32.4.3). Each thread of execution has an associated `thread::id` object that is not equal to the `thread::id` object of any other thread of execution

and that is not equal to the `thread::id` object of any `thread` object that does not represent threads of execution.

2 The *text representation* for the character type `charT` of an object of type `thread::id` is an unspecified sequence of `charT` such that, for two objects of type `thread::id` `x` and `y`, if `x == y` is true, the `thread::id` objects have the same text representation, and if `x != y` is true, the `thread::id` objects have distinct text representations.

3 `thread::id` is a trivially copyable class (11.2). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.

4 [Note 1: Relational operators allow `thread::id` objects to be used as keys in associative containers. — end note]

```
id() noexcept;
```

5 *Postconditions:* The constructed object does not represent a thread of execution.

```
bool operator==(thread::id x, thread::id y) noexcept;
```

6 *Returns:* true only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

```
strong_ordering operator<=(thread::id x, thread::id y) noexcept;
```

7 Let  $P(x,y)$  be an unspecified total ordering over `thread::id` as described in 26.8.

8 *Returns:* `strong_ordering::less` if  $P(x,y)$  is true. Otherwise, `strong_ordering::greater` if  $P(y,x)$  is true. Otherwise, `strong_ordering::equal`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& out, thread::id id);
```

9 *Effects:* Inserts the text representation for `charT` of `id` into `out`.

10 *Returns:* `out`.

```
template<class charT> struct formatter<thread::id, charT>;
```

11 `formatter<thread::id, charT>` interprets *format-spec* as a *thread-id-format-spec*. The syntax of format specifications is as follows:

```
thread-id-format-spec:
fill-and-alignopt widthopt
```

[Note 2: The productions *fill-and-align* and *width* are described in 28.5.2.2. — end note]

12 If the *align* option is omitted it defaults to `>`.

13 A `thread::id` object is formatted by writing its text representation for `charT` to the output with additional padding and adjustments as specified by the format specifiers.

```
template<> struct hash<thread::id>;
```

14 The specialization is enabled (22.10.19).

#### 32.4.3.4 Constructors

[thread.thread.constr]

```
thread() noexcept;
```

1 *Effects:* The object does not represent a thread of execution.

2 *Postconditions:* `get_id() == id()`.

```
template<class... Args> explicit thread(Args&&... args);
```

3 *Constraints:*

(3.1) — `Args` is not an empty pack, and

(3.2) — `remove_cvref_t<Args...[0]>` is not the same type as `thread`.

4 Let  $i$  be the smallest value such that `decay_t<Args...[i]>` is not a thread attribute type, if such a value exists. Then the following notation is used:

(4.1) — Let  $F$  be `Args...[i]`.

- (4.2) — Let **f** be `args...[i]`.
- (4.3) — Let **Attrs** be a pack of the types `Args...[j]` for each  $j$  such that  $0 \leq j < i$ .
- (4.4) — Let **attrs** be a pack of the expressions `args...[j]` for each  $j$  such that  $0 \leq j < i$ .
- (4.5) — Let **FArgs** be a pack of the types `Args...[j]` for each  $j$  such that  $i < j < \text{sizeof}...(args)$ .
- (4.6) — Let **fargs** be a pack of the expressions `args...[j]` for each  $j$  such that  $i < j < \text{sizeof}...(args)$ .

5 *Mandates:* The value  $i$  exists, and the following are all **true**:

- (5.1) — `is_constructible_v<decay_t<F>, F>`,
- (5.2) — `(is_constructible_v<decay_t<FArgs>, FArgs> && ...)`,
- (5.3) — `is_invocable_v<decay_t<F>, decay_t<FArgs>...>`, and
- (5.4) — no type is present more than once in the pack `remove_cvref_t<Attrs>`.

6 *Effects:* The new thread of execution executes

```
invoke(auto(std::forward<F>(f)), // for invoke, see 22.10.5
 auto(std::forward<FArgs>(fargs))...)
```

with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[*Note 1:* This implies that any exceptions not thrown from the invocation of the copy of **f** will be thrown in the constructing thread, not the new thread. — *end note*]

If the invocation of `invoke` terminates with an uncaught exception, `terminate` is invoked (14.6.2).

[*Note 2:* The parameters `attrs...` can affect the behavior of the new thread (32.4.3.2). — *end note*]

7 *Synchronization:* The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of **f**.

8 *Postconditions:* `get_id() != id()`. `*this` represents the newly started thread.

9 *Throws:* `system_error` if unable to start the new thread.

10 *Error conditions:*

- (10.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
```

11 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

### 32.4.3.5 Destructor

[`thread.thread.destr`]

```
~thread();
```

1 *Effects:* If `joinable()`, invokes `terminate` (14.6.2). Otherwise, has no effects.

[*Note 1:* Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable. — *end note*]

### 32.4.3.6 Assignment

[`thread.thread.assign`]

```
thread& operator=(thread&& x) noexcept;
```

1 *Effects:* If `joinable()`, invokes `terminate` (14.6.2). Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

2 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

3 *Returns:* `*this`.

**32.4.3.7 Members**

[thread.thread.member]

```
void swap(thread& x) noexcept;
```

1     *Effects:* Swaps the state of *\*this* and *x*.

```
bool joinable() const noexcept;
```

2     *Returns:* `get_id() != id()`.

```
void join();
```

3     *Effects:* Blocks until the thread represented by *\*this* has completed.

4     *Synchronization:* The completion of the thread represented by *\*this* synchronizes with (6.10.2) the corresponding successful `join()` return.

[*Note 1:* Operations on *\*this* are not synchronized. — *end note*]

5     *Postconditions:* The thread represented by *\*this* has completed. `get_id() == id()`.

6     *Throws:* `system_error` when an exception is required (32.2.2).

7     *Error conditions:*

(7.1)     — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.

(7.2)     — `no_such_process` — if the thread is not valid.

(7.3)     — `invalid_argument` — if the thread is not joinable.

```
void detach();
```

8     *Effects:* The thread represented by *\*this* continues execution without the calling thread blocking. When `detach()` returns, *\*this* no longer represents the possibly continuing thread of execution. When the thread previously represented by *\*this* ends execution, the implementation releases any owned resources.

9     *Postconditions:* `get_id() == id()`.

10     *Throws:* `system_error` when an exception is required (32.2.2).

11     *Error conditions:*

(11.1)     — `no_such_process` — if the thread is not valid.

(11.2)     — `invalid_argument` — if the thread is not joinable.

```
id get_id() const noexcept;
```

12     *Returns:* A default constructed `id` object if *\*this* does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by *\*this*.

**32.4.3.8 Static members**

[thread.thread.static]

```
unsigned hardware_concurrency() noexcept;
```

1     *Returns:* The number of hardware thread contexts.

[*Note 1:* This value should only be considered to be a hint. — *end note*]

If this value is not computable or well-defined, an implementation should return 0.

**32.4.3.9 Specialized algorithms**

[thread.thread.algorithm]

```
void swap(thread& x, thread& y) noexcept;
```

1     *Effects:* As if by `x.swap(y)`.

**32.4.4 Class `jthread`**

[thread.jthread.class]

**32.4.4.1 General**

[thread.jthread.class.general]

1 The class `jthread` provides a mechanism to create a new thread of execution. The functionality is the same as for class `thread` (32.4.3) with the additional abilities to provide a `stop_token` (32.3) to the new thread of execution, make stop requests, and automatically join.

```

namespace std {
 class jthread {
 public:
 // types
 using id = thread::id;
 using native_handle_type = thread::native_handle_type;

 template<class T>
 using name_hint = thread::name_hint<T>;
 using stack_size_hint = thread::stack_size_hint;

 // 32.4.4.2, constructors, move, and assignment
 jthread() noexcept;
 template<class... Args>
 explicit jthread(Args&&... args);
 ~jthread();
 jthread(const jthread&) = delete;
 jthread(jthread&&) noexcept;
 jthread& operator=(const jthread&) = delete;
 jthread& operator=(jthread&&) noexcept;

 // 32.4.4.3, members
 void swap(jthread&) noexcept;
 bool joinable() const noexcept;
 void join();
 void detach();
 id get_id() const noexcept;
 native_handle_type native_handle(); // see 32.2.3

 // 32.4.4.4, stop token handling
 stop_source get_stop_source() noexcept;
 stop_token get_stop_token() const noexcept;
 bool request_stop() noexcept;

 // 32.4.4.5, specialized algorithms
 friend void swap(jthread& lhs, jthread& rhs) noexcept;

 // 32.4.4.6, static members
 static unsigned int hardware_concurrency() noexcept;

 private:
 stop_source ssource; // exposition only
 };
}

```

#### 32.4.4.2 Constructors, move, and assignment

[thread.jthread.cons]

jthread() noexcept;

1     *Effects:* Constructs a jthread object that does not represent a thread of execution.

2     *Postconditions:* get\_id() == id() is true and ssource.stop\_possible() is false.

template<class... Args> explicit jthread(Args&&... args);

3     *Constraints:*

(3.1)     — Args is not an empty pack, and

(3.2)     — remove\_cvref\_t<Args...[0]> is not the same type as jthread.

4     Let  $i$  be the smallest value such that decay\_t<Args...[ $i$ ]> is not a thread attribute type, if such a value exists. Then the following notation is used:

(4.1)     — Let  $F$  be Args...[ $i$ ].

(4.2)     — Let  $f$  be args...[ $i$ ].

(4.3)     — Let Attrs be a pack of the types Args...[ $j$ ] for each  $j$  such that  $0 \leq j < i$ .

- (4.4) — Let `attrs` be a pack of the expressions `args...[j]` for each  $j$  such that  $0 \leq j < i$ .
- (4.5) — Let `FArgs` be a pack of the types `Args...[j]` for each  $j$  such that  $i < j < \text{sizeof}...(args)$ .
- (4.6) — Let `fargs` be a pack of the expressions `args...[j]` for each  $j$  such that  $i < j < \text{sizeof}...(args)$ .
- 5 *Mandates:* The value  $i$  exists, and the following are all true:
- (5.1) — `is_constructible_v<decay_t<F>, F>`,
- (5.2) — `(is_constructible_v<decay_t<FArgs>, FArgs> && ...)`,
- (5.3) — `is_invocable_v<decay_t<F>, decay_t<FArgs>...> || is_invocable_v<decay_t<F>, stop_token, decay_t<FArgs>...>`, and
- (5.4) — no type is present more than once in the pack `remove_cvref_t<Attrs>`.
- 6 *Effects:* Initializes `ssource`. The new thread of execution executes
- ```
    invoke(auto(std::forward<F>(f)), get_stop_token(), // for invoke, see 22.10.5
           auto(std::forward<FArgs>(fargs))...)
```
- if that expression is well-formed, otherwise
- ```
 invoke(auto(std::forward<F>(f)), auto(std::forward<FArgs>(fargs))...)
```
- with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.
- [Note 1: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — end note]
- If the `invoke` expression exits via an exception, `terminate` is called.
- [Note 2: The parameters `attrs...` can affect the behavior of the new thread (32.4.3.2). — end note]
- 7 *Synchronization:* The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.
- 8 *Postconditions:* `get_id() != id()` is true and `ssource.stop_possible()` is true and `*this` represents the newly started thread.
- [Note 3: The calling thread can make a stop request only once, because it cannot replace this stop token. — end note]
- 9 *Throws:* `system_error` if unable to start the new thread.
- 10 *Error conditions:*
- (10.1) — `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.
- ```
jthread(jthread&& x) noexcept;
```
- 11 *Postconditions:* `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction. `ssource` has the value of `x.ssource` prior to the start of construction and `x.ssource.stop_possible()` is false.
- ```
~jthread();
```
- 12 *Effects:* If `joinable()` is true, calls `request_stop()` and then `join()`.
- [Note 4: Operations on `*this` are not synchronized. — end note]
- ```
jthread& operator=(jthread&& x) noexcept;
```
- 13 *Effects:* If `&x == this` is true, there are no effects. Otherwise, if `joinable()` is true, calls `request_stop()` and then `join()`, then assigns the state of `x` to `*this` and sets `x` to a default constructed state.
- 14 *Postconditions:* `get_id()` returns the value of `x.get_id()` prior to the assignment. `ssource` has the value of `x.ssource` prior to the assignment.
- 15 *Returns:* `*this`.

32.4.4.3 Members

[thread.jthread.mem]

```
void swap(jthread& x) noexcept;
```

1 *Effects:* Exchanges the values of **this* and *x*.

```
bool joinable() const noexcept;
```

2 *Returns:* `get_id() != id()`.

```
void join();
```

3 *Effects:* Blocks until the thread represented by **this* has completed.

4 *Synchronization:* The completion of the thread represented by **this* synchronizes with (6.10.2) the corresponding successful `join()` return.

[Note 1: Operations on **this* are not synchronized. — end note]

5 *Postconditions:* The thread represented by **this* has completed. `get_id() == id()`.

6 *Throws:* `system_error` when an exception is required (32.2.2).

7 *Error conditions:*

(7.1) — `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.

(7.2) — `no_such_process` — if the thread is not valid.

(7.3) — `invalid_argument` — if the thread is not joinable.

```
void detach();
```

8 *Effects:* The thread represented by **this* continues execution without the calling thread blocking. When `detach()` returns, **this* no longer represents the possibly continuing thread of execution. When the thread previously represented by **this* ends execution, the implementation releases any owned resources.

9 *Postconditions:* `get_id() == id()`.

10 *Throws:* `system_error` when an exception is required (32.2.2).

11 *Error conditions:*

(11.1) — `no_such_process` — if the thread is not valid.

(11.2) — `invalid_argument` — if the thread is not joinable.

```
id get_id() const noexcept;
```

12 *Returns:* A default constructed `id` object if **this* does not represent a thread, otherwise `this_thread::get_id()` for the thread of execution represented by **this*.

32.4.4.4 Stop token handling

[thread.jthread.stop]

```
stop_source get_stop_source() noexcept;
```

1 *Effects:* Equivalent to: `return ssource`;

```
stop_token get_stop_token() const noexcept;
```

2 *Effects:* Equivalent to: `return ssource.get_token()`;

```
bool request_stop() noexcept;
```

3 *Effects:* Equivalent to: `return ssource.request_stop()`;

32.4.4.5 Specialized algorithms

[thread.jthread.special]

```
friend void swap(jthread& x, jthread& y) noexcept;
```

1 *Effects:* Equivalent to: `x.swap(y)`.

32.4.4.6 Static members

[thread.jthread.static]

```
static unsigned int hardware_concurrency() noexcept;
```

1 *Returns:* thread::hardware_concurrency().

32.4.5 Namespace this_thread

[thread.thread.this]

```
namespace std::this_thread {
    thread::id get_id() noexcept;

    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}
```

```
thread::id this_thread::get_id() noexcept;
```

1 *Returns:* An object of type thread::id that uniquely identifies the current thread of execution. Every invocation from this thread of execution returns the same value. The object returned does not compare equal to a default-constructed thread::id.

```
void this_thread::yield() noexcept;
```

2 *Effects:* Offers the implementation the opportunity to reschedule.

3 *Synchronization:* None.

```
template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

4 *Effects:* Blocks the calling thread for the absolute timeout (32.2.4) specified by abs_time.

5 *Synchronization:* None.

6 *Throws:* Timeout-related exceptions (32.2.4).

```
template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);
```

7 *Effects:* Blocks the calling thread for the relative timeout (32.2.4) specified by rel_time.

8 *Synchronization:* None.

9 *Throws:* Timeout-related exceptions (32.2.4).

32.5 Atomic operations

[atomics]

32.5.1 General

[atomics.general]

- 1 Let *COPYCV*(FROM, TO) be an alias for type TO with the addition of FROM's top-level cv-qualifiers.
- 2 Subclause 32.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

32.5.2 Header <atomic> synopsis

[atomics.syn]

```
// mostly freestanding
namespace std {
    // 32.5.4, order and consistency
    enum class memory_order : unspecified;
    inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;
    inline constexpr memory_order memory_order_acquire = memory_order::acquire;
    inline constexpr memory_order memory_order_release = memory_order::release;
    inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;
    inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;
}
```

32.5.3 Type aliases

[atomics.alias]

- ¹ The type aliases `atomic_intN_t` and `atomic_uintN_t` are declared if and only if `intN_t` and `uintN_t` are declared, respectively.
- ² The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is true.

[Note 1: These aliases are optional in freestanding implementations (16.4.2.5). — end note]

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (32.5.6) are most efficient.

32.5.4 Order and consistency

[atomics.order]

```

namespace std {
    enum class memory_order : unspecified {
        relaxed = 0, acquire = 2, release = 3, acq_rel = 4, seq_cst = 5
    };
}

```

- ¹ The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.10.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

- (1.1) — `memory_order::relaxed`: no operation orders memory.
- (1.2) — `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
- (1.3) — `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[Note 1: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — end note]

- ² An atomic operation *A* that performs a release operation on an atomic object *M* synchronizes with an atomic operation *B* that performs an acquire operation on *M* and takes its value from any side effect in the release sequence headed by *A*.
- ³ An atomic operation *A* on some atomic object *M* is *coherence-ordered before* another atomic operation *B* on *M* if
 - (3.1) — *A* is a modification, and *B* reads the value stored by *A*, or
 - (3.2) — *A* precedes *B* in the modification order of *M*, or

- (3.3) — A and B are not the same atomic read-modify-write operation, and there exists an atomic modification X of M such that A reads the value stored by X and X precedes B in the modification order of M , or
- (3.4) — there exists an atomic modification X of M such that A is coherence-ordered before X and X is coherence-ordered before B .
- 4 There is a single total order S on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if A and B are `memory_order::seq_cst` operations and A strongly happens before B , then A precedes B in S . Second, for every pair of atomic operations A and B on an object M , where A is coherence-ordered before B , the following four conditions are required to be satisfied by S :
- (4.1) — if A and B are both `memory_order::seq_cst` operations, then A precedes B in S ; and
- (4.2) — if A is a `memory_order::seq_cst` operation and B happens before a `memory_order::seq_cst` fence Y , then A precedes Y in S ; and
- (4.3) — if a `memory_order::seq_cst` fence X happens before A and B is a `memory_order::seq_cst` operation, then X precedes B in S ; and
- (4.4) — if a `memory_order::seq_cst` fence X happens before A and B happens before a `memory_order::seq_cst` fence Y , then X precedes Y in S .
- 5 [Note 2: This definition ensures that S is consistent with the modification order of any atomic object M . It also ensures that a `memory_order::seq_cst` load A of M gets its value either from the last modification of M that precedes A in S or from some non-`memory_order::seq_cst` modification of M that does not happen before any modification of M that precedes A in S . — end note]
- 6 [Note 3: We do not require that S be consistent with “happens before” (6.10.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — end note]
- 7 [Note 4: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — end note]
- 8 Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[Note 5: For example, with x and y initially zero,

```
// Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);

// Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing `r1 == r2 == 42`, since the store of 42 to y is only possible if the store to x stores 42, which circularly depends on the store to y storing 42. Note that without this restriction, such an execution is possible. — end note]

- 9 [Note 6: The recommendation similarly disallows `r1 == r2 == 42` in the following example, with x and y again initially zero:

```
// Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);

// Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
```

— end note]

[Note 7: An implementation that translates to instruction sequences for a physical machine and treats non-volatile atomic accesses as though they were volatile does not produce out-of-thin-air values for a program free of undefined behavior. An implementation that performs only thread-at-a-time analysis in support of optimizations that omit and merge non-volatile atomic accesses to the same object and reorder non-volatile atomic accesses to different objects (when permitted by the as-if rule) and otherwise treats non-volatile atomic accesses as though they were volatile does not produce out-of-thin-air values for a program free of undefined behavior. The possibility of out-of-thin-air values remains for implementations not meeting these restrictions. — end note]

- 10 [Note 8: Unlike abstract machines, physical machines are subject to instruction-execution and information-transfer latencies. Physical machines carefully manage any speculative execution so as to avoid generating out-of-thin-air values at the hardware level. — end note]
- 11 An atomic read-modify-write operation always reads the value from the side effect that immediately precedes the side effect of the read-modify-write operation in the modification order.
- 12 An *atomic modify-write operation* is an atomic read-modify-write operation with weaker synchronization requirements as specified in 32.5.11.
- [Note 9: The intent is for atomic modify-write operations to be implemented using mechanisms that are not ordered, in hardware, by the implementation of acquire fences. No other semantic or hardware property (e.g., that the mechanism is a far atomic operation) is implied. — end note]
- 13 *Recommended practice:* The implementation should make atomic stores visible to atomic loads, and atomic loads should observe atomic stores, within a reasonable amount of time.

32.5.5 Lock-free property

[atomics.lockfree]

```
#define ATOMIC_BOOL_LOCK_FREE unspecified
#define ATOMIC_CHAR_LOCK_FREE unspecified
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified
#define ATOMIC_SHORT_LOCK_FREE unspecified
#define ATOMIC_INT_LOCK_FREE unspecified
#define ATOMIC_LONG_LOCK_FREE unspecified
#define ATOMIC_LLONG_LOCK_FREE unspecified
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

- 1 The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.
- 2 On a hosted implementation (16.4.2.5), at least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.9.3), is always lock-free.
- 3 The functions `atomic<T>::is_lock_free` and `atomic_is_lock_free` (32.5.8.2) indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.
- 4 Atomic operations that are not lock-free are considered to potentially block (6.10.2.3).
- 5 *Recommended practice:* Operations that are lock-free should also be address-free.²⁷³ The implementation of these operations should not depend on any per-process state.

[Note 1: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — end note]

32.5.6 Waiting and notifying

[atomics.wait]

- 1 *Atomic waiting operations* and *atomic notifying operations* provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function's effects.

[Note 1: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — end note]

- 2 [Note 2: The following functions are atomic waiting operations:

- (2.1) — `atomic<T>::wait`,
- (2.2) — `atomic_flag::wait`,
- (2.3) — `atomic_wait` and `atomic_wait_explicit`,
- (2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and
- (2.5) — `atomic_ref<T>::wait`.

— end note]

²⁷³) That is, atomic operations on the same memory location via two different addresses will communicate atomically.

³ [Note 3: The following functions are atomic notifying operations:

- (3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`,
- (3.2) — `atomic_flag::notify_one` and `atomic_flag::notify_all`,
- (3.3) — `atomic_notify_one` and `atomic_notify_all`,
- (3.4) — `atomic_flag_notify_one` and `atomic_flag_notify_all`, and
- (3.5) — `atomic_ref<T>::notify_one` and `atomic_ref<T>::notify_all`.

— *end note*]

⁴ A call to an atomic waiting operation on an atomic object M is *eligible to be unblocked* by a call to an atomic notifying operation on M if there exist side effects X and Y on M such that:

- (4.1) — the atomic waiting operation has blocked after observing the result of X,
- (4.2) — X precedes Y in the modification order of M, and
- (4.3) — Y happens before the call to the atomic notifying operation.

32.5.7 Class template `atomic_ref`

[atomics.ref.generic]

32.5.7.1 General

[atomics.ref.generic.general]

```
namespace std {
    template<class T> struct atomic_ref {
    private:
        T* ptr;                // exposition only

    public:
        using value_type = remove_cv_t<T>;
        using address-return-type = COPYCV(T, void)*;    // exposition only
        static constexpr size_t required_alignment = implementation-defined;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr explicit atomic_ref(T&);
        explicit atomic_ref(T&&) = delete;
        constexpr atomic_ref(const atomic_ref&) noexcept;
        template<class U>
            constexpr atomic_ref(const atomic_ref<U>&) noexcept;
        atomic_ref& operator=(const atomic_ref&) = delete;

        constexpr void store(value_type, memory_order = memory_order::seq_cst) const noexcept;
        constexpr value_type operator=(value_type) const noexcept;
        constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
        constexpr operator value_type() const noexcept;

        constexpr value_type exchange(value_type,
                                      memory_order = memory_order::seq_cst) const noexcept;
        constexpr bool compare_exchange_weak(value_type&, value_type,
                                             memory_order, memory_order) const noexcept;
        constexpr bool compare_exchange_strong(value_type&, value_type,
                                                memory_order, memory_order) const noexcept;
        constexpr bool compare_exchange_weak(value_type&, value_type,
                                              memory_order = memory_order::seq_cst) const noexcept;
        constexpr bool compare_exchange_strong(value_type&, value_type,
                                                memory_order = memory_order::seq_cst) const noexcept;

        constexpr void wait(value_type, memory_order = memory_order::seq_cst) const noexcept;
        constexpr void notify_one() const noexcept;
        constexpr void notify_all() const noexcept;
        constexpr address-return-type address() const noexcept;
    };
}
```

- ¹ An `atomic_ref` object applies atomic operations (32.5.1) to the object referenced by `*ptr` such that, for the lifetime (6.8.4) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.10.2.2).
- ² The program is ill-formed if `is_trivially_copyable_v<T>` is false.
- ³ The lifetime (6.8.4) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_refs` that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.
- ⁴ Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object.
[Note 1: Atomic operations or the `atomic_ref` constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — end note]
- ⁵ The program is ill-formed if `is_always_lock_free` is false and `is_volatile_v<T>` is true.

32.5.7.2 Operations

[atomics.ref.ops]

```
static constexpr size_t required_alignment;
```

- ¹ The alignment required for an object to be referenced by an atomic reference, which is at least `alignof(T)`. For any type `U` similar to `T`, the value of `required_alignment` is the same as `atomic_ref<remove_cv_t<U>>::required_alignment`.

- ² [Note 1: An implementation can choose to define `atomic_ref<T>::required_alignment` to a value greater than `alignof(T)` in order to ensure that operations on all objects of type `atomic_ref<T>` are lock-free. — end note]

```
static constexpr bool is_always_lock_free;
```

- ³ The static data member `is_always_lock_free` is true if the `atomic_ref` type's operations are always lock-free, and false otherwise. For any type `U` similar to `T`, the value of `is_always_lock_free` is the same as `atomic_ref<remove_cv_t<U>>::is_always_lock_free`.

```
bool is_lock_free() const noexcept;
```

- ⁴ *Returns:* true if operations on all objects of the type `atomic_ref<T>` are lock-free, false otherwise.

```
constexpr atomic_ref(T& obj);
```

- ⁵ *Preconditions:* The referenced object is aligned to `required_alignment`.

- ⁶ *Postconditions:* `*this` references `obj`.

- ⁷ *Throws:* Nothing.

```
constexpr atomic_ref(const atomic_ref& ref) noexcept;
```

- ⁸ *Postconditions:* `*this` references the object referenced by `ref`.

```
template<class U>
```

```
constexpr atomic_ref(const atomic_ref<U>& ref) noexcept;
```

- ⁹ *Constraints:*

- (9.1) — `T` and `U` are similar types (7.3.6), and

- (9.2) — `is_convertible_v<U*, T*>` is true.

- ¹⁰ *Postconditions:* `*this` references the object referenced by `ref`.

```
constexpr void store(value_type desired,  
                    memory_order order = memory_order::seq_cst) const noexcept;
```

- ¹¹ *Constraints:* `is_const_v<T>` is false.

- ¹² *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

- ¹³ *Effects:* Atomically replaces the value referenced by `*ptr` with the value of `desired`. Memory is affected according to the value of `order`.

```
constexpr value_type operator=(value_type desired) const noexcept;
```

14 *Constraints:* `is_const_v<T>` is false.

15 *Effects:* Equivalent to:

```
    store(desired);
    return desired;
```

```
constexpr value_type load(memory_order order = memory_order::seq_cst) const noexcept;
```

16 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

17 *Effects:* Memory is affected according to the value of `order`.

18 *Returns:* Atomically returns the value referenced by **ptr*.

```
constexpr operator value_type() const noexcept;
```

19 *Effects:* Equivalent to: `return load();`

```
constexpr value_type exchange(value_type desired,
                             memory_order order = memory_order::seq_cst) const noexcept;
```

20 *Constraints:* `is_const_v<T>` is false.

21 *Effects:* Atomically replaces the value referenced by **ptr* with `desired`. Memory is affected according to the value of `order`. This operation is an atomic read-modify-write operation (6.10.2).

22 *Returns:* Atomically returns the value referenced by **ptr* immediately before the effects.

```
constexpr bool compare_exchange_weak(value_type& expected, value_type desired,
                                     memory_order success, memory_order failure) const noexcept;
```

```
constexpr bool compare_exchange_strong(value_type& expected, value_type desired,
                                       memory_order success, memory_order failure) const noexcept;
```

```
constexpr bool compare_exchange_weak(value_type& expected, value_type desired,
                                     memory_order order = memory_order::seq_cst) const noexcept;
```

```
constexpr bool compare_exchange_strong(value_type& expected, value_type desired,
                                       memory_order order = memory_order::seq_cst) const noexcept;
```

23 *Constraints:* `is_const_v<T>` is false.

24 *Preconditions:* `failure` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

25 *Effects:* Retrieves the value in `expected`. It then atomically compares the value representation of the value referenced by **ptr* for equality with that previously retrieved from `expected`, and if `true`, replaces the value referenced by **ptr* with that in `desired`. If and only if the comparison is `true`, memory is affected according to the value of `success`, and if the comparison is `false`, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`. If and only if the comparison is `false` then, after the atomic operation, the value in `expected` is replaced by the value read from the value referenced by **ptr* during the atomic comparison. If the operation returns `true`, these operations are atomic read-modify-write operations (6.10.2.2) on the value referenced by **ptr*. Otherwise, these operations are atomic load operations on that memory.

26 *Returns:* The result of the comparison.

27 *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the value representations referred to by `expected` and *ptr* compare equal, it may return `false` and store back to `expected` the same value representation that was originally there.

[Note 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield

better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — *end note*]

```
constexpr void wait(value_type old, memory_order order = memory_order::seq_cst) const noexcept;
```

28 *Preconditions:* order is memory_order::relaxed, memory_order::acquire, or memory_order::seq_cst.

29 *Effects:* Repeatedly performs the following steps, in order:

(29.1) — Evaluates load(order) and compares its value representation for equality against that of old.

(29.2) — If they compare unequal, returns.

(29.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

30 *Remarks:* This function is an atomic waiting operation (32.5.6) on atomic object *ptr.

```
constexpr void notify_one() const noexcept;
```

31 *Constraints:* is_const_v<T> is false.

32 *Effects:* Unblocks the execution of at least one atomic waiting operation on *ptr that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

33 *Remarks:* This function is an atomic notifying operation (32.5.6) on atomic object *ptr.

```
constexpr void notify_all() const noexcept;
```

34 *Constraints:* is_const_v<T> is false.

35 *Effects:* Unblocks the execution of all atomic waiting operations on *ptr that are eligible to be unblocked (32.5.6) by this call.

36 *Remarks:* This function is an atomic notifying operation (32.5.6) on atomic object *ptr.

```
constexpr address-return-type address() const noexcept;
```

37 *Returns:* ptr.

32.5.7.3 Specializations for integral types

[atomics.ref.int]

- 1 There are specializations of the atomic_ref class template for all integral types except cv bool. For each such type *integral-type*, the specialization atomic_ref<integral-type> provides additional atomic operations appropriate to integral types.

[*Note 1:* The specialization atomic_ref<bool> uses the primary template (32.5.7). — *end note*]

- 2 The program is ill-formed if is_always_lock_free is false and is_volatile_v<integral-type> is true.

```
namespace std {
    template<> struct atomic_ref<integral-type> {
    private:
        integral-type* ptr;           // exposition only

    public:
        using value_type = remove_cv_t<integral-type>;
        using difference_type = value_type;
        using address-return-type = COPYCV(integral-type, void)*; // exposition only
        static constexpr size_t required_alignment = implementation-defined;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr explicit atomic_ref(integral-type&);
        explicit atomic_ref(integral-type&&) = delete;
        constexpr atomic_ref(const atomic_ref&) noexcept;
        template<class U>
            constexpr atomic_ref(const atomic_ref<U>&) noexcept;
        atomic_ref& operator=(const atomic_ref&) = delete;

        constexpr void store(value_type, memory_order = memory_order::seq_cst) const noexcept;
        constexpr value_type operator=(value_type) const noexcept;
```

```

constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
constexpr operator value_type() const noexcept;

constexpr value_type exchange(value_type,
                               memory_order = memory_order::seq_cst) const noexcept;
constexpr bool compare_exchange_weak(value_type&, value_type,
                                     memory_order, memory_order) const noexcept;
constexpr bool compare_exchange_strong(value_type&, value_type,
                                       memory_order, memory_order) const noexcept;
constexpr bool compare_exchange_weak(value_type&, value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
constexpr bool compare_exchange_strong(value_type&, value_type,
                                       memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type fetch_add(value_type,
                               memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_sub(value_type,
                               memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_and(value_type,
                               memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_or(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_xor(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_max(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_min(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;

constexpr void store_add(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_sub(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_and(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_or(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_xor(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_max(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_min(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type operator++(int) const noexcept;
constexpr value_type operator--(int) const noexcept;
constexpr value_type operator++() const noexcept;
constexpr value_type operator--() const noexcept;
constexpr value_type operator+=(value_type) const noexcept;
constexpr value_type operator-=(value_type) const noexcept;
constexpr value_type operator&=(value_type) const noexcept;
constexpr value_type operator|=(value_type) const noexcept;
constexpr value_type operator^=(value_type) const noexcept;

constexpr void wait(value_type, memory_order = memory_order::seq_cst) const noexcept;
constexpr void notify_one() const noexcept;
constexpr void notify_all() const noexcept;
constexpr address-return-type address() const noexcept;
};
}

```

³ Descriptions are provided below only for members that differ from the primary template.

⁴ The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 155](#).

```
constexpr value_type fetch_key(value_type operand,
    memory_order order = memory_order::seq_cst) const noexcept;
```

5 *Constraints:* `is_const_v<integral-type>` is false.

6 *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.10.2.2).

7 *Returns:* Atomically, the value referenced by `*ptr` immediately before the effects.

8 *Remarks:* Except for `fetch_max` and `fetch_min`, for signed integer types the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

9 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

```
constexpr void store_key(value_type operand,
    memory_order order = memory_order::seq_cst) const noexcept;
```

10 *Constraints:* `is_const_v<integral-type>` is false.

11 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

12 *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic modify-write operations (32.5.4).

13 *Remarks:* Except for `store_max` and `store_min`, for signed integer types, the result is as if `*ptr` and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 3: There are no undefined results arising from the computation. — end note]

For `store_max` and `store_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with `*ptr` and the first parameter as the arguments.

```
constexpr value_type operator op=(value_type operand) const noexcept;
```

14 *Constraints:* `is_const_v<integral-type>` is false.

15 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

32.5.7.4 Specializations for floating-point types

[atomics.ref.float]

1 There are specializations of the `atomic_ref` class template for all floating-point types. For each such type *floating-point-type*, the specialization `atomic_ref<floating-point-type>` provides additional atomic operations appropriate to floating-point types.

2 The program is ill-formed if `is_always_lock_free` is false and `is_volatile_v<floating-point-type>` is true.

```
namespace std {
    template<> struct atomic_ref<floating-point-type> {
    private:
        floating-point-type* ptr;    // exposition only

    public:
        using value_type = remove_cv_t<floating-point-type>;
        using difference_type = value_type;
        using address-return-type = COPYCV(floating-point-type, void)*;    // exposition only
        static constexpr size_t required_alignment = implementation-defined;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr explicit atomic_ref(floating-point-type&);
        explicit atomic_ref(floating-point-type&&) = delete;
```

```

constexpr atomic_ref(const atomic_ref&) noexcept;
template<class U>
    constexpr atomic_ref(const atomic_ref<U>&) noexcept;
atomic_ref& operator=(const atomic_ref&) = delete;

constexpr void store(value_type,
                     memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type operator=(value_type) const noexcept;
constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
constexpr operator value_type() const noexcept;

constexpr value_type exchange(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr bool compare_exchange_weak(value_type&, value_type,
                                     memory_order, memory_order) const noexcept;
constexpr bool compare_exchange_strong(value_type&, value_type,
                                       memory_order, memory_order) const noexcept;
constexpr bool compare_exchange_weak(value_type&, value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
constexpr bool compare_exchange_strong(value_type&, value_type,
                                       memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type fetch_add(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_sub(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type fetch_max(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_min(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_fmaximum(value_type,
                                    memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_fminimum(value_type,
                                    memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_fmaximum_num(value_type,
                                        memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_fminimum_num(value_type,
                                        memory_order = memory_order::seq_cst) const noexcept;

constexpr void store_add(value_type, memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_sub(value_type, memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_max(value_type, memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_min(value_type, memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_fmaximum(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_fminimum(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_fmaximum_num(value_type,
                                  memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_fminimum_num(value_type,
                                  memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type operator+=(value_type) const noexcept;
constexpr value_type operator-=(value_type) const noexcept;

constexpr void wait(value_type,
                   memory_order = memory_order::seq_cst) const noexcept;
constexpr void notify_one() const noexcept;
constexpr void notify_all() const noexcept;
constexpr address-return-type address() const noexcept;
};
}

```

³ Descriptions are provided below only for members that differ from the primary template.

⁴ The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 155, except for the keys `max`, `min`, `fmaximum`, `fminimum`, `fmaximum_num`, and `fminimum_num`, which are specified below.

```
constexpr value_type fetch_key(value_type operand,
                               memory_order order = memory_order::seq_cst) const noexcept;
```

⁵ *Constraints:* `is_const_v<floating-point-type>` is false.

⁶ *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.10.2.2).

⁷ *Returns:* Atomically, the value referenced by `*ptr` immediately before the effects.

⁸ *Remarks:* If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `std::numeric_limits<value_type>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment.

- (8.1) — For `fetch_fmaximum` and `fetch_fminimum`, the maximum and minimum computation is performed as if by `fmaximum` and `fminimum`, respectively, with `*ptr` and the first parameter as the arguments.
- (8.2) — For `fetch_fmaximum_num` and `fetch_fminimum_num`, the maximum and minimum computation is performed as if by `fmaximum_num` and `fminimum_num`, respectively, with `*ptr` and the first parameter as the arguments.
- (8.3) — For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `fmaximum_num` and `fminimum_num`, respectively, with `*ptr` and the first parameter as the arguments, except that:
 - (8.3.1) — If both arguments are NaN, an unspecified NaN value is stored at `*ptr`.
 - (8.3.2) — If exactly one argument is a NaN, either the other argument or an unspecified NaN value is stored at `*ptr`; it is unspecified which.
 - (8.3.3) — If the arguments are differently signed zeros, which of these values is stored at `*ptr` is unspecified.

⁹ *Recommended practice:* The implementation of `fetch_max` and `fetch_min` should treat negative zero as smaller than positive zero.

```
constexpr void store_key(value_type operand,
                         memory_order order = memory_order::seq_cst) const noexcept;
```

¹⁰ *Constraints:* `is_const_v<floating-point-type>` is false.

¹¹ *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

¹² *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic modify-write operations (32.5.4).

¹³ *Remarks:* If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `numeric_limits<floating-point-type>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment. The arithmetic rules of floating-point atomic modify-write operations may be different from operations on floating-point types or atomic floating-point types.

[Note 1: Tree reductions are permitted for atomic modify-write operations. — end note]

- (13.1) — For `store_fmaximum` and `store_fminimum`, the maximum and minimum computation is performed as if by `fmaximum` and `fminimum`, respectively, with `*ptr` and the first parameter as the arguments.

- (13.2) — For `store_fmaximum_num` and `store_fminimum_num`, the maximum and minimum computation is performed as if by `fmaximum_num` and `fminimum_num`, respectively, with **ptr* and the first parameter as the arguments.
- (13.3) — For `store_max` and `store_min`, the maximum and minimum computation is performed as if by `fmaximum_num` and `fminimum_num`, respectively, with **ptr* and the first parameter as the arguments, except that:
 - (13.3.1) — If both arguments are NaN, an unspecified NaN value is stored at **ptr*.
 - (13.3.2) — If exactly one argument is a NaN, either the other argument or an unspecified NaN value is stored at **ptr*, it is unspecified which.
 - (13.3.3) — If the arguments are differently signed zeros, which of these values is stored at **ptr* is unspecified.
- 14 *Recommended practice:* The implementation of `store_max` and `store_min` should treat negative zero as smaller than positive zero.

`constexpr value_type operator op=(value_type operand) const noexcept;`

15 *Constraints:* `is_const_v<floating-point-type>` is false.

16 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

32.5.7.5 Specialization for pointers

[atomics.ref.pointer]

- 1 There are specializations of the `atomic_ref` class template for all pointer-to-object types. For each such type *pointer-type*, the specialization `atomic_ref<pointer-type>` provides additional atomic operations appropriate to pointer types.
- 2 Except during constant evaluation, when an operation on an atomic pointer would otherwise result in a pointer value *p* that is not valid in the context of the evaluation (6.9.5), that result instead is `reinterpret_cast<T*>(reinterpret_cast<uintptr_t>(p))`.
- 3 The program is ill-formed if `is_always_lock_free` is false and `is_volatile_v<pointer-type>` is true.

```
namespace std {
    template<> struct atomic_ref<pointer-type> {
    private:
        pointer-type* ptr;          // exposition only

    public:
        using value_type = remove_cv_t<pointer-type>;
        using difference_type = ptrdiff_t;
        using address-return-type = COPYCV(pointer-type, void)*; // exposition only
        static constexpr size_t required_alignment = implementation-defined;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr explicit atomic_ref(pointer-type&);
        explicit atomic_ref(pointer-type&&) = delete;
        constexpr atomic_ref(const atomic_ref&) noexcept;
        template<class U>
            constexpr atomic_ref(const atomic_ref<U>&) noexcept;
        atomic_ref& operator=(const atomic_ref&) = delete;

        constexpr void store(value_type, memory_order = memory_order::seq_cst) const noexcept;
        constexpr value_type operator=(value_type) const noexcept;
        constexpr value_type load(memory_order = memory_order::seq_cst) const noexcept;
        constexpr operator value_type() const noexcept;

        constexpr value_type exchange(value_type,
                                      memory_order = memory_order::seq_cst) const noexcept;
        constexpr bool compare_exchange_weak(value_type&, value_type,
                                             memory_order, memory_order) const noexcept;
        constexpr bool compare_exchange_strong(value_type&, value_type,
                                              memory_order, memory_order) const noexcept;
```

```

constexpr bool compare_exchange_weak(value_type&, value_type,
                                     memory_order = memory_order::seq_cst) const noexcept;
constexpr bool compare_exchange_strong(value_type&, value_type,
                                       memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type fetch_add(difference_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_sub(difference_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_max(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;
constexpr value_type fetch_min(value_type,
                              memory_order = memory_order::seq_cst) const noexcept;

constexpr void store_add(difference_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_sub(difference_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_max(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;
constexpr void store_min(value_type,
                        memory_order = memory_order::seq_cst) const noexcept;

constexpr value_type operator++(int) const noexcept;
constexpr value_type operator--(int) const noexcept;
constexpr value_type operator++() const noexcept;
constexpr value_type operator--() const noexcept;
constexpr value_type operator+=(difference_type) const noexcept;
constexpr value_type operator-=(difference_type) const noexcept;

constexpr void wait(value_type, memory_order = memory_order::seq_cst) const noexcept;
constexpr void notify_one() const noexcept;
constexpr void notify_all() const noexcept;
constexpr address-return-type address() const noexcept;
};
}

```

4 Descriptions are provided below only for members that differ from the primary template.

5 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 156](#).

```
constexpr value_type fetch_key(see above operand,
                             memory_order order = memory_order::seq_cst) const noexcept;
```

6 *Constraints:* `is_const_v<pointer-type>` is false.

7 *Mandates:* `remove_pointer_t<pointer-type>` is a complete object type.

8 *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.10.2.2](#)).

9 *Returns:* Atomically, the value referenced by `*ptr` immediately before the effects.

10 *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

11 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms ([26.8.9](#)), respectively, with the object value and the first parameter as the arguments.

[*Note 1:* If the pointers point to different complete objects (or subobjects thereof), the `<` operator does not establish a strict weak ordering ([Table 29](#), [7.6.9](#)). — *end note*]

```
constexpr void store_key(see above operand,
                       memory_order order = memory_order::seq_cst) const noexcept;
```

12 *Constraints:* `is_const_v<pointer-type>` is false.

13 *Mandates:* `remove_pointer_t<pointer-type>` is a complete object type.

14 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

15 *Effects:* Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic modify-write operations (32.5.4).

16 *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior. For `store_max` and `store_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with `*ptr` and the first parameter as the arguments.

[*Note 2:* If the pointers point to different complete objects (or subobjects thereof), the `<` operator does not establish a strict weak ordering (Table 29, 7.6.9). — end note]

```
constexpr value_type operator op=(difference_type operand) const noexcept;
```

17 *Constraints:* `is_const_v<pointer-type>` is false.

18 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

32.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

1 Let *referred-type* be *pointer-type* for the specializations in 32.5.7.5 and be *integral-type* for the specializations in 32.5.7.3.

```
constexpr value_type operator++(int) const noexcept;
```

2 *Constraints:* `is_const_v<referred-type>` is false.

3 *Effects:* Equivalent to: `return fetch_add(1);`

```
constexpr value_type operator--(int) const noexcept;
```

4 *Constraints:* `is_const_v<referred-type>` is false.

5 *Effects:* Equivalent to: `return fetch_sub(1);`

```
constexpr value_type operator++() const noexcept;
```

6 *Constraints:* `is_const_v<referred-type>` is false.

7 *Effects:* Equivalent to: `return fetch_add(1) + 1;`

```
constexpr value_type operator--() const noexcept;
```

8 *Constraints:* `is_const_v<referred-type>` is false.

9 *Effects:* Equivalent to: `return fetch_sub(1) - 1;`

32.5.8 Class template atomic

[atomics.types.generic]

32.5.8.1 General

[atomics.types.generic.general]

```
namespace std {
    template<class T> struct atomic {
        using value_type = T;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        // 32.5.8.2, operations on atomic types
        constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
        constexpr atomic(T) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        T load(memory_order = memory_order::seq_cst) const volatile noexcept;
        constexpr T load(memory_order = memory_order::seq_cst) const noexcept;
        operator T() const volatile noexcept;
        constexpr operator T() const noexcept;
        void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
```

```

constexpr void store(T, memory_order = memory_order::seq_cst) noexcept;
T operator=(T) volatile noexcept;
constexpr T operator=(T) noexcept;

T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr T exchange(T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
constexpr bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
constexpr bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr void wait(T, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
constexpr void notify_one() noexcept;
void notify_all() volatile noexcept;
constexpr void notify_all() noexcept;
};
}

```

- ¹ The template argument for T shall meet the *Cpp17CopyConstructible* and *Cpp17CopyAssignable* requirements. The program is ill-formed if any of

- (1.1) — `is_trivially_copyable_v<T>`,
- (1.2) — `is_copy_constructible_v<T>`,
- (1.3) — `is_move_constructible_v<T>`,
- (1.4) — `is_copy_assignable_v<T>`,
- (1.5) — `is_move_assignable_v<T>`, or
- (1.6) — `is_same_v<T, remove_cv_t<T>>`,

is false.

[Note 1: Type arguments that are not also statically initializable can be difficult to use. — end note]

- ² The specialization `atomic<bool>` is a standard-layout struct. It has a trivial destructor.
- ³ [Note 2: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]

32.5.8.2 Operations on atomic types

[atomics.types.operations]

```
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
```

- ¹ *Constraints:* `is_default_constructible_v<T>` is true.

- ² *Effects:* Initializes the atomic object with the value of `T()`. Initialization is not an atomic operation (6.10.2).

```
constexpr atomic(T desired) noexcept;
```

- ³ *Effects:* Initializes the object with the value `desired`. Initialization is not an atomic operation (6.10.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example by communicating the address of the just-constructed object A to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

```
static constexpr bool is_always_lock_free = implementation-defined;
```

- ⁴ The static data member `is_always_lock_free` is true if the atomic type's operations are always lock-free, and false otherwise.

[Note 2: The value of `is_always_lock_free` is consistent with the value of the corresponding `ATOMIC_..._LOCK_FREE` macro, if defined. — end note]

```
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;
```

5 *Returns:* true if the object's operations are lock-free, false otherwise.

[Note 3: The return value of the `is_lock_free` member function is consistent with the value of `is_always_lock_free` for the same type. — end note]

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void store(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

6 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

7 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

8 *Effects:* Atomically replaces the value pointed to by `this` with the value of `desired`. Memory is affected according to the value of `order`.

```
T operator=(T desired) volatile noexcept;
constexpr T operator=(T desired) noexcept;
```

9 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

10 *Effects:* Equivalent to `store(desired)`.

11 *Returns:* `desired`.

```
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
constexpr T load(memory_order order = memory_order::seq_cst) const noexcept;
```

12 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

13 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

14 *Effects:* Memory is affected according to the value of `order`.

15 *Returns:* Atomically returns the value pointed to by `this`.

```
operator T() const volatile noexcept;
constexpr operator T() const noexcept;
```

16 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

17 *Effects:* Equivalent to: `return load();`

```
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;
```

18 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

19 *Effects:* Atomically replaces the value pointed to by `this` with `desired`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.10.2).

20 *Returns:* Atomically returns the value pointed to by `this` immediately before the effects.

```
bool compare_exchange_weak(T& expected, T desired,
                           memory_order success, memory_order failure) volatile noexcept;
constexpr bool compare_exchange_weak(T& expected, T desired,
                                     memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order success, memory_order failure) volatile noexcept;
constexpr bool compare_exchange_strong(T& expected, T desired,
                                       memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
                           memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_weak(T& expected, T desired,
                                     memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
                             memory_order order = memory_order::seq_cst) volatile noexcept;
```

```
constexpr bool compare_exchange_strong(T& expected, T desired,
                                       memory_order order = memory_order::seq_cst) noexcept;
```

21 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

22 *Preconditions:* failure is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

23 *Effects:* Retrieves the value in `expected`. It then atomically compares the value representation of the value pointed to by `this` for equality with that previously retrieved from `expected`, and if true, replaces the value pointed to by `this` with that in `desired`. If and only if the comparison is true, memory is affected according to the value of `success`, and if the comparison is false, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`. If and only if the comparison is false then, after the atomic operation, the value in `expected` is replaced by the value pointed to by `this` during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.10.2.2) on the memory pointed to by `this`. Otherwise, these operations are atomic load operations on that memory.

24 *Returns:* The result of the comparison.

25 [Note 4: For example, the effect of `compare_exchange_strong` on objects without padding bits (6.9.1) is

```
    if (memcmp(this, &expected, sizeof(*this)) == 0)
        memcpy(this, &desired, sizeof(*this));
    else
        memcpy(&expected, this, sizeof(*this));
```

— end note]

[Example 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update `expected` when another iteration of the loop is needed.

```
    expected = current.load();
    do {
        desired = function(expected);
    } while (!current.compare_exchange_weak(expected, desired));
```

— end example]

[Example 2: Because the expected value is updated only on failure, code releasing the memory containing the `expected` value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:

```
    do {
        p->next = head;
    } while (!head.compare_exchange_weak(p->next, p)); // make new list node point to the current head
                                                    // try to insert
```

— end example]

26 *Recommended practice:* Implementations should ensure that weak compare-and-exchange operations do not consistently return false unless either the atomic object has value different from `expected` or there are concurrent modifications to the atomic object.

27 *Remarks:* A weak compare-and-exchange operation may fail spuriously. That is, even when the value representations referred to by `expected` and `this` compare equal, it may return false and store back to `expected` the same value representation that was originally there.

[Note 5: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

28 [Note 6: Under cases where the `memcpy` and `memcmp` semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with `operator==` if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC 60559, floating-point `-0.0` and `+0.0` will not compare equal with `memcmp` but will compare equal with `operator==`, and NaNs with the same payload will compare equal with `memcmp` but will not compare equal with `operator==`. — end note]

[*Note 7*: Because compare-and-exchange acts on an object's value representation, padding bits that never participate in the object's value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

```
struct padded {
    char clank = 0x42;
    // Padding here.
    unsigned biff = 0xC0DEF0FE;
};
atomic<padded> pad = {};

bool zap() {
    padded expected, desired{0, 0};
    return pad.compare_exchange_strong(expected, desired);
}
```

— *end note*]

[*Note 8*: For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

```
union pony {
    double celestia = 0.;
    short luna;        // padded
};
atomic<pony> princesses = {};

bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
}
```

— *end note*]

```
void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
constexpr void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

29 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

30 *Preconditions*: `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

31 *Effects*: Repeatedly performs the following steps, in order:

- (31.1) — Evaluates `load(order)` and compares its value representation for equality against that of `old`.
- (31.2) — If they compare unequal, returns.
- (31.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

32 *Remarks*: This function is an atomic waiting operation (32.5.6).

```
void notify_one() volatile noexcept;
constexpr void notify_one() noexcept;
```

33 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

34 *Effects*: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

35 *Remarks*: This function is an atomic notifying operation (32.5.6).

```
void notify_all() volatile noexcept;
constexpr void notify_all() noexcept;
```

36 *Constraints*: For the `volatile` overload of this function, `is_always_lock_free` is `true`.

37 *Effects*: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

38 *Remarks*: This function is an atomic notifying operation (32.5.6).

32.5.8.3 Specializations for integers

[atomics.types.int]

- ¹ There are specializations of the `atomic` class template for each character type (6.9.3), each standard integer type, and any other types needed by the typedefs in the header `<stdint>` (17.4.1). For each such type *integral-type*, the specialization `atomic<integral-type>` provides additional atomic operations appropriate to integral types.

[Note 1: The specialization `atomic<bool>` uses the primary template (32.5.8). — end note]

```
namespace std {
    template<> struct atomic<integral-type> {
        using value_type = integral-type;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(integral-type) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(integral-type, memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr void store(integral-type, memory_order = memory_order::seq_cst) noexcept;
        integral-type operator=(integral-type) volatile noexcept;
        constexpr integral-type operator=(integral-type) noexcept;
        integral-type load(memory_order = memory_order::seq_cst) const volatile noexcept;
        constexpr integral-type load(memory_order = memory_order::seq_cst) const noexcept;
        operator integral-type() const volatile noexcept;
        constexpr operator integral-type() const noexcept;

        integral-type exchange(integral-type,
                               memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr integral-type exchange(integral-type,
                                         memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(integral-type&, integral-type,
                                   memory_order, memory_order) volatile noexcept;
        constexpr bool compare_exchange_weak(integral-type&, integral-type,
                                              memory_order, memory_order) noexcept;
        bool compare_exchange_strong(integral-type&, integral-type,
                                     memory_order, memory_order) volatile noexcept;
        constexpr bool compare_exchange_strong(integral-type&, integral-type,
                                                memory_order, memory_order) noexcept;
        bool compare_exchange_weak(integral-type&, integral-type,

constexpr void store_max(integral-type,
                        memory_order = memory_order::seq_cst) noexcept;
void store_min(integral-type,
              memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_min(integral-type,
                        memory_order = memory_order::seq_cst) noexcept;

integral-type operator++(int) volatile noexcept;
constexpr integral-type operator++(int) noexcept;
integral-type operator--(int) volatile noexcept;
constexpr integral-type operator--(int) noexcept;
integral-type operator++() volatile noexcept;
constexpr integral-type operator++() noexcept;
integral-type operator--() volatile noexcept;
constexpr integral-type operator--() noexcept;
integral-type operator+=(integral-type) volatile noexcept;
constexpr integral-type operator+=(integral-type) noexcept;
integral-type operator-=(integral-type) volatile noexcept;
constexpr integral-type operator-=(integral-type) noexcept;
integral-type operator&=(integral-type) volatile noexcept;
constexpr integral-type operator&=(integral-type) noexcept;
integral-type operator|=(integral-type) volatile noexcept;
constexpr integral-type operator|=(integral-type) noexcept;

```

```

    integral-type operator^=(integral-type) volatile noexcept;
    constexpr integral-type operator^=(integral-type) noexcept;

    void wait(integral-type, memory_order = memory_order::seq_cst) const volatile noexcept;
    constexpr void wait(integral-type, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    constexpr void notify_one() noexcept;
    void notify_all() volatile noexcept;
    constexpr void notify_all() noexcept;
};
}

```

2 The atomic integral specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in [Table 155](#).

Table 155 — Atomic arithmetic computations [tab:atomic.types.int.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	and	&	bitwise and
sub	-	subtraction	or		bitwise inclusive or
max		maximum	xor	^	bitwise exclusive or
min		minimum			

```

integral-type fetch_key(integral-type operand,
                        memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr integral-type fetch_key(integral-type operand,
                                memory_order order = memory_order::seq_cst) noexcept;

```

5 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

6 *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations ([6.10.2](#)).

7 *Returns:* Atomically, the value pointed to by `this` immediately before the effects.

8 *Remarks:* Except for `fetch_max` and `fetch_min`, for signed integer types the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

9 For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms ([26.8.9](#)), respectively, with the object value and the first parameter as the arguments.

```

void store_key(integral-type operand,
              memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void store_key(integral-type operand,
                        memory_order order = memory_order::seq_cst) noexcept;

```

10 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

11 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

12 *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic modify-write operations ([32.5.4](#)).

13 *Remarks:* Except for `store_max` and `store_min`, for signed integer types, the result is as if the value pointed to by `this` and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 3: There are no undefined results arising from the computation. — end note]

For `store_max` and `store_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the value pointed to by `this` and the first parameter as the arguments.

```
integral-type operator op=(integral-type operand) volatile noexcept;
constexpr integral-type operator op=(integral-type operand) noexcept;
```

14 *Constraints*: For the volatile overload of this function, `is_always_lock_free` is true.

15 *Effects*: Equivalent to: `return fetch_key(operand) op operand;`

32.5.8.4 Specializations for floating-point types [atomics.types.float]

- 1 There are specializations of the atomic class template for all cv-unqualified floating-point types. For each such type *floating-point-type*, the specialization `atomic<floating-point-type>` provides additional atomic operations appropriate to floating-point types.

```
namespace std {
    template<> struct atomic<floating-point-type> {
        using value_type = floating-point-type;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(floating-point-type) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(floating-point-type, memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr void store(floating-point-type, memory_order = memory_order::seq_cst) noexcept;
        floating-point-type operator=(floating-point-type) volatile noexcept;
        constexpr floating-point-type operator=(floating-point-type) noexcept;
        floating-point-type load(memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr floating-point-type load(memory_order = memory_order::seq_cst) noexcept;
        operator floating-point-type() volatile noexcept;
        constexpr operator floating-point-type() noexcept;

        floating-point-type exchange(floating-point-type,
                                    memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr floating-point-type exchange(floating-point-type,
                                                memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order, memory_order) volatile noexcept;
        constexpr bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                                memory_order, memory_order) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                      memory_order, memory_order) volatile noexcept;
        constexpr bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                                memory_order, memory_order) noexcept;
        bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                   memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr bool compare_exchange_weak(floating-point-type&, floating-point-type,
                                                memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                      memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr bool compare_exchange_strong(floating-point-type&, floating-point-type,
                                                memory_order = memory_order::seq_cst) noexcept;

        floating-point-type fetch_add(floating-point-type,
                                      memory_order = memory_order::seq_cst) volatile noexcept;
        constexpr floating-point-type fetch_add(floating-point-type,
                                                memory_order = memory_order::seq_cst) noexcept;
```

```

floating-point-type fetch_sub(floating-point-type,
                             memory_order = memory_order::seq_cst) volatile noexcept;
constexpr floating-point-type fetch_sub(floating-point-type,
                                         memory_order = memory_order::seq_cst) noexcept;
floating-point-type fetch_max(floating-point-type,
                              memory_order = memory_order::seq_cst) volatile noexcept;
constexpr floating-point-type fetch_max(floating-point-type,
                                         memory_order = memory_order::seq_cst) noexcept;
floating-point-type fetch_min(floating-point-type,
                              memory_order = memory_order::seq_cst) volatile noexcept;
constexpr floating-point-type fetch_min(floating-point-type,
                                         memory_order = memory_order::seq_cst) noexcept;
floating-point-type fetch_fmaximum(floating-point-type,
                                   memory_order = memory_order::seq_cst) volatile noexcept;
constexpr floating-point-type fetch_fmaximum(floating-point-type,
                                              memory_order = memory_order::seq_cst) noexcept;
floating-point-type fetch_fminimum(floating-point-type,
                                   memory_order = memory_order::seq_cst) volatile noexcept;

                              memory_order = memory_order::seq_cst) noexcept;
void store_fminimum(floating-point-type,
                   memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_fminimum(floating-point-type,
                              memory_order = memory_order::seq_cst) noexcept;
void store_fmaximum_num(floating-point-type,
                        memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_fmaximum_num(floating-point-type,
                                  memory_order = memory_order::seq_cst) noexcept;
void store_fminimum_num(floating-point-type,
                        memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_fminimum_num(floating-point-type,
                                  memory_order = memory_order::seq_cst) noexcept;

floating-point-type operator+=(floating-point-type) volatile noexcept;
constexpr floating-point-type operator+=(floating-point-type) noexcept;

```

```

floating-point-type operator==(floating-point-type) volatile noexcept;
constexpr floating-point-type operator==(floating-point-type) noexcept;

void wait(floating-point-type, memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr void wait(floating-point-type,
                    memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
constexpr void notify_one() noexcept;
void notify_all() volatile noexcept;
constexpr void notify_all() noexcept;
};
}

```

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in Table 155, except for the keys max, min, fmaximum, fminimum, fmaximum_num, and fminimum_num, which are specified below.

```

floating-point-type fetch_key(floating-point-type operand,
                             memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr floating-point-type fetch_key(floating-point-type operand,
                                       memory_order order = memory_order::seq_cst) noexcept;

```

5 *Constraints:* For the volatile overload of this function, is_always_lock_free is true.

6 *Effects:* Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.10.2).

7 *Returns:* Atomically, the value pointed to by this immediately before the effects.

8 *Remarks:* If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point-type should conform to the std::numeric_limits<floating-point-type> traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on floating-point-type may be different than the calling thread's floating-point environment.

(8.1) — For fetch_fmaximum and fetch_fminimum, the maximum and minimum computation is performed as if by fmaximum and fminimum, respectively, with the value pointed to by this and the first parameter as the arguments.

(8.2) — For fetch_fmaximum_num and fetch_fminimum_num, the maximum and minimum computation is performed as if by fmaximum_num and fminimum_num, respectively, with the value pointed to by this and the first parameter as the arguments.

(8.3) — For fetch_max and fetch_min, the maximum and minimum computation is performed as if by fmaximum_num and fminimum_num, respectively, with the value pointed to by this and the first parameter as the arguments, except that:

(8.3.1) — If both arguments are NaN, an unspecified NaN value replaces the value pointed to by this.

(8.3.2) — If exactly one argument is a NaN, either the other argument or an unspecified NaN value replaces the value pointed to by this; it is unspecified which.

(8.3.3) — If the arguments are differently signed zeros, which of these values replaces the value pointed to by this is unspecified.

9 *Recommended practice:* The implementation of fetch_max and fetch_min should treat negative zero as smaller than positive zero.

```

void store_key(floating-point-type operand,
               memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void store_key(floating-point-type operand,
                         memory_order order = memory_order::seq_cst) noexcept;

```

10 *Constraints:* For the volatile overload of this function, is_always_lock_free is true.

11 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

12 *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given operand. Memory is affected according to the value of `order`. These operations are atomic modify-write operations (32.5.4).

13 *Remarks:* If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `numeric_limits<floating-point-type>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment. The arithmetic rules of floating-point atomic modify-write operations may be different from operations on floating-point types or atomic floating-point types.

[Note 1: Tree reductions are permitted for atomic modify-write operations. — end note]

(13.1) — For `store_fmaximum` and `store_fminimum`, the maximum and minimum computation is performed as if by `fmaximum` and `fminimum`, respectively, with the value pointed to by `this` and the first parameter as the arguments.

(13.2) — For `store_fmaximum_num` and `store_fminimum_num`, the maximum and minimum computation is performed as if by `fmaximum_num` and `fminimum_num`, respectively, with the value pointed to by `this` and the first parameter as the arguments.

(13.3) — For `store_max` and `store_min`, the maximum and minimum computation is performed as if by `fmaximum_num` and `fminimum_num`, respectively, with the value pointed to by `this` and the first parameter as the arguments, except that:

(13.3.1) — If both arguments are NaN, an unspecified NaN value replaces the value pointed to by `this`.

(13.3.2) — If exactly one argument is a NaN, either the other argument or an unspecified NaN value replaces the value pointed to by `this`; it is unspecified which.

(13.3.3) — If the arguments are differently signed zeros, which of these values replaces the value pointed to by `this` is unspecified.

14 *Recommended practice:* The implementation of `store_max` and `store_min` should treat negative zero as smaller than positive zero.

```
floating-point-type operator op=(floating-point-type operand) volatile noexcept;
constexpr floating-point-type operator op=(floating-point-type operand) noexcept;
```

15 *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

16 *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

17 *Remarks:* If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on *floating-point-type* should conform to the `std::numeric_limits<floating-point-type>` traits associated with the floating-point type (17.3.3). The floating-point environment (29.3) for atomic arithmetic operations on *floating-point-type* may be different than the calling thread's floating-point environment.

32.5.8.5 Partial specialization for pointers

[atomics.types.pointer]

```
namespace std {
    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(T*) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
```

```

void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store(T*, memory_order = memory_order::seq_cst) noexcept;
T* operator=(T*) volatile noexcept;
constexpr T* operator=(T*) noexcept;
T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr T* load(memory_order = memory_order::seq_cst) const noexcept;
operator T*() const volatile noexcept;
constexpr operator T*() const noexcept;

T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
constexpr bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
constexpr bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T*&, T*,
                           memory_order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_weak(T*&, T*,
                                     memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T*&, T*,
                             memory_order = memory_order::seq_cst) volatile noexcept;
constexpr bool compare_exchange_strong(T*&, T*,
                                       memory_order = memory_order::seq_cst) noexcept;

T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_max(T*, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr T* fetch_max(T*, memory_order = memory_order::seq_cst) noexcept;
T* fetch_min(T*, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr T* fetch_min(T*, memory_order = memory_order::seq_cst) noexcept;

void store_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
void store_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
void store_max(T*, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_max(T*, memory_order = memory_order::seq_cst) noexcept;
void store_min(T*, memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void store_min(T*, memory_order = memory_order::seq_cst) noexcept;

T* operator++(int) volatile noexcept;
constexpr T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
constexpr T* operator--(int) noexcept;
T* operator++() volatile noexcept;
constexpr T* operator++() noexcept;
T* operator--() volatile noexcept;
constexpr T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
constexpr T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
constexpr T* operator-=(ptrdiff_t) noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
constexpr void notify_one() noexcept;
void notify_all() volatile noexcept;
constexpr void notify_all() noexcept;
};
}

```

- ¹ There is a partial specialization of the `atomic` class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.
- ² Except during constant evaluation, when an operation on an atomic pointer would otherwise result in a pointer value `p` that is not valid in the context of the evaluation (6.9.5), that result instead is `reinterpret_cast<T*>(reinterpret_cast<uintptr_t>(p))`.
- ³ Descriptions are provided below only for members that differ from the primary template.
- ⁴ The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in Table 156.

Table 156 — Atomic pointer computations [tab:atomic.types.pointer.comp]

key	Op	Computation	key	Op	Computation
add	+	addition	sub	-	subtraction
max		maximum	min		minimum

```
T* fetch_key(see above operand, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr T* fetch_key(see above operand, memory_order order = memory_order::seq_cst) noexcept;
```

⁵ *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

⁶ *Mandates:* `T` is a complete object type.

[Note 1: Pointer arithmetic on `void*` or function pointers is ill-formed. — end note]

⁷ *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.10.2).

⁸ *Returns:* Atomically, the value pointed to by `this` immediately before the effects.

⁹ *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior.

¹⁰ For `fetch_max` and `fetch_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the object value and the first parameter as the arguments.

[Note 2: If the pointers point to different complete objects (or subobjects thereof), the `<` operator does not establish a strict weak ordering (Table 29, 7.6.9). — end note]

```
void store_key(see above operand, memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void store_key(see above operand, memory_order order = memory_order::seq_cst) noexcept;
```

¹¹ *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

¹² *Mandates:* `T` is a complete object type.

[Note 3: Pointer arithmetic on `void*` or function pointers is ill-formed. — end note]

¹³ *Effects:* Atomically replaces the value pointed to by `this` with the result of the computation applied to the value pointed to by `this` and the given `operand`. Memory is affected according to the value of `order`. These operations are atomic modify-write operations (32.5.4).

¹⁴ *Remarks:* The result may be an undefined address, but the operations otherwise have no undefined behavior. For `store_max` and `store_min`, the maximum and minimum computation is performed as if by `max` and `min` algorithms (26.8.9), respectively, with the value pointed to by `this` and the first parameter as the arguments.

[Note 4: If the pointers point to different complete objects (or subobjects thereof), the `<` operator does not establish a strict weak ordering (Table 29, 7.6.9). — end note]

```
T* operator op=(ptrdiff_t operand) volatile noexcept;
constexpr T* operator op=(ptrdiff_t operand) noexcept;
```

¹⁵ *Constraints:* For the `volatile` overload of this function, `is_always_lock_free` is `true`.

¹⁶ *Effects:* Equivalent to: `return fetch_key(operand) op operand;`

32.5.8.6 Member operators common to integers and pointers to objects[atomics.types.memop]

```
value_type operator++(int) volatile noexcept;
constexpr value_type operator++(int) noexcept;
```

1 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

2 *Effects:* Equivalent to: `return fetch_add(1);`

```
value_type operator--(int) volatile noexcept;
constexpr value_type operator--(int) noexcept;
```

3 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

4 *Effects:* Equivalent to: `return fetch_sub(1);`

```
value_type operator++() volatile noexcept;
constexpr value_type operator++() noexcept;
```

5 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

6 *Effects:* Equivalent to: `return fetch_add(1) + 1;`

```
value_type operator--() volatile noexcept;
constexpr value_type operator--() noexcept;
```

7 *Constraints:* For the volatile overload of this function, `is_always_lock_free` is true.

8 *Effects:* Equivalent to: `return fetch_sub(1) - 1;`

32.5.8.7 Partial specializations for smart pointers

[util.smartptr.atomic]

32.5.8.7.1 General

[util.smartptr.atomic.general]

1 The library provides partial specializations of the `atomic` template for shared-ownership smart pointers (20.4.2).

[*Note 1:* The partial specializations are declared in header `<memory>` (20.2.2). — *end note*]

The behavior of all operations is as specified in 32.5.8, unless specified otherwise. The template parameter `T` of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in 32.5.8.7, and all associated `use_count` increments, are guaranteed to be performed atomically. Associated `use_count` decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[*Note 2:* If the atomic operation uses locks, locks acquired by the implementation will be held when any `use_count` adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — *end note*]

3 [*Example 1:*

```
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

public:
    shared_ptr<node> find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;

        return p;
    }

    void push_front(T t) {
        auto p = make_shared<node>();
        p->t = t;
        p->next = head;
    }
};
```

```

    while (!head.compare_exchange_weak(p->next, p)) {}
}
};
— end example]

```

32.5.8.7.2 Partial specialization for shared_ptr

[util.smartptr.atomic.shared]

```

namespace std {
    template<class T> struct atomic<shared_ptr<T>> {
        using value_type = shared_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(nullptr_t) noexcept : atomic() { }
        constexpr atomic(shared_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        constexpr shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        constexpr operator shared_ptr<T>() const noexcept;
        constexpr void store(shared_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
        constexpr void operator=(shared_ptr<T> desired) noexcept;
        constexpr void operator=(nullptr_t) noexcept;

        constexpr shared_ptr<T> exchange(shared_ptr<T> desired,
                                           memory_order order = memory_order::seq_cst) noexcept;
        constexpr bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                              memory_order success, memory_order failure) noexcept;
        constexpr bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                                memory_order success, memory_order failure) noexcept;
        constexpr bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                              memory_order order = memory_order::seq_cst) noexcept;
        constexpr bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                                memory_order order = memory_order::seq_cst) noexcept;

        constexpr void wait(shared_ptr<T> old,
                             memory_order order = memory_order::seq_cst) const noexcept;
        constexpr void notify_one() noexcept;
        constexpr void notify_all() noexcept;

    private:
        shared_ptr<T> p;           // exposition only
    };
}

```

```
constexpr atomic() noexcept;
```

¹ *Effects:* Value-initializes *p*.

```
constexpr atomic(shared_ptr<T> desired) noexcept;
```

² *Effects:* Initializes the object with the value *desired*. Initialization is not an atomic operation (6.10.2).

[*Note 1:* It is possible to have an access to an atomic object *A* race with its construction, for example, by communicating the address of the just-constructed object *A* to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing *A* in the receiving thread. This results in undefined behavior. — end note]

```
constexpr void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

³ *Preconditions:* *order* is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

4 *Effects:* Atomically replaces the value pointed to by `this` with the value of `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`.

```
constexpr void operator=(shared_ptr<T> desired) noexcept;
```

5 *Effects:* Equivalent to `store(desired)`.

```
constexpr void operator=(nullptr_t) noexcept;
```

6 *Effects:* Equivalent to `store(nullptr)`.

```
constexpr shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

7 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

8 *Effects:* Memory is affected according to the value of `order`.

9 *Returns:* Atomically returns `p`.

```
constexpr operator shared_ptr<T>() const noexcept;
```

10 *Effects:* Equivalent to: `return load();`

```
constexpr shared_ptr<T> exchange(shared_ptr<T> desired,
                                memory_order order = memory_order::seq_cst) noexcept;
```

11 *Effects:* Atomically replaces `p` with `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`. This is an atomic read-modify-write operation (6.10.2.2).

12 *Returns:* Atomically returns the value of `p` immediately before the effects.

```
constexpr bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                    memory_order success, memory_order failure) noexcept;
```

```
constexpr bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                       memory_order success, memory_order failure) noexcept;
```

13 *Preconditions:* `failure` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

14 *Effects:* If `p` is equivalent to `expected`, assigns `desired` to `p` and has synchronization semantics corresponding to the value of `success`, otherwise assigns `p` to `expected` and has synchronization semantics corresponding to the value of `failure`.

15 *Returns:* `true` if `p` was equivalent to `expected`, `false` otherwise.

16 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 32.5.8.2.

17 If the operation returns `true`, `expected` is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.10.2) on the memory pointed to by `this`. Otherwise, the operation is an atomic load operation on that memory, and `expected` is updated with the existing value read from the atomic object in the attempted atomic update. The `use_count` update corresponding to the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
constexpr bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                    memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
constexpr bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                       memory_order order = memory_order::seq_cst) noexcept;
```

19 *Effects:* Equivalent to:

```
return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
constexpr void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

20 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

21 *Effects:* Repeatedly performs the following steps, in order:

(21.1) — Evaluates `load(order)` and compares it to `old`.

(21.2) — If the two are not equivalent, returns.

(21.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

22 *Remarks:* Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (32.5.6).

```
constexpr void notify_one() noexcept;
```

23 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

24 *Remarks:* This function is an atomic notifying operation (32.5.6).

```
constexpr void notify_all() noexcept;
```

25 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

26 *Remarks:* This function is an atomic notifying operation (32.5.6).

32.5.8.7.3 Partial specialization for `weak_ptr`

[util.smartptr.atomic.weak]

```
namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        constexpr weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        constexpr operator weak_ptr<T>() const noexcept;
        constexpr void store(weak_ptr<T> desired,
                             memory_order order = memory_order::seq_cst) noexcept;
        constexpr void operator=(weak_ptr<T> desired) noexcept;

        constexpr weak_ptr<T> exchange(weak_ptr<T> desired,
                                         memory_order order = memory_order::seq_cst) noexcept;
        constexpr bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                              memory_order success, memory_order failure) noexcept;
        constexpr bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                                memory_order success, memory_order failure) noexcept;
        constexpr bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                              memory_order order = memory_order::seq_cst) noexcept;
        constexpr bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                                memory_order order = memory_order::seq_cst) noexcept;

        constexpr void wait(weak_ptr<T> old,
                             memory_order order = memory_order::seq_cst) const noexcept;
        constexpr void notify_one() noexcept;
        constexpr void notify_all() noexcept;
    };
}
```

```
private:
    weak_ptr<T> p;           // exposition only
};
}
```

```
constexpr atomic() noexcept;
```

1 *Effects:* Value-initializes *p*.

```
constexpr atomic(weak_ptr<T> desired) noexcept;
```

2 *Effects:* Initializes the object with the value *desired*. Initialization is not an atomic operation (6.10.2).

[*Note 1:* It is possible to have an access to an atomic object *A* race with its construction, for example, by communicating the address of the just-constructed object *A* to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing *A* in the receiving thread. This results in undefined behavior. — *end note*]

```
constexpr void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

3 *Preconditions:* *order* is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

4 *Effects:* Atomically replaces the value pointed to by *this* with the value of *desired* as if by *p.swap(desired)*. Memory is affected according to the value of *order*.

```
constexpr void operator=(weak_ptr<T> desired) noexcept;
```

5 *Effects:* Equivalent to `store(desired)`.

```
constexpr weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

6 *Preconditions:* *order* is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

7 *Effects:* Memory is affected according to the value of *order*.

8 *Returns:* Atomically returns *p*.

```
constexpr operator weak_ptr<T>() const noexcept;
```

9 *Effects:* Equivalent to: `return load();`

```
constexpr weak_ptr<T> exchange(weak_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
```

10 *Effects:* Atomically replaces *p* with *desired* as if by *p.swap(desired)*. Memory is affected according to the value of *order*. This is an atomic read-modify-write operation (6.10.2.2).

11 *Returns:* Atomically returns the value of *p* immediately before the effects.

```
constexpr bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                     memory_order success, memory_order failure) noexcept;
```

```
constexpr bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                       memory_order success, memory_order failure) noexcept;
```

12 *Preconditions:* *failure* is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

13 *Effects:* If *p* is equivalent to *expected*, assigns *desired* to *p* and has synchronization semantics corresponding to the value of *success*, otherwise assigns *p* to *expected* and has synchronization semantics corresponding to the value of *failure*.

14 *Returns:* `true` if *p* was equivalent to *expected*, `false` otherwise.

15 *Remarks:* Two `weak_ptr` objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 32.5.8.2.

16 If the operation returns `true`, *expected* is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.10.2) on the memory pointed to by *this*. Otherwise, the operation is an atomic load operation on that memory, and *expected* is updated with the existing value read from the atomic object in the attempted atomic update. The *use_count* update corresponding to

the write to `expected` is part of the atomic operation. The write to `expected` itself is not required to be part of the atomic operation.

```
constexpr bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                     memory_order order = memory_order::seq_cst) noexcept;
```

17 *Effects:* Equivalent to:

```
return compare_exchange_weak(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
constexpr bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                       memory_order order = memory_order::seq_cst) noexcept;
```

18 *Effects:* Equivalent to:

```
return compare_exchange_strong(expected, desired, order, fail_order);
```

where `fail_order` is the same as `order` except that a value of `memory_order::acq_rel` shall be replaced by the value `memory_order::acquire` and a value of `memory_order::release` shall be replaced by the value `memory_order::relaxed`.

```
constexpr void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

19 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

20 *Effects:* Repeatedly performs the following steps, in order:

(20.1) — Evaluates `load(order)` and compares it to `old`.

(20.2) — If the two are not equivalent, returns.

(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

21 *Remarks:* Two `weak_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (32.5.6).

```
constexpr void notify_one() noexcept;
```

22 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

23 *Remarks:* This function is an atomic notifying operation (32.5.6).

```
constexpr void notify_all() noexcept;
```

24 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

25 *Remarks:* This function is an atomic notifying operation (32.5.6).

32.5.9 Non-member functions

[atomics.nonmembers]

- 1 A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_explicit` invokes the member function `f`, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

- 2 [Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

32.5.10 Flag type and operations

[atomics.flag]

```
namespace std {
    struct atomic_flag {
        constexpr atomic_flag() noexcept;
        atomic_flag(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) = delete;
        atomic_flag& operator=(const atomic_flag&) volatile = delete;
    };
}
```

```

bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr bool test(memory_order = memory_order::seq_cst) const noexcept;
bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
constexpr bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
void clear(memory_order = memory_order::seq_cst) volatile noexcept;
constexpr void clear(memory_order = memory_order::seq_cst) noexcept;

void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
constexpr void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
constexpr void notify_one() noexcept;
void notify_all() volatile noexcept;
constexpr void notify_all() noexcept;
};
}

```

- 1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.
- 2 Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free.
- 3 The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

```
constexpr atomic_flag::atomic_flag() noexcept;
```

- 4 *Effects:* Initializes `*this` to the clear state.

```

bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
constexpr bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object,
                               memory_order order) noexcept;
constexpr bool atomic_flag_test_explicit(const atomic_flag* object,
                                          memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
constexpr bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;

```

- 5 For `atomic_flag_test`, let `order` be `memory_order::seq_cst`.

- 6 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

- 7 *Effects:* Memory is affected according to the value of `order`.

- 8 *Returns:* Atomically returns the value pointed to by `object` or `this`.

```

bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
constexpr bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
constexpr bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;

```

- 9 *Effects:* Atomically sets the value pointed to by `object` or by `this` to true. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.10.2).

- 10 *Returns:* Atomically, the value of the object immediately before the effects.

```

void atomic_flag_clear(volatile atomic_flag* object) noexcept;
constexpr void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
constexpr void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
constexpr void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;

```

- 11 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::release`, or `memory_order::seq_cst`.

- 12 *Effects:* Atomically sets the value pointed to by `object` or by `this` to false. Memory is affected according to the value of `order`.

```

void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
constexpr void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;

```

```

void atomic_flag_wait_explicit(const volatile atomic_flag* object,
                              bool old, memory_order order) noexcept;
constexpr void atomic_flag_wait_explicit(const atomic_flag* object,
                                          bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order =
                      memory_order::seq_cst) const volatile noexcept;
constexpr void atomic_flag::wait(bool old, memory_order order =
                                memory_order::seq_cst) const noexcept;

```

13 For `atomic_flag_wait`, let `order` be `memory_order::seq_cst`. Let `flag` be `object` for the non-member functions and `this` for the member functions.

14 *Preconditions:* `order` is `memory_order::relaxed`, `memory_order::acquire`, or `memory_order::seq_cst`.

15 *Effects:* Repeatedly performs the following steps, in order:

(15.1) — Evaluates `flag->test(order) != old`.

(15.2) — If the result of that evaluation is `true`, returns.

(15.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 *Remarks:* This function is an atomic waiting operation (32.5.6).

```

void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
constexpr void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
constexpr void atomic_flag::notify_one() noexcept;

```

17 *Effects:* Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (32.5.6) by this call, if any such atomic waiting operations exist.

18 *Remarks:* This function is an atomic notifying operation (32.5.6).

```

void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
constexpr void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
constexpr void atomic_flag::notify_all() noexcept;

```

19 *Effects:* Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (32.5.6) by this call.

20 *Remarks:* This function is an atomic notifying operation (32.5.6).

```
#define ATOMIC_FLAG_INIT see below
```

21 *Remarks:* The macro `ATOMIC_FLAG_INIT` is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

32.5.11 Fences

[atomics.fences]

1 This subclause introduces synchronization primitives called *fences*. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an *acquire fence*. A fence with release semantics is called a *release fence*.

2 A release fence *A* synchronizes with an acquire fence *B* if there exist atomic operations *X* and *Y*, where *Y* is not an atomic modify-write operation (32.5.4), both operating on some atomic object *M*, such that *A* is sequenced before *X*, *X* modifies *M*, *Y* is sequenced before *B*, and *Y* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.

3 A release fence *A* synchronizes with an atomic operation *B* that performs an acquire operation on an atomic object *M* if there exists an atomic operation *X* such that *A* is sequenced before *X*, *X* modifies *M*, and *B* reads the value written by *X* or a value written by any side effect in the hypothetical release sequence *X* would head if it were a release operation.

- ⁴ An atomic operation *A* that is a release operation on an atomic object *M* synchronizes with an acquire fence *B* if there exists some atomic operation *X* on *M* such that *X* is sequenced before *B* and reads the value written by *A* or a value written by any side effect in the release sequence headed by *A*.

```
extern "C" constexpr void atomic_thread_fence(memory_order order) noexcept;
```

- ⁵ *Effects:* Depending on the value of *order*, this operation:

- (5.1) — has no effects, if *order* == `memory_order::relaxed`;
- (5.2) — is an acquire fence, if *order* == `memory_order::acquire`;
- (5.3) — is a release fence, if *order* == `memory_order::release`;
- (5.4) — is both an acquire fence and a release fence, if *order* == `memory_order::acq_rel`;
- (5.5) — is a sequentially consistent acquire and release fence, if *order* == `memory_order::seq_cst`.

```
extern "C" constexpr void atomic_signal_fence(memory_order order) noexcept;
```

- ⁶ *Effects:* Equivalent to `atomic_thread_fence(order)`, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

- ⁷ [*Note 1:* `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — *end note*]

32.5.12 C compatibility

[stdatomic.h.syn]

The header `<stdatomic.h>` provides the following definitions:

```
template<class T>
    using std-atomic = std::atomic<T>;           // exposition only

#define _Atomic(T) std-atomic<T>

#define ATOMIC_BOOL_LOCK_FREE see below

```

- ¹ Each *using-declaration* for some name *A* in the synopsis above makes available the same entity as `std::A` declared in `<atomic>` (32.5.2). Each macro listed above other than `_Atomic(T)` is defined as in `<atomic>`. It is unspecified whether `<stdatomic.h>` makes available any declarations in namespace `std`.
- ² Each of the *using-declarations* for `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` listed above is declared if and only if the implementation declares the corresponding *typedef-name* in 32.5.2.
- ³ Neither the `_Atomic` macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than `<stdatomic.h>`.
- ⁴ *Recommended practice*: Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an `_Atomic(T)` from C code and an `atomic<T>` from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

32.6 Mutual exclusion

[thread.mutex]

32.6.1 General

[thread.mutex.general]

- ¹ Subclause 32.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.10.2).

32.6.2 Header `<mutex>` synopsis

[mutex.syn]

```
namespace std {
    // 32.6.4.2.2, class mutex
    class mutex;
    // 32.6.4.2.3, class recursive_mutex
    class recursive_mutex;
    // 32.6.4.3.2, class timed_mutex
    class timed_mutex;
    // 32.6.4.3.3, class recursive_timed_mutex
    class recursive_timed_mutex;

    struct defer_lock_t { explicit defer_lock_t() = default; };
    struct try_to_lock_t { explicit try_to_lock_t() = default; };
    struct adopt_lock_t { explicit adopt_lock_t() = default; };

    inline constexpr defer_lock_t  defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t  adopt_lock { };

    // 32.6.5, locks
    template<class Mutex> class lock_guard;
    template<class... MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

    template<class Mutex>
        void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

    // 32.6.6, generic locking algorithms
    template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
    template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

    struct once_flag;

    template<class Callable, class... Args>
        void call_once(once_flag& flag, Callable&& func, Args&&... args);
}
```

32.6.3 Header `<shared_mutex>` synopsis

[shared.mutex.syn]

```
namespace std {
    // 32.6.4.4.2, class shared_mutex
    class shared_mutex;
```

```

// 32.6.4.5.2, class shared_timed_mutex
class shared_timed_mutex;
// 32.6.5.5, class template shared_lock
template<class Mutex> class shared_lock;
template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}

```

32.6.4 Mutex requirements

[thread.mutex.requirements]

32.6.4.1 General

[thread.mutex.requirements.general]

- ¹ A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (32.2.5). An execution agent *owns* a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

32.6.4.2 Mutex types

[thread.mutex.requirements.mutex]

32.6.4.2.1 General

[thread.mutex.requirements.mutex.general]

- ¹ The *mutex types* are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 32.6.4.2. In this description, `m` denotes an object of a mutex type.

[Note 1: The mutex types meet the *Cpp17Lockable* requirements (32.2.5.3). — end note]

- ² The mutex types meet *Cpp17DefaultConstructible* and *Cpp17Destructible*. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.

- ³ The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

- (3.1) — `resource_unavailable_try_again` — if any native handle type manipulated is not available.
- (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (3.3) — `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.

- ⁴ The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.10.2). The lock and unlock operations on a single mutex appear to occur in a single total order.

[Note 2: This can be viewed as the modification order (6.10.2) of the mutex. — end note]

[Note 3: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — end note]

- ⁵ The expression `m.lock()` is well-formed and has the following semantics:

⁶ *Preconditions:* If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

⁷ *Effects:* Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

⁸ *Synchronization:* Prior `unlock()` operations on the same object *synchronize with* (6.10.2) this operation.

⁹ *Postconditions:* The calling thread owns the mutex.

¹⁰ *Return type:* `void`.

¹¹ *Throws:* `system_error` when an exception is required (32.2.2).

¹² *Error conditions:*

- (12.1) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- (12.2) — `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

- ¹³ The expression `m.try_lock()` is well-formed and has the following semantics:

¹⁴ *Preconditions:* If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

¹⁵ *Effects:* Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[*Note 4*: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (32.5). — *end note*]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

16 *Synchronization*: If `try_lock()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.10.2) this operation.

[*Note 5*: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — *end note*]

17 *Return type*: `bool`.

18 *Returns*: `true` if ownership was obtained, otherwise `false`.

19 *Throws*: Nothing.

20 The expression `m.unlock()` is well-formed and has the following semantics:

21 *Preconditions*: The calling thread owns the mutex.

22 *Effects*: Releases the calling thread's ownership of the mutex.

23 *Return type*: `void`.

24 *Synchronization*: This operation synchronizes with (6.10.2) subsequent lock operations that obtain ownership on the same object.

25 *Throws*: Nothing.

32.6.4.2.2 Class `mutex`

[`thread.mutex.class`]

```
namespace std {
    class mutex {
    public:
        constexpr mutex() noexcept;
        ~mutex();

        mutex(const mutex&) = delete;
        mutex& operator=(const mutex&) = delete;

        void lock();
        bool try_lock();
        void unlock();

        using native_handle_type = implementation-defined;           // see 32.2.3
        native_handle_type native_handle();                          // see 32.2.3
    };
}
```

1 The class `mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the owning thread has released ownership with a call to `unlock()`.

2 [*Note 1*: After a thread A has called `unlock()`, releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Conforming implementations handle such scenarios correctly, as long as thread A does not access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — *end note*]

3 The class `mutex` meets all of the mutex requirements (32.6.4). It is a standard-layout class (11.2).

4 [*Note 2*: A program can deadlock if the thread that owns a `mutex` object calls `lock()` on that object. If the implementation can detect the deadlock, a `resource_deadlock_would_occur` error condition might be observed. — *end note*]

5 The behavior of a program is undefined if it destroys a `mutex` object owned by any thread or a thread terminates while owning a `mutex` object.

32.6.4.2.3 Class `recursive_mutex`

[thread.mutex.recursive]

```

namespace std {
    class recursive_mutex {
    public:
        recursive_mutex();
        ~recursive_mutex();

        recursive_mutex(const recursive_mutex&) = delete;
        recursive_mutex& operator=(const recursive_mutex&) = delete;

        void lock();
        bool try_lock() noexcept;
        void unlock();

        using native_handle_type = implementation-defined;           // see 32.2.3
        native_handle_type native_handle();                           // see 32.2.3
    };
}

```

- ¹ The class `recursive_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the first thread has completely released ownership.
- ² The class `recursive_mutex` meets all of the mutex requirements (32.6.4). It is a standard-layout class (11.2).
- ³ A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.
- ⁴ The behavior of a program is undefined if
 - (4.1) — it destroys a `recursive_mutex` object owned by any thread or
 - (4.2) — a thread terminates while owning a `recursive_mutex` object.

32.6.4.3 Timed mutex types

[thread.timedmutex.requirements]

32.6.4.3.1 General

[thread.timedmutex.requirements.general]

- ¹ The *timed mutex types* are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of a specialization of `duration` (30.5), and `abs_time` denotes an object of a specialization of `time_point` (30.6).

[Note 1: The timed mutex types meet the *Cpp17TimedLockable* requirements (32.2.5.4). — end note]

- ² The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:
- ³ *Preconditions:* If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.
- ⁴ *Effects:* The function attempts to obtain ownership of the mutex within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

[Note 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]
- ⁵ *Synchronization:* If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object *synchronize with* (6.10.2) this operation.
- ⁶ *Return type:* `bool`.
- ⁷ *Returns:* `true` if ownership was obtained, otherwise `false`.
- ⁸ *Throws:* Timeout-related exceptions (32.2.4).

9 The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

10 *Preconditions:* If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

11 *Effects:* The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

[Note 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

12 *Synchronization:* If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.10.2) this operation.

13 *Return type:* `bool`.

14 *Returns:* `true` if ownership was obtained, otherwise `false`.

15 *Throws:* Timeout-related exceptions (32.2.4).

32.6.4.3.2 Class `timed_mutex`

[`thread.timedmutex.class`]

```
namespace std {
    class timed_mutex {
    public:
        timed_mutex();
        ~timed_mutex();

        timed_mutex(const timed_mutex&) = delete;
        timed_mutex& operator=(const timed_mutex&) = delete;

        void lock();    // blocking
        bool try_lock();
        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        using native_handle_type = implementation-defined;    // see 32.2.3
        native_handle_type native_handle();    // see 32.2.3
    };
}
```

1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

2 The class `timed_mutex` meets all of the timed mutex requirements (32.6.4.3). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

- (3.1) — it destroys a `timed_mutex` object owned by any thread,
- (3.2) — a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
- (3.3) — a thread terminates while owning a `timed_mutex` object.

32.6.4.3.3 Class `recursive_timed_mutex`

[`thread.timedmutex.recursive`]

```
namespace std {
    class recursive_timed_mutex {
    public:
        recursive_timed_mutex();
        ~recursive_timed_mutex();
    };
}
```

```

recursive_timed_mutex(const recursive_timed_mutex&) = delete;
recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

void lock();    // blocking
bool try_lock() noexcept;
template<class Rep, class Period>
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock();

using native_handle_type = implementation-defined;    // see 32.2.3
native_handle_type native_handle();                  // see 32.2.3
};
}

```

- ¹ The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).
- ² The class `recursive_timed_mutex` meets all of the timed mutex requirements (32.6.4.3). It is a standard-layout class (11.2).
- ³ A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.
- ⁴ The behavior of a program is undefined if
 - (4.1) — it destroys a `recursive_timed_mutex` object owned by any thread, or
 - (4.2) — a thread terminates while owning a `recursive_timed_mutex` object.

32.6.4.4 Shared mutex types

[thread.sharedmutex.requirements]

32.6.4.4.1 General

[thread.sharedmutex.requirements.general]

- ¹ The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (32.6.4.2) and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared mutex type.

[Note 1: The shared mutex types meet the *Cpp17SharedLockable* requirements (32.2.5.5). — end note]

- ² In addition to the exclusive lock ownership mode specified in 32.6.4.2, shared mutex types provide a *shared lock* ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.
- ³ The expression `m.lock_shared()` is well-formed and has the following semantics:
 - ⁴ *Preconditions:* The calling thread has no ownership of the mutex.
 - ⁵ *Effects:* Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.
 - ⁶ *Synchronization:* Prior `unlock()` operations on the same object synchronize with (6.10.2) this operation.
 - ⁷ *Postconditions:* The calling thread has a shared lock on the mutex.
 - ⁸ *Return type:* `void`.

9 *Throws:* **system_error** when an exception is required (32.2.2).

10 *Error conditions:*

(10.1) — **operation_not_permitted** — if the thread does not have the privilege to perform the operation.

(10.2) — **resource_deadlock_would_occur** — if the implementation detects that a deadlock would occur.

11 The expression `m.unlock_shared()` is well-formed and has the following semantics:

12 *Preconditions:* The calling thread holds a shared lock on the mutex.

13 *Effects:* Releases a shared lock on the mutex held by the calling thread.

14 *Return type:* **void**.

15 *Synchronization:* This operation synchronizes with (6.10.2) subsequent `lock()` operations that obtain ownership on the same object.

16 *Throws:* Nothing.

17 The expression `m.try_lock_shared()` is well-formed and has the following semantics:

18 *Preconditions:* The calling thread has no ownership of the mutex.

19 *Effects:* Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

20 *Synchronization:* If `try_lock_shared()` returns **true**, prior `unlock()` operations on the same object synchronize with (6.10.2) this operation.

21 *Return type:* **bool**.

22 *Returns:* **true** if the shared lock was acquired, otherwise **false**.

23 *Throws:* Nothing.

32.6.4.4.2 Class `shared_mutex`

[thread.sharedmutex.class]

```
namespace std {
    class shared_mutex {
    public:
        shared_mutex();
        ~shared_mutex();

        shared_mutex(const shared_mutex&) = delete;
        shared_mutex& operator=(const shared_mutex&) = delete;

        // exclusive ownership
        void lock();                // blocking
        bool try_lock();
        void unlock();

        // shared ownership
        void lock_shared();         // blocking
        bool try_lock_shared();
        void unlock_shared();

        using native_handle_type = implementation-defined;    // see 32.2.3
        native_handle_type native_handle();                    // see 32.2.3
    };
}
```

1 The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.

2 The class `shared_mutex` meets all of the shared mutex requirements (32.6.4.4). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if

(3.1) — it destroys a `shared_mutex` object owned by any thread,

(3.2) — a thread attempts to recursively gain any ownership of a `shared_mutex`, or

(3.3) — a thread terminates while possessing any ownership of a `shared_mutex`.

⁴ `shared_mutex` may be a synonym for `shared_timed_mutex`.

32.6.4.5 Shared timed mutex types [thread.sharedtimedmutex.requirements]

32.6.4.5.1 General [thread.sharedtimedmutex.requirements.general]

¹ The standard library type `shared_timed_mutex` is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (32.6.4.3), shared mutex types (32.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of a specialization of `duration` (30.5), and `abs_time` denotes an object of a specialization of `time_point` (30.6).

[Note 1: The shared timed mutex types meet the *Cpp17SharedTimedLockable* requirements (32.2.5.6). — end note]

² The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

³ *Preconditions:* The calling thread has no ownership of the mutex.

⁴ *Effects:* Attempts to obtain shared lock ownership for the calling thread within the relative timeout (32.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[Note 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

⁵ *Synchronization:* If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.10.2) this operation.

⁶ *Return type:* `bool`.

⁷ *Returns:* `true` if the shared lock was acquired, otherwise `false`.

⁸ *Throws:* Timeout-related exceptions (32.2.4).

⁹ The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

¹⁰ *Preconditions:* The calling thread has no ownership of the mutex.

¹¹ *Effects:* The function attempts to obtain shared ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain shared ownership without blocking (as if by calling `try_lock_shared()`). The function returns before the absolute timeout (32.2.4) specified by `abs_time` only if it has obtained shared ownership of the mutex object.

[Note 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

¹² *Synchronization:* If `try_lock_shared_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.10.2) this operation.

¹³ *Return type:* `bool`.

¹⁴ *Returns:* `true` if the shared lock was acquired, otherwise `false`.

¹⁵ *Throws:* Timeout-related exceptions (32.2.4).

32.6.4.5.2 Class `shared_timed_mutex` [thread.sharedtimedmutex.class]

```
namespace std {
    class shared_timed_mutex {
    public:
        shared_timed_mutex();
        ~shared_timed_mutex();

        shared_timed_mutex(const shared_timed_mutex&) = delete;
        shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

        // exclusive ownership
        void lock();                // blocking
        bool try_lock();
```

```

template<class Rep, class Period>
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock();

// shared ownership
void lock_shared();           // blocking
bool try_lock_shared();
template<class Rep, class Period>
    bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
void unlock_shared();
};
}

```

- ¹ The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.
- ² The class `shared_timed_mutex` meets all of the shared timed mutex requirements (32.6.4.5). It is a standard-layout class (11.2).
- ³ The behavior of a program is undefined if
 - (3.1) — it destroys a `shared_timed_mutex` object owned by any thread,
 - (3.2) — a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
 - (3.3) — a thread terminates while possessing any ownership of a `shared_timed_mutex`.

32.6.5 Locks

[thread.lock]

32.6.5.1 General

[thread.lock.general]

- ¹ A *lock* is an object that holds a reference to a lockable object and may unlock the lockable object during the lock's destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to *own* a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[Note 1: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — end note]

- ² Some lock constructors take tag types which describe what should be done with the lockable object during the lock's construction.

```

namespace std {
    struct defer_lock_t { };           // do not acquire ownership of the mutex
    struct try_to_lock_t { };         // try to acquire ownership of the mutex
                                      // without blocking
    struct adopt_lock_t { };          // assume the calling thread has already
                                      // obtained mutex ownership and manage it

    inline constexpr defer_lock_t defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t adopt_lock { };
}

```

32.6.5.2 Class template lock_guard

[thread.lock.guard]

```

namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();
    };
}

```

```

    lock_guard(const lock_guard&) = delete;
    lock_guard& operator=(const lock_guard&) = delete;

private:
    mutex_type& pm;           // exposition only
};
}

```

- ¹ An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object's lifetime (6.8.4). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

```
explicit lock_guard(mutex_type& m);
```

- ² *Effects:* Initializes `pm` with `m`. Calls `m.lock()`.

```
lock_guard(mutex_type& m, adopt_lock_t);
```

- ³ *Preconditions:* The calling thread holds a non-shared lock on `m`.

- ⁴ *Effects:* Initializes `pm` with `m`.

- ⁵ *Throws:* Nothing.

```
~lock_guard();
```

- ⁶ *Effects:* Equivalent to: `pm.unlock()`

32.6.5.3 Class template `scoped_lock`

[thread.lock.scoped]

```

namespace std {
    template<class... MutexTypes>
    class scoped_lock {
    public:
        using mutex_type = see below;    // Only if sizeof...(MutexTypes) == 1 is true

        explicit scoped_lock(MutexTypes&... m);
        explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
        ~scoped_lock();

        scoped_lock(const scoped_lock&) = delete;
        scoped_lock& operator=(const scoped_lock&) = delete;

    private:
        tuple<MutexTypes&...> pm;    // exposition only
    };
}

```

- ¹ An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object's lifetime (6.8.4). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object.

- (1.1) — If `sizeof...(MutexTypes)` is one, let `Mutex` denote the sole type constituting the pack `MutexTypes`. `Mutex` shall meet the *Cpp17BasicLockable* requirements (32.2.5.2). The member *typedef-name* `mutex_type` denotes the same type as `Mutex`.

- (1.2) — Otherwise, all types in the template parameter pack `MutexTypes` shall meet the *Cpp17Lockable* requirements (32.2.5.3) and there is no member `mutex_type`.

```
explicit scoped_lock(MutexTypes&... m);
```

- ² *Effects:* Initializes `pm` with `tie(m...)`. Then if `sizeof...(MutexTypes)` is 0, no effects. Otherwise if `sizeof...(MutexTypes)` is 1, then `m.lock()`. Otherwise, `lock(m...)`.

```
explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
```

- ³ *Preconditions:* The calling thread holds a non-shared lock on each element of `m`.

- ⁴ *Effects:* Initializes `pm` with `tie(m...)`.

5 *Throws:* Nothing.

```
~scoped_lock();
```

6 *Effects:* For all i in $[0, \text{sizeof} \dots (\text{MutexTypes}))$, $\text{get}\langle i \rangle(\text{pm})$.unlock().

32.6.5.4 Class template `unique_lock`

[thread.lock.unique]

32.6.5.4.1 General

[thread.lock.unique.general]

```
namespace std {
    template<class Mutex>
    class unique_lock {
    public:
        using mutex_type = Mutex;

        // 32.6.5.4.2, construct/copy/destroy
        unique_lock() noexcept;
        explicit unique_lock(mutex_type& m);
        unique_lock(mutex_type& m, defer_lock_t) noexcept;
        unique_lock(mutex_type& m, try_to_lock_t);
        unique_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
            unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
            unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~unique_lock();

        unique_lock(const unique_lock&) = delete;
        unique_lock& operator=(const unique_lock&) = delete;

        unique_lock(unique_lock&& u) noexcept;
        unique_lock& operator=(unique_lock&& u) noexcept;

        // 32.6.5.4.3, locking
        void lock();
        bool try_lock();

        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

        void unlock();

        // 32.6.5.4.4, modifiers
        void swap(unique_lock& u) noexcept;
        mutex_type* release() noexcept;

        // 32.6.5.4.5, observers
        bool owns_lock() const noexcept;
        explicit operator bool() const noexcept;
        mutex_type* mutex() const noexcept;

    private:
        mutex_type* pm;           // exposition only
        bool owns;                // exposition only
    };
}
```

- ¹ An object of type `unique_lock` controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `unique_lock` object. Objects of type `unique_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed to by pm does not exist for the entire remaining lifetime (6.8.4) of the `unique_lock` object. The supplied `Mutex` type shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

² [Note 1: `unique_lock<Mutex>` meets the *Cpp17BasicLockable* requirements. If `Mutex` meets the *Cpp17Lockable* requirements (32.2.5.3), `unique_lock<Mutex>` also meets the *Cpp17Lockable* requirements; if `Mutex` meets the *Cpp17TimedLockable* requirements (32.2.5.4), `unique_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements. — end note]

32.6.5.4.2 Constructors, destructor, and assignment

[thread.lock.unique.cons]

```
unique_lock() noexcept;

1     Postconditions: pm == nullptr and owns == false.

explicit unique_lock(mutex_type& m);

2     Effects: Calls m.lock().

3     Postconditions: pm == addressof(m) and owns == true.

unique_lock(mutex_type& m, defer_lock_t) noexcept;

4     Postconditions: pm == addressof(m) and owns == false.

unique_lock(mutex_type& m, try_to_lock_t);

5     Preconditions: The supplied Mutex type meets the Cpp17Lockable requirements (32.2.5.3).

6     Effects: Calls m.try_lock().

7     Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the
    call to m.try_lock().

unique_lock(mutex_type& m, adopt_lock_t);

8     Preconditions: The calling thread holds a non-shared lock on m.

9     Postconditions: pm == addressof(m) and owns == true.

10    Throws: Nothing.

template<class Clock, class Duration>
    unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);

11    Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).

12    Effects: Calls m.try_lock_until(abs_time).

13    Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call
    to m.try_lock_until(abs_time).

template<class Rep, class Period>
    unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);

14    Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (32.2.5.4).

15    Effects: Calls m.try_lock_for(rel_time).

16    Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call
    to m.try_lock_for(rel_time).

unique_lock(unique_lock&& u) noexcept;

17    Postconditions: pm == u.p.pm and owns == u.p.owns (where u.p is the state of u just prior to this
    construction), u.pm == 0 and u.owns == false.

unique_lock& operator=(unique_lock&& u) noexcept;

18    Effects: Equivalent to: unique_lock(std::move(u)).swap(*this)

19    Returns: *this.

~unique_lock();

20    Effects: If owns calls pm->unlock().
```

32.6.5.4.3 Locking

[thread.lock.unique.locking]

```
void lock();
```

1 *Effects:* As if by `pm->lock()`.

2 *Postconditions:* `owns == true`.

3 *Throws:* Any exception thrown by `pm->lock()`. `system_error` when an exception is required (32.2.2).

4 *Error conditions:*

(4.1) — `operation_not_permitted` — if `pm` is nullptr.

(4.2) — `resource_deadlock_would_occur` — if on entry `owns` is true.

```
bool try_lock();
```

5 *Preconditions:* The supplied Mutex meets the *Cpp17Lockable* requirements (32.2.5.3).

6 *Effects:* As if by `pm->try_lock()`.

7 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock()`.

8 *Returns:* The value returned by `pm->try_lock()`.

9 *Throws:* Any exception thrown by `pm->try_lock()`. `system_error` when an exception is required (32.2.2).

10 *Error conditions:*

(10.1) — `operation_not_permitted` — if `pm` is nullptr.

(10.2) — `resource_deadlock_would_occur` — if on entry `owns` is true.

```
template<class Clock, class Duration>
```

```
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

11 *Preconditions:* The supplied Mutex type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

12 *Effects:* As if by `pm->try_lock_until(abs_time)`.

13 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_until(abs_time)`.

14 *Returns:* The value returned by `pm->try_lock_until(abs_time)`.

15 *Throws:* Any exception thrown by `pm->try_lock_until(abs_time)`. `system_error` when an exception is required (32.2.2).

16 *Error conditions:*

(16.1) — `operation_not_permitted` — if `pm` is nullptr.

(16.2) — `resource_deadlock_would_occur` — if on entry `owns` is true.

```
template<class Rep, class Period>
```

```
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

17 *Preconditions:* The supplied Mutex type meets the *Cpp17TimedLockable* requirements (32.2.5.4).

18 *Effects:* As if by `pm->try_lock_for(rel_time)`.

19 *Postconditions:* `owns == res`, where `res` is the value returned by `pm->try_lock_for(rel_time)`.

20 *Returns:* The value returned by `pm->try_lock_for(rel_time)`.

21 *Throws:* Any exception thrown by `pm->try_lock_for(rel_time)`. `system_error` when an exception is required (32.2.2).

22 *Error conditions:*

(22.1) — `operation_not_permitted` — if `pm` is nullptr.

(22.2) — `resource_deadlock_would_occur` — if on entry `owns` is true.

```
void unlock();
```

23 *Effects:* As if by `pm->unlock()`.

24 *Postconditions:* `owns == false`.

25 *Throws:* `system_error` when an exception is required (32.2.2).

26 *Error conditions:*

(26.1) — `operation_not_permitted` — if on entry *owns* is false.

32.6.5.4.4 Modifiers

[thread.lock.unique.mod]

```
void swap(unique_lock& u) noexcept;
```

1 *Effects:* Swaps the data members of **this* and *u*.

```
mutex_type* release() noexcept;
```

2 *Postconditions:* *pm* == 0 and *owns* == false.

3 *Returns:* The previous value of *pm*.

```
template<class Mutex>
```

```
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

4 *Effects:* As if by *x.swap(y)*.

32.6.5.4.5 Observers

[thread.lock.unique.obs]

```
bool owns_lock() const noexcept;
```

1 *Returns:* *owns*.

```
explicit operator bool() const noexcept;
```

2 *Returns:* *owns*.

```
mutex_type *mutex() const noexcept;
```

3 *Returns:* *pm*.

32.6.5.5 Class template `shared_lock`

[thread.lock.shared]

32.6.5.5.1 General

[thread.lock.shared.general]

```
namespace std {
```

```
template<class Mutex>
```

```
class shared_lock {
```

```
public:
```

```
using mutex_type = Mutex;
```

```
// 32.6.5.5.2, construct/copy/destroy
```

```
shared_lock() noexcept;
```

```
explicit shared_lock(mutex_type& m); // blocking
```

```
shared_lock(mutex_type& m, defer_lock_t) noexcept;
```

```
shared_lock(mutex_type& m, try_to_lock_t);
```

```
shared_lock(mutex_type& m, adopt_lock_t);
```

```
template<class Clock, class Duration>
```

```
shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
```

```
template<class Rep, class Period>
```

```
shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
```

```
~shared_lock();
```

```
shared_lock(const shared_lock&) = delete;
```

```
shared_lock& operator=(const shared_lock&) = delete;
```

```
shared_lock(shared_lock&& u) noexcept;
```

```
shared_lock& operator=(shared_lock&& u) noexcept;
```

```
// 32.6.5.5.3, locking
```

```
void lock(); // blocking
```

```
bool try_lock();
```

```
template<class Rep, class Period>
```

```
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
```

```
template<class Clock, class Duration>
```

```
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
```

```
void unlock();
```

```

// 32.6.5.5.4, modifiers
void swap(shared_lock& u) noexcept;
mutex_type* release() noexcept;

// 32.6.5.5.5, observers
bool owns_lock() const noexcept;
explicit operator bool() const noexcept;
mutex_type* mutex() const noexcept;

private:
    mutex_type* pm;                // exposition only
    bool owns;                    // exposition only
};
}

```

- ¹ An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.8.4) of the `shared_lock` object. The supplied `Mutex` type shall meet the *Cpp17SharedLockable* requirements (32.2.5.5).
- ² [Note 1: `shared_lock<Mutex>` meets the *Cpp17Lockable* requirements (32.2.5.3). If `Mutex` meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6), `shared_lock<Mutex>` also meets the *Cpp17TimedLockable* requirements (32.2.5.4). — end note]

32.6.5.5.2 Constructors, destructor, and assignment

[thread.lock.shared.cons]

- ```

shared_lock() noexcept;

```
- <sup>1</sup> *Postconditions:* `pm == nullptr` and `owns == false`.
- ```

explicit shared_lock(mutex_type& m);

```
- ² *Effects:* Calls `m.lock_shared()`.
- ³ *Postconditions:* `pm == addressof(m)` and `owns == true`.
- ```

shared_lock(mutex_type& m, defer_lock_t) noexcept;

```
- <sup>4</sup> *Postconditions:* `pm == addressof(m)` and `owns == false`.
- ```

shared_lock(mutex_type& m, try_to_lock_t);

```
- ⁵ *Effects:* Calls `m.try_lock_shared()`.
- ⁶ *Postconditions:* `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared()`.

11 *Effects:* As if by  $pm \rightarrow \text{try\_lock\_shared\_until}(\text{abs\_time})$ .

12 *Postconditions:*  $owns == res$ , where  $res$  is the value returned by the call to  $pm \rightarrow \text{try\_lock\_shared\_until}(\text{abs\_time})$ .

13 *Returns:* The value returned by the call to  $pm \rightarrow \text{try\_lock\_shared\_until}(\text{abs\_time})$ .

14 *Throws:* Any exception thrown by  $pm \rightarrow \text{try\_lock\_shared\_until}(\text{abs\_time})$ . `system_error` when an exception is required (32.2.2).

15 *Error conditions:*

(15.1) — `operation_not_permitted` — if  $pm$  is `nullptr`.

(15.2) — `resource_deadlock_would_occur` — if on entry  $owns$  is `true`.

$\text{template}<\text{class Rep}, \text{class Period}>$

$\text{bool try\_lock\_for}(\text{const chrono::duration}<\text{Rep}, \text{Period}>\& \text{rel\_time});$

16 *Preconditions:* Mutex meets the *Cpp17SharedTimedLockable* requirements (32.2.5.6).

17 *Effects:* As if by  $pm \rightarrow \text{try\_lock\_shared\_for}(\text{rel\_time})$ .

18 *Postconditions:* `owns == res`, where `res` is the value returned by the call to `pm->try_lock_shared_for(rel_time)`.

19 *Returns:* The value returned by the call to `pm->try_lock_shared_for(rel_time)`.

20 *Throws:* Any exception thrown by `pm->try_lock_shared_for(rel_time)`. `system_error` when an exception is required (32.2.2).

21 *Error conditions:*

(21.1) — `operation_not_permitted` — if `pm` is `nullptr`.

(21.2) — `resource_deadlock_would_occur` — if on entry `owns` is `true`.

`void unlock();`

22 *Effects:* As if by `pm->unlock_shared()`.

23 *Postconditions:* `owns == false`.

24 *Throws:* `system_error` when an exception is required (32.2.2).

25 *Error conditions:*

(25.1) — `operation_not_permitted` — if on entry `owns` is `false`.

#### 32.6.5.5.4 Modifiers

[thread.lock.shared.mod]

`void swap(shared_lock& s1) noexcept;`

1 *Effects:* Swaps the data members of `*this` and `s1`.

`mutex_type* release() noexcept;`

2 *Postconditions:* `pm == nullptr` and `owns == false`.

3 *Returns:* The previous value of `pm`.

`template<class Mutex>`  
`void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;`

4 *Effects:* As if by `x.swap(y)`.

#### 32.6.5.5.5 Observers

[thread.lock.shared.obs]

`bool owns_lock() const noexcept;`

1 *Returns:* `owns`.

`explicit operator bool() const noexcept;`

2 *Returns:* `owns`.

`mutex_type* mutex() const noexcept;`

3 *Returns:* `pm`.

### 32.6.6 Generic locking algorithms

[thread.lock.algorithm]

`template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);`

1 *Preconditions:* Each template parameter type meets the *Cpp17Lockable* requirements.  
 [Note 1: The `unique_lock` class template meets these requirements when suitably instantiated. — end note]

2 *Effects:* Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` is called for all prior arguments with no further calls to `try_lock()`.

3 *Returns:* -1 if all calls to `try_lock()` returned `true`, otherwise a zero-based index value that indicates the argument for which `try_lock()` returned `false`.

`template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);`

4 *Preconditions:* Each template parameter type meets the *Cpp17Lockable* requirements.  
 [Note 2: The `unique_lock` class template meets these requirements when suitably instantiated. — end note]

5 *Effects:* All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

[*Note 3:* A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — *end note*]

If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

### 32.6.7 Call once

[thread.once]

#### 32.6.7.1 Struct `once_flag`

[thread.once.onceflag]

```
namespace std {
 struct once_flag {
 constexpr once_flag() noexcept;

 once_flag(const once_flag&) = delete;
 once_flag& operator=(const once_flag&) = delete;
 };
}
```

1 The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.

```
constexpr once_flag() noexcept;
```

2 *Synchronization:* The construction of a `once_flag` object is not synchronized.

3 *Postconditions:* The object's internal state is set to indicate to an invocation of `call_once` with the object as its initial argument that no function has been called.

#### 32.6.7.2 Function `call_once`

[thread.once.callonce]

```
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1 *Mandates:* `is_invocable_v<Callable, Args...>` is true.

2 *Effects:* An execution of `call_once` that does not call its `func` is a *passive* execution. An execution of `call_once` that calls its `func` is an *active* execution. An active execution evaluates `INVOKE(std::forward<Callable>(func), std::forward<Args>(args)...) (22.10.4)`. If such a call to `func` throws an exception the execution is *exceptional*, otherwise it is *returning*. An exceptional execution propagates the exception to the caller of `call_once`. Among all executions of `call_once` for any given `once_flag`: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[*Note 1:* Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — *end note*]

3 *Synchronization:* For any given `once_flag`: all active executions occur in a total order; completion of an active execution synchronizes with (6.10.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

4 *Throws:* `system_error` when an exception is required (32.2.2), or any exception thrown by `func`.

5 [*Example 1:*

```
// global flag, regular function
void init();
std::once_flag flag;

void f() {
 std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
 void operator()();
};
```

```

void g() {
 static std::once_flag flag2;
 std::call_once(flag2, initializer());
}

// object flag, member function
class information {
 std::once_flag verified;
 void verifier();
public:
 void verify() { std::call_once(verified, &information::verifier, *this); }
};
— end example]

```

## 32.7 Condition variables

[thread.condition]

### 32.7.1 General

[thread.condition.general]

- <sup>1</sup> Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.
- <sup>2</sup> Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.
- <sup>3</sup> The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:
  1. the release of the mutex and entry into the waiting state;
  2. the unblocking of the wait; and
  3. the reacquisition of the lock.
- <sup>4</sup> The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the “happens before” order.
- <sup>5</sup> Condition variable construction and destruction need not be synchronized.
- <sup>6</sup> The definitions in 32.7 make use of the following exposition-only function:

```

template<class Dur>
chrono::steady_clock::time_point rel-to-abs(const Dur& rel_time) {
 return chrono::steady_clock::now() + chrono::ceil<chrono::steady_clock::duration>(rel_time);
}

```

### 32.7.2 Header <condition\_variable> synopsis

[condition.variable.syn]

```

namespace std {
 // 32.7.4, class condition_variable
 class condition_variable;
 // 32.7.5, class condition_variable_any
 class condition_variable_any;

 // 32.7.3, non-member functions
 void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

 enum class cv_status { no_timeout, timeout };
}

```

### 32.7.3 Non-member functions

[thread.condition.nonmember]

```
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

- <sup>1</sup> *Preconditions:* `lk` is locked by the calling thread and either
  - (1.1) — no other thread is waiting on `cond`, or

- (1.2) — `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- 2 *Effects:* Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits. This notification is sequenced after all objects with thread storage duration associated with the current thread have been destroyed and is equivalent to:
- ```
cond.notify_all();
lk.unlock();
```
- 3 *Synchronization:* The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.
- 4 [Note 1: The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering issues. — *end note*]
- 5 [Note 2: It is the user's responsibility to ensure that waiting threads do not incorrectly assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`. — *end note*]

32.7.4 Class `condition_variable`

[`thread.condition.condvar`]

```
namespace std {
    class condition_variable {
    public:
        condition_variable();
        ~condition_variable();

        condition_variable(const condition_variable&) = delete;
        condition_variable& operator=(const condition_variable&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;
        void wait(unique_lock<mutex>& lock);
        template<class Predicate>
            void wait(unique_lock<mutex>& lock, Predicate pred);
        template<class Clock, class Duration>
            cv_status wait_until(unique_lock<mutex>& lock,
                                chrono::time_point<Clock, Duration> abs_time);
        template<class Clock, class Duration, class Predicate>
            bool wait_until(unique_lock<mutex>& lock,
                            chrono::time_point<Clock, Duration> abs_time,
                            Predicate pred);
        template<class Rep, class Period>
            cv_status wait_for(unique_lock<mutex>& lock,
                               chrono::duration<Rep, Period> rel_time);
        template<class Rep, class Period, class Predicate>
            bool wait_for(unique_lock<mutex>& lock,
                           chrono::duration<Rep, Period> rel_time,
                           Predicate pred);

        using native_handle_type = implementation-defined;           // see 32.2.3
        native_handle_type native_handle();                          // see 32.2.3
    };
}
```

- 1 The class `condition_variable` is a standard-layout class (11.2).
- `condition_variable()`;
- 2 *Throws:* `system_error` when an exception is required (32.2.2).
- 3 *Error conditions:*
- (3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

```
~condition_variable();
```

4 *Preconditions:* There is no thread blocked on `*this`.

[*Note 1:* That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

```
void wait(unique_lock<mutex>& lock);
```

7 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either

(7.1) — no other thread is waiting on this `condition_variable` object or

(7.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

8 *Effects:*

(8.1) — Atomically calls `lock.unlock()` and blocks on `*this`.

(8.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.

(8.3) — The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

9 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

10 *Throws:* Nothing.

11 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 2:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Predicate>
```

```
void wait(unique_lock<mutex>& lock, Predicate pred);
```

12 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either

(12.1) — no other thread is waiting on this `condition_variable` object or

(12.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

13 *Effects:* Equivalent to:

```
while (!pred())
    wait(lock);
```

14 *Postconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

15 *Throws:* Any exception thrown by `pred`.

16 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 3:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```
template<class Clock, class Duration>
```

```
cv_status wait_until(unique_lock<mutex>& lock,
                    chrono::time_point<Clock, Duration> abs_time);
```

17 *Preconditions:* `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either

(17.1) — no other thread is waiting on this `condition_variable` object or

(17.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

18 *Effects:*

- (18.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (18.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
- (18.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.
- (18.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

19 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

20 *Returns:* `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

21 *Throws:* Timeout-related exceptions (32.2.4).

22 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 4: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
                  chrono::duration<Rep, Period> rel_time);
```

23 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

- (23.1) — no other thread is waiting on this `condition_variable` object or
- (23.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

24 *Effects:* Equivalent to:

```
    return wait_until(lock, rel-to-abs(rel_time));
```

25 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

26 *Returns:* `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

27 *Throws:* Timeout-related exceptions (32.2.4).

28 *Remarks:* If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
               chrono::time_point<Clock, Duration> abs_time,
               Predicate pred);
```

29 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either

- (29.1) — no other thread is waiting on this `condition_variable` object or
- (29.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

30 *Effects:* Equivalent to:

```
    while (!pred())
        if (wait_until(lock, abs_time) == cv_status::timeout)
            return pred();
    return true;
```

31 *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.

32 [Note 6: The returned value indicates whether the predicate evaluated to `true` regardless of whether the timeout was triggered. — end note]

33 *Throws:* Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.

34 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 7: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
              chrono::duration<Rep, Period> rel_time,
              Predicate pred);
```

- 35 *Preconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread, and either
- (35.1) — no other thread is waiting on this `condition_variable` object or
- (35.2) — `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.
- 36 *Effects:* Equivalent to:
- ```
 return wait_until(lock, rel-to-abs(rel_time), std::move(pred));
```
- 37     [*Note 8:* There is no blocking if `pred()` is initially `true`, even if the timeout has already expired. — *end note*]
- 38     *Postconditions:* `lock.owns_lock()` is `true` and `lock.mutex()` is locked by the calling thread.
- 39     [*Note 9:* The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — *end note*]
- 40     *Throws:* Timeout-related exceptions (32.2.4) or any exception thrown by `pred`.
- 41     *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).
- [*Note 10:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

### 32.7.5 Class `condition_variable_any` [thread.condition.condvarany]

#### 32.7.5.1 General [thread.condition.condvarany.general]

- <sup>1</sup> In 32.7.5, template arguments for template parameters named `Lock` shall meet the *Cpp17BasicLockable* requirements (32.2.5.2).

[*Note 1:* All of the standard mutex types meet this requirement. If a type other than one of the standard mutex types or a `unique_lock` wrapper for a standard mutex type is used with `condition_variable_any`, any necessary synchronization is assumed to be in place with respect to the predicate associated with the `condition_variable_any` instance. — *end note*]

```
namespace std {
 class condition_variable_any {
 public:
 condition_variable_any();
 ~condition_variable_any();

 condition_variable_any(const condition_variable_any&) = delete;
 condition_variable_any& operator=(const condition_variable_any&) = delete;

 void notify_one() noexcept;
 void notify_all() noexcept;

 // 32.7.5.2, noninterruptible waits
 template<class Lock>
 void wait(Lock& lock);
 template<class Lock, class Predicate>
 void wait(Lock& lock, Predicate pred);

 template<class Lock, class Clock, class Duration>
 cv_status wait_until(Lock& lock, chrono::time_point<Clock, Duration> abs_time);
 template<class Lock, class Clock, class Duration, class Predicate>
 bool wait_until(Lock& lock, chrono::time_point<Clock, Duration> abs_time,
 Predicate pred);
 template<class Lock, class Rep, class Period>
 cv_status wait_for(Lock& lock, chrono::duration<Rep, Period> rel_time);
 template<class Lock, class Rep, class Period, class Predicate>
 bool wait_for(Lock& lock, chrono::duration<Rep, Period> rel_time, Predicate pred);

 // 32.7.5.3, interruptible waits
 template<class Lock, class Predicate>
 bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

```

template<class Lock, class Clock, class Duration, class Predicate>
 bool wait_until(Lock& lock, stop_token stoken,
 chrono::time_point<Clock, Duration> abs_time, Predicate pred);
template<class Lock, class Rep, class Period, class Predicate>
 bool wait_for(Lock& lock, stop_token stoken,
 chrono::duration<Rep, Period> rel_time, Predicate pred);
};
}

```

```
condition_variable_any();
```

2 *Throws:* `bad_alloc` or `system_error` when an exception is required (32.2.2).

3 *Error conditions:*

- (3.1) — `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.
- (3.2) — `operation_not_permitted` — if the thread does not have the privilege to perform the operation.

```
~condition_variable_any();
```

4 *Preconditions:* There is no thread blocked on `*this`.

[*Note 2:* That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — *end note*]

```
void notify_one() noexcept;
```

5 *Effects:* If any threads are blocked waiting for `*this`, unblocks one of those threads.

```
void notify_all() noexcept;
```

6 *Effects:* Unblocks all threads that are blocked waiting for `*this`.

### 32.7.5.2 Noninterruptible waits

[`thread.condvarany.wait`]

```

template<class Lock>
 void wait(Lock& lock);

```

1 *Effects:*

- (1.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (1.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.
- (1.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, or spuriously.

2 *Postconditions:* `lock` is locked by the calling thread.

3 *Throws:* Nothing.

4 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[*Note 1:* This can happen if the re-locking of the mutex throws an exception. — *end note*]

```

template<class Lock, class Predicate>
 void wait(Lock& lock, Predicate pred);

```

5 *Effects:* Equivalent to:

```

 while (!pred())
 wait(lock);

```

```

template<class Lock, class Clock, class Duration>
 cv_status wait_until(Lock& lock, chrono::time_point<Clock, Duration> abs_time);

```

6 *Effects:*

- (6.1) — Atomically calls `lock.unlock()` and blocks on `*this`.
- (6.2) — When unblocked, calls `lock.lock()` (possibly blocking on the lock) and returns.

- (6.3) — The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`, expiration of the absolute timeout (32.2.4) specified by `abs_time`, or spuriously.
- (6.4) — If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

7 *Postconditions:* `lock` is locked by the calling thread.

8 *Returns:* `cv_status::timeout` if the absolute timeout (32.2.4) specified by `abs_time` expired, otherwise `cv_status::no_timeout`.

9 *Throws:* Timeout-related exceptions (32.2.4).

10 *Remarks:* If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, chrono::duration<Rep, Period> rel_time);
```

11 *Effects:* Equivalent to:

```
 return wait_until(lock, rel-to-abs(rel_time));
```

12 *Postconditions:* `lock` is locked by the calling thread.

13 *Returns:* `cv_status::timeout` if the relative timeout (32.2.4) specified by `rel_time` expired, otherwise `cv_status::no_timeout`.

14 *Throws:* Timeout-related exceptions (32.2.4).

15 *Remarks:* If the function fails to meet the postcondition, `terminate` is invoked (14.6.2).

[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, chrono::time_point<Clock, Duration> abs_time, Predicate pred);
```

16 *Effects:* Equivalent to:

```
 while (!pred())
 if (wait_until(lock, abs_time) == cv_status::timeout)
 return pred();
 return true;
```

17 [Note 4: There is no blocking if `pred()` is initially `true`, or if the timeout has already expired. — end note]

18 [Note 5: The returned value indicates whether the predicate evaluates to `true` regardless of whether the timeout was triggered. — end note]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, chrono::duration<Rep, Period> rel_time, Predicate pred);
```

19 *Effects:* Equivalent to:

```
 return wait_until(lock, rel-to-abs(rel_time), std::move(pred));
```

### 32.7.5.3 Interruptible waits

[`thread.condvarany.intwait`]

- 1 The following wait functions will be notified when there is a stop request on the passed `stop_token`. In that case the functions return immediately, returning `false` if the predicate evaluates to `false`.

```
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token token, Predicate pred);
```

2 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `token` during this call and then equivalent to:

```
 while (!token.stop_requested()) {
 if (pred())
 return true;
 wait(lock);
 }
 return pred();
```

3 [Note 1: The returned value indicates whether the predicate evaluated to `true` regardless of whether there was a stop request. — end note]

4 *Postconditions:* `lock` is locked by the calling thread.

5 *Throws:* Any exception thrown by `pred`.

6 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
 chrono::time_point<Clock, Duration> abs_time, Predicate pred);
```

7 *Effects:* Registers for the duration of this call `*this` to get notified on a stop request on `stoken` during this call and then equivalent to:

```
while (!stoken.stop_requested()) {
 if (pred())
 return true;
 if (wait_until(lock, abs_time) == cv_status::timeout)
 return pred();
}
return pred();
```

8 [Note 3: There is no blocking if `pred()` is initially true, `stoken.stop_requested()` was already true or the timeout has already expired. — end note]

9 [Note 4: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered or a stop request was made. — end note]

10 *Postconditions:* `lock` is locked by the calling thread.

11 *Throws:* Timeout-related exceptions (32.2.4), or any exception thrown by `pred`.

12 *Remarks:* If the function fails to meet the postcondition, `terminate` is called (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

```
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
 chrono::duration<Rep, Period> rel_time, Predicate pred);
```

13 *Effects:* Equivalent to:

```
return wait_until(lock, std::move(stoken), rel-to-abs(rel_time), std::move(pred));
```

## 32.8 Semaphore

[thread.sema]

### 32.8.1 General

[thread.sema.general]

1 Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

2 A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

### 32.8.2 Header <semaphore> synopsis

[semaphore.syn]

```
namespace std {
 // 32.8.3, class template counting_semaphore
 template<ptrdiff_t least_max_value = implementation-defined>
 class counting_semaphore;

 using binary_semaphore = counting_semaphore<1>;
}
```

### 32.8.3 Class template counting\_semaphore

[thread.sema.cnt]

```
namespace std {
 template<ptrdiff_t least_max_value = implementation-defined>
 class counting_semaphore {
 public:
 static constexpr ptrdiff_t max() noexcept;
```

```

constexpr explicit counting_semaphore(ptrdiff_t desired);
~counting_semaphore();

counting_semaphore(const counting_semaphore&) = delete;
counting_semaphore& operator=(const counting_semaphore&) = delete;

void release(ptrdiff_t update = 1);
void acquire();
bool try_acquire() noexcept;
template<class Rep, class Period>
 bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
 bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

private:
 ptrdiff_t counter; // exposition only
};

```

1 Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

2 `least_max_value` shall be non-negative; otherwise the program is ill-formed.

3 Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

4 *Returns:* The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

```
constexpr explicit counting_semaphore(ptrdiff_t desired);
```

5 *Preconditions:* `desired >= 0` is true, and `desired <= max()` is true.

6 *Effects:* Initializes `counter` with `desired`.

7 *Throws:* Nothing.

```
void release(ptrdiff_t update = 1);
```

8 *Preconditions:* `update >= 0` is true, and `update <= max() - counter` is true.

9 *Effects:* Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.

10 *Synchronization:* Strongly happens before invocations of `try_acquire` that observe the result of the effects.

11 *Throws:* `system_error` when an exception is required (32.2.2).

12 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
bool try_acquire() noexcept;
```

13 *Effects:* Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

[Note 1: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (32.5). — end note]

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

14 *Returns:* `true` if `counter` was decremented, otherwise `false`.

```
void acquire();
```

15 *Effects:* Repeatedly performs the following steps, in order:

- (15.1) — Evaluates `try_acquire()`. If the result is `true`, returns.
- (15.2) — Blocks on `*this` until `counter` is greater than zero.
- 16 *Throws:* `system_error` when an exception is required (32.2.2).
- 17 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).
- ```
template<class Rep, class Period>
    bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
    bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```
- 18 *Effects:* Repeatedly performs the following steps, in order:
- (18.1) — Evaluates `try_acquire()`. If the result is `true`, returns `true`.
- (18.2) — Blocks on `*this` until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.
- The timeout expires (32.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).
- 19 *Throws:* Timeout-related exceptions (32.2.4), or `system_error` when a non-timeout-related exception is required (32.2.2).
- 20 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

32.9 Coordination types

[thread.coord]

32.9.1 General

[thread.coord.general]

- ¹ Subclause 32.9 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

32.9.2 Latches

[thread.latch]

32.9.2.1 General

[thread.latch.general]

- ¹ A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

32.9.2.2 Header <latch> synopsis

[latch.syn]

```
namespace std {
    class latch;
}
```

32.9.2.3 Class latch

[thread.latch.class]

```
namespace std {
    class latch {
    public:
        static constexpr ptrdiff_t max() noexcept;

        constexpr explicit latch(ptrdiff_t expected);
        ~latch();

        latch(const latch&) = delete;
        latch& operator=(const latch&) = delete;

        void count_down(ptrdiff_t update = 1);
        bool try_wait() const noexcept;
        void wait() const;
        void arrive_and_wait(ptrdiff_t update = 1);

    private:
        ptrdiff_t counter; // exposition only
    };
}
```

- ¹ A **latch** maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.
- ² Concurrent invocations of the member functions of **latch**, other than its destructor, do not introduce data races.

```
static constexpr ptrdiff_t max() noexcept;
```

- ³ *Returns:* The maximum value of *counter* that the implementation supports.

```
constexpr explicit latch(ptrdiff_t expected);
```

- ⁴ *Preconditions:* `expected >= 0` is true and `expected <= max()` is true.

- ⁵ *Effects:* Initializes *counter* with `expected`.

- ⁶ *Throws:* Nothing.

```
void count_down(ptrdiff_t update = 1);
```

- ⁷ *Preconditions:* `update >= 0` is true, and `update <= counter` is true.

- ⁸ *Effects:* Atomically decrements *counter* by `update`. If *counter* is equal to zero, unblocks all threads blocked on **this*.

- ⁹ *Synchronization:* Strongly happens before the returns from all calls that are unblocked.

- ¹⁰ *Throws:* **system_error** when an exception is required (32.2.2).

- ¹¹ *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
bool try_wait() const noexcept;
```

- ¹² *Returns:* With very low probability **false**. Otherwise *counter* == 0.

```
void wait() const;
```

- ¹³ *Effects:* If *counter* equals zero, returns immediately. Otherwise, blocks on **this* until a call to `count_down` that decrements *counter* to zero.

- ¹⁴ *Throws:* **system_error** when an exception is required (32.2.2).

- ¹⁵ *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
void arrive_and_wait(ptrdiff_t update = 1);
```

- ¹⁶ *Effects:* Equivalent to:

```
count_down(update);
wait();
```

32.9.3 Barriers

[thread.barrier]

32.9.3.1 General

[thread.barrier.general]

- ¹ A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[Note 1: A barrier is useful for managing repeated tasks that are handled by multiple threads. — end note]

32.9.3.2 Header <barrier> synopsis

[barrier.syn]

```
namespace std {
    template<class CompletionFunction = see below>
        class barrier;
}
```

32.9.3.3 Class template barrier

[thread.barrier.class]

```
namespace std {
    template<class CompletionFunction = see below>
        class barrier {
        public:
            using arrival_token = see below;

            static constexpr ptrdiff_t max() noexcept;
```

```

constexpr explicit barrier(ptrdiff_t expected,
                           CompletionFunction f = CompletionFunction());
~barrier();

barrier(const barrier&) = delete;
barrier& operator=(const barrier&) = delete;

arrival_token arrive(ptrdiff_t update = 1);
void wait(arrival_token&& arrival) const;

void arrive_and_wait();
void arrive_and_drop();

private:
    CompletionFunction completion;    // exposition only
};

```

¹ Each *barrier phase* consists of the following steps:

- (1.1) — The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
- (1.2) — Exactly once after the expected count reaches zero, a thread executes the completion step during its call to `arrive`, `arrive_and_drop`, or `wait`, except that it is implementation-defined whether the step executes if no thread calls `wait`.
- (1.3) — When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

² Each phase defines a *phase synchronization point*. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.

³ The *phase completion step* that is executed at the end of each phase has the following effects:

- (3.1) — Invokes the completion function, equivalent to `completion()`.
- (3.2) — Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object's member functions other than `wait` are called while the completion step is in progress.

⁴ Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

⁵ `CompletionFunction` shall meet the *Cpp17MoveConstructible* (Table 31) and *Cpp17Destructible* (Table 35) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be `true`.

⁶ The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the *Cpp17DefaultConstructible* requirements (Table 30) and `completion()` has no effects.

⁷ `barrier::arrival_token` is an unspecified type, such that it meets the *Cpp17MoveConstructible* (Table 31), *Cpp17MoveAssignable* (Table 33), and *Cpp17Destructible* (Table 35) requirements.

```
static constexpr ptrdiff_t max() noexcept;
```

⁸ *Returns:* The maximum expected count that the implementation supports.

```
constexpr explicit barrier(ptrdiff_t expected,
                           CompletionFunction f = CompletionFunction());
```

⁹ *Preconditions:* `expected >= 0` is true and `expected <= max()` is true.

¹⁰ *Effects:* Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

[Note 1: If `expected` is 0 this object can only be destroyed. — end note]

¹¹ *Throws:* Any exception thrown by `CompletionFunction`'s move constructor.

```
arrival_token arrive(ptrdiff_t update = 1);
```

12 *Preconditions:* `update > 0` is `true`, and `update` is less than or equal to the expected count for the current barrier phase.

13 *Effects:* Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

14 *Synchronization:* The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

15 *Returns:* The constructed `arrival_token` object.

16 *Throws:* `system_error` when an exception is required (32.2.2).

17 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

18 [Note 2: This call can cause the completion step for the current phase to start. — end note]

```
void wait(arrival_token&& arrival) const;
```

19 *Preconditions:* `arrival` is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

20 *Effects:* Blocks at the synchronization point associated with `std::move(arrival)` until the phase completion step of the synchronization point's phase is run.

[Note 3: If `arrival` is associated with the synchronization point for a previous phase, the call returns immediately. — end note]

21 *Throws:* `system_error` when an exception is required (32.2.2).

22 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

```
void arrive_and_wait();
```

23 *Effects:* Equivalent to: `wait(arrive())`.

```
void arrive_and_drop();
```

24 *Preconditions:* The expected count for the current barrier phase is greater than zero.

25 *Effects:* Decrements the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

26 *Synchronization:* The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.

27 *Throws:* `system_error` when an exception is required (32.2.2).

28 *Error conditions:* Any of the error conditions allowed for mutex types (32.6.4.2).

29 [Note 4: This call can cause the completion step for the current phase to start. — end note]

32.10 Futures

[futures]

32.10.1 Overview

[futures.overview]

1 32.10 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

32.10.2 Header <future> synopsis

[future.syn]

```
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };
};
```

```

enum class launch : unspecified {
    async = unspecified,
    deferred = unspecified,
    implementation-defined
};

enum class future_status {
    ready,
    timeout,
    deferred
};

// 32.10.3, error handling
template<> struct is_error_code_enum<future_errc> : public true_type { };
error_code make_error_code(future_errc e) noexcept;
error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

// 32.10.4, class future_error
class future_error;

// 32.10.6, class template promise
template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
    void swap(promise<R>& x, promise<R>& y) noexcept;

// 32.10.7, class template future
template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

// 32.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

// 32.10.10, class template packaged_task
template<class> class packaged_task; // not defined
template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>;

template<class R, class... ArgTypes>
    void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 32.10.9, function template async
template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
        async(F&& f, Args&&... args);
template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
        async(launch policy, F&& f, Args&&... args);
}

```

¹ The enum type `launch` is a bitmask type (16.3.3.3.3) with elements `launch::async` and `launch::deferred`.

[Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by `async()` applicable to a corresponding subset of available launch policies. Implementations can extend the behavior of the first overload of `async()` by adding their extensions to the launch policy under the “as if” rule. — end note]

² The enumerator values of `future_errc` are distinct and not zero.

32.10.3 Error handling

[futures.errors]

```
const error_category& future_category() noexcept;
```

1 *Returns:* A reference to an object of a type derived from class `error_category`.

2 The object's `default_error_condition` and equivalent virtual functions shall behave as specified for the class `error_category`. The object's `name` virtual function returns a pointer to the string "future".

```
error_code make_error_code(future_errc e) noexcept;
```

3 *Returns:* `error_code(static_cast<int>(e), future_category())`.

```
error_condition make_error_condition(future_errc e) noexcept;
```

4 *Returns:* `error_condition(static_cast<int>(e), future_category())`.

32.10.4 Class `future_error`

[futures.future.error]

```
namespace std {
    class future_error : public logic_error {
    public:
        explicit future_error(future_errc e);

        const error_code& code() const noexcept;
        const char* what() const noexcept;

    private:
        error_code ec_;           // exposition only
    };
}
```

```
explicit future_error(future_errc e);
```

1 *Effects:* Initializes `ec_` with `make_error_code(e)`.

```
const error_code& code() const noexcept;
```

2 *Returns:* `ec_`.

```
const char* what() const noexcept;
```

3 *Returns:* An NTBS incorporating `code().message()`.

32.10.5 Shared state

[futures.state]

1 Many of the classes introduced in subclause 32.10 use some state to communicate results. This *shared state* consists of some state information and some (possibly not yet evaluated) *result*, which can be a (possibly void) value or an exception.

[Note 1: Futures, promises, and tasks defined in this Clause reference such shared state. — end note]

2 [Note 2: The result can be any kind of object including a function to compute that result, as used by `async` when `policy` is `launch::deferred`. — end note]

3 An *asynchronous return object* is an object that reads results from a shared state. A *waiting function* of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (32.2.5), then it is a *timed waiting function*, otherwise it is a *non-timed waiting function*.

4 An *asynchronous provider* is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[Example 1: Promises and tasks are examples of asynchronous providers. — end example]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

5 When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

- (5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and
- (5.2) — the return object or provider gives up its reference to its shared state; and

- (5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to `std::async`, the shared state is not yet ready, and this was the last reference to the shared state.

6 When an asynchronous provider is said to make its shared state ready, it means:

- (6.1) — first, the provider marks its shared state as ready; and
- (6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

7 When an asynchronous provider is said to abandon its shared state, it means:

- (7.1) — first, if that state is not ready, the provider
 - (7.1.1) — stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then
 - (7.1.2) — makes its shared state ready;
- (7.2) — second, the provider releases its shared state.

8 A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

9 Calls to functions that successfully set the stored result of a shared state synchronize with (6.10.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.10.2) the successful return from a call to a waiting function on the shared state.

10 Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread's objects with thread storage duration (6.8.6.3) is sequenced before making that shared state ready.

11 Access to the result of the same shared state may conflict (6.10.2).

[*Note 3:* This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (32.10.8) must either use read-only operations or provide additional synchronization. — *end note*]

32.10.6 Class template `promise`

[`futures.promise`]

```
namespace std {
    template<class R>
    class promise {
    public:
        promise();
        template<class Allocator>
            promise(allocator_arg_t, const Allocator& a);
        promise(promise&& rhs) noexcept;
        promise(const promise&) = delete;
        ~promise();

        // assignment
        promise& operator=(promise&& rhs) noexcept;
        promise& operator=(const promise&) = delete;
        void swap(promise& other) noexcept;

        // retrieving the result
        future<R> get_future();

        // setting the result
        void set_value(see below);
        void set_exception(exception_ptr p);

        // setting the result with deferred notification
        void set_value_at_thread_exit(see below);
        void set_exception_at_thread_exit(exception_ptr p);
    };
}
```

```
};
}
```

- 1 For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.
- 2 The implementation provides the template `promise` and two specializations, `promise<R&>` and `promise<void>`. These differ only in the argument type of the member functions `set_value` and `set_value_at_thread_exit`, as set out in their descriptions, below.
- 3 The `set_value`, `set_exception`, `set_value_at_thread_exit`, and `set_exception_at_thread_exit` member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```
promise();
template<class Allocator>
promise(allocator_arg_t, const Allocator& a);
```

- 4 *Effects*: Creates a shared state. The second constructor uses the allocator `a` to allocate memory for the shared state.

```
promise(promise&& rhs) noexcept;
```

- 5 *Effects*: Transfers ownership of the shared state of `rhs` (if any) to the newly-constructed object.

- 6 *Postconditions*: `rhs` has no shared state.

```
~promise();
```

- 7 *Effects*: Abandons any shared state (32.10.5).

```
promise& operator=(promise&& rhs) noexcept;
```

- 8 *Effects*: Equivalent to `promise(std::move(rhs)).swap(*this)`.

- 9 *Returns*: `*this`.

```
void swap(promise& other) noexcept;
```

- 10 *Effects*: Exchanges the shared state of `*this` and `other`.

- 11 *Postconditions*: `*this` has the shared state (if any) that `other` had prior to the call to `swap`. `other` has the shared state (if any) that `*this` had prior to the call to `swap`.

```
future<R> get_future();
```

- 12 *Synchronization*: Calls to this function do not introduce data races (6.10.2) with calls to `set_value`, `set_exception`, `set_value_at_thread_exit`, or `set_exception_at_thread_exit`.

[Note 1: Such calls need not synchronize with each other. — end note]

- 13 *Returns*: A `future<R>` object with the same shared state as `*this`.

- 14 *Throws*: `future_error` if `*this` has no shared state or if `get_future` has already been called on a `promise` with the same shared state as `*this`.

- 15 *Error conditions*:

- (15.1) — `future_already_retrieved` if `get_future` has already been called on a `promise` with the same shared state as `*this`.

- (15.2) — `no_state` if `*this` has no shared state.

```
void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();
```

- 16 *Effects*: Atomically stores the value `r` in the shared state and makes that state ready (32.10.5).

- 17 *Throws*:

- (17.1) — `future_error` if its shared state already has a stored value or exception, or

- (17.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

- (17.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

18 *Error conditions:*

(18.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(18.2) — `no_state` if `*this` has no shared state.

`void set_exception(exception_ptr p);`

19 *Preconditions:* `p` is not null.

20 *Effects:* Atomically stores the exception pointer `p` in the shared state and makes that state ready (32.10.5).

21 *Throws:* `future_error` if its shared state already has a stored value or exception.

22 *Error conditions:*

(22.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(22.2) — `no_state` if `*this` has no shared state.

`void promise::set_value_at_thread_exit(const R& r);`
`void promise::set_value_at_thread_exit(R&& r);`
`void promise<R>::set_value_at_thread_exit(R& r);`
`void promise<void>::set_value_at_thread_exit();`

23 *Effects:* Stores the value `r` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects with thread storage duration associated with the current thread have been destroyed.

24 *Throws:*

(24.1) — `future_error` if its shared state already has a stored value or exception, or

(24.2) — for the first version, any exception thrown by the constructor selected to copy an object of `R`, or

(24.3) — for the second version, any exception thrown by the constructor selected to move an object of `R`.

25 *Error conditions:*

(25.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(25.2) — `no_state` if `*this` has no shared state.

`void set_exception_at_thread_exit(exception_ptr p);`

26 *Preconditions:* `p` is not null.

27 *Effects:* Stores the exception pointer `p` in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects with thread storage duration associated with the current thread have been destroyed.

28 *Throws:* `future_error` if an error condition occurs.

29 *Error conditions:*

(29.1) — `promise_already_satisfied` if its shared state already has a stored value or exception.

(29.2) — `no_state` if `*this` has no shared state.

`template<class R>`
`void swap(promise<R>& x, promise<R>& y) noexcept;`

30 *Effects:* As if by `x.swap(y)`.

32.10.7 Class template `future`

[`futures.unique.future`]

1 The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (32.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

2 [Note 1: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`. — end note]

- ³ The effect of calling any member function other than the destructor, the move assignment operator, **share**, or **valid** on a **future** object for which **valid()** == **false** is undefined.

[*Note 2*: It is valid to move from a future object for which **valid()** == **false**. — *end note*]

Recommended practice: Implementations should detect this case and throw an object of type **future_error** with an error condition of **future_errc::no_state**.

```
namespace std {
    template<class R>
    class future {
    public:
        future() noexcept;
        future(future&&) noexcept;
        future(const future&) = delete;
        ~future();
        future& operator=(const future&) = delete;
        future& operator=(future&&) noexcept;
        shared_future<R> share() noexcept;

        // retrieving the value
        see below get();

        // functions to check state
        bool valid() const noexcept;

        void wait() const;
        template<class Rep, class Period>
            future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
        template<class Clock, class Duration>
            future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

- ⁴ For the primary template, **R** shall be an object type that meets the *Cpp17Destructible* requirements.
- ⁵ The implementation provides the template **future** and two specializations, **future<R&>** and **future<void>**. These differ only in the return type and return value of the member function **get**, as set out in its description, below.

```
future() noexcept;
```

- ⁶ *Effects*: The object does not refer to a shared state.

- ⁷ *Postconditions*: **valid()** == **false**.

```
future(future&& rhs) noexcept;
```

- ⁸ *Effects*: Move constructs a **future** object that refers to the shared state that was originally referred to by **rhs** (if any).

- ⁹ *Postconditions*:

(9.1) — **valid()** returns the same value as **rhs.valid()** prior to the constructor invocation.

(9.2) — **rhs.valid()** == **false**.

```
~future();
```

- ¹⁰ *Effects*:

(10.1) — Releases any shared state (32.10.5);

(10.2) — destroys ***this**.

```
future& operator=(future&& rhs) noexcept;
```

- ¹¹ *Effects*: If **addressof(rhs)** == **this** is true, there are no effects. Otherwise:

(11.1) — Releases any shared state (32.10.5).

(11.2) — move assigns the contents of **rhs** to ***this**.

```

12      Postconditions:
(12.1)      — valid() returns the same value as rhs.valid() prior to the assignment.
(12.2)      — If addressof(rhs) == this is false, rhs.valid() == false.

      shared_future<R> share() noexcept;
13      Postconditions: valid() == false.
14      Returns: shared_future<R>(std::move(*this)).

      R future::get();
      R& future<R&>::get();
      void future<void>::get();
15      [Note 3: As described above, the template and its two required specializations differ only in the return type
      and return value of the member function get. — end note]
16      Effects:
(16.1)      — wait()s until the shared state is ready, then retrieves the value stored in the shared state;
(16.2)      — releases any shared state (32.10.5).
17      Postconditions: valid() == false.
18      Returns:
(18.1)      — future::get() returns the value v stored in the object's shared state as std::move(v).
(18.2)      — future<R&>::get() returns the reference stored as value in the object's shared state.
(18.3)      — future<void>::get() returns nothing.
19      Throws: The stored exception, if an exception was stored in the shared state.

      bool valid() const noexcept;
20      Returns: true only if *this refers to a shared state.

      void wait() const;
21      Effects: Blocks until the shared state is ready.

      template<class Rep, class Period>
      future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
22      Effects: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the
      shared state is ready or until the relative timeout (32.2.4) specified by rel_time has expired.
23      Returns:
(23.1)      — future_status::deferred if the shared state contains a deferred function.
(23.2)      — future_status::ready if the shared state is ready.
(23.3)      — future_status::timeout if the function is returning because the relative timeout (32.2.4) specified
      by rel_time has expired.
24      Throws: timeout-related exceptions (32.2.4).

      template<class Clock, class Duration>
      future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
25      Effects: None if the shared state contains a deferred function (32.10.9), otherwise blocks until the
      shared state is ready or until the absolute timeout (32.2.4) specified by abs_time has expired.
26      Returns:
(26.1)      — future_status::deferred if the shared state contains a deferred function.
(26.2)      — future_status::ready if the shared state is ready.
(26.3)      — future_status::timeout if the function is returning because the absolute timeout (32.2.4)
      specified by abs_time has expired.
27      Throws: timeout-related exceptions (32.2.4).

```

32.10.8 Class template `shared_future`[`futures.shared.future`]

¹ The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (32.10.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

² [Note 1: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — end note]

³ The effect of calling any member function other than the destructor, the move assignment operator, the copy assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined.

[Note 2: It is valid to copy or move from a `shared_future` object for which `valid()` is `false`. — end note]

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class shared_future {
    public:
        shared_future() noexcept;
        shared_future(const shared_future& rhs) noexcept;
        shared_future(future<R>&&) noexcept;
        shared_future(shared_future&& rhs) noexcept;
        ~shared_future();
        shared_future& operator=(const shared_future& rhs) noexcept;
        shared_future& operator=(shared_future&& rhs) noexcept;

        // retrieving the value
        see below get() const;

        // functions to check state
        bool valid() const noexcept;

        void wait() const;
        template<class Rep, class Period>
            future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
        template<class Clock, class Duration>
            future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

⁴ For the primary template, `R` shall be an object type that meets the *Cpp17Destructible* requirements.

⁵ The implementation provides the template `shared_future` and two specializations, `shared_future<R>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
shared_future() noexcept;
```

⁶ *Effects:* The object does not refer to a shared state.

⁷ *Postconditions:* `valid() == false`.

```
shared_future(const shared_future& rhs) noexcept;
```

⁸ *Effects:* The object refers to the same shared state as `rhs` (if any).

⁹ *Postconditions:* `valid()` returns the same value as `rhs.valid()`.

```
shared_future(future<R>&& rhs) noexcept;
shared_future(shared_future&& rhs) noexcept;
```

¹⁰ *Effects:* Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

¹¹ *Postconditions:*

(11.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

(11.2) — `rhs.valid() == false`.

```
~shared_future();
```

12 *Effects:*

(12.1) — Releases any shared state (32.10.5);

(12.2) — destroys `*this`.

```
shared_future& operator=(shared_future&& rhs) noexcept;
```

13 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

(13.1) — Releases any shared state (32.10.5);

(13.2) — move assigns the contents of `rhs` to `*this`.

14 *Postconditions:*

(14.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the assignment.

(14.2) — If `addressof(rhs) == this` is false, `rhs.valid() == false`.

```
shared_future& operator=(const shared_future& rhs) noexcept;
```

15 *Effects:* If `addressof(rhs) == this` is true, there are no effects. Otherwise:

(15.1) — Releases any shared state (32.10.5);

(15.2) — assigns the contents of `rhs` to `*this`.
[Note 3: As a result, `*this` refers to the same shared state as `rhs` (if any). — end note]

16 *Postconditions:* `valid() == rhs.valid()`.

```
const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;
```

17 [Note 4: As described above, the template and its two required specializations differ only in the return type and return value of the member function `get`. — end note]

18 [Note 5: Access to a value object stored in the shared state is unsynchronized, so operations on `R` might introduce a data race (6.10.2). — end note]

19 *Effects:* `wait()`s until the shared state is ready, then retrieves the value stored in the shared state.

20 *Returns:*

(20.1) — `shared_future::get()` returns a const reference to the value stored in the object's shared state.
[Note 6: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the `shared_future` object that returned the reference. — end note]

(20.2) — `shared_future<R&>::get()` returns the reference stored as value in the object's shared state.

(20.3) — `shared_future<void>::get()` returns nothing.

21 *Throws:* The stored exception, if an exception was stored in the shared state.

```
bool valid() const noexcept;
```

22 *Returns:* true only if `*this` refers to a shared state.

```
void wait() const;
```

23 *Effects:* Blocks until the shared state is ready.

```
template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
```

24 *Effects:* None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the relative timeout (32.2.4) specified by `rel_time` has expired.

25 *Returns:*

(25.1) — `future_status::deferred` if the shared state contains a deferred function.

- (25.2) — `future_status::ready` if the shared state is ready.
- (25.3) — `future_status::timeout` if the function is returning because the relative timeout (32.2.4) specified by `rel_time` has expired.

26 *Throws:* timeout-related exceptions (32.2.4).

```
template<class Clock, class Duration>
    future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
```

27 *Effects:* None if the shared state contains a deferred function (32.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (32.2.4) specified by `abs_time` has expired.

28 *Returns:*

- (28.1) — `future_status::deferred` if the shared state contains a deferred function.
- (28.2) — `future_status::ready` if the shared state is ready.
- (28.3) — `future_status::timeout` if the function is returning because the absolute timeout (32.2.4) specified by `abs_time` has expired.

29 *Throws:* timeout-related exceptions (32.2.4).

32.10.9 Function template `async`

[`futures.async`]

- 1 The function template `async` provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a `future` object with which it shares a shared state.

```
template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
        async(F&& f, Args&&... args);
template<class F, class... Args>
    future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
        async(launch_policy, F&& f, Args&&... args);
```

2 *Mandates:* The following are all true:

- (2.1) — `is_constructible_v<decay_t<F>, F>`,
- (2.2) — `(is_constructible_v<decay_t<Args>, Args> && ...)`, and
- (2.3) — `is_invocable_v<decay_t<F>, decay_t<Args>...>`.

3 *Effects:* The first function behaves the same as a call to the second function with a policy argument of `launch::async` | `launch::deferred` and the same arguments for `F` and `Args`. The second function creates a shared state that is associated with the returned `future` object. The further behavior of the second function depends on the policy argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

- (3.1) — If `launch::async` is set in policy, calls `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` (22.10.5, 32.4.3.4) as if in a new thread of execution represented by a `thread` object with the values produced by `auto` being materialized (7.3.5) in the thread that called `async`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` is stored as the exceptional result in the shared state. The `thread` object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.
- (3.2) — If `launch::deferred` is set in policy, stores `auto(std::forward<F>(f))` and `auto(std::forward<Args>(args))...` in the shared state. These copies of `f` and `args` constitute a *deferred function*. Invocation of the deferred function evaluates `invoke(std::move(g), std::move(xyz))` where `g` is the stored value of `auto(std::forward<F>(f))` and `xyz` is the stored copy of `auto(std::forward<Args>(args))...`. Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (32.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of `invoke(std::move(g), std::move(xyz))` begins, the function is no longer considered deferred.

Recommended practice: If this policy is specified together with other policies, such as when using a `policy` value of `launch::async` | `launch::deferred`, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

- (3.3) — If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

4 *Synchronization:* The invocation of `async` synchronizes with the invocation of `f`. The completion of the function `f` is sequenced before the shared state is made ready.

[*Note 1:* These apply regardless of the provided `policy` argument, and even if the corresponding `future` object is moved to another thread. However, it is possible for `f` not to be called at all, in which case its completion never happens. — *end note*]

If the implementation chooses the `launch::async` policy,

- (4.1) — a call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (32.4.3.7);
- (4.2) — the associated thread completion synchronizes with (6.10.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

5 *Returns:* An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

[*Note 2:* If a future obtained from `async` is moved outside the local scope, the future's destructor can block for the shared state to become ready. — *end note*]

6 *Throws:* `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

7 *Error conditions:*

- (7.1) — `resource_unavailable_try_again` — if `policy == launch::async` and the system is unable to start a new thread.

8 [*Example 1:*

```
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async(=[]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get();    // #1
}
```

[*Note 3:* Line #1 might not result in concurrency because the `async` call uses the default policy, which might use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. — *end note*]

— *end example*]

32.10.10 Class template `packaged_task`

[`futures.task`]

32.10.10.1 General

[`futures.task.general`]

- 1 The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.
- 2 When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```
namespace std {
    template<class> class packaged_task;    // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)> {
    public:
        // construction and destruction
        packaged_task() noexcept;
```

```

template<class F>
    explicit packaged_task(F&& f);
template<class F, class Allocator>
    explicit packaged_task(allocator_arg_t, const Allocator& a, F&& f);
~packaged_task();

// no copy
packaged_task(const packaged_task&) = delete;
packaged_task& operator=(const packaged_task&) = delete;

// move support
packaged_task(packaged_task&& rhs) noexcept;
packaged_task& operator=(packaged_task&& rhs) noexcept;
void swap(packaged_task& other) noexcept;

bool valid() const noexcept;

// result retrieval
future<R> get_future();

// execution
void operator()(ArgTypes... );
void make_ready_at_thread_exit(ArgTypes...);

void reset();
};

template<class R, class... ArgTypes>
    packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>;

template<class F> packaged_task(F) -> packaged_task<see below>;
}

```

32.10.10.2 Member functions

[futures.task.members]

packaged_task() noexcept;

1 *Effects:* The object has no shared state and no stored task.

```

template<class F>
    explicit packaged_task(F&& f);

```

2 *Effects:* Equivalent to `packaged_task(allocator_arg, allocator<int>(), std::forward<F>(f))`.

```

template<class F, class Allocator>
    explicit packaged_task(allocator_arg_t, const Allocator& a, F&& f);

```

3 *Constraints:* `remove_cvref_t<F>` is not the same type as `packaged_task<R(ArgTypes...)>`.

4 *Mandates:* `is_invocable_r_v<R, decay_t<F>&, ArgTypes...>` is true.

5 *Preconditions:* `Allocator` meets the *Cpp17Allocator* requirements (16.4.4.6.1).

6 *Effects:* Let `A2` be `allocator_traits<Allocator>::rebind_alloc<unspecified>` and let `a2` be an object of type `A2` initialized with `A2(a)`. Constructs a new `packaged_task` object with a stored task of type `decay_t<F>` and a shared state. Initializes the object's stored task with `std::forward<F>(f)`. Uses `a2` to allocate storage for the shared state and stores a copy of `a2` in the shared state.

7 *Throws:* Any exceptions thrown by the initialization of the stored task. If storage for the shared state cannot be allocated, any exception thrown by `A2::allocate`.

```

template<class F> packaged_task(F) -> packaged_task<see below>;

```

8 *Constraints:* `&F::operator()` is well-formed when treated as an unevaluated operand (7.2.3) and either

(8.1) — `F::operator()` is a non-static member function and `decltype(&F::operator())` is either of the form `R(G:*)(A...) cv &opt noexceptopt` or of the form `R(*) (G, A...) noexceptopt` for a type `G`, or

(8.2) — `F::operator()` is a static member function and `decltype(&F::operator())` is of the form `R(*) (A...) noexceptopt`.

9 *Remarks:* The deduced type is `packaged_task<R(A...)>`.

```
packaged_task(packaged_task&& rhs) noexcept;
```

10 *Effects:* Transfers ownership of `rhs`'s shared state to `*this`, leaving `rhs` with no shared state. Moves the stored task from `rhs` to `*this`.

11 *Postconditions:* `rhs` has no shared state.

```
packaged_task& operator=(packaged_task&& rhs) noexcept;
```

12 *Effects:* Equivalent to `packaged_task(std::move(rhs)).swap(*this)`.

13 *Returns:* `*this`.

```
~packaged_task();
```

14 *Effects:* Abandons any shared state (32.10.5).

```
void swap(packaged_task& other) noexcept;
```

15 *Effects:* Exchanges the shared states and stored tasks of `*this` and `other`.

16 *Postconditions:* `*this` has the same shared state and stored task (if any) as `other` prior to the call to `swap`. `other` has the same shared state and stored task (if any) as `*this` prior to the call to `swap`.

```
bool valid() const noexcept;
```

17 *Returns:* `true` only if `*this` has a shared state.

```
future<R> get_future();
```

18 *Synchronization:* Calls to this function do not introduce data races (6.10.2) with calls to `operator()` or `make_ready_at_thread_exit`.

[Note 1: Such calls need not synchronize with each other. — end note]

19 *Returns:* A `future` object that shares the same shared state as `*this`.

20 *Throws:* A `future_error` object if an error occurs.

21 *Error conditions:*

(21.1) — `future_already_retrieved` if `get_future` has already been called on a `packaged_task` object with the same shared state as `*this`.

(21.2) — `no_state` if `*this` has no shared state.

```
void operator()(ArgTypes... args);
```

22 *Effects:* As if by `INVOKE<R>(f, t1, t2, ..., tN)` (22.10.4), where `f` is the stored task of `*this` and `t1, t2, ..., tN` are the values in `args...`. If the task returns normally, the return value is stored as the asynchronous result in the shared state of `*this`, otherwise the exception thrown by the task is stored. The shared state of `*this` is made ready, and any threads blocked in a function waiting for the shared state of `*this` to become ready are unblocked.

23 *Throws:* A `future_error` exception object if there is no shared state or the stored task has already been invoked.

24 *Error conditions:*

(24.1) — `promise_already_satisfied` if the stored task has already been invoked.

(24.2) — `no_state` if `*this` has no shared state.

```
void make_ready_at_thread_exit(ArgTypes... args);
```

25 *Effects:* As if by `INVOKE<R>(f, t1, t2, ..., tN)` (22.10.4), where `f` is the stored task and `t1, t2, ..., tN` are the values in `args...`. If the task returns normally, the return value is stored as the asynchronous result in the shared state of `*this`, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (32.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects with thread storage duration associated with the current thread have been destroyed.

26 *Throws:* `future_error` if an error condition occurs.

27 *Error conditions:*

(27.1) — `promise_already_satisfied` if the stored task has already been invoked.

(27.2) — `no_state` if `*this` has no shared state.

`void reset();`

28 *Effects:* Equivalent to:

```
if (!valid()) {
    throw future_error(future_errc::no_state);
}
*this = packaged_task(allocator_arg, a, std::move(f));
```

where `f` is the task stored in `*this` and `a` is the allocator stored in the shared state.

[*Note 2:* This constructs a new shared state for `*this`. The old state is abandoned (32.10.5). — *end note*]

29 *Throws:*

(29.1) — Any exception thrown by the `packaged_task` constructor.

(29.2) — `future_error` with an error condition of `no_state` if `*this` has no shared state.

32.10.10.3 Globals

[`futures.task.nonmembers`]

```
template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;
```

1 *Effects:* As if by `x.swap(y)`.

32.11 Safe reclamation

[`saferecl`]

32.11.1 General

[`saferecl.general`]

1 Subclause 32.11 contains safe-reclamation techniques, which are most frequently used to straightforwardly resolve access-deletion races.

32.11.2 Read-copy update (RCU)

[`saferecl.rcu`]

32.11.2.1 General

[`saferecl.rcu.general`]

1 RCU is a synchronization mechanism that can be used for linked data structures that are frequently read, but seldom updated. RCU does not provide mutual exclusion, but instead allows the user to schedule specified actions such as deletion at some later time.

2 A class type `T` is *rcu-protectable* if it has exactly one base class of type `rcu_obj_base<T, D>` for some `D`, and that base is public and non-virtual, and it has no base classes of type `rcu_obj_base<X, Y>` for any other combination `X, Y`. An object is *rcu-protectable* if it is of *rcu-protectable* type.

3 An invocation of `unlock U` on an `rcu_domain dom` corresponds to an invocation of `lock L` on `dom` if `L` is sequenced before `U` and either

(3.1) — no other invocation of `lock` on `dom` is sequenced after `L` and before `U`, or

(3.2) — every invocation of `unlock U2` on `dom` such that `L` is sequenced before `U2` and `U2` is sequenced before `U` corresponds to an invocation of `lock L2` on `dom` such that `L` is sequenced before `L2` and `L2` is sequenced before `U2`.

[*Note 1:* This pairs nested locks and unlocks on a given domain in each thread. — *end note*]

4 A *region of RCU protection* on a domain `dom` starts with a `lock L` on `dom` and ends with its corresponding `unlock U`.

5 Given a region of RCU protection `R` on a domain `dom` and given an evaluation `E` that scheduled another evaluation `F` in `dom`, if `E` does not strongly happen before the start of `R`, the end of `R` strongly happens before evaluating `F`.

6 The evaluation of a scheduled evaluation is potentially concurrent with any other scheduled evaluation. Each scheduled evaluation is evaluated at most once.

32.11.2.2 Header <rcu> synopsis

[rcu.syn]

```

namespace std {
    // 32.11.2.3, class template rcu_obj_base
    template<class T, class D = default_delete<T>> class rcu_obj_base;

    // 32.11.2.4, class rcu_domain
    class rcu_domain;

    // 32.11.2.4.3, non-member functions
    rcu_domain& rcu_default_domain() noexcept;
    void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
    void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
    template<class T, class D = default_delete<T>>
        void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
}

```

32.11.2.3 Class template rcu_obj_base

[saferecl.rcu.base]

- ¹ Objects of type T to be protected by RCU inherit from a specialization rcu_obj_base<T, D> for some D.

```

namespace std {
    template<class T, class D = default_delete<T>>
    class rcu_obj_base {
    public:
        void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
    protected:
        rcu_obj_base() = default;
        rcu_obj_base(const rcu_obj_base&) = default;
        rcu_obj_base(rcu_obj_base&&) = default;
        rcu_obj_base& operator=(const rcu_obj_base&) = default;
        rcu_obj_base& operator=(rcu_obj_base&&) = default;
        ~rcu_obj_base() = default;
    private:
        D deleter;           // exposition only
    };
}

```

- ² The behavior of a program that adds specializations for rcu_obj_base is undefined.
- ³ T may be an incomplete type. It shall be complete before any member of the resulting specialization of rcu_obj_base is referenced.
- ⁴ D shall be a function object type (22.10) for which, given a value d of type D and a value ptr of type T*, the expression d(ptr) is valid.
- ⁵ D shall meet the requirements for Cpp17DefaultConstructible and Cpp17MoveAssignable.
- ⁶ If D is trivially copyable, all specializations of rcu_obj_base<T, D> are trivially copyable.

```
void retire(D d = D(), rcu_domain& dom = rcu_default_domain()) noexcept;
```

- ⁷ *Mandates:* T is an rcu-protectable type.
- ⁸ *Preconditions:* *this is a base class subobject of an object x of type T. The member function rcu_obj_base<T, D>::retire was not invoked on x before. The assignment to deleter does not exit via an exception.
- ⁹ *Effects:* Evaluates deleter = std::move(d) and schedules the evaluation of the expression deleter(addressof(x)) in the domain dom; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in dom.
- [Note 1: If such evaluations acquire resources held across any invocation of retire on dom, deadlock can occur. — end note]

32.11.2.4 Class rcu_domain

[saferecl.rcu.domain]

32.11.2.4.1 General

[saferecl.rcu.domain.general]

```

namespace std {
    class rcu_domain {
    public:

```

```

    rcu_domain(const rcu_domain&) = delete;
    rcu_domain& operator=(const rcu_domain&) = delete;

    void lock() noexcept;
    bool try_lock() noexcept;
    void unlock() noexcept;
};
}

```

¹ This class meets the requirements of *Cpp17Lockable* (32.2.5.3) and provides regions of RCU protection.

[Example 1:

```
std::scoped_lock<rcu_domain> rlock(rcu_default_domain());
```

— end example]

² The functions `lock` and `unlock` establish (possibly nested) regions of RCU protection.

32.11.2.4.2 Member functions

[saferecl.rcu.domain.members]

```
void lock() noexcept;
```

¹ *Effects:* Opens a region of RCU protection.

² *Remarks:* Calls to `lock` do not introduce a data race (6.10.2.2) involving `*this`.

```
bool try_lock() noexcept;
```

³ *Effects:* Equivalent to `lock()`.

⁴ *Returns:* `true`.

```
void unlock() noexcept;
```

⁵ *Preconditions:* A call to `lock` that opened an unclosed region of RCU protection is sequenced before the call to `unlock`.

⁶ *Effects:* Closes the unclosed region of RCU protection that was most recently opened. May invoke scheduled evaluations in `*this`.

⁷ [Note 1: If such evaluations acquire resources held across any invocation of `unlock` on `*this`, deadlock can occur. — end note]

⁸ *Remarks:* Calls to `unlock` do not introduce a data race involving `*this`.

[Note 2: Evaluation of scheduled evaluations can still cause a data race. — end note]

32.11.2.4.3 Non-member functions

[saferecl.rcu.domain.func]

```
rcu_domain& rcu_default_domain() noexcept;
```

¹ *Returns:* A reference to a static-duration object of type `rcu_domain`. A reference to the same object is returned every time this function is called.

```
void rcu_synchronize(rcu_domain& dom = rcu_default_domain()) noexcept;
```

² *Effects:* If the call to `rcu_synchronize` does not strongly happen before the lock opening an RCU protection region `R` on `dom`, blocks until the `unlock` closing `R` happens.

³ *Synchronization:* The `unlock` closing `R` strongly happens before the return from `rcu_synchronize`.

```
void rcu_barrier(rcu_domain& dom = rcu_default_domain()) noexcept;
```

⁴ *Effects:* May evaluate any scheduled evaluations in `dom`. For any evaluation that happens before the call to `rcu_barrier` and that schedules an evaluation `E` in `dom`, blocks until `E` has been evaluated.

⁵ *Synchronization:* The evaluation of any such `E` strongly happens before the return from `rcu_barrier`.

[Note 1: A call to `rcu_barrier` does not imply a call to `rcu_synchronize` and vice versa. — end note]

```
template<class T, class D = default_delete<T>>
```

```
void rcu_retire(T* p, D d = D(), rcu_domain& dom = rcu_default_domain());
```

⁶ *Mandates:* `is_move_constructible_v<D>` is `true` and the expression `d(p)` is well-formed.

⁷ *Preconditions:* `D` meets the *Cpp17MoveConstructible* and *Cpp17Destructible* requirements.

8 *Effects:* May allocate memory. It is unspecified whether the memory allocation is performed by invoking operator `new`. Initializes an object `d1` of type `D` from `std::move(d)`. Schedules the evaluation of `d1(p)` in the domain `dom`; the behavior is undefined if that evaluation exits via an exception. May invoke scheduled evaluations in `dom`.

[*Note 2:* If `rcu_retire` exits via an exception, no evaluation is scheduled. — *end note*]

9 *Throws:* `bad_alloc` or any exception thrown by the initialization of `d1`.

10 [*Note 3:* If scheduled evaluations acquire resources held across any invocation of `rcu_retire` on `dom`, deadlock can occur. — *end note*]

32.11.3 Hazard pointers

[saferecl.hp]

32.11.3.1 General

[saferecl.hp.general]

1 A hazard pointer is a single-writer multi-reader pointer that can be owned by at most one thread at any time. Only the owner of the hazard pointer can set its value, while any number of threads may read its value. The owner thread sets the value of a hazard pointer to point to an object in order to indicate to concurrent threads—which may delete such an object—that the object is not yet safe to delete.

2 A class type `T` is *hazard-protectable* if it has exactly one base class of type `hazard_pointer_obj_base<T, D>` for some `D`, that base is public and non-virtual, and it has no base classes of type `hazard_pointer_obj_base<T2, D2>` for any other combination `T2, D2`. An object is *hazard-protectable* if it is of hazard-protectable type.

3 The time span between creation and destruction of a hazard pointer `h` is partitioned into a series of *protection epochs*; in each protection epoch, `h` either is *associated with* a hazard-protectable object, or is *unassociated*. Upon creation, a hazard pointer is unassociated. Changing the association (possibly to the same object) initiates a new protection epoch and ends the preceding one.

4 An object `x` of hazard-protectable type `T` is *retired* with a deleter of type `D` when the member function `hazard_pointer_obj_base<T, D>::retire` is invoked on `x`. Any given object `x` shall be retired at most once.

5 A retired object `x` is *reclaimed* by invoking its deleter with a pointer to `x`; the behavior is undefined if that invocation exits via an exception.

6 A hazard-protectable object `x` is *possibly-reclaimable* with respect to an evaluation `A` if

(6.1) — `x` is not reclaimed; and

(6.2) — `x` is retired in an evaluation `R` and `A` does not happen before `R`; and

(6.3) — for all hazard pointers `h` and for every protection epoch `E` of `h` during which `h` is associated with `x`:

(6.3.1) — if the beginning of `E` happens before `R`, the end of `E` strongly happens before `A`; and

(6.3.2) — if `E` began by an evaluation of `try_protect` with argument `src`, label its atomic load operation `L`. If there exists an atomic modification `B` on `src` such that `L` observes a modification that is modification-ordered before `B`, and `B` happens before `x` is retired, the end of `E` strongly happens before `A`.

[*Note 1:* In typical use, a store to `src` sequenced before retiring `x` will be such an atomic operation `B`. — *end note*]

[*Note 2:* The latter two conditions convey the informal notion that a protection epoch that began before retiring `x`, as implied either by the happens-before relation or the coherence order of some source, delays the reclamation of `x`. — *end note*]

7 The number of possibly-reclaimable objects has an unspecified bound.

[*Note 3:* The bound can be a function of the number of hazard pointers, the number of threads that retire objects, and the number of threads that use hazard pointers. — *end note*]

[*Example 1:* The following example shows how hazard pointers allow updates to be carried out in the presence of concurrent readers. The object of type `hazard_pointer` in `print_name` protects the object `*ptr` from being reclaimed by `ptr->retire` until the end of the protection epoch.

```
struct Name : public hazard_pointer_obj_base<Name> { /* details */ };
atomic<Name*> name;
// called often and in parallel!
void print_name() {
    hazard_pointer h = make_hazard_pointer();
```

```

    Name* ptr = h.protect(name);           // Protection epoch starts
    // ... safe to access *ptr
}                                           // Protection epoch ends.

```

// called rarely, but possibly concurrently with print_name

```

void update_name(Name* new_name) {
    Name* ptr = name.exchange(new_name);
    ptr->retire();
}

```

— end example]

32.11.3.2 Header <hazard_pointer> synopsis

[hazard.pointer.syn]

```

namespace std {
    // 32.11.3.3, class template hazard_pointer_obj_base
    template<class T, class D = default_delete<T>> class hazard_pointer_obj_base;

    // 32.11.3.4, class hazard_pointer
    class hazard_pointer;

    // 32.11.3.4.4, non-member functions
    hazard_pointer make_hazard_pointer();
    void swap(hazard_pointer&, hazard_pointer&) noexcept;
    void make_hazard_pointer_batch(span<hazard_pointer>);
    void clear_hazard_pointer_batch(span<hazard_pointer>) noexcept;
}

```

32.11.3.3 Class template hazard_pointer_obj_base

[saferecl.hp.base]

```

namespace std {
    template<class T, class D = default_delete<T>>
    class hazard_pointer_obj_base {
    public:
        void retire(D d = D()) noexcept;
    protected:
        hazard_pointer_obj_base() = default;
        hazard_pointer_obj_base(const hazard_pointer_obj_base&) = default;
        hazard_pointer_obj_base(hazard_pointer_obj_base&&) = default;
        hazard_pointer_obj_base& operator=(const hazard_pointer_obj_base&) = default;
        hazard_pointer_obj_base& operator=(hazard_pointer_obj_base&&) = default;
        ~hazard_pointer_obj_base() = default;
    private:
        D deleter;           // exposition only
    };
}

```

- ¹ D shall be a function object type (22.10.4) for which, given a value d of type D and a value ptr of type T*, the expression d(ptr) is valid.
- ² The behavior of a program that adds specializations for hazard_pointer_obj_base is undefined.
- ³ D shall meet the requirements for Cpp17DefaultConstructible and Cpp17MoveAssignable.
- ⁴ T may be an incomplete type. It shall be complete before any member of the resulting specialization of hazard_pointer_obj_base is referenced.

```
void retire(D d = D()) noexcept;
```

- ⁵ *Mandates:* T is a hazard-protectable type.
- ⁶ *Preconditions:* *this is a base class subobject of an object x of type T. x is not retired. Move-assigning d to deleter does not exit via an exception.
- ⁷ *Effects:* Move-assigns d to deleter, thereby setting it as the deleter of x, then retires x. May reclaim possibly-reclaimable objects.

32.11.3.4 Class hazard_pointer

[saferecl.hp.holder]

32.11.3.4.1 General

[saferecl.hp.holder.general]

```

namespace std {
    class hazard_pointer {
    public:
        hazard_pointer() noexcept;
        hazard_pointer(hazard_pointer&&) noexcept;
        hazard_pointer& operator=(hazard_pointer&&) noexcept;
        ~hazard_pointer();

        bool empty() const noexcept;
        template<class T> T* protect(const atomic<T*>& src) noexcept;
        template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
        template<class T> void reset_protection(const T* ptr) noexcept;
        void reset_protection(nullptr_t = nullptr) noexcept;
        void swap(hazard_pointer&) noexcept;
    };
}

```

- ¹ An object of type `hazard_pointer` is either empty or *owns* a hazard pointer. Each hazard pointer is owned by exactly one object of type `hazard_pointer`.

[Note 1: An empty `hazard_pointer` object is different from a `hazard_pointer` object that owns an unassociated hazard pointer. An empty `hazard_pointer` object does not own any hazard pointers. — end note]

32.11.3.4.2 Constructors, destructor, and assignment

[saferecl.hp.holder.ctor]

```
hazard_pointer() noexcept;
```

- ¹ *Postconditions:* `*this` is empty.

```
hazard_pointer(hazard_pointer&& other) noexcept;
```

- ² *Postconditions:* If `other` is empty, `*this` is empty. Otherwise, `*this` owns the hazard pointer originally owned by `other`; `other` is empty.

```
~hazard_pointer();
```

- ³ *Effects:* If `*this` is not empty, destroys the hazard pointer owned by `*this`, thereby ending its current protection epoch.

```
hazard_pointer& operator=(hazard_pointer&& other) noexcept;
```

- ⁴ *Effects:* If `this == &other` is true, no effect. Otherwise, if `*this` is not empty, destroys the hazard pointer owned by `*this`, thereby ending its current protection epoch.

- ⁵ *Postconditions:* If `other` was empty, `*this` is empty. Otherwise, `*this` owns the hazard pointer originally owned by `other`. If `this != &other` is true, `other` is empty.

- ⁶ *Returns:* `*this`.

32.11.3.4.3 Member functions

[saferecl.hp.holder.mem]

```
bool empty() const noexcept;
```

- ¹ *Returns:* true if and only if `*this` is empty.

```
template<class T> T* protect(const atomic<T*>& src) noexcept;
```

- ² *Effects:* Equivalent to:

```

    T* ptr = src.load(memory_order::relaxed);
    while (!try_protect(ptr, src)) {}
    return ptr;

```

```
template<class T> bool try_protect(T*& ptr, const atomic<T*>& src) noexcept;
```

- ³ *Mandates:* T is a hazard-protectable type.

- ⁴ *Preconditions:* `*this` is not empty.

- ⁵ *Effects:* Performs the following steps in order:

(5.1) — Initializes a variable `old` of type `T*` with the value of `ptr`.

(5.2) — Evaluates `reset_protection(old)`.

(5.3) — Assigns the value of `src.load(memory_order::acquire)` to `ptr`.

(5.4) — If `old == ptr` is false, evaluates `reset_protection()`.

6 *Returns:* `old == ptr`.

```
template<class T> void reset_protection(const T* ptr) noexcept;
```

7 *Mandates:* `T` is a hazard-protectable type.

8 *Preconditions:* `*this` is not empty.

9 *Effects:* If `ptr` is a null pointer value, invokes `reset_protection()`. Otherwise, associates the hazard pointer owned by `*this` with `*ptr`, thereby ending the current protection epoch.

10 *Complexity:* Constant.

```
void reset_protection(nullptr_t = nullptr) noexcept;
```

11 *Preconditions:* `*this` is not empty.

12 *Postconditions:* The hazard pointer owned by `*this` is unassociated.

13 *Complexity:* Constant.

```
void swap(hazard_pointer& other) noexcept;
```

14 *Effects:* Swaps the hazard pointer ownership of this object with that of `other`.

[*Note 1:* The owned hazard pointers, if any, remain unchanged during the swap and continue to be associated with the respective objects that they were protecting before the swap, if any. No protection epochs are ended or initiated. — *end note*]

15 *Complexity:* Constant.

32.11.3.4.4 Non-member functions

[saferecl.hp.holder.nonmem]

```
hazard_pointer make_hazard_pointer();
```

1 *Effects:* Constructs a hazard pointer.

2 *Returns:* A `hazard_pointer` object that owns the newly-constructed hazard pointer.

3 *Throws:* May throw `bad_alloc` if memory for the hazard pointer could not be allocated.

```
void swap(hazard_pointer& a, hazard_pointer& b) noexcept;
```

4 *Effects:* Equivalent to `a.swap(b)`.

```
void make_hazard_pointer_batch(span<hazard_pointer> batch);
```

5 *Effects:* If an exception is thrown, there are no effects. Otherwise, for each element `e` of `batch` such that `e.empty()` is true, constructs a hazard pointer and makes `e` the owner of that hazard pointer.

6 *Throws:* `bad_alloc` if memory for any of the newly-constructed hazard pointers could not be allocated.

```
void clear_hazard_pointer_batch(span<hazard_pointer> batch) noexcept;
```

7 *Effects:* For each element `e` of `batch`, if `e.empty()` is false, destroys the hazard pointer owned by `e` and makes `e` empty.

33 Execution control library

[exec]

33.1 General

[exec.general]

- ¹ This Clause describes components supporting execution of function objects (22.10).
- ² The following subclauses describe the requirements, concepts, and components for execution control primitives as summarized in Table 157.

Table 157 — Execution control library summary [tab:exec.summary]

Subclause	Header
33.6 Schedulers	<execution>
33.7 Receivers	
33.8 Operation states	
33.9 Senders	

- ³ Table 158 shows the types of customization point objects (16.3.3.3.5) used in the execution control library.

Table 158 — Types of customization point objects in the execution control library
[tab:exec.pos]

Customization point object type	Purpose	Examples
core	provide core execution functionality, and connection between core components	e.g., <code>connect</code> , <code>start</code>
completion functions	called by senders to announce the completion of the work (success, error, or cancellation)	<code>set_value</code> , <code>set_error</code> , <code>set_stopped</code>
senders	allow the specialization of the provided sender algorithms	— sender factories (e.g., <code>schedule</code> , <code>just</code> , <code>read_env</code>) — sender adaptors (e.g., <code>continues_on</code> , <code>then</code> , <code>let_value</code>) — sender consumers (e.g., <code>sync_wait</code>)
queries	allow querying different properties of objects	— general queries (e.g., <code>get_allocator</code> , <code>get_stop_token</code>) — environment queries (e.g., <code>get_scheduler</code> , <code>get_delegation_scheduler</code>) — scheduler queries (e.g., <code>get_forward_progress_guarantee</code>) — sender attribute queries (e.g., <code>get_completion_scheduler</code>)

- ⁴ This clause makes use of the following exposition-only entities.
- ⁵ For a subexpression `expr`, let `MANDATE-NOTHROW(expr)` be expression-equivalent to `expr`.
Mandates: `noexcept(expr)` is true.

```

6 namespace std {
  template<class T>
    concept movable-value =                                // exposition only
      move_constructible<decay_t<T>> &&
      constructible_from<decay_t<T>, T> &&
      (!is_array_v<remove_reference_t<T>>);
}

```

7 For function types $F1$ and $F2$ denoting $R1(\text{Args1} \dots)$ and $R2(\text{Args2} \dots)$, respectively, *MATCHING-SIG* ($F1$, $F2$) is true if and only if `same_as< $R1(\text{Args1} \dots)$ ,  $R2(\text{Args2} \dots)$ >` is true.

8 For a subexpression `err`, let `Err` be `decltype((err))` and let *AS-EXCEPT-PTR*(`err`) be:

(8.1) — `err` if `decay_t<Err>` denotes the type `exception_ptr`.

Preconditions: `!err` is false.

(8.2) — Otherwise, `make_exception_ptr(system_error(err))` if `decay_t<Err>` denotes the type `error_code`.

(8.3) — Otherwise, `make_exception_ptr(err)`.

9 For a subexpression `expr`, let *AS-CONST*(`expr`) be expression-equivalent to

```

[] (const auto& x) noexcept -> const auto& { return x; }(expr)

```

33.2 Queries and queryables

[exec.queryable]

33.2.1 General

[exec.queryable.general]

1 A *queryable object* is a read-only collection of key/value pair where each key is a customization point object known as a *query object*. A *query* is an invocation of a query object with a queryable object as its first argument and a (possibly empty) set of additional arguments. A query imposes syntactic and semantic requirements on its invocations.

2 Let `q` be a query object, let `args` be a (possibly empty) pack of subexpressions, let `env` be a subexpression that refers to a queryable object `o` of type `O`, and let `cenv` be a subexpression referring to `o` such that `decltype((cenv))` is `const O&`. The expression `q(env, args...)` is equal to (18.2) the expression `q(cenv, args...)`.

3 The type of a query expression cannot be `void`.

4 The expression `q(env, args...)` is equality-preserving (18.2) and does not modify the query object or the arguments.

5 If the expression `env.query(q, args...)` is well-formed, then it is expression-equivalent to `q(env, args...)`.

6 Unless otherwise specified, the result of a query is valid as long as the queryable object is valid.

33.2.2 queryable concept

[exec.queryable.concept]

```

namespace std {
  template<class T>
    concept queryable = destructible<T>; // exposition only
}

```

1 The exposition-only *queryable* concept specifies the constraints on the types of queryable objects.

2 Let `env` be an object of type `Env`. The type `Env` models *queryable* if for each callable object `q` and a pack of subexpressions `args`, if `requires { q(env, args...) }` is true then `q(env, args...)` meets any semantic requirements imposed by `q`.

33.3 Asynchronous operations

[exec.async.ops]

1 An *execution resource* is a program entity that manages a (possibly dynamic) set of execution agents (32.2.5.1), which it uses to execute parallel work on behalf of callers.

[Example 1: The currently active thread, a system-provided thread pool, and uses of an API associated with an external hardware accelerator are all examples of execution resources. — end example]

Execution resources execute asynchronous operations. An execution resource is either valid or invalid.

2 An *asynchronous operation* is a distinct unit of program execution that

(2.1) — is explicitly created;

- (2.2) — can be explicitly started once at most;
- (2.3) — once started, eventually completes exactly once with a (possibly empty) set of result datums and in exactly one of three *dispositions*: success, failure, or cancellation;
 - (2.3.1) — A successful completion, also known as a *value completion*, can have an arbitrary number of result datums.
 - (2.3.2) — A failure completion, also known as an *error completion*, has a single result datum.
 - (2.3.3) — A cancellation completion, also known as a *stopped completion*, has no result datum.

An asynchronous operation's *async result* is its disposition and its (possibly empty) set of result datums.

- (2.4) — can complete on a different execution resource than the execution resource on which it started; and
- (2.5) — can create and start other asynchronous operations called *child operations*. A child operation is an asynchronous operation that is created by the parent operation and, if started, completes before the parent operation completes. A *parent operation* is the asynchronous operation that created a particular child operation.

[Note 1: An asynchronous operation can execute synchronously; that is, it can complete during the execution of its start operation on the thread of execution that started it. — end note]

- 3 An asynchronous operation has associated state known as its *operation state*.
- 4 An asynchronous operation has an associated environment. An *environment* is a queryable object (33.2) representing the execution-time properties of the operation's caller. The caller of an asynchronous operation is its parent operation or the function that created it.
- 5 An asynchronous operation has an associated receiver. A *receiver* is an aggregation of three handlers for the three asynchronous completion dispositions:
 - (5.1) — a value completion handler for a value completion,
 - (5.2) — an error completion handler for an error completion, and
 - (5.3) — a stopped completion handler for a stopped completion.

A receiver has an associated environment. An asynchronous operation's operation state owns the operation's receiver. The environment of an asynchronous operation is equal to its receiver's environment.

- 6 For each completion disposition, there is a *completion function*. A completion function is a customization point object (16.3.3.3.5) that accepts an asynchronous operation's receiver as the first argument and the result datums of the asynchronous operation as additional arguments. The value completion function invokes the receiver's value completion handler with the value result datums; likewise for the error completion function and the stopped completion function. A completion function has an associated type known as its *completion tag* that is the unqualified type of the completion function. A valid invocation of a completion function is called a *completion operation*.
- 7 The *lifetime of an asynchronous operation*, also known as the operation's *async lifetime*, begins when its start operation begins executing and ends when its completion operation begins executing. If the lifetime of an asynchronous operation's associated operation state ends before the lifetime of the asynchronous operation, the behavior is undefined. After an asynchronous operation executes a completion operation, its associated operation state is invalid. Accessing any part of an invalid operation state is undefined behavior.
- 8 An asynchronous operation shall not execute a completion operation before its start operation has begun executing. After its start operation has begun executing, exactly one completion operation shall execute. The lifetime of an asynchronous operation's operation state can end during the execution of the completion operation.
- 9 A *sender* is a factory for one or more asynchronous operations. *Connecting* a sender and a receiver creates an asynchronous operation. The asynchronous operation's associated receiver is equal to the receiver used to create it, and its associated environment is equal to the environment associated with the receiver used to create it. The lifetime of an asynchronous operation's associated operation state does not depend on the lifetimes of either the sender or the receiver from which it was created. A sender is started when it is connected to a receiver and the resulting asynchronous operation is started. A sender's *async result* is the *async result* of the asynchronous operation created by connecting it to a receiver. A sender sends its results by way of the asynchronous operation(s) it produces, and a receiver receives those results. A sender is either valid or invalid; it becomes invalid when its parent sender (see below) becomes invalid.

- ¹⁰ A *scheduler* is an abstraction of an execution resource with a uniform, generic interface for scheduling work onto that resource. It is a factory for senders whose asynchronous operations execute value completion operations on an execution agent belonging to the scheduler's associated execution resource. A *schedule-expression* obtains such a sender from a scheduler. A *schedule sender* is the result of a schedule expression. On success, an asynchronous operation produced by a schedule sender executes a value completion operation with an empty set of result datums. Multiple schedulers can refer to the same execution resource. A scheduler can be valid or invalid. A scheduler becomes invalid when the execution resource to which it refers becomes invalid, as do any schedule senders obtained from the scheduler, and any operation states obtained from those senders.
- ¹¹ An asynchronous operation has one or more associated completion schedulers for each of its possible dispositions. A *completion scheduler* is a scheduler whose associated execution resource is used to execute a completion operation for an asynchronous operation. A value completion scheduler is a scheduler on which an asynchronous operation's value completion operation can execute. Likewise for error completion schedulers and stopped completion schedulers.
- ¹² A sender has an associated queryable object (33.2) known as its *attributes* that describes various characteristics of the sender and of the asynchronous operation(s) it produces. For each disposition, there is a query object for reading the associated completion scheduler from a sender's attributes; i.e., a value completion scheduler query object for reading a sender's value completion scheduler, etc. If a completion scheduler query is well-formed, the returned completion scheduler is unique for that disposition for any asynchronous operation the sender creates. A schedule sender is required to have a value completion scheduler attribute whose value is equal to the scheduler that produced the schedule sender.
- ¹³ A *completion signature* is a function type that describes a completion operation. An asynchronous operation has a finite set of possible completion signatures corresponding to the completion operations that the asynchronous operation potentially evaluates (6.3). For a completion function `set`, receiver `rcvr`, and pack of arguments `args`, let `c` be the completion operation `set(rcvr, args...)`, and let `F` be the function type `decltype(auto)(set))(decltype((args))...)`. A completion signature `Sig` is associated with `c` if and only if `MATCHING-SIG(Sig, F)` is `true` (33.1). Together, a sender type and an environment type `Env` determine the set of completion signatures of an asynchronous operation that results from connecting the sender with a receiver that has an environment of type `Env`. The type of the receiver does not affect an asynchronous operation's completion signatures, only the type of the receiver's environment. A *non-dependent sender* is a sender type whose completion signatures are knowable independent of an execution environment.
- ¹⁴ A sender algorithm is a function that takes and/or returns a sender. There are three categories of sender algorithms:
- (14.1) — A *sender factory* is a function that takes non-senders as arguments and that returns a sender.
 - (14.2) — A *sender adaptor* is a function that constructs and returns a parent sender from a set of one or more child senders and a (possibly empty) set of additional arguments. An asynchronous operation created by a parent sender is a parent operation to the child operations created by the child senders.
 - (14.3) — A *sender consumer* is a function that takes one or more senders and a (possibly empty) set of additional arguments, and whose return type is not the type of a sender.

33.4 Header <execution> synopsis

[execution.syn]

```

namespace std {
    // 26.3.6.2, execution policy type trait
    template<class T> struct is_execution_policy;           // freestanding

}
}

```

¹ The exposition-only type *variant-or-empty*<Ts...> is defined as follows:

- (1.1) — If `sizeof...(Ts)` is greater than zero, *variant-or-empty*<Ts...> denotes *variant*<Us...> where Us... is the pack decay_t<Ts>... with duplicate types removed.
- (1.2) — Otherwise, *variant-or-empty*<Ts...> denotes the exposition-only class type:

```

namespace std::execution {
    struct empty-variant {          // exposition only
        empty-variant() = delete;
    };
}

```

² For type Sndr and pack of types Env, let CS be *completion_signatures_of_t*<Sndr, Env...>. Then *single-sender-value-type*<Sndr, Env...> is ill-formed if CS is ill-formed; otherwise, it is an alias for:

- (2.1) — *gather-signatures*<set_value_t, CS, decay_t, type_identity_t> if that type is well-formed,
- (2.2) — Otherwise, void if *gather-signatures*<set_value_t, CS, tuple, variant> is *variant*<tuple<>> or *variant*<>,
- (2.3) — Otherwise, *gather-signatures*<set_value_t, CS, *decayed-tuple*, type_identity_t> if that type is well-formed,
- (2.4) — Otherwise, *single-sender-value-type*<Sndr, Env...> is ill-formed.

³ The exposition-only concept *single-sender* is defined as follows:

```

namespace std::execution {
    template<class Sndr, class... Env>
        concept single-sender = sender_in<Sndr, Env...> &&
            requires {
                typename single-sender-value-type<Sndr, Env...>;
            };
}

```

⁴ A type satisfies and models the exposition-only concept *valid-completion-signatures* if it is a specialization of the *completion_signatures* class template.

33.5 Queries

[exec.queries]

33.5.1 Query utilities

[exec.queries.expos]

- ¹ Subclause 33.5 makes use of the following exposition-only entities.
- ² For subexpressions *q* and *tag* and pack *args*, let *TRY-QUERY*(*q*, *tag*, *args*...) be expression-equivalent to *AS-CONST*(*q*).*query*(*tag*, *args*...) if that expression is well-formed, and *AS-CONST*(*q*).*query*(*tag*) otherwise except that *args*... is evaluated.
- ³ For subexpressions *q* and *tag* and pack *args*, let *HIDE-SCHED*(*q*) be an object *o* such that *o*.*query*(*tag*, *args*...) is ill-formed when the decayed type of *tag* is *get_scheduler_t* or *get_domain_t*, and *q*.*query*(*tag*, *args*...) otherwise.

33.5.2 forwarding_query

[exec.fwd.env]

- ¹ *forwarding_query* asks a query object whether it should be forwarded through queryable adaptors.
- ² The name *forwarding_query* denotes a query object. For some query object *q* of type *Q*, *forwarding_query*(*q*) is expression-equivalent to:
 - (2.1) — *MANDATE-NOT_THROW*(*q*.*query*(*forwarding_query*)) if that expression is well-formed.
Mandates: The expression above has type *bool* and is a core constant expression if *q* is a core constant expression.
 - (2.2) — Otherwise, *true* if *derived_from*<*Q*, *forwarding_query_t*> is *true*.
 - (2.3) — Otherwise, *false*.

33.5.3 get_allocator

[exec.get.allocator]

- ¹ *get_allocator* asks a queryable object for its associated allocator.
- ² The name *get_allocator* denotes a query object. For a subexpression *env*, *get_allocator*(*env*) is expression-equivalent to *MANDATE-NOT_THROW*(*AS-CONST*(*env*).*query*(*get_allocator*)).
Mandates: If the expression above is well-formed, its type satisfies *simple-allocator* (16.4.4.6.1).
- ³ *forwarding_query*(*get_allocator*) is a core constant expression and has value *true*.

33.5.4 get_stop_token

[exec.get.stop.token]

- ¹ *get_stop_token* asks a queryable object for an associated stop token.
- ² The name *get_stop_token* denotes a query object. For a subexpression *env*, *get_stop_token*(*env*) is expression-equivalent to:
 - (2.1) — *MANDATE-NOT_THROW*(*AS-CONST*(*env*).*query*(*get_stop_token*)) if that expression is well-formed.
Mandates: The type of the expression above satisfies *stoppable_token*.
 - (2.2) — Otherwise, *never_stop_token*{}
- ³ *forwarding_query*(*get_stop_token*) is a core constant expression and has value *true*.

33.5.5 execution::get_env

[exec.get.env]

- ¹ *execution::get_env* is a customization point object. For a subexpression *o*, *execution::get_env*(*o*) is expression-equivalent to:
 - (1.1) — *MANDATE-NOT_THROW*(*AS-CONST*(*o*).*get_env*()) if that expression is well-formed.
Mandates: The type of the expression above satisfies *queryable* (33.2).
 - (1.2) — Otherwise, *env<>{}.*
- ² The value of *get_env*(*o*) shall be valid while *o* is valid.
- ³ [Note 1: When passed a sender object, *get_env* returns the sender's associated attributes. When passed a receiver, *get_env* returns the receiver's associated execution environment. — end note]

33.5.6 execution::get_domain

[exec.get.domain]

- ¹ *get_domain* asks a queryable object for its associated execution domain tag.

- ² The name `get_domain` denotes a query object. For a subexpression `env`, `get_domain(env)` is expression-equivalent to `MANDATE-NOTHROW(D())`, where `D` is the type of the first of the following expressions that is well-formed:

- (2.1) — `auto(AS-CONST(env).query(get_domain))`.
- (2.2) — `get_completion_domain<set_value_t>(get_scheduler(env), HIDE-SCHED(env))`.
- (2.3) — `default_domain()`, except that `env` is evaluated.

- ³ `forwarding_query(execution::get_domain)` is a core constant expression and has value `true`.

33.5.7 `execution::get_scheduler`

[`exec.get.scheduler`]

- ¹ `get_scheduler` asks a queryable object for its associated scheduler.
- ² The name `get_scheduler` denotes a query object. For a subexpression `env`, `get_scheduler(env)` is expression-equivalent to `get_completion_scheduler<set_value_t>(MANDATE-NOTHROW(AS-CONST(env).query(get_scheduler)), HIDE-SCHED(env))`.
- Mandates:* If the expression above is well-formed, its type satisfies `scheduler`.
- ³ `forwarding_query(execution::get_scheduler)` is a core constant expression and has value `true`.

33.5.8 `execution::get_start_scheduler`

[`exec.get.start.scheduler`]

- ¹ `get_start_scheduler` asks a queryable object for the scheduler an operation will be or was started on.
- ² The name `get_start_scheduler` denotes a query object. For a subexpression `env`, `get_start_scheduler(env)` is expression-equivalent to `MANDATE-NOTHROW(AS-CONST(env).query(get_start_scheduler))`.
- Mandates:* If the expression above is well-formed, its type satisfies `scheduler`.
- ³ `forwarding_query(execution::get_start_scheduler)` is a core constant expression and has value `true`.
- ⁴ Given subexpressions `sndr` and `rcvr` such that `sender-to<decltype((sndr)), decltype((rcvr))>` is `true` and the expression `get_start_scheduler(get_env(rcvr))` is well-formed, an operation state that is the result of calling `connect(sndr, rcvr)` shall, if it is started, be started on an execution agent associated with the scheduler `get_start_scheduler(get_env(rcvr))`.

33.5.9 `execution::get_delegation_scheduler`

[`exec.get.delegation.scheduler`]

- ¹ `get_delegation_scheduler` asks a queryable object for a scheduler that can be used to delegate work to for the purpose of forward progress delegation (6.10.2.3).
- ² The name `get_delegation_scheduler` denotes a query object. For a subexpression `env`, `get_delegation_scheduler(env)` is expression-equivalent to `MANDATE-NOTHROW(AS-CONST(env).query(get_delegation_scheduler))`.
- Mandates:* If the expression above is well-formed, its type satisfies `scheduler`.
- ³ `forwarding_query(execution::get_delegation_scheduler)` is a core constant expression and has value `true`.

33.5.10 `execution::get_forward_progress_guarantee`

[`exec.get.fwd.progress`]

```
namespace std::execution {
    enum class forward_progress_guarantee {
        concurrent,
        parallel,
        weakly_parallel
    };
}
```

- ¹ `get_forward_progress_guarantee` asks a scheduler about the forward progress guarantee of execution agents created by that scheduler's associated execution resource (6.10.2.3).
- ² The name `get_forward_progress_guarantee` denotes a query object. For a subexpression `sch`, let `Sch` be `decltype((sch))`. If `Sch` does not satisfy `scheduler`, `get_forward_progress_guarantee` is ill-formed. Otherwise, `get_forward_progress_guarantee(sch)` is expression-equivalent to:
- `MANDATE-NOTHROW(AS-CONST(sch).query(get_forward_progress_guarantee))`

Mandates: The type of the expression above is `forward_progress_guarantee`.

- ³ If `get_forward_progress_guarantee(sch)` for some scheduler `sch` returns `forward_progress_guarantee::concurrent`, all execution agents created by that scheduler's associated execution resource shall provide the concurrent forward progress guarantee. If it returns `forward_progress_guarantee::parallel`, all such execution agents shall provide at least the parallel forward progress guarantee.

33.5.11 `execution::get_completion_scheduler` [exec.get.compl.sched]

- ¹ The name `get_completion_scheduler` denotes a query object template.
- ² Let *completion-fn* be a completion function (33.3); let *completion-fn-tag* be the associated completion tag of *completion-fn*; let `args` and `envs` be packs of subexpressions; and let `sndr` be a subexpression such that `sender<decltype((sndr))>` is true and `get_completion_scheduler<completion-fn-tag>(get_env(sndr), envs...)` is well-formed and denotes a scheduler `sch`.
- ³ `get_completion_scheduler<completion-fn-tag>` obtains the completion scheduler associated with a completion tag from a sender's attributes.
- ⁴ For subexpression `sch1` and pack `envs`, let `sch2` be `TRY-QUERY(sch1, get_completion_scheduler<set_value_t>, envs...)` and let `RECURSE-QUERY(sch1, envs...)` be expression-equivalent to `sch1` if `sch2` is ill-formed or if `sch1` and `sch2` have the same type and compare equal; otherwise, `RECURSE-QUERY(sch2, envs...)`.
- ⁵ For a subexpression `q` and pack `envs`, the expression `get_completion_scheduler<completion-fn-tag>(q, envs...)` is ill-formed if *completion-fn-tag* is not one of `set_value_t`, `set_error_t`, or `set_stopped_t`. Otherwise, the expression is expression-equivalent to:
- (5.1) — `MANDATE-NOTHROW(RECURSE-QUERY(TRY-QUERY(q, get_completion_scheduler<completion-fn-tag>, envs...), envs...))` if that expression is well-formed, except that `envs...` is evaluated only once.
- (5.2) — Otherwise, `auto(q)` if the type of `q` satisfies `scheduler` and `envs` is not an empty pack, except that `envs...` is evaluated.
- (5.3) — Otherwise, `get_completion_scheduler<completion-fn-tag>(q, envs...)` is ill-formed.

Mandates: If `get_completion_scheduler<completion-fn-tag>(q, envs...)` is well-formed, its type satisfies `scheduler`.

- ⁶ For a type `Tag`, subexpression `sndr`, and pack `envs`, let `CS` be `completion_signatures_of_t<decay_t<decltype((sndr))>, decltype((envs))...>`. If both `get_completion_scheduler<Tag>(get_env(sndr), envs...)` and `CS` are well-formed and `CS().count-of(Tag()) == 0` is true, the program is ill-formed.
- ⁷ If an asynchronous operation created by connecting `sndr` with a receiver `rcvr` causes the evaluation of `completion-fn(rcvr, args...)`, the behavior is undefined unless the evaluation happens on an execution agent that belongs to `sch`'s associated execution resource.
- ⁸ The expression `forwarding_query(get_completion_scheduler<completion-fn-tag>)` is a core constant expression and has value `true`.

33.5.12 `execution::get_completion_domain` [exec.get.compl.domain]

- ¹ `get_completion_domain<completion-tag>` obtains the completion domain associated with a completion tag from a sender's attributes.
- ² The name `get_completion_domain` denotes a query object template. For a subexpression `attrs` and pack `envs`, the expression `get_completion_domain<completion-tag>(attrs, envs...)` is ill-formed if *completion-tag* is not one of `void`, `set_value_t`, `set_error_t`, or `set_stopped_t`. Otherwise, the expression is expression-equivalent to `MANDATE-NOTHROW(D())`, where `D` is:
- (2.1) — The type of `TRY-QUERY(attrs, get_completion_domain<completion-tag>, envs...)` if that expression is well-formed.
- (2.2) — Otherwise, the type of `get_completion_domain<set_value_t>(attrs, envs...)` if *completion-tag* is `void`.
- (2.3) — Otherwise, the type of

```
TRY-QUERY(get_completion_scheduler<completion-tag>(attrs, envs...),
           get_completion_domain<set_value_t>, envs...)
```

if that expression is well-formed.

- (2.4) — Otherwise, `default_domain` if `scheduler<decltype((attrs))>` is true and `envs` is not an empty pack.
- (2.5) — Otherwise, `get_completion_domain<completion-tag>(attrs, envs...)` is ill-formed.
- 3 For a type `Tag`, subexpression `sndr`, and pack `envs`, let `CS` be `completion_signatures_of_t<decay_t<decltype((sndr))>, decltype((envs))...>`. If both `get_completion_domain<Tag>(get_env(sndr), envs...)` and `CS` are well-formed and `CS().count-of(Tag()) == 0` is true, the program is ill-formed.
- 4 Let `completion-fn` be a completion function (33.3); let `completion-tag` be the associated completion tag of `completion-fn`; let `args` and `envs` be packs of subexpressions; and let `sndr` be a subexpression such that `sender<decltype((sndr))>` is true and `get_completion_domain<completion-tag>(get_env(sndr), envs...)` is well-formed and denotes a domain tag `D`. If an asynchronous operation created by connecting `sndr` with a receiver `rcvr` causes the evaluation of `completion-fn(rcvr, args...)`, the behavior is undefined unless the evaluation happens on an execution agent of an execution resource whose associated execution domain tag is `D`.

The expression `forwarding_query(get_completion_domain<completion-tag>)` is a core constant expression and has value true.

33.5.13 execution::get_await_completion_adaptor [exec.get.await.adapt]

- 1 `get_await_completion_adaptor` asks a queryable object for its associated awaitable completion adaptor.
- 2 The name `get_await_completion_adaptor` denotes a query object. For a subexpression `env`,

```
get_await_completion_adaptor(env)
```

is expression-equivalent to

```
MANDATE-NOTROW(AS-CONST(env).query(get_await_completion_adaptor))
```
- 3 `forwarding_query(execution::get_await_completion_adaptor)` is a core constant expression and has value true.

33.6 Schedulers [exec.sched]

- 1 The `scheduler` concept defines the requirements of a scheduler type (33.3). `schedule` is a customization point object that accepts a scheduler. A valid invocation of `schedule` is a schedule-expression.

```
namespace std::execution {
    template<class Sch>
    concept scheduler =
        derived_from<typename remove_cvref_t<Sch>::scheduler_concept, scheduler_tag> &&
        queryable<Sch> &&
        requires(Sch&& sch) {
            { schedule(std::forward<Sch>(sch)) } -> sender;
            { get_forward_progress_guarantee(sch) } -> same_as<forward_progress_guarantee>;
        } &&
        equality_comparable<remove_cvref_t<Sch>> &&
        copyable<remove_cvref_t<Sch>>;
}
```

- 2 Let `Sch` be the type of a scheduler and let `Env` be the type of an execution environment for which `sender_in<schedule_result_t<Sch>, Env>` is satisfied. Then `sender-in-of<schedule_result_t<Sch>, Env>` shall be modeled.
- 3 No operation required by `copyable<remove_cvref_t<Sch>>` and `equality_comparable<remove_cvref_t<Sch>>` shall exit via an exception. None of these operations, nor a scheduler type's `schedule` function, shall introduce data races as a result of potentially concurrent (6.10.2.2) invocations of those operations from different threads.
- 4 For any two values `sch1` and `sch2` of some scheduler type `Sch`, `sch1 == sch2` shall return true only if both `sch1` and `sch2` share the same associated execution resource.
- 5 For a given scheduler expression `sch`, if the expression `get_completion_scheduler<set_value_t>(get_env(schedule(sch)))` is well-formed, it shall compare equal to `sch`.

- ⁶ For a given scheduler expression `sch`, type `T`, and pack of subexpressions `envs`, the following expressions are either both ill-formed, or both well-formed with the same type:

- (6.1) — `get_completion_domain<T>(sch, envs...)`
 (6.2) — `get_completion_domain<T>(get_env(schedule(sch)), envs...)`

Likewise, the following expressions are either both ill-formed, or both well-formed with the same type and value:

- (6.3) — `get_completion_scheduler<T>(sch, envs...)`
 (6.4) — `get_completion_scheduler<T>(get_env(schedule(sch)), envs...)`

- ⁷ A scheduler type's destructor shall not block pending completion of any receivers connected to the sender objects returned from `schedule`.
⁸ The exposition-only *infallible-scheduler* concept defines the requirements of a scheduler type whose `schedule` asynchronous operation can only complete with `set_value` unless stop can be requested:

```
template<class Sch, class Env>
concept infallible_scheduler =
    scheduler<Sch> &&
    (same_as<completion_signatures<set_value_t()>,
     completion_signatures_of_t<decltype(schedule(declval<Sch>())), Env>> ||
     (!unstoppable_token<stop_token_of_t<Env>> &&
      (same_as<completion_signatures<set_value_t(), set_stopped_t()>,
       completion_signatures_of_t<decltype(schedule(declval<Sch>())), Env>> ||
       same_as<completion_signatures<set_stopped_t(), set_value_t()>,
        completion_signatures_of_t<decltype(schedule(declval<Sch>())), Env>>)));
```

33.7 Receivers

[exec.recv]

33.7.1 Receiver concepts

[exec.recv.concepts]

- ¹ A receiver represents the continuation of an asynchronous operation. The `receiver` concept defines the requirements for a receiver type (33.3). The exposition-only concept *receiver-of* defines the requirements for a receiver type that is usable as the first argument of a set of completion operations corresponding to a set of completion signatures. The `get_env` customization point object is used to access a receiver's associated environment.

```
namespace std::execution {
    template<class Rcvr>
    concept receiver =
        derived_from<typename remove_cvref_t<Rcvr>::receiver_concept, receiver_tag> &&
        requires(const remove_cvref_t<Rcvr>& rcvr) {
            { get_env(rcvr) } -> queryable;
        } &&
        move_constructible<remove_cvref_t<Rcvr>> && // rvalues are movable, and
        constructible_from<remove_cvref_t<Rcvr>, Rcvr> && // lvalues are copyable, and
        is_nothrow_move_constructible_v<remove_cvref_t<Rcvr>>; // no-throw-movable

    template<class Signature, class Rcvr>
    concept valid_completion_for = // exposition only
        requires (Signature* sig) {
            []<class Tag, class... Args>(Tag*)(Args...)
                requires callable<Tag, remove_cvref_t<Rcvr>, Args...>
            {}(sig);
        };

    template<class Rcvr, class Completions>
    concept has_completions = // exposition only
        requires (Completions* completions) {
            []<valid_completion_for<Rcvr>... Sigs>(completion_signatures<Sigs...>*)
                {}(completions);
        };
};
```

```

template<class Rcvr, class Completions>
    concept receiver-of = // exposition only
        receiver<Rcvr> && has-completions<Rcvr, Completions>;
}

```

² Class types that are marked **final** do not model the **receiver** concept.

³ Let **rcvr** be a receiver and let **op_state** be an operation state associated with an asynchronous operation created by connecting **rcvr** with a sender. Let **token** be a stop token equal to **get_stop_token(get_env(rcvr))**. **token** shall remain valid for the duration of the asynchronous operation's lifetime (33.3).

[Note 1: This means that, unless it knows about further guarantees provided by the type of **rcvr**, the implementation of **op_state** cannot use **token** after it executes a completion operation. This also implies that any stop callbacks registered on **token** must be destroyed before the invocation of the completion operation. — end note]

```

4 namespace std::execution {
    template<class Rcvr, class ChildOp>
        concept inlinable_receiver = receiver<Rcvr> &&
            requires (ChildOp* child) {
                { remove_cvref_t<Rcvr>::make_receiver_for(child) } noexcept
                -> same_as<remove_cvref_t<Rcvr>>;
            };
}

```

The **inlinable_receiver** concept defines the requirements for a receiver that can be reconstructed on demand from a pointer to the operation state object created when the receiver was connected to a sender. Given a receiver object **rcvr** of type **Rcvr** which was connected to a sender producing an operation state object **op** of type **Op**, **Rcvr** models **inlinable_receiver<Op>** only if the expression **Rcvr::make_receiver_for(addressof(op))** evaluates to a receiver that is equal to **rcvr** (18.2).

[Note 2: Such a receiver does not need to be stored as a data member of **op** as it can be recreated on demand. — end note]

ChildOp may be an incomplete type.

⁵ Given objects $O_0, \dots, O_n$, O_n is *transitively constructed* from O_0 if

(5.1) — **remove_cvref_t<decltype(O_n)>** denotes the same type as **remove_cvref_t<decltype(O_0)>** and

(5.2) — either

(5.2.1) — O_1 was initialized by decay-copying a reference to O_0 , or

(5.2.2) — $n > 1$ and O_{n-1} is transitively constructed from O_0 and O_n was initialized from a non-const, non-volatile rvalue reference to O_{n-1} .

⁶ Let E be some well-formed expression **connect(sndr, rcvr)**. E *inlines the receiver* **rcvr** if the lifetimes of all objects transitively constructed from **rcvr** during the evaluation of E end within the evaluation of E .

[Note 3: This means such an expression does not store the receiver in the operation state. — end note]

⁷ Let E be some well-formed expression **connect(sndr, rcvr)** where

(7.1) — **sndr** denotes a sender type defined by this document and

(7.2) — E inlines the receiver **rcvr**.

Then, let **op** be the result of the evaluation of E , and wherever the specification of the operation associated with **op** contains a glvalue which would denote an object transitively constructed from **rcvr**, that glvalue instead denotes the result of applying the temporary materialization conversion to the expression **remove_cvref_t<decltype(rcvr)>::make_receiver_for(addressof(op))**.

⁸ Let **StdRcvr** be a receiver type defined by this document. Given some operation state type **Op**, it is unspecified whether **StdRcvr** models **inlinable_receiver<Op>**.

⁹ Let **StdOp** be some operation state type defined by this document, and let **Sndr** and **Rcvr** be types such that **is_same_v<connect_result_t<Sndr, Rcvr>, StdOp>** is true. If **Rcvr** models **inlinable_receiver<StdOp>** then it is implementation-defined whether, given an object **rcvr** of type **Rcvr**, the **connect** operation which produces an object of type **StdOp** inlines the receiver **rcvr**.

33.7.2 execution::set_value

[exec.set.value]

¹ **set_value** is a value completion function (33.3). Its associated completion tag is **set_value_t**. The expression **set_value(rcvr, vs...)** for a subexpression **rcvr** and pack of subexpressions **vs** is ill-formed if **rcvr** is an

lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to `MANDATE-NOTHROW(rcvr.set_value(vs...))`.

Mandates: If the expression above is well-formed, its type is void.

33.7.3 `execution::set_error` [exec.set.error]

- ¹ `set_error` is an error completion function (33.3). Its associated completion tag is `set_error_t`. The expression `set_error(rcvr, err)` for some subexpressions `rcvr` and `err` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to `MANDATE-NOTHROW(rcvr.set_error(err))`.

Mandates: If the expression above is well-formed, its type is void.

33.7.4 `execution::set_stopped` [exec.set.stopped]

- ¹ `set_stopped` is a stopped completion function (33.3). Its associated completion tag is `set_stopped_t`. The expression `set_stopped(rcvr)` for a subexpression `rcvr` is ill-formed if `rcvr` is an lvalue or an rvalue of const type. Otherwise, it is expression-equivalent to `MANDATE-NOTHROW(rcvr.set_stopped())`.

Mandates: If the expression above is well-formed, its type is void.

33.8 Operation states [exec.opstate]

33.8.1 General [exec.opstate.general]

- ¹ The `operation_state` concept defines the requirements of an operation state type (33.3).

```
namespace std::execution {
    template<class O>
        concept operation_state =
            derived_from<typename O::operation_state_concept, operation_state_tag> &&
            requires (O& o) {
                start(o);
            };
}
```

- ² If an `operation_state` object is destroyed during the lifetime of its asynchronous operation (33.3), the behavior is undefined.

[Note 1: The `operation_state` concept does not impose requirements on any operations other than destruction and `start`, including copy and move operations. Invoking any such operation on an object whose type models `operation_state` can lead to undefined behavior. — end note]

- ³ The program is ill-formed if it performs a copy or move construction or assignment operation on an operation state object created by connecting a library-provided sender.

33.8.2 `execution::start` [exec.opstate.start]

- ¹ The name `start` denotes a customization point object that starts (33.3) the asynchronous operation associated with the operation state object. For a subexpression `op`, the expression `start(op)` is ill-formed if `op` is an rvalue. Otherwise, it is expression-equivalent to `MANDATE-NOTHROW(op.start())`.

Mandates: If the expression above is well-formed, its type is void.

- ² If `op.start()` does not start (33.3) the asynchronous operation associated with the operation state `op`, the behavior of calling `start(op)` is undefined.

33.9 Senders [exec.snd]

33.9.1 General [exec.snd.general]

- ¹ Subclauses 33.9.11 and 33.9.12 define customizable algorithms that return senders. Each algorithm has a default implementation. Let `sndr` be the result of an invocation of such an algorithm or an object equal to the result (18.2), and let `Sndr` be `decltype((sndr))`. Let `rcvr` be a receiver of type `Rcvr` with associated environment `env` of type `Env` such that `sender-to<Sndr, Rcvr>` is true. For the default implementation of the algorithm that produced `sndr`, connecting `sndr` to `rcvr` and starting the resulting operation state (33.3) necessarily results in the potential evaluation (6.3) of a set of completion operations whose first argument is a subexpression equal to `rcvr`.
- ² Let `Sigs` be a pack of completion signatures corresponding to this set of completion operations, and let `CS` be the type of the expression `get_completion_signatures<Sndr, Env>()`. Then `CS` is a specialization of the

class template `completion_signatures` (33.10), the set of whose template arguments is `Sigs`. If none of the types in `Sigs` are dependent on the type `Env`, then the expression `get_completion_signatures<Sndr>()` is well-formed and its type is `CS`.

- 3 Each completion operation can potentially be evaluated on one of several different execution agents as determined by the semantics of the algorithm, the environment of the receiver, and the completions of any child senders. For a completion tag `T`, let `DsT` be a pack comprised of the set of domain tags associated with the execution agents that could potentially evaluate any of the operation's completions with tag `T`. If there are no potentially evaluated completion operations with tag type `T`, then `get_completion_domain<T>(get_env(sndr), env)` is ill-formed; otherwise, it has type `COMMON-DOMAIN<DsT...>` (33.9.2).

[Example 1: Let `sndr2` be the sender `then(sndr, fn)`. `sndr2` has the same `set_value` completion domain tag as `sndr`, but if `fn`'s evaluation is potentially throwing, `sndr2`'s `set_error` completion domain tag would be the `COMMON-DOMAIN` of `sndr`'s value and error completion domain tags, in accordance with the semantics of the `then` algorithm (33.9.12.9). — end example]

- 4 If `sndr` can determine that all of its completion operations with tag `T` happen on execution agents associated with a particular scheduler `sch` (as determined by the semantics of the algorithm, the environment of the receiver, and the completion schedulers of any child senders), then `get_completion_scheduler<T>(get_env(sndr), env)` is well-formed and has the type and value of `sch`; otherwise, it is ill-formed.

[Example 2: Let `sndr2` be the sender from the example above. The `set_value` completion scheduler of `sndr2` is the `set_value` completion scheduler of `sndr`, if any. But `sndr2` can only report a `set_error` completion scheduler when invocations of `fn` are not potentially throwing or when `sndr` has no `set_error` completions. When `fn` can throw, `sndr2` could complete with `set_error` either by forwarding an error completion from `sndr` or by completing with the exception thrown by `fn`, which would happen on an agent associated with `sndr`'s `set_value` completion scheduler. — end example]

- 5 If a user-provided implementation of the algorithm that produced `sndr` is selected instead of the default:

- (5.1) — Any completion signature that is in the set of types denoted by `completion_signatures_of_t<Sndr, Env>` and that is not part of `Sigs` shall correspond to error or stopped completion operations, unless otherwise specified.
- (5.2) — If none of the types in `Sigs` are dependent on the type `Env`, then `completion_signatures_of_t<Sndr>` and `completion_signatures_of_t<Sndr, Env>` shall denote the same type.

- 6 Various function templates in subclause 33.9 can throw an exception of type `unspecified-exception`. Each such exception object is of an unspecified type such that a `handler` of type `exception` matches (14.4) the exception object but a `handler` of type `dependent_sender_error` does not.

[Note 1: There is no requirement that two such exception objects have the same type. — end note]

33.9.2 Exposition-only entities

[exec.snd.expos]

- 1 Given an expression `sndr`, whose type is any sender type defined in the standard library, it is unspecified whether the expression `sndr.affine()` is well-formed. If that expression is well-formed, then the evaluation thereof meets the semantic requirements of the `affine` (33.13.3) algorithm.
- 2 Given an expression `sndr`, whose type is any sender type defined in the standard library, and an expression `p`, whose type is a promise type, it is unspecified whether the expression `sndr.as_awaitable(p)` is well-formed. If that expression is well-formed, then the evaluation thereof meets the semantic requirements of the `as_awaitable` (33.13.1) algorithm.
- 3 Subclause 33.9 makes use of the following exposition-only entities.
- 4 For a queryable object `env`, `FWD-ENV(env)` is an expression whose type satisfies `queryable` such that for a query object `q` and a pack of subexpressions `as`, the expression `FWD-ENV(env).query(q, as...)` is ill-formed if `forwarding_query(q)` is `false`; otherwise, it is expression-equivalent to `env.query(q, as...)`. The type `FWD-ENV-T(Env)` is `decltype(FWD-ENV(declval<Env>()))`.
- 5 For a query object `q`, a subexpression `v`, and a pack of subexpressions `args`, `MAKE-ENV(q, v)` is an expression `env` whose type satisfies `queryable` such that the result of `env.query(q, args...)` has a value equal to `v` (18.2). Unless otherwise stated, the object to which `env.query(q, args...)` refers remains valid while `env` remains valid.
- 6 For two queryable objects `env1` and `env2`, a query object `q`, and a pack of subexpressions `as`, `JOIN-ENV(env1, env2)` is an expression `env3` whose type satisfies `queryable` such that `env3.query(q, as...)` is expression-equivalent to:

- (6.1) — `env1.query(q, as...)` if that expression is well-formed,
- (6.2) — otherwise, `env2.query(q, as...)` if that expression is well-formed,
- (6.3) — otherwise, `env3.query(q, as...)` is ill-formed.

⁷ The results of *FWD-ENV*, *MAKE-ENV*, and *JOIN-ENV* can be context-dependent; i.e., they can evaluate to expressions with different types and value categories in different contexts for the same arguments.

⁸ For a pack of subexpressions `domains`, *COMMON-DOMAIN*(`domains...`) is expression-equivalent to `common_type_t<decltype(auto(domains))...>()` if that expression is well-formed, and *indeterminate_domain*<`Ds...`>() otherwise, where `Ds` is the pack of types consisting of `decltype(auto(domains))...` with duplicate types removed.

⁹ For a type `Tag`, subexpression `sndr`, and pack `envs`, *COMPL-DOMAIN*(`Tag, sndr, envs`) is expression-equivalent to `D()`, where `D` is the type of `get_completion_domain<Tag>(get_env(sndr), envs...)` if that expression is well-formed or `envs` is an empty pack, and *indeterminate_domain*() otherwise.

¹⁰ For a scheduler `sch`, *SCHED-ENV*(`sch`) is an expression `o` whose type satisfies *queryable* such that `o.query(get_start_scheduler)` is a prvalue with the same type and value as `sch`, and such that `o.query(get_domain)` is expression-equivalent to `sch.query(get_domain)`.

¹¹ For two subexpressions `rcvr` and `expr`, *SET-VALUE*(`rcvr, expr`) is expression-equivalent to `(expr, set_value(std::move(rcvr)))` if the type of `expr` is void; otherwise, `set_value(std::move(rcvr), expr)`. *TRY-EVAL*(`rcvr, expr`) is equivalent to:

```
try {
    expr;
} catch(...) {
    set_error(std::move(rcvr), current_exception());
}
```

if `expr` is potentially-throwing; otherwise, `expr`. *TRY-SET-VALUE*(`rcvr, expr`) is

```
TRY-EVAL(rcvr, SET-VALUE(rcvr, expr))
```

except that `rcvr` is evaluated only once.

```
template<class Tag, class Env, class Default>
constexpr decltype(auto) query-with-default(
    Tag, const Env& env, Default&& value) noexcept(see below);
```

¹² Let `e` be the expression `Tag()(env)` if that expression is well-formed; otherwise, it is `static_cast<Default>(std::forward<Default>(value))`.

¹³ *Returns:* `e`.

¹⁴ *Remarks:* The expression in the `noexcept` clause is `noexcept(e)`.

```
15 template<callable Fun>
    requires is_nothrow_move_constructible_v<Fun>
    struct emplace-from {
        Fun fun; // exposition only
        using type = call-result-t<Fun>;

        constexpr operator type() && noexcept(nothrow-callable<Fun>) {
            return std::move(fun)();
        }

        constexpr type operator()() && noexcept(nothrow-callable<Fun>) {
            return std::move(fun)();
        }
    };
};
```

[Note 1: *emplace-from* is used to emplace non-movable types into tuple, optional, variant, and similar types. — end note]

```
16 struct on-stop-request {
    inplace_stop_source& stop_src; // exposition only
    void operator()() noexcept { stop_src.request_stop(); }
};
```

```

17  template<class T0, class T1, ..., class Tn>
    struct product-type {           // exposition only
        T0 t0;           // exposition only
        T1 t1;           // exposition only
        ⋮
        Tn tn;           // exposition only

        template<size_t I, class Self>
        constexpr decltype(auto) get(this Self&& self) noexcept;           // exposition only

        template<class Self, class Fn>
        constexpr decltype(auto) apply(this Self&& self, Fn&& fn)           // exposition only
            noexcept(see below);
    };

```

18 [Note 2: *product-type* is presented here in pseudo-code form for the sake of exposition. It can be approximated in standard C++ with a tuple-like implementation that takes care to keep the type an aggregate that can be used as the initializer of a structured binding declaration. — end note]

[Note 3: An expression of type *product-type* is usable as the initializer of a structured binding declaration (9.7). — end note]

```

template<size_t I, class Self>
constexpr decltype(auto) get(this Self&& self) noexcept;

```

19 *Effects*: Equivalent to:

```

    auto& [...ts] = self;
    return std::forward_like<Self>(ts...[I]);

```

```

template<class Self, class Fn>
constexpr decltype(auto) apply(this Self&& self, Fn&& fn) noexcept(see below);

```

20 *Constraints*: The expression in the *return* statement below is well-formed.

21 *Effects*: Equivalent to:

```

    auto& [...ts] = self;
    return std::forward<Fn>(fn)(std::forward_like<Self>(ts)...);

```

22 *Remarks*: The expression in the *noexcept* clause is *true* if the *return* statement above is not potentially throwing; otherwise, *false*.

23 Let *valid-specialization* be the following concept:

```

namespace std::execution {
    template<template<class...> class T, class... Args>
    concept valid-specialization =           // exposition only
        requires { typename T<Args...>; };
}

```

```

template<class Tag, class Data = see below, class... Child>
constexpr auto make-sender(Tag tag, Data&& data, Child&&... child);

```

24 *Mandates*: The following expressions are true:

(24.1) — *semiregular*<Tag>

(24.2) — *movable-value*<Data>

(24.3) — (*sender*<Child> && ...)

(24.4) — *dependent_sender*<Sndr> || *sender_in*<Sndr>, where *Sndr* is *basic-sender*<Tag, decay_t<Data>, decay_t<Child>...> as defined below.

Recommended practice: If evaluation of *sender_in*<Sndr> results in an uncaught exception from the evaluation of *get_completion_signatures*<Sndr>(), the implementation should include information about that exception in the resulting diagnostic.

25 *Returns*: A prvalue of type *basic-sender*<Tag, decay_t<Data>, decay_t<Child>...> that has been direct-list-initialized with the forwarded arguments, where *basic-sender* is the following exposition-only class template except as noted below.

26 *Remarks:* The default template argument for the `Data` template parameter denotes an unspecified empty trivially copyable class type that models `semiregular`.

```

27 namespace std::execution {
    template<class Snдр, class Rcvr>                                // exposition only
    using state-type = decay_t<call-result-t<
        decltype(impls-for<tag_of_t<Snдр>>::get-state), Snдр, Rcvr&>>;

    template<class Index, class Snдр, class Rcvr>                 // exposition only
    using env-type = call-result-t<
        decltype(impls-for<tag_of_t<Snдр>>::get-env), Index,
        state-type<Snдр, Rcvr&>, const Rcvr&>;

    template<class Snдр>
    using data-type = decltype(declval<Snдр>().template get<1>()); // exposition only

    template<class Snдр, size_t I = 0>
    using child-type = decltype(declval<Snдр>().template get<I+2>()); // exposition only

    template<class Snдр>
    using indices-for = remove_reference_t<Snдр>::indices-for;      // exposition only

    template<class Snдр, class Rcvr>
    struct basic-state {                                          // exposition only
        basic-state(Snдр&& snдр, Rcvr&& rcvr) noexcept(see below)
            : rcvr(std::move(rcvr))
            , state(impls-for<tag_of_t<Snдр>>::get-state(std::forward<Snдр>(snдр), rcvr)) { }

        Rcvr rcvr;                                              // exposition only
        state-type<Snдр, Rcvr> state;                            // exposition only
    };
}

```

28 The expression in the `noexcept` clause of the constructor of `basic-state` is

```

is_nothrow_move_constructible_v<Rcvr> &&
nothrow_callable<decltype(impls-for<tag_of_t<Snдр>>::get-state), Snдр, Rcvr&> &&
(same_as<state-type<Snдр, Rcvr>, get-state-result> ||
is_nothrow_constructible_v<state-type<Snдр, Rcvr>, get-state-result>)

```

where `get-state-result` is

```

call-result-t<decltype(impls-for<tag_of_t<Snдр>>::get-state), Snдр, Rcvr&>.

```

```

29 namespace std::execution {
    template<class Snдр, class Rcvr, class Index>
    requires valid-specialization<env-type, Index, Snдр, Rcvr>
    struct basic-receiver {                                     // exposition only
        using receiver_concept = receiver_tag;

        using tag-t = tag_of_t<Snдр>;
        using state-t = state-type<Snдр, Rcvr>;               // exposition only
        static constexpr const auto& complete = impls-for<tag-t>::complete; // exposition only

        template<class... Args>
        void set_value(Args&&... args) && noexcept {
            complete(Index(), op->state, op->rcvr, set_value_t(), std::forward<Args>(args)...);
        }

        template<class Error>
        void set_error(Error&& err) && noexcept {
            complete(Index(), op->state, op->rcvr, set_error_t(), std::forward<Error>(err));
        }

        void set_stopped() && noexcept {
            complete(Index(), op->state, op->rcvr, set_stopped_t());
        }
    }
}

```

```

    auto get_env() const noexcept -> env-type<Index, Sndr, Rcvr> {
        return impls-for<tag-t>::get-env(Index(), op->state, op->rcvr);
    }

    basic-state<Sndr, Rcvr>* op; // exposition only
};
}

namespace std::execution {
    constexpr auto connect-all = see below; // exposition only

    template<class Sndr, class Rcvr>
    using connect-all-result = call-result-t< // exposition only
        decltype(connect-all), basic-state<Sndr, Rcvr>*, Sndr, indices-for<Sndr>>;
}

```

30 The object *connect-all* is initialized with a callable object equivalent to the following lambda:

```

[]<class Sndr, class Rcvr, size_t... Is>(
    basic-state<Sndr, Rcvr>* op, Sndr&& sndr, index_sequence<Is...>) noexcept(see below)
-> decltype(auto) {
    auto& [_ , data, ...child] = sndr;
    return product-type{connect(
        std::forward_like<Sndr>(child),
        basic-receiver<Sndr, Rcvr, integral_constant<size_t, Is>>{op})...};
}

```

31 *Constraints:* The expression in the `return` statement is well-formed.

32 *Remarks:* The expression in the `noexcept` clause is true if the `return` statement is not potentially throwing; otherwise, false.

```

33 namespace std::execution {
    template<class Sndr, class Rcvr>
    requires valid-specialization<state-type, Sndr, Rcvr> &&
        valid-specialization<connect-all-result, Sndr, Rcvr>
    struct basic-operation : basic-state<Sndr, Rcvr> { // exposition only
        using operation_state_concept = operation_state_tag;
        using tag-t = tag_of_t<Sndr>; // exposition only

        connect-all-result<Sndr, Rcvr> inner-ops; // exposition only

        basic-operation(Sndr&& sndr, Rcvr&& rcvr) noexcept(see below) // exposition only
        : basic-state<Sndr, Rcvr>(std::forward<Sndr>(sndr), std::move(rcvr)),
          inner-ops(connect-all(this, std::forward<Sndr>(sndr), indices-for<Sndr>()))
        {}

        void start() & noexcept {
            auto& [...ops] = inner-ops;
            impls-for<tag-t>::start(this->state, this->rcvr, ops...);
        }
    };
}

```

34 The expression in the `noexcept` clause of the constructor of *basic-operation* is:

```

is_nothrow_constructible_v<basic-state<Self, Rcvr>, Self, Rcvr> &&
noexcept(connect-all(this, std::forward<Sndr>(sndr), indices-for<Sndr>()))

```

```

35 namespace std::execution {
    struct default-impls { // exposition only
        static constexpr auto get-env = see below; // exposition only
        static constexpr auto get-state = see below; // exposition only
        static constexpr auto start = see below; // exposition only
        static constexpr auto complete = see below; // exposition only

        template<class Sndr, class... Env>
        static consteval void check-types(); // exposition only
    };
}

```

```
};
```

```
template<class Tag>
struct impls-for : default-impls {};           // exposition only
}
```

36 The member `default-impls::get-env` is initialized with a callable object equivalent to the following lambda:

```
[(auto, auto&, const auto& rcvr) noexcept -> decltype(auto) {
    return FWD-ENV(get_env(rcvr));
}]
```

37 The member `default-impls::get-state` is initialized with a callable object equivalent to the following lambda:

```
[(<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept -> decltype(auto) {
    auto& [_ , data, ...child] = sndr;
    return allocator-aware-forward(std::forward_like<Sndr>(data), rcvr);
}]
```

38 The member `default-impls::start` is initialized with a callable object equivalent to the following lambda:

```
[(auto&, auto&, auto&... ops) noexcept -> void {
    (execution::start(ops), ...);
}]
```

39 The member `default-impls::complete` is initialized with a callable object equivalent to the following lambda:

```
[(<class Index, class Rcvr, class Tag, class... Args>(
    Index, auto& state, Rcvr& rcvr, Tag, Args&&... args) noexcept
-> void requires callable<Tag, Rcvr, Args...> {
    static_assert(Index::value == 0);
    Tag()(std::move(rcvr), std::forward<Args>(args)...);
}]
```

```
template<class Sndr, class... Env>
static consteval void default-impls::check-types();
```

40 Let `Is` be the pack of integral template arguments of the `integer_sequence` specialization denoted by `indices-for<Sndr>`.

41 *Effects:* Equivalent to:

```
((void)get_completion_signatures<child-type<Sndr, Is>, FWD-ENV-T(Env)...>(), ...);
```

42 [Note 4: For any types `T` and `S`, and pack `E`, let `e` be the expression `impls-for<T>::check-types<S, E...>()`. Then exactly one of the following is true:

- (42.1) — `e` is ill-formed, or
- (42.2) — the evaluation of `e` exits with an exception, or
- (42.3) — `e` is a core constant expression.

When `e` is a core constant expression, the pack `S, E...` uniquely determines a set of completion signatures.
— end note]

```
43 namespace std::execution {
    template<class Tag, class Data, class... Child>
    struct basic-sender : product-type<Tag, Data, Child...> {           // exposition only
        using sender_concept = sender_tag;
        using indices-for = index_sequence_for<Child...>;              // exposition only

        decltype(auto) get_env() const noexcept {
            auto& [_ , data, ...child] = *this;
            return impls-for<Tag>::get-attrs(data, child...);
        }

        template<decays-to<basic-sender> Self, receiver Rcvr>
        auto connect(this Self&& self, Rcvr rcvr) noexcept(see below)
            -> basic-operation<Self, Rcvr> {
```

```

        return {std::forward<Self>(self), std::move(rcvr)};
    }

    template<decays-to<basic-sender> Self, class... Env>
    static constexpr auto get_completion_signatures();
};

```

44 It is unspecified whether a specialization of *basic-sender* is an aggregate.

45 An expression of type *basic-sender* is usable as the initializer of a structured binding declaration (9.7).

46 The expression in the `noexcept` clause of the `connect` member function of *basic-sender* is:

```
is_nothrow_constructible_v<basic-operation<Self, Rcvr>, Self, Rcvr>
```

```

template<class Tag, class Data, class... Child>
template<decays-to<basic-sender> Sndr, class... Env>
constexpr auto basic-sender<Tag, Data, Child...>::get_completion_signatures();

```

47 Let *Rcvr* be the type of a receiver whose environment has type *E*, where *E* is the first type in the list *Env...*, *env*<>. Let *CHECK-TYPES*() be the expression *impls-for*<Tag>::template *check-types*<*Sndr*, *E*>(), and let *CS* be a type determined as follows:

(47.1) — If *CHECK-TYPES*() is a core constant expression, let *op* be an lvalue subexpression whose type is *connect_result_t*<*Sndr*, *Rcvr*>. Then *CS* is the specialization of *completion_signatures* the set of whose template arguments correspond to the set of completion operations that are potentially evaluated (6.3) as a result of evaluating *op.start*().

(47.2) — Otherwise, *CS* is *completion_signatures*<>.

48 *Constraints*: *CHECK-TYPES*() is a well-formed expression.

49 *Effects*: Equivalent to:

```

CHECK-TYPES();
return CS();

```

```

50 template<class... Fns>
struct overload-set : Fns... {
    using Fns::operator()...;
};

51 struct not-a-sender {
    using sender_concept = sender_tag;

    template<class Sndr>
    static constexpr auto get_completion_signatures() -> completion_signatures<> {
        throw unspecified-exception();
    }
};

```

```

52 struct not-a-scheduler {
    using scheduler_concept = scheduler_tag;

    constexpr auto schedule() const noexcept {
        return not-a-sender();
    }
};

```

```

53 constexpr void decay-copyable-result-datums(auto cs) {
    cs.for-each([]<class Tag, class... Ts>(Tag*)(Ts...)) {
        if constexpr (!is_constructible_v<decay_t<Ts>, Ts> &&...))
            throw unspecified-exception();
    });
}

```

```

template<class T, class Context>
decltype(auto) allocator-aware-forward(T&& obj, Context&& context); // exposition only

```

54 *allocator-aware-forward* is an exposition-only function template used to either create a new object of type *remove_cvref_t*<*T*> from *obj* or forward *obj* depending on whether an allocator is available. If the

environment associated with `context` provides an allocator (i.e., the expression `get_allocator(get_env(context))` is valid), let `alloc` be the result of this expression and let `P` be `remove_cvref_t<T>`.

55 *Returns:*

- (55.1) — If `alloc` is not defined, returns `std::forward<T>(obj)`,
- (55.2) — otherwise if `P` is a specialization of *product-type*, returns an object of type `P` whose elements are initialized using

```
make_obj_using_allocator<decltype(e)>(alloc, std::forward_like<T>(e))
```

 where `e` is the corresponding element of `obj`,
- (55.3) — otherwise, returns `make_obj_using_allocator<P>(alloc, std::forward<T>(obj))`.

```
template<class Fn, class Default, class... Args>
constexpr decltype(auto) call-with-default(
    Fn&& fn, Default&& value, Args&&... args) noexcept(see below);
```

56 Let `expr` be the expression `std::forward<Fn>(fn)(std::forward<Args>(args)...) if that expression is well-formed; otherwise, it is static_cast<Default>(std::forward<Default>(value)).`

57 *Returns:* `expr`.

58 *Remarks:* The expression in the `noexcept` clause is `noexcept(expr)`.

```
59 template<class Tag>
struct inline-attrs {
    see below
};
```

60 For a subexpression `env`, `inline-attrs<Tag>{}.query(get_completion_scheduler<Tag>, env)` is expression-equivalent to `get_scheduler(env)`.

61 For a subexpression `env`, `inline-attrs<Tag>{}.query(get_completion_domain<Tag>, env)` is expression-equivalent to `get_domain(env)`.

33.9.3 Sender concepts

[exec.snd.concepts]

- 1 The **sender** concept defines the requirements for a sender type (33.3). The **sender_in** concept defines the requirements for a sender type that can create asynchronous operations given an associated environment type. The exposition-only concept *sender-to* defines the requirements for a sender type that can connect with a specific receiver type. The `get_env` customization point object is used to access a sender's associated attributes. The `connect` customization point object is used to connect (33.3) a sender and a receiver to produce an operation state.

```
namespace std::execution {
    template<auto>
        concept is-constant = true;                                // exposition only

    template<class Sndr>
        concept is-sender =                                        // exposition only
            derived_from<typename Sndr::sender_concept, sender_tag>;

    template<class Sndr>
        concept enable-sender =                                    // exposition only
            is-sender<Sndr> ||
            is-awaitable<Sndr, env-promise<env<>>>>;                // 33.9.4

    template<class Sndr>
        inline constexpr bool enable_sender = enable-sender<Sndr>;

    template<class Sndr>
        consteval bool is-dependent-sender-helper() try {          // exposition only
            get_completion_signatures<Sndr>();
            return false;
        } catch (dependent_sender_error&) {
            return true;
        }
}
```

```

template<class Sndr>
concept sender =
    enable_sender<remove_cvref_t<Sndr>> &&
    requires (const remove_cvref_t<Sndr>& sndr) {
        { get_env(sndr) } -> queryable;
    } &&
    move_constructible<remove_cvref_t<Sndr>> &&
    constructible_from<remove_cvref_t<Sndr>, Sndr>;

template<class Sndr, class... Env>
concept sender_in =
    sender<Sndr> &&
    (sizeof...(Env) <= 1) &&
    (queryable<Env> &&...) &&
    is-constant<get_completion_signatures<Sndr, Env...>()>;

template<class Sndr>
concept dependent_sender =
    sender<Sndr> && bool_constant<is-dependent-sender-helper<Sndr>()>::value;

template<class Sndr, class Rcvr>
concept sender-to = // exposition only
    sender_in<Sndr, env_of_t<Rcvr>> &&
    receiver-of<Rcvr, completion_signatures_of_t<Sndr, env_of_t<Rcvr>>> &&
    requires (Sndr&& sndr, Rcvr&& rcvr) {
        connect(std::forward<Sndr>(sndr), std::forward<Rcvr>(rcvr));
    };
}

```

- ² For a type `Sndr`, if `sender<Sndr>` is true and `dependent_sender<Sndr>` is false, then `Sndr` is a non-dependent sender (33.3).
- ³ Given a subexpression `sndr`, let `Sndr` be `decltype((sndr))` and let `rcvr` be a receiver with an associated environment whose type is `Env`. A completion operation is a *permissible completion* for `Sndr` and `Env` if its completion signature appears in the argument list of the specialization of `completion_signatures` denoted by `completion_signatures_of_t<Sndr, Env>`. `Sndr` and `Env` model `sender_in<Sndr, Env>` if all the completion operations that are potentially evaluated by connecting `sndr` to `rcvr` and starting the resulting operation state are permissible completions for `Sndr` and `Env`.
- ⁴ *Remarks:* Pursuant to 16.4.5.2.1, users may specialize `enable_sender` to `true` for cv-unqualified program-defined types that model `sender`, and `false` for types that do not. Such specializations shall be usable in constant expressions (7.7.4) and have type `const bool`.
- ⁵ The exposition-only concepts *sender-of* and *sender-in-of* define the requirements for a sender type that completes with a given unique set of value result types.

```

namespace std::execution {
    template<class... As>
        using value-signature = set_value_t(As...); // exposition only

    template<class Sndr, class SetValue, class... Env>
        concept sender-in-of-impl = // exposition only
            sender_in<Sndr, Env...> &&
            MATCHING-SIG(SetValue, // see 33.1
                gather-signatures<set_value_t, // see 33.10
                    completion_signatures_of_t<Sndr, Env...>,
                    value-signature,
                    type_identity_t>);

    template<class Sndr, class Env, class... Values>
        concept sender-in-of = // exposition only
            sender-in-of-impl<Sndr, set_value_t(Values...), Env>;
}

```

```

template<class Sndr, class... Values>
    concept sender-of =                               // exposition only
        sender-in-of-impl<Sndr, set_value_t(Values...)>;
}

```

6 Let `sndr` be an expression such that `decltype((sndr))` is `Sndr`. The type `tag_of_t<Sndr>` is as follows:

(6.1) — If the declaration

```

auto&& [tag, data, ...children] = sndr;

```

would be well-formed, `tag_of_t<Sndr>` is an alias for `decltype(auto(tag))`.

(6.2) — Otherwise, `tag_of_t<Sndr>` is ill-formed.

7 Let `sender-for` be an exposition-only concept defined as follows:

```

namespace std::execution {
    template<class Sndr, class Tag>
    concept sender-for =
        sender<Sndr> &&
        same_as<tag_of_t<Sndr>, Tag>;
}

```

8 For a type `T`, `SET-VALUE-SIG(T)` denotes the type `set_value_t()` if `T` is *cv* `void`; otherwise, it denotes the type `set_value_t(T)`.

9 Library-provided sender types

(9.1) — always expose an overload of a member `connect` that accepts an rvalue sender and

(9.2) — only expose an overload of a member `connect` that accepts an lvalue sender if they model `copy_constructible`.

33.9.4 Awaitable helpers

[exec.awaitable]

1 The sender concepts recognize awaitables as senders. For [Clause 33](#), an *awaitable* is an expression that would be well-formed as the operand of a `co_await` expression within a given context.

2 For a subexpression `c`, let `GET-AWAITER(c, p)` be expression-equivalent to the series of transformations and conversions applied to `c` as the operand of an *await-expression* in a coroutine, resulting in lvalue `e` as described by [7.6.2.4](#), where `p` is an lvalue referring to the coroutine's promise, which has type `Promise`.

[Note 1: This includes the invocation of the promise type's `await_transform` member if any, the invocation of the operator `co_await` picked by overload resolution if any, and any necessary implicit conversions and materializations. — end note]

Let `GET-AWAITER(c)` be expression-equivalent to `GET-AWAITER(c, q)` where `q` is an lvalue of an unspecified empty class type *none-such* that lacks an `await_transform` member, and where `coroutine_handle<none-such>` behaves as `coroutine_handle<void>`.

3 Let *is-awaitable* be the following exposition-only concept:

```

namespace std {
    template<class T>
    concept await-suspend-result = see below;                               // exposition only

    template<class A, class... Promise>
    concept is-awaiter =                                                    // exposition only
        requires (A& a, coroutine_handle<Promise...> h) {
            a.await_ready() ? 1 : 0;
            { a.await_suspend(h) } -> await-suspend-result;
            a.await_resume();
        };

    template<class C, class... Promise>
    concept is-awaitable =                                                  // exposition only
        requires (C (*fc)() noexcept, Promise&... p) {
            { GET-AWAITER(fc(), p...) } -> is-awaiter<Promise...>;
        };
}

```

await-suspend-result<T> is true if and only if one of the following is true:

- (3.1) — T is void, or
 - (3.2) — T is bool, or
 - (3.3) — T is a specialization of `coroutine_handle`.
- ⁴ For a subexpression *c* such that `decltype((c))` is type *C*, and an lvalue *p* of type `Promise`, *await-result-type*<*C*, `Promise`> denotes the type `decltype(GET-AWAITER(c, p).await_resume())` and *await-result-type*<*C*> denotes the type `decltype(GET-AWAITER(c).await_resume())`.
- ⁵ Let *with-await-transform* be the exposition-only class template:

```
namespace std::execution {
    template<class T, class Promise>
        concept has-as-awaitable = // exposition only
        requires (T&& t, Promise& p) {
            { std::forward<T>(t).asAwaitable(p) } -> isAwaitable<Promise&>;
        };

    template<class Derived>
        struct with-await-transform { // exposition only
            template<class T>
                T&& await_transform(T&& value) noexcept {
                    return std::forward<T>(value);
                }

            template<has-as-awaitable<Derived> T>
                auto await_transform(T&& value)
                    noexcept(noexcept(std::forward<T>(value).asAwaitable(declval<Derived&>())))
                    -> decltype(std::forward<T>(value).asAwaitable(declval<Derived&>())) {
                        return std::forward<T>(value).asAwaitable(static_cast<Derived&>(*this));
                    }
        };
}
```

- ⁶ Let *env-promise* be the exposition-only class template:

```
namespace std::execution {
    template<class Env>
        struct env_promise : with-await-transform<env_promise<Env>> { // exposition only
            unspecified get_return_object() noexcept;
            unspecified initial_suspend() noexcept;
            unspecified final_suspend() noexcept;
            void unhandled_exception() noexcept;
            void return_void() noexcept;
            coroutine_handle<> unhandled_stopped() noexcept;

            const Env& get_env() const noexcept;
        };
}
```

[Note 2: Specializations of *env-promise* are used only for the purpose of type computation; its members need not be defined. — end note]

33.9.5 execution::indeterminate_domain

[exec.domain.indeterminate]

- ¹ namespace std::execution {
- ```
 template<class... Domains>
 struct indeterminate_domain {
 indeterminate_domain() = default;
 constexpr indeterminate_domain(auto&&) noexcept {}

 template<class Tag, sender Sndr, queryable Env>
 static constexpr decltype(auto) transform_sender(Tag, Sndr&& sndr, const Env& env)
 noexcept(see below);
 };
}
```

```
template<class Tag, sender Sndr, queryable Env>
static constexpr decltype(auto) transform_sender(Tag, Sndr&& sndr, const Env& env)
noexcept(see below);
```

2 *Mandates:* For each type *D* in *Domains...*, the expression

```
D().transform_sender(Tag(), std::forward<Sndr>(sndr), env)
```

is either ill-formed or has the same decayed type as `default_domain().transform_sender(Tag(), std::forward<Sndr>(sndr), env)`.

3 *Returns:* `default_domain().transform_sender(Tag(), std::forward<Sndr>(sndr), env)`.

4 *Remarks:* For a pack of types *Ds*,

```
common_type_t<indeterminate_domain<Domains...>, indeterminate_domain<Ds...>>
```

is `indeterminate_domain<Us...>` where *Us* is a pack that contains each type in *Domains...*, *Ds...* except with duplicate types removed. For a type *D* that is not a specialization of `indeterminate_domain`, `common_type_t<indeterminate_domain<Domains...>, D>` is *D* if *Domains* is an empty pack, and `common_type_t<indeterminate_domain<Domains...>, indeterminate_domain<D>>` otherwise.

### 33.9.6 execution::default\_domain

[exec.domain.default]

```
1 namespace std::execution {
 struct default_domain {
 template<class Tag, sender Sndr, queryable Env>
 static constexpr decltype(auto) transform_sender(Tag, Sndr&& sndr, const Env& env)
 noexcept(see below);

 template<class Tag, sender Sndr, class... Args>
 static constexpr decltype(auto) apply_sender(Tag, Sndr&& sndr, Args&&... args)
 noexcept(see below);
 };
}
```

```
template<class Tag, sender Sndr, queryable Env>
constexpr decltype(auto) transform_sender(Tag, Sndr&& sndr, const Env& env)
noexcept(see below);
```

2 Let *e* be the expression

```
tag_of_t<Sndr>().transform_sender(Tag(), std::forward<Sndr>(sndr), env)
```

if that expression is well-formed; otherwise, `static_cast<Sndr>(std::forward<Sndr>(sndr))`.

3 *Returns:* *e*.

4 *Remarks:* The exception specification is equivalent to `noexcept(e)`.

```
template<class Tag, sender Sndr, class... Args>
constexpr decltype(auto) apply_sender(Tag, Sndr&& sndr, Args&&... args)
noexcept(see below);
```

5 Let *e* be the expression

```
Tag().apply_sender(std::forward<Sndr>(sndr), std::forward<Args>(args)...)

```

6 *Constraints:* *e* is a well-formed expression.

7 *Returns:* *e*.

8 *Remarks:* The exception specification is equivalent to `noexcept(e)`.

### 33.9.7 execution::transform\_sender

[exec.snd.transform]

```
namespace std::execution {
 template<sender Sndr, queryable Env>
 constexpr decltype(auto) transform_sender(Sndr&& sndr, const Env& env)
 noexcept(see below);
}
```

1 For a subexpression *s*, let *start-domain* be *D()* where *D* is the decayed type of `get_domain(env)` if that expression is well-formed, and `default_domain` otherwise.

- 2 Let *completion-domain*(s) be D() where D is the decayed type of `get_completion_domain<>(get_env(s), env)` if that is well-formed; otherwise, D is `default_domain`.
- 3 Let *transformed-sndr*(dom, tag, s) be the expression  
`dom.transform_sender(tag, s, env)`  
 if that expression is well-formed; otherwise,  
`default_domain().transform_sender(tag, s, env)`
- Let *transform-recurse*(dom, tag, s) be the expression *transformed-sndr*(dom, tag, s) if *transformed-sndr*(dom, tag, s) and s have the same type ignoring cv-qualifiers; otherwise, it is the expression *transform-recurse*(dom2, tag, s2), where s2 is *transformed-sender*(dom, tag, s) and dom2 is *start-domain* if tag is *start*, and *completion-domain*(s2) otherwise.
- Let *tmp-sndr* be the expression  
`transform-recurse(completion-domain(sndr), set_value, sndr)`
- and let *final-sndr* be the expression  
`transform-recurse(start-domain, start, tmp-sndr)`
- 4 Returns: *final-sndr*.
- 5 Remarks: The exception specification is equivalent to `noexcept(final-sndr)`.

### 33.9.8 `execution::apply_sender`

[exec.snd.apply]

```
namespace std::execution {
 template<class Domain, class Tag, sender Sndr, class... Args>
 constexpr decltype(auto) apply_sender(Domain dom, Tag, Sndr&& sndr, Args&&... args)
 noexcept(see below);
}
```

- 1 Let *e* be the expression  
`dom.apply_sender(Tag(), std::forward<Sndr>(sndr), std::forward<Args>(args)...)
 if that expression is well-formed; otherwise,  
default_domain().apply_sender(Tag(), std::forward<Sndr>(sndr), std::forward<Args>(args)...)
 2 Constraints: The expression e is well-formed.`
- 3 Returns: *e*.
- 4 Remarks: The exception specification is equivalent to `noexcept(e)`.

### 33.9.9 `execution::get_completion_signatures`

[exec.getcomplsigs]

```
template<class Sndr, class... Env>
constexpr auto get_completion_signatures() -> valid-completion-signatures auto;
```

- 1 Let *except* be an rvalue subexpression of an unspecified class type *Except* such that `move_constructible<Except> && derived_from<Except, exception> is true`. Let *CHECKED-COMPLSIGS*(*e*) be *e* if *e* is a core constant expression whose type satisfies *valid-completion-signatures*; otherwise, it is the following expression:  
`(e, throw except, completion_signatures())`
- Let *get-complsigs*<Sndr, Env...>() be expression-equivalent to `remove_reference_t<Sndr>::template get_completion_signatures<Sndr, Env...>()`. Let *NewSndr* be Sndr if `sizeof...(Env) == 0` is true; otherwise, `decltype(s)` where *s* is the following expression:  
`transform_sender(
 declval<Sndr>(),
 declval<Env>()...)`
- 2 Constraints: `sizeof...(Env) <= 1` is true.
- 3 Effects: Equivalent to: `return e`; where *e* is expression-equivalent to the following:
- (3.1) — *CHECKED-COMPLSIGS*(*get-complsigs*<NewSndr, Env...>()) if *get-complsigs*<NewSndr, Env...>() is a well-formed expression.

- (3.2) — Otherwise, *CHECKED-COMPLSIGS*(*get-complsig*s<NewSndr>()) if *get-complsig*s<NewSndr>() is a well-formed expression.
- (3.3) — Otherwise,
- ```
completion_signatures<
    SET-VALUE-SIG(await-result-type<NewSndr, env-promise<Env>...>), // 33.9.3
    set_error_t(exception_ptr),
    set_stopped_t()>
```
- if *is-awaitable*<NewSndr, *env-promise*<Env>...> is true.
- (3.4) — Otherwise, (throw *dependent-sender-error*(), *completion_signatures*()) if *sizeof*...(Env) == 0 is true, where *dependent-sender-error* is *dependent_sender_error* or an unspecified type derived publicly and unambiguously from *dependent_sender_error*.
- (3.5) — Otherwise, (throw *except*, *completion_signatures*()).
- 4 Given a type Env, if *completion_signatures_of_t*<Sndr> and *completion_signatures_of_t*<Sndr, Env> are both well-formed, the former shall be a superset of the latter, with the difference corresponding to error or stopped completion operations.
- 5 Let *rcvr* be an rvalue whose type *Rcvr* models receiver, and let *Sndr* be the type of a sender such that *sender_in*<Sndr, *env_of_t*<*Rcvr*>> is true. Let *Sigs*... be the template arguments of the *completion_signatures* specialization named by *completion_signatures_of_t*<Sndr, *env_of_t*<*Rcvr*>>. Let *CS0* be a completion function. If sender *Sndr* or its operation state cause the expression *CS0*(*rcvr*, *args*...) to be potentially evaluated (6.3) then there shall be a signature *Sig* in *Sigs*... such that
- ```
MATCHING-SIG(decayed-typeof<CS0>(decltype(args)...), Sig)
```
- is true (33.1).

### 33.9.10 execution::connect

[exec.connect]

- 1 *connect* connects (33.3) a sender with a receiver.
- 2 The name *connect* denotes a customization point object. For subexpressions *sndr* and *rcvr*, let *Sndr* be *decltype*((*sndr*)) and *Rcvr* be *decltype*((*rcvr*)), let *new\_sndr* be the expression *transform\_sender*(*sndr*, *get\_env*(*rcvr*)) and let *DS* and *DR* be *decay\_t*<*decltype*((*new\_sndr*))> and *decay\_t*<*Rcvr*>, respectively.
- 3 Let *connect-awaitable-promise* be the following exposition-only class:

```
namespace std::execution {
 struct connect-awaitable-promise : with-await-transform<connect-awaitable-promise> {

 connect-awaitable-promise(DS&, DR& rcvr) noexcept : rcvr(rcvr) {}

 suspend_always initial_suspend() noexcept { return {}; }
 [[noreturn]] suspend_always final_suspend() noexcept { terminate(); }
 [[noreturn]] void unhandled_exception() noexcept { terminate(); }
 [[noreturn]] void return_void() noexcept { terminate(); }

 coroutine_handle<> unhandled_stopped() noexcept {
 set_stopped(std::move(rcvr));
 return noop_coroutine();
 }

 operation-state-task get_return_object() noexcept {
 return operation-state-task{
 coroutine_handle<connect-awaitable-promise>::from_promise(*this);
 }
 }

 env_of_t<DR> get_env() const noexcept {
 return execution::get_env(rcvr);
 }

 private:
 DR& rcvr; // exposition only
 };
}
```

```
};
}
```

- 4 Let *operation-state-task* be the following exposition-only class:

```
namespace std::execution {
 struct operation-state-task { // exposition only
 using operation_state_concept = operation_state_tag;
 using promise_type = connect-awaitable-promise;

 explicit operation-state-task(coroutine_handle<> h) noexcept : coro(h) {}
 operation-state-task(operation-state-task&&) = delete;
 ~operation-state-task() { coro.destroy(); }

 void start() & noexcept {
 coro.resume();
 }

 private:
 coroutine_handle<> coro; // exposition only
 };
}
```

- 5 Let *V* name the type *await-result-type*<*DS*, *connect-awaitable-promise*>, let *Sigs* name the type

```
completion_signatures<
 SET-VALUE-SIG(V), // see 33.9.3
 set_error_t(exception_ptr),
 set_stopped_t(>>
```

and let *connect-awaitable* be an exposition-only coroutine defined as follows:

```
namespace std::execution {
 template<class Fun, class... Ts>
 auto suspend-complete(Fun fun, Ts&&... as) noexcept { // exposition only
 auto fn = [&, fun]() noexcept { fun(std::forward<Ts>(as)...); };

 struct awaiter {
 decltype(fn) fn; // exposition only

 static constexpr bool await_ready() noexcept { return false; }
 void await_suspend(coroutine_handle<>) noexcept { fn(); }
 [[noreturn]] void await_resume() noexcept { unreachable(); }
 };
 return awaiter{fn};
 }

 operation-state-task connect-awaitable(DS sndr, DR rcvr) requires receiver-of<DR, Sigs> {
 exception_ptr ep;
 try {
 if constexpr (same_as<V, void>) {
 co_await std::move(sndr);
 co_await suspend-complete(set_value, std::move(rcvr));
 } else {
 co_await suspend-complete(set_value, std::move(rcvr), co_await std::move(sndr));
 }
 } catch(...) {
 ep = current_exception();
 }
 co_await suspend-complete(set_error, std::move(rcvr), std::move(ep));
 }
}
```

- 6 The expression *connect*(*sndr*, *rcvr*) is expression-equivalent to:

(6.1) — *new\_sndr*.*connect*(*rcvr*) if that expression is well-formed.

*Mandates:* The type of the expression above satisfies *operation\_state*.

- (6.2) — Otherwise, *connect-awaitable*(*new\_sndr*, *rcvr*).

Except that *rcvr* is evaluated only once. The program is ill-formed, no diagnostic required, if there exists an rvalue expression *rcvr2* such that:

- (6.3) — *decltype*(*rcvr2*) models receiver,  
 (6.4) — *noexcept*(*rcvr2*) is true,  
 (6.5) — *is\_same\_v*<*decltype*(*get\_env*(*rcvr2*)), *decltype*(*get\_env*(*rcvr*))> is true,  
 (6.6) — *noexcept*(*execution::connect*(*sndr*, *rcvr*)) is true, and  
 (6.7) — *noexcept*(*execution::connect*(*sndr*, *rcvr2*)) is well-formed and evaluates to false.

[*Note 1*: This allows determination of whether *connect* throws with only the context of the environment, such as within *get\_completion\_signatures*. — *end note*]

*Mandates*: The following are true:

- (6.8) — *sender\_in*<*Sndr*, *env\_of\_t*<*Rcvr*>>  
 (6.9) — *receiver-of*<*Rcvr*, *completion\_signatures\_of\_t*<*Sndr*, *env\_of\_t*<*Rcvr*>>>

### 33.9.11 Sender factories

[*exec.factories*]

#### 33.9.11.1 *execution::schedule*

[*exec.schedule*]

- <sup>1</sup> *schedule* obtains a schedule sender (33.3) from a scheduler.
- <sup>2</sup> The name *schedule* denotes a customization point object. For a subexpression *sch*, the expression *schedule*(*sch*) is expression-equivalent to *sch.schedule*() .
- <sup>3</sup> *Mandates*: The type of *sch.schedule*() satisfies *sender*.

#### 33.9.11.2 *execution::just*, *execution::just\_error*, *execution::just\_stopped*

[*exec.just*]

- <sup>1</sup> *just*, *just\_error*, and *just\_stopped* are sender factories whose asynchronous operations complete synchronously in their start operation with a value completion operation, an error completion operation, or a stopped completion operation, respectively.
- <sup>2</sup> The names *just*, *just\_error*, and *just\_stopped* denote customization point objects. Let *just-cpo* be one of *just*, *just\_error*, or *just\_stopped*. For a pack of subexpressions *ts*, let *Ts* be the pack of types *decltype*((*ts*)). The expression *just-cpo*(*ts...*) is ill-formed if
  - (2.1) — (*movable-value*<*Ts*> &&...) is false, or
  - (2.2) — *just-cpo* is *just\_error* and *sizeof...(ts) == 1* is false, or
  - (2.3) — *just-cpo* is *just\_stopped* and *sizeof...(ts) == 0* is false.

Otherwise, it is expression-equivalent to *make-sender*(*just-cpo*, *product-type*{*ts...*}).

For *just*, *just\_error*, and *just\_stopped*, let *set-cpo* be *set\_value*, *set\_error*, and *set\_stopped*, respectively. The exposition-only class template *impls-for* (33.9.2) is specialized for *just-cpo* as follows:

```
namespace std::execution {
 template<>
 struct impls-for<decayed-typeof<just-cpo>> : default-impls {
 static constexpr auto start =
 [](auto& state, auto& rcvr) noexcept -> void {
 auto& [...ts] = state;
 set-cpo(std::move(rcvr), std::move(ts)...);
 };
 };
}
```

#### 33.9.11.3 *execution::read\_env*

[*exec.read.env*]

- <sup>1</sup> *read\_env* is a sender factory for a sender whose asynchronous operation completes synchronously in its start operation with a value completion result equal to a value read from the receiver's associated environment.
- <sup>2</sup> *read\_env* is a customization point object. For some query object *q*, the expression *read\_env*(*q*) is expression-equivalent to *make-sender*(*read\_env*, *q*).
- <sup>3</sup> The exposition-only class template *impls-for* (33.9.2) is specialized for *read\_env* as follows:

```

namespace std::execution {
 template<>
 struct impls-for<decayed-typeof<read_env>> : default-impls {
 static constexpr auto start =
 [] (auto query, auto& rcvr) noexcept -> void {
 TRY-SET-VALUE(rcvr, query(get_env(rcvr)));
 };
 };

 template<class Sndr, class Env>
 static consteval void check-types();
}

```

```

template<class Sndr, class Env>
static consteval void check-types();

```

4 Let Q be `decay_t<data-type<Sndr>>`.

5 *Throws:* An exception of type *unspecified-exception* (33.9.1) if the expression `Q()(env)` is ill-formed or has type `void`, where `env` is an lvalue subexpression whose type is `Env`.

### 33.9.12 Sender adaptors

[exec.adapt]

#### 33.9.12.1 General

[exec.adapt.general]

- 1 Subclause 33.9.12 specifies a set of sender adaptors.
- 2 The bitwise inclusive OR operator is overloaded for the purpose of creating sender chains. The adaptors also support function call syntax with equivalent semantics.
- 3 Unless otherwise specified:
  - (3.1) — A sender adaptor is prohibited from causing observable effects, apart from moving and copying its arguments, before the returned sender is connected with a receiver using `connect`, and `start` is called on the resulting operation state.
  - (3.2) — A parent sender (33.3) with a single child sender `sndr` has an associated attribute object equal to `FWD-ENV(get_env(sndr))` (33.5.2) except that the `get_completion_scheduler<completion-tag>` and `get_completion_domain<completion-tag>` queries are handled as described in 33.9.1.
  - (3.3) — A parent sender with more than one child sender has an associated attributes object equal to `env<>{}` except that the `get_completion_scheduler<completion-tag>` and `get_completion_domain<completion-tag>` queries are handled as described in 33.9.1.
  - (3.4) — When a parent sender is connected to a receiver `rcvr`, any receiver used to connect a child sender has an associated environment equal to `FWD-ENV(get_env(rcvr))`.
  - (3.5) — An adaptor whose child senders are all non-dependent (33.3) is itself non-dependent.
  - (3.6) — These requirements apply to any function that is selected by the implementation of the sender adaptor.
  - (3.7) — *Recommended practice:* Implementations should use the completion signatures of the adaptors to communicate type errors to users and to propagate any such type errors from child senders.
- 4 If a sender returned from a sender adaptor specified in 33.9.12 is specified to include `set_error_t(Err)` among its set of completion signatures where `decay_t<Err>` denotes the type `exception_ptr`, but the implementation does not potentially evaluate an error completion operation with an `exception_ptr` argument, the implementation is allowed to omit the `exception_ptr` error completion signature from the set.

#### 33.9.12.2 Closure objects

[exec.adapt.obj]

- 1 A *pipeable sender adaptor closure object* is a function object that accepts one or more `sender` arguments and returns a `sender`. For a pipeable sender adaptor closure object `c` and an expression `sndr` such that `decltype((sndr))` models `sender`, the following expressions are equivalent and yield a `sender`:

```

c(sndr)
sndr | c

```

Given an additional pipeable sender adaptor closure object `d`, the expression `c | d` produces another pipeable sender adaptor closure object `e`:

`e` is a perfect forwarding call wrapper (22.10.4) with the following properties:

- (1.1) — Its target object is an object `d2` of type `decltype(auto(d))` direct-non-list-initialized with `d`.
- (1.2) — It has one bound argument entity, an object `c2` of type `decltype(auto(c))` direct-non-list-initialized with `c`.
- (1.3) — Its call pattern is `d2(c2(arg))`, where `arg` is the argument used in a function call expression of `e`.

The expression `c | d` is well-formed if and only if the initializations of the state entities (22.10.3) of `e` are all well-formed.

- 2 An object `t` of type `T` is a pipeable sender adaptor closure object if `T` models `derived_from<sender_adaptor_closure<T>>`, `T` has no other base classes of type `sender_adaptor_closure<U>` for any other type `U`, and `T` does not satisfy `sender`.
- 3 The template parameter `D` for `sender_adaptor_closure` can be an incomplete type. Before any expression of type `cv D` appears as an operand to the `|` operator, `D` shall be complete and model `derived_from<sender_adaptor_closure<D>>`. The behavior of an expression involving an object of type `cv D` as an operand to the `|` operator is undefined if overload resolution selects a program-defined `operator|` function.
- 4 A *pipeable sender adaptor object* is a customization point object that accepts a `sender` as its first argument and returns a `sender`. If a pipeable sender adaptor object accepts only one argument, then it is a pipeable sender adaptor closure object.
- 5 If a pipeable sender adaptor object adaptor accepts more than one argument, then let `sndr` be an expression such that `decltype((sndr))` models `sender`, let `args...` be arguments such that `adaptor(sndr, args...)` is a well-formed expression as specified below, and let `BoundArgs` be a pack that denotes `decltype(auto(args))...`. The expression `adaptor(args...)` produces a pipeable sender adaptor closure object `f` that is a perfect forwarding call wrapper with the following properties:
  - (5.1) — Its target object is a copy of adaptor.
  - (5.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward, respectively.`
  - (5.3) — Its call pattern is `adaptor(rcvr, bound_args...)`, where `rcvr` is the argument used in a function call expression of `f`.

The expression `adaptor(args...)` is well-formed if and only if the initializations of the bound argument entities of the result, as specified above, are all well-formed.

### 33.9.12.3 execution::write\_env

[exec.write.env]

- 1 `write_env` is a sender adaptor that accepts a sender and a queryable object, and that returns a sender that, when connected with a receiver `rcvr`, connects the adapted sender with a receiver whose execution environment is the result of joining the *queryable* object to the result of `get_env(rcvr)`.
- 2 `write_env` is a customization point object. For some subexpressions `sndr` and `env`, if `decltype((sndr))` does not satisfy `sender` or if `decltype((env))` does not satisfy *queryable*, the expression `write_env(sndr, env)` is ill-formed. Otherwise, it is expression-equivalent to `make_sender(write_env, env, sndr)`.
- 3 Let *write-env-t* denote the type `decltype(auto(write_env))`. The exposition-only class template *impls-for* (33.9.2) is specialized for *write-env-t* as follows:

```
template<>
struct impls_for<write-env-t> : default_impls {
 static constexpr auto join_env(const auto& state, const auto& env) noexcept {
 return see below;
 }

 static constexpr auto get_env =
 [](auto, const auto& state, const auto& rcvr) noexcept {
 return join_env(state, FWD-ENV(get_env(rcvr)));
 };

 template<class Sndr, class... Env>
 static consteval void check_types();
};
```

- 4 Invocation of `impls_for<write-env-t>::join_env` returns an object `e` such that
  - (4.1) — `decltype(e)` models *queryable* and

(4.2) — given a query object `q`, the expression `e.query(q)` is expression-equivalent to `state.query(q)` if that expression is valid, otherwise, `e.query(q)` is expression-equivalent to `env.query(q)`.

- <sup>5</sup> For a type `Sndr` and a pack of types `Env`, let `State` be *data-type*<`Sndr`> and let `JoinEnv` be the pack `decltype(join-env(declval<State>(), FWD-ENV(declval<Env>())))`. Then *impls-for*<*write-env-t*>::*check-types*<`Sndr`, `Env...`>() is expression-equivalent to `get_completion_signatures<child-type<Sndr>, JoinEnv...>()`.

#### 33.9.12.4 execution::unstoppable

[exec.unstoppable]

- <sup>1</sup> `unstoppable` is a sender adaptor that connects its inner sender with a receiver that has the execution environment of the outer receiver but with an object of type `never_stop_token` as the result of the `get_stop_token` query.
- <sup>2</sup> For a subexpression `sndr`, `unstoppable(sndr)` is expression-equivalent to `write_env(sndr, prop(get_stop_token, never_stop_token{}))`.

#### 33.9.12.5 execution::starts\_on

[exec.starts.on]

- <sup>1</sup> `starts_on` adapts an input sender into a sender that will start on an execution agent belonging to a particular scheduler's associated execution resource.
- <sup>2</sup> The name `starts_on` denotes a customization point object. For subexpressions `sch` and `sndr`, if `decltype((sch))` does not satisfy `scheduler`, or `decltype((sndr))` does not satisfy `sender`, `starts_on(sch, sndr)` is ill-formed.
- <sup>3</sup> Otherwise, the expression `starts_on(sch, sndr)` is expression-equivalent to: *make-sender*(`starts_on`, `sch`, `sndr`).
- <sup>4</sup> Let `out_sndr` and `env` be subexpressions such that `OutSndr` is `decltype((out_sndr))`. If *sender-for*<`OutSndr`, `starts_on_t`> is false, then the expression `starts_on.transform_sender(set_value, out_sndr, env)` is ill-formed; otherwise `starts_on.transform_sender(set_value, out_sndr, env)` is equivalent to:

```
auto&& [_, sch, sndr] = out_sndr;
return let_value(
 continues_on(just(), sch),
 [sndr = std::forward_like<OutSndr>(sndr)]() mutable
 noexcept(is_nothrow_move_constructible_v<decay_t<OutSndr>>) {
 return std::move(sndr);
 });
```

- <sup>5</sup> Let `out_sndr` be a subexpression denoting a sender returned from `starts_on(sch, sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that *sender\_in*<`OutSndr`, `Env`> is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall start `sndr` on an execution agent of the associated execution resource of `sch`. If scheduling onto `sch` fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

#### 33.9.12.6 execution::continues\_on

[exec.continues.on]

- <sup>1</sup> `continues_on` schedules work dependent on the completion of a sender onto a scheduler's associated execution resource.
- <sup>2</sup> The name `continues_on` denotes a customization point object. For some subexpressions `sch` and `sndr`, let `Sch` be `decltype((sch))` and `Sndr` be `decltype((sndr))`. If `Sch` does not satisfy `scheduler`, or `Sndr` does not satisfy `sender`, `continues_on(sndr, sch)` is ill-formed.
- <sup>3</sup> Otherwise, the expression `continues_on(sndr, sch)` is expression-equivalent to *make-sender*(`continues_on`, `sch`, `schedule_from(sndr)`).
- <sup>4</sup> The exposition-only class template *impls-for* (33.9.2) is specialized for `continues_on_t` as follows:

```
namespace std::execution {
 template<>
 struct impls_for<continues_on_t> : default_impls {
 static constexpr auto get_state = see below;
 static constexpr auto complete = see below;
 };
}
```

```

 template<class Sndr, class... Env>
 static consteval void check-types();
};

```

- 5 The member *impls-for*<continues\_on\_t>::*get-state* is initialized with a callable object equivalent to the following lambda:

```

[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(see below)
 requires sender_in<child-type<Sndr>, FWD-ENV-T(env_of_t<Rcvr>)> {
 auto& [_ , sch, child] = sndr;

 using sched_t = decltype(auto(sch));
 using variant_t = see below;
 using receiver_t = see below;
 using operation_t = connect_result_t<schedule_result_t<sched_t>, receiver_t>;
 constexpr bool nothrow = noexcept(connect(schedule(sch), receiver_t{nullptr}));

 struct state-type {
 Rcvr& rcvr; // exposition only
 variant_t async-result; // exposition only
 operation_t op-state; // exposition only

 explicit state-type(sched_t sch, Rcvr& rcvr) noexcept(nothrow)
 : rcvr(rcvr), op-state(connect(schedule(sch), receiver_t{this})) {}
 };

 return state-type{sch, rcvr};
}

```

```

template<class Sndr, class... Env>
 static consteval void check-types();

```

- 6 *Effects*: Equivalent to:

```

 get_completion_signatures<schedule_result_t<data-type<Sndr>>, FWD-ENV-T(Env)...>();
 auto cs = get_completion_signatures<child-type<Sndr>, FWD-ENV-T(Env)...>();
 decay-copyable-result-datums(cs); // see 33.9.2

```

- 7 Objects of the local class *state-type* can be used to initialize a structured binding.

- 8 Let Sigs be a pack of the arguments to the *completion\_signatures* specialization named by *completion\_signatures\_of\_t*<*child-type*<Sndr>, *FWD-ENV-T*(env\_of\_t<Rcvr>)>. Let *as-tuple* be an alias template such that *as-tuple*<Tag(Args...)> denotes the type *decayed-tuple*<Tag, Args...>, and let *is-nothrow-decay-copy-sig* be a variable template such that *auto*(*is-nothrow-decay-copy-sig*<Tag(Args...)>) is a constant expression of type *bool* and equal to (*is\_nothrow\_constructible\_v*<*decay\_t*<Args>, Args> && ...). Let *error-completion* be a pack consisting of the type *set\_error\_t*(*exception\_ptr*) if (*is-nothrow-decay-copy-sig*<Sigs> &&...) is false, and an empty pack otherwise. Then *variant\_t* denotes the type *variant*<*monostate*, *as-tuple*<Sigs>..., *error-completion*...>, except with duplicate types removed.

- 9 *receiver\_t* is an alias for the following exposition-only class:

```

namespace std::execution {
 struct receiver-type {
 using receiver_concept = receiver_tag;
 state-type* state; // exposition only

 void set_value() && noexcept {
 visit(
 [this]<class Tuple>(Tuple& result) noexcept -> void {
 if constexpr (!same_as<monostate, Tuple>) {
 auto& [tag, ...args] = result;
 tag(std::move(state->rcvr), std::move(args)...);
 }
 },
 state->async-result);
 }
 };
}

```

```

template<class Error>
void set_error(Error&& err) && noexcept {
 execution::set_error(std::move(state->rcvr), std::forward<Error>(err));
}

void set_stopped() && noexcept {
 execution::set_stopped(std::move(state->rcvr));
}

decltype(auto) get_env() const noexcept {
 return FWD-ENV(execution::get_env(state->rcvr));
}
};
}

```

- <sup>10</sup> The expression in the `noexcept` clause of the lambda is `true` if the construction of the returned *state-type* object is not potentially throwing; otherwise, `false`.
- <sup>11</sup> The member *impls-for*<continues\_on\_t>::*complete* is initialized with a callable object equivalent to the following lambda:

```

[]<class Tag, class... Args>(auto, auto& state, auto& rcvr, Tag, Args&&... args) noexcept
-> void {
 using result_t = decayed-tuple<Tag, Args...>;
 constexpr bool nothrow = (is_nothrow_constructible_v<decay_t<Args>, Args> && ...);

 try {
 state.async-result.template emplace<result_t>(Tag(), std::forward<Args>(args)...);
 } catch (...) {
 if constexpr (!nothrow)
 state.async-result.template emplace<tuple<set_error_t,
 exception_ptr>>(set_error, current_exception());
 }
 start(state.op-state);
};

```

- <sup>12</sup> Let *out\_sndr* be a subexpression denoting a sender returned from *continues\_on\_t*(*sndr*, *sch*) or one equal to such, and let *OutSndr* be the type `decltype((out_sndr))`. Let *out\_rcvr* be a subexpression denoting a receiver that has an environment of type *Env* such that *sender\_in*<*OutSndr*, *Env*> is `true`. Let *op* be an lvalue referring to the operation state that results from connecting *out\_sndr* with *out\_rcvr*. Calling *start*(*op*) shall start *sndr* on the current execution agent and execute completion operations on *out\_rcvr* on an execution agent of the execution resource associated with *sch*. If scheduling onto *sch* fails, an error completion on *out\_rcvr* shall be executed on an unspecified execution agent.

### 33.9.12.7 execution::schedule\_from

[exec.schedule.from]

- <sup>1</sup> The name *schedule\_from* denotes a customization point object. For some subexpression *sndr*, if `decltype((sndr))` does not satisfy *sender*, *schedule\_from*(*sndr*) is ill-formed. Otherwise, the expression *schedule\_from*(*sndr*) is expression-equivalent to *make\_sender*(*schedule\_from*, {}, *sndr*).

[Note 1: *schedule\_from* is used by schedulers to control how to transition off of their schedulers' associated execution contexts. — end note]

### 33.9.12.8 execution::on

[exec.on]

- <sup>1</sup> The *on* sender adaptor has two forms:
- (1.1) — *on*(*sch*, *sndr*), which starts a sender *sndr* on an execution agent belonging to a scheduler *sch*'s associated execution resource and that, upon *sndr*'s completion, transfers execution back to the execution resource on which the *on* sender was started.
- (1.2) — *on*(*sndr*, *sch*, *closure*), which upon completion of a sender *sndr*, transfers execution to an execution agent belonging to a scheduler *sch*'s associated execution resource, then executes a sender adaptor closure *closure* with the async results of the sender, and that then transfers execution back to the execution resource on which *sndr* completed.
- <sup>2</sup> The name *on* denotes a pipeable sender adaptor object. For subexpressions *sch* and *sndr*, *on*(*sch*, *sndr*) is ill-formed if any of the following is `true`:

- (2.1) — `decltype((sch))` does not satisfy `scheduler`, or
- (2.2) — `decltype((sndr))` does not satisfy `sender` and `sndr` is not a pipeable sender adaptor closure object (33.9.12.2), or
- (2.3) — `decltype((sndr))` satisfies `sender` and `sndr` is also a pipeable sender adaptor closure object.
- 3 Otherwise, if `decltype((sndr))` satisfies `sender`, the expression `on(sch, sndr)` is expression-equivalent to `make-sender(on, sch, sndr)`.
- 4 For subexpressions `sndr`, `sch`, and `closure`, if
  - (4.1) — `decltype((sch))` does not satisfy `scheduler`, or
  - (4.2) — `decltype((sndr))` does not satisfy `sender`, or
  - (4.3) — `closure` is not a pipeable sender adaptor closure object (33.9.12.2),
 the expression `on(sndr, sch, closure)` is ill-formed; otherwise, it is expression-equivalent to `make-sender(on, product-type{sch, closure}, sndr)`.
- 5 Let `out_sndr` and `env` be subexpressions, let `OutSndr` be `decltype((out_sndr))`, and let `Env` be `decltype((env))`. If `sender-for<OutSndr, on_t>` is false, then the expression `on.transform_sender(set_value, out_sndr, env)` is ill-formed.
- 6 Otherwise, the expression `on.transform_sender(set_value, out_sndr, env)` has effects equivalent to:
 

```
auto&& [_, data, child] = out_sndr;
if constexpr (scheduler<decltype(data)>) {
 auto orig_sch = call-with-default(get_start_scheduler, not-a-scheduler(), env);
 return continues_on(
 starts_on(std::forward_like<OutSndr>(data), std::forward_like<OutSndr>(child)),
 std::move(orig_sch));
} else {
 auto& [sch, closure] = data;
 auto orig_sch = call-with-default(
 get_completion_scheduler<set_value_t>, not-a-scheduler(), get_env(child), env);
 return continues_on(
 std::forward_like<OutSndr>(closure)(continues_on(std::forward_like<OutSndr>(child), sch)),
 orig_sch);
}
```
- 7 Let `out_sndr` be a subexpression denoting a sender returned from `on(sch, sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall
  - (7.1) — remember the current scheduler, which is obtained by `get_start_scheduler(get_env(rcvr))`;
  - (7.2) — start `sndr` on an execution agent belonging to `sch`'s associated execution resource;
  - (7.3) — upon `sndr`'s completion, transfer execution back to the execution resource associated with the scheduler remembered in step 1; and
  - (7.4) — forward `sndr`'s async result to `out_rcvr`.
 If any scheduling operation fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.
- 8 Let `out_sndr` be a subexpression denoting a sender returned from `on(sndr, sch, closure)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env` such that `sender_in<OutSndr, Env>` is true. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` with `out_rcvr`. Calling `start(op)` shall
  - (8.1) — remember the current scheduler, which is `get_completion_scheduler<set_value_t>(get_env(sndr), get_env(out_rcvr))`;
  - (8.2) — start `sndr` on the current execution agent;
  - (8.3) — upon `sndr`'s completion, transfer execution to an agent owned by `sch`'s associated execution resource;
  - (8.4) — forward `sndr`'s async result as if by connecting and starting a sender `closure(S)`, where `S` is a sender that completes synchronously with `sndr`'s async result; and

- (8.5) — upon completion of the operation started in the previous step, transfer execution back to the execution resource associated with the scheduler remembered in step 1 and forward the operation's async result to `out_rcvr`.

If any scheduling operation fails, an error completion on `out_rcvr` shall be executed on an unspecified execution agent.

### 33.9.12.9 `execution::then`, `execution::upon_error`, `execution::upon_stopped` [exec.then]

- 1 `then` attaches an invocable as a continuation for an input sender's value completion operation. `upon_error` and `upon_stopped` do the same for the error and stopped completion operations, respectively, sending the result of the invocable as a value completion.
- 2 The names `then`, `upon_error`, and `upon_stopped` denote pipeable sender adaptor objects. Let the expression `then-cpo` be one of `then`, `upon_error`, or `upon_stopped`. For subexpressions `sndr` and `f`, if `decltype((sndr))` does not satisfy `sender`, or `decltype((f))` does not satisfy `movable-value`, `then-cpo` (`sndr`, `f`) is ill-formed.
- 3 Otherwise, the expression `then-cpo` (`sndr`, `f`) is expression-equivalent to `make-sender(then-cpo, f, sndr)`.
- 4 For `then`, `upon_error`, and `upon_stopped`, let `set-cpo` be `set_value`, `set_error`, and `set_stopped`, respectively. The exposition-only class template `impls-for` (33.9.2) is specialized for `then-cpo` as follows:

```
namespace std::execution {
 template<>
 struct impls-for<decayed-typeof<then-cpo>> : default-impls {
 static constexpr auto complete =
 []<class Tag, class... Args>
 (auto, auto& fn, auto& rcvr, Tag, Args&&... args) noexcept -> void {
 if constexpr (same_as<Tag, decayed-typeof<set-cpo>>) {
 TRY-SET-VALUE(rcvr,
 invoke(std::move(fn), std::forward<Args>(args)...));
 } else {
 Tag()(std::move(rcvr), std::forward<Args>(args)...);
 }
 };

 template<class Sndr, class... Env>
 static constexpr void check-types();
 };
}
```

```
template<class Sndr, class... Env>
static constexpr void check-types();
```

- 5 *Effects:* Equivalent to:

```
auto cs = get_completion_signatures<child-type<Sndr>, FWD-ENV-T(Env)...>();
auto fn = []<class... Ts>(decayed-typeof<set-cpo>(*) (Ts...)) {
 if constexpr (!invocable<remove_cvref_t<data-type<Sndr>>, Ts...>)
 throw unspecified-exception();
};
cs.for-each(overload-set{fn, [] (auto){}});
```

- 6 The expression `then-cpo` (`sndr`, `f`) has undefined behavior unless it returns a sender `out_sndr` that
  - (6.1) — invokes `f` or a copy of such with the value, error, or stopped result datums of `sndr` for `then`, `upon_error`, and `upon_stopped`, respectively, using the result value of `f` as `out_sndr`'s value completion, and
  - (6.2) — forwards all other completion operations unchanged.

### 33.9.12.10 `execution::let_value`, `execution::let_error`, `execution::let_stopped` [exec.let]

- 1 `let_value`, `let_error`, and `let_stopped` transform a sender's value, error, and stopped completions, respectively, into a new child asynchronous operation by passing the sender's result datums to a user-specified callable, which returns a new sender that is connected and started.
- 2 For `let_value`, `let_error`, and `let_stopped`, let `set-cpo` be `set_value`, `set_error`, and `set_stopped`, respectively. Let the expression `let-cpo` be one of `let_value`, `let_error`, or `let_stopped`. Let `let-tag`

denote a unique, empty class type for each of `let_value`, `let_error`, and `let_stopped`. For subexpressions `sndr` and `env`, let `let-env(sndr, env)` be expression-equivalent to the first well-formed expression below:

- (2.1) — `SCHED-ENV(get_completion_scheduler<decayed-typeof<set-cpo>>(get_env(sndr)), FWD-ENV(env))`
- (2.2) — `MAKE-ENV(get_domain, get_completion_domain<decayed-typeof<set-cpo>>(get_env(sndr)), FWD-ENV(env))`
- (2.3) — `(void(sndr), env<>{})`

<sup>3</sup> The names `let_value`, `let_error`, and `let_stopped` denote pipeable sender adaptor objects. For subexpressions `sndr` and `f`, let `F` be the decayed type of `f`. If `decltype((sndr))` does not satisfy `sender` or if `decltype((f))` does not satisfy `movable-value`, the expression `let-cpo(sndr, f)` is ill-formed. If `F` does not satisfy `invocable`, the expression `let_stopped(sndr, f)` is ill-formed.

<sup>4</sup> Otherwise, the expression `let-cpo(sndr, f)` is expression-equivalent to `make-sender(let-cpo, f, sndr)`.

<sup>5</sup> Let `let-data` denote the following exposition-only class template:

```
template<class Sndr, class Fn>
struct let_data {
 Sndr sndr; // exposition only
 Fn fn; // exposition only
};
```

<sup>6</sup> Then let the expression `let-cpo.transform_sender(s, es...)` be expression-equivalent to:

```
make-sender(let-tag{}, let-data{s.template get<2>(), s.template get<1>()})
```

except that `s` is evaluated only once.

<sup>7</sup> The exposition-only class template `impls-for` (33.9.2) is specialized for `let-tag` as follows:

```
namespace std::execution {
 template<>
 struct impls_for<let-tag> : default_impls {
 static constexpr auto get_state = see below;
 static constexpr auto start = see below;

 template<class Sndr, class... Env>
 static constexpr void check_types();
 };
}
```

<sup>8</sup> Let `receiver2` denote the following exposition-only class template:

```
namespace std::execution {
 template<class Rcvr, class Env>
 struct receiver2 {
 using receiver_concept = receiver_tag;

 template<class... Args>
 void set_value(Args&&... args) && noexcept {
 execution::set_value(std::move(rcvr), std::forward<Args>(args)...);
 }

 template<class Error>
 void set_error(Error&& err) && noexcept {
 execution::set_error(std::move(rcvr), std::forward<Error>(err));
 }

 void set_stopped() && noexcept {
 execution::set_stopped(std::move(rcvr));
 }

 decltype(auto) get_env() const noexcept {
 return see below;
 }
 };
}
```

```

 Rcvr& rcvr; // exposition only
 Env env; // exposition only
};
}

```

Invocation of the function `receiver2::get_env` returns an object `e` such that

- (8.1) — `decltype(e)` models *queryable* and
- (8.2) — given a query object `q` and a pack of subexpressions `args`, the expression `e.query(q, args...)` is expression-equivalent to `env.query(q, args...)` if that expression is valid; otherwise, if the type of `q` satisfies *forwarding-query*, `e.query(q, args...)` is expression-equivalent to `get_env(rcvr).query(q, args...)`; otherwise, `e.query(q, args...)` is ill-formed.

```

template<class Sndr, class... Env>
static consteval void check-types();

```

9 *Effects*: Equivalent to:

```

using LetFn = remove_cvref_t<data-type<Sndr>>;
auto cs = get_completion_signatures<child-type<Sndr>, FWD-ENV-T(Env)...>();
auto fn = []<class... Ts>(decayed-typeof<set-cpo>(*) (Ts...)) {
 if constexpr (!is-valid-let-sender) // see below
 throw unspecified-exception();
};
cs.for-each(overload-set(fn, [] (auto){}));

```

where *is-valid-let-sender* is true if and only if all of the following are true:

- (9.1) — `(constructible_from<decay_t<Ts>, Ts> &&...)`
- (9.2) — `invocable<LetFn, decay_t<Ts>&...>`
- (9.3) — `sender<invoke_result_t<LetFn, decay_t<Ts>&...>>`
- (9.4) — `sizeof...(Env) == 0 || sender_in<invoke_result_t<LetFn, decay_t<Ts>&...>, env-t...>`

where *env-t* is the pack `decltype(JOIN-ENV(let-env(declval<child-type<Sndr>>()), declval<Env>()), FWD-ENV(declval<Env>()))`.

10 Let *let-state* denote the following exposition-only class template:

```

template<class Cpo, class Sndr, class Fn, class Rcvr, class ArgsVariant, class OpsVariant>
struct let-state {
 using env_t = decltype(let-env(declval<Sndr>(), get_env(declval<Rcvr>&()))); // exposition only
 Fn fn; // exposition only
 env_t env; // exposition only
 ArgsVariant args; // exposition only
 OpsVariant ops; // exposition only

 template<class Tag, class... Ts>
 constexpr void impl(Rcvr& rcvr, Tag tag, Ts&&... ts) noexcept { // exposition only
 using args_t = decayed-tuple<Ts...>;
 using receiver_type = receiver2<Rcvr, env_t>;
 using sender_type = apply_result_t<Fn, args_t&>;
 if constexpr (is_same_v<Tag, Cpo>) {
 try {
 auto& tuple = args.template emplace<args_t>(std::forward<Ts>(ts)...);
 ops.template emplace<monostate>();
 auto&& sndr = apply(std::move(fn), tuple);
 using op_t = connect_result_t<sender_type, receiver_type>;
 auto mkop2 = [&] {
 return connect(std::forward<sender_type>(sndr),
 receiver_type{rcvr, env});
 };
 auto& op = ops.template emplace<op_t>(emplace-from{mkop2});
 start(op);
 }
 }
 }
};

```

```

 } catch (...) {
 constexpr bool nothrow =
 is_nothrow_constructible_v<args_t, Ts...> &&
 is_nothrow_applicable_v<Fn, args_t&> &&
 noexcept(connect(declval<sender_type>(), receiver_type{rcvr, env}));
 if constexpr (!nothrow) {
 set_error(std::move(rcvr), current_exception());
 }
 }
} else {
 tag(std::move(rcvr), std::forward<Ts>(ts)...);
}
}

struct receiver { // exposition only
 let-state& state; // exposition only
 Rcvr& rcvr; // exposition only

 using receiver_concept = receiver_tag;

 template<class... Args>
 constexpr void set_value(Args&&... args) noexcept {
 state.impl(rcvr, execution::set_value, std::forward<Args>(args)...);
 }
 template<class... Args>
 constexpr void set_error(Args&&... args) noexcept {
 state.impl(rcvr, execution::set_error, std::forward<Args>(args)...);
 }
 template<class... Args>
 constexpr void set_stopped(Args&&... args) noexcept {
 state.impl(rcvr, execution::set_stopped, std::forward<Args>(args)...);
 }

 constexpr env_of_t<const Rcvr&> get_env() const noexcept {
 return execution::get_env(rcvr);
 }
};

using op_t = connect_result_t<Sndr, receiver>; // exposition only

constexpr let-state(Sndr&& sndr, Fn fn, Rcvr& rcvr) // exposition only
 : fn(std::move(fn)), env(let-env(sndr, get_env(rcvr))),
 ops(in_place_type<op_t>, std::forward<Sndr>(sndr), receiver{*this, rcvr}) {}
};

```

- 11 *impls-for<let-tag>::get-state* is initialized with a callable object equivalent to the following:

```

[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) requires see below {
 auto& [_ , data] = sndr;
 auto& [child, fn] = data;
 using child_t = decltype(std::forward_like<Sndr>(child));
 using fn_t = decay_t<decltype(fn)>;
 using args_variant_t = see below;
 using ops_variant_t = see below;
 using state_t = let-state<decayed-typeof<set-cpo>, child_t, fn_t, Rcvr,
 args_variant_t, ops_variant_t>;
 return state_t(std::forward_like<Sndr>(child), std::forward_like<Sndr>(fn), rcvr);
}

```

- 12 Let *Sigs* be a pack of the arguments to the *completion\_signatures* specialization named by *completion\_signatures\_of\_t<child-type<Sndr>, FWD-ENV-T(env\_of\_t<Rcvr>)>*. Let *LetSigs* be a pack of those types in *Sigs* with a return type of *decayed-typeof<set-cpo>*. Let *as-tuple* be an alias template such that *as-tuple<Tag(Args...)>* denotes the type *decayed-tuple<Args...>*. Then *args\_variant\_t* denotes the type *variant<monostate, as-tuple<LetSigs>...>* except with duplicate types removed.

- 13 Given a type `Tag` and a pack `Args`, let `as-sndr2` be an alias template such that `as-sndr2<Tag(Args...)>` denotes the type `call-result-t<F, decay_t<Args>&...>`. Then `ops_variant_t` denotes the type

```
variant<monostate,
 connect_result_t<child_t, let-state::receiver>,
 connect_result_t<as-sndr2<LetSigs>, receiver2<Rcvr, env_t>>...>
```

except with duplicate types removed.

- 14 The *requires-clause* constraining the above lambda is satisfied if and only if the types `args_variant_t` and `ops2_variant_t` are well-formed.
- 15 `impls-for<let-tag>::start` is initialized with a callable object equivalent to the following:

```
[]<class State, class Rcvr>(State& state, Rcvr&) noexcept {
 start(get<typename State::op_t>(state.ops));
}
```

- 16 Let the subexpression `out_sndr` denote the result of the invocation `let-cpo(sndr, f)` or an object equal to such, and let the subexpression `rcvr` denote a receiver such that the expression `connect(out_sndr, rcvr)` is well-formed. The expression `connect(out_sndr, rcvr)` has undefined behavior unless it creates an asynchronous operation (33.3) that, when started:

- (16.1) — invokes `f` when `set-cpo` is called with `sndr`'s result datums,
- (16.2) — makes its completion dependent on the completion of a sender returned by `f`, and
- (16.3) — propagates the other completion operations sent by `sndr`.

#### 33.9.12.11 `execution::bulk`, `execution::bulk_chunked`, and `execution::bulk_unchunked` [`exec.bulk`]

- 1 `bulk`, `bulk_chunked`, and `bulk_unchunked` run a task repeatedly for every index in an index space.

- 2 The names `bulk`, `bulk_chunked`, and `bulk_unchunked` denote pipeable sender adaptor objects. Let `bulk-algo` be either `bulk`, `bulk_chunked`, or `bulk_unchunked`. For subexpressions `sndr`, `policy`, `shape`, and `f`, let `Policy` be `remove_cvref_t<decltype(policy)>`, `Shape` be `decltype(auto(shape))`, and `Func` be `decay_t<decltype((f))>`. If

- (2.1) — `decltype((sndr))` does not satisfy `sender`, or
- (2.2) — `is_execution_policy_v<Policy>` is false, or
- (2.3) — `Shape` does not satisfy `integral`, or
- (2.4) — `Func` does not model `copy_constructible`,

`bulk-algo(sndr, policy, shape, f)` is ill-formed.

- 3 Otherwise, the expression `bulk-algo(sndr, policy, shape, f)` is expression-equivalent to:

```
make-sender(bulk-algo, product-type<see below, Shape, Func>{policy, shape, f}, sndr)
```

The first template argument of *product-type* is `Policy` if `Policy` models `copy_constructible`, and `const Policy&` otherwise.

- 4 Let `sndr` and `env` be subexpressions such that `Sndr` is `decltype((sndr))`. If `sender-for<Sndr, bulk_t>` is false, then the expression `bulk.transform_sender(set_value, sndr, env)` is ill-formed; otherwise, it is equivalent to:

```
auto [_, data, child] = sndr;
auto& [policy, shape, f] = data;
auto new_f = [func = std::move(f)](Shape begin, Shape end, auto&&... vs)
 noexcept(noexcept(f(begin, vs...))) {
 while (begin != end) func(begin++, vs...);
}
return bulk_chunked(std::move(child), policy, shape, std::move(new_f));
```

[Note 1: This causes the `bulk(sndr, policy, shape, f)` sender to be expressed in terms of `bulk_chunked(sndr, policy, shape, f)` when it is connected to a receiver whose execution domain does not customize `bulk`. — end note]

- 5 The exposition-only class template *impls-for* (33.9.2) is specialized for `bulk_chunked_t` as follows:

```

namespace std::execution {
 template<>
 struct impls-for<bulk_chunked_t> : default-impls {
 static constexpr auto complete = see below;

 template<class Sndr, class... Env>
 static consteval void check-types();
 };
}

```

The member *impls-for*<bulk\_chunked\_t>::*complete* is initialized with a callable object equivalent to the following lambda:

```

[]<class Index, class State, class Rcvr, class Tag, class... Args>
(Index, State& state, Rcvr& rcvr, Tag, Args&&... args) noexcept
-> void requires see below {
 if constexpr (same_as<Tag, set_value_t>) {
 auto& [policy, shape, f] = state;
 constexpr bool nothrow = noexcept(f(auto(shape), auto(shape), args...));
 TRY-EVAL(rcvr, [&]() noexcept(nothrow) {
 f(static_cast<decltype(auto(shape))>(0), auto(shape), args...);
 Tag()(std::move(rcvr), std::forward<Args>(args)...);
 }());
 } else {
 Tag()(std::move(rcvr), std::forward<Args>(args)...);
 }
}

```

The expression in the *requires-clause* of the lambda above is *true* if and only if *Tag* denotes a type other than *set\_value\_t* or if the expression *f*(*auto*(*shape*), *auto*(*shape*), *args*...) is well-formed.

```

template<class Sndr, class... Env>
 static consteval void check-types();

```

6     *Effects*: Equivalent to:

```

 auto cs = get_completion_signatures<child-type<Sndr>, FWD-ENV-T(Env)...\>();
 auto fn = []<class... Ts>(set_value_t(*) (Ts...)) {
 using data_type = data-type<Sndr>;
 if constexpr (!invocable<remove_cvref_t<child-type<data_type>&,
 remove_cvref_t<data-type<data_type>>, Ts&...\>)
 throw unspecified-exception();
 };
 cs.for-each(overload-set(fn, [] (auto){}));

```

7     The exposition-only class template *impls-for* (33.9.2) is specialized for *bulk\_unchunked\_t* as follows:

```

namespace std::execution {
 template<>
 struct impls-for<bulk_unchunked_t> : default-impls {
 static constexpr auto complete = see below;

 template<class Sndr, class... Env>
 static consteval void check-types();
 };
}

```

The member *impls-for*<bulk\_unchunked\_t>::*complete* is initialized with a callable object equivalent to the following lambda:

```

[]<class Index, class State, class Rcvr, class Tag, class... Args>
(Index, State& state, Rcvr& rcvr, Tag, Args&&... args) noexcept
-> void requires see below {
 if constexpr (same_as<Tag, set_value_t>) {
 auto& [policy, shape, f] = state;
 constexpr bool nothrow = noexcept(f(auto(shape), args...));
 TRY-EVAL(rcvr, [&]() noexcept(nothrow) {
 for (decltype(auto(shape)) i = 0; i < shape; ++i) {
 f(auto(i), args...);
 }
 });
 }
}

```

```

 }
 Tag()(std::move(rcvr), std::forward<Args>(args)...);
}());
} else {
 Tag()(std::move(rcvr), std::forward<Args>(args)...);
}
}

```

The expression in the *requires-clause* of the lambda above is `true` if and only if `Tag` denotes a type other than `set_value_t` or if the expression `f(auto(shape), args...)` is well-formed.

```

template<class Sndr, class... Env>
static consteval void check-types();

```

8 *Effects*: Equivalent to:

```

 auto cs = get_completion_signatures<child-type<Sndr>, FWD-ENV-T(Env)...>();
 auto fn = []<class... Ts>(set_value_t*)(Ts...) {
 using data_type = data-type<Sndr>;
 if constexpr (!invocable<remove_cvref_t<child-type<data_type>&,
 remove_cvref_t<data-type<data_type>>, Ts&...>)
 throw unspecified-exception();
 };
 cs.for-each(overload-set(fn, []{auto}{}));

```

9 Let the subexpression `out_sndr` denote the result of the invocation `bulk_algo(sndr, policy, shape, f)` or an object equal to such, and let the subexpression `rcvr` denote a receiver such that the expression `connect(out_sndr, rcvr)` is well-formed. The expression `connect(out_sndr, rcvr)` has undefined behavior unless it creates an asynchronous operation (33.3) that, when started:

(9.1) — If `sndr` has a successful completion, where `args` is a pack of lvalue subexpressions referring to the value completion result datums of `sndr`, or decayed copies of those values if they model `copy_constructible`, then:

(9.1.1) — If `out_sndr` also completes successfully, then:

(9.1.1.1) — for `bulk`, invokes `f(i, args...)` for every `i` of type `Shape` from 0 to `shape`;

(9.1.1.2) — for `bulk_unchunked`, invokes `f(i, args...)` for every `i` of type `Shape` from 0 to `shape`;

*Recommended practice*: The underlying scheduler should execute each iteration on a distinct execution agent.

(9.1.1.3) — for `bulk_chunked`, invokes `f(b, e, args...)` zero or more times with pairs of `b` and `e` of type `Shape` in range `[0, shape]`, such that `b < e` and for every `i` of type `Shape` from 0 to `shape`, there is exactly one invocation with a pair `b` and `e`, such that `i` is in the range `[b, e)`.

(9.1.2) — If `out_sndr` completes with `set_error(rcvr, eptr)`, then the asynchronous operation may invoke a subset of the invocations of `f` before the error completion handler is called, and `eptr` is an `exception_ptr` containing either:

(9.1.2.1) — an exception thrown by an invocation of `f`, or

(9.1.2.2) — a `bad_alloc` exception if the implementation fails to allocate required resources, or

(9.1.2.3) — an exception derived from `runtime_error`.

(9.1.3) — If `out_sndr` completes with `set_stopped(rcvr)`, then the asynchronous operation may invoke a subset of the invocations of `f` before the stopped completion handler.

(9.2) — If `sndr` does not complete with `set_value`, then the completion is forwarded to `recv`.

(9.3) — For `bulk_algo`, the parameter `policy` describes the manner in which the execution of the asynchronous operations corresponding to these algorithms may be parallelized and the manner in which they apply `f`. Permissions and requirements on parallel algorithm element access functions (26.3.3) apply to `f`.

10 [Note 2: The asynchronous operation corresponding to `bulk_algo(sndr, policy, shape, f)` can complete with `set_stopped` if cancellation is requested or ignore cancellation requests. — end note]

### 33.9.12.12 execution::when\_all

[exec.when.all]

1 `when_all` and `when_all_with_variant` both adapt multiple input senders into a sender that completes when all input senders have completed. `when_all` only accepts senders with a single value completion signature and

on success concatenates all the input senders' value result datums into its own value completion operation. `when_all_with_variant(sndrs...)` is semantically equivalent to `when_all(into_variant(sndrs)...)`, where `sndrs` is a pack of subexpressions whose types model `sender`.

- <sup>2</sup> The names `when_all` and `when_all_with_variant` denote customization point objects. Let `sndrs` be a pack of subexpressions and let `Sndrs` be a pack of the types `decltype((sndrs))...`. The expressions `when_all(sndrs...)` and `when_all_with_variant(sndrs...)` are ill-formed if any of the following is true:

(2.1) — `sizeof...(sndrs)` is 0, or

(2.2) — `(sender<Sndrs> && ...)` is false.

- <sup>3</sup> The expression `when_all(sndrs...)` is expression-equivalent to `make_sender(when_all, {}, sndrs...)`.

- <sup>4</sup> The exposition-only class template `impls-for` (33.9.2) is specialized for `when_all_t` as follows:

```
namespace std::execution {
 template<>
 struct impls-for<when_all_t> : default-impls {
 static constexpr auto get-env = see below;
 static constexpr auto get-state = see below;
 static constexpr auto start = see below;
 static constexpr auto complete = see below;

 template<class Sndr, class... Env>
 static consteval void check-types();
 };
}
```

- <sup>5</sup> Let `make-when-all-env` be the following exposition-only function template:

```
template<class Env>
constexpr auto make-when-all-env(inplace_stop_source& stop_src, // exposition only
 Env&& env) noexcept;
```

- <sup>6</sup> *Returns:* An object `e` such that

(6.1) — `decltype(e)` models *queryable*, and

(6.2) — `e.query(get_stop_token)` is expression-equivalent to `stop_src.get_token()`, and

(6.3) — given a query object `q` with type other than `cv get_stop_token_t`, `e.query(q)` is expression-equivalent to `env.query(q)` if the type of `q` satisfies *forwarding-query*, and ill-formed otherwise.

- <sup>7</sup> Let `when-all-env` be an alias template such that `when-all-env<Env>` denotes the type `decltype(make-when-all-env(declval<inplace_stop_source&>(), declval<Env>()))`.

```
template<class Sndr, class... Env>
static consteval void check-types();
```

- <sup>8</sup> Let `Is` be the pack of integral template arguments of the `integer_sequence` specialization denoted by `indices-for<Sndr>`.

- <sup>9</sup> *Effects:* Equivalent to:

```
auto fn = []<class Child>() {
 auto cs = get_completion_signatures<Child, when-all-env<Env>...>();
 if constexpr (cs.count-of(set_value) >= 2)
 throw unspecified-exception();
 decay-copyable-result-datums(cs); // see 33.9.2
};
(fn.template operator()<child-type<Sndr, Is>>(), ...);
```

- <sup>10</sup> The member `impls-for<when_all_t>::get-env` is initialized with a callable object equivalent to the following lambda expression:

```
[]<class State, class Rcvr>(auto&&, State& state, const Rcvr& rcvr) noexcept {
 return make-when-all-env(state.stop_src, get_env(rcvr));
}
```

- <sup>11</sup> The member `impls-for<when_all_t>::get-state` is initialized with a callable object equivalent to the following lambda expression:

```

[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(noexcept(e)) -> decltype(e) {
 return e;
}

```

where  $e$  is the expression

```
std::forward<Sndr>(sndr).apply(make-state<Rcvr>())
```

and where *make-state* is the following exposition-only class template:

```

enum class disposition { started, error, stopped }; // exposition only

template<class Rcvr>
struct make-state {
 template<class... Sndrs>
 auto operator()(auto, auto, Sndrs&&... sndrs) const {
 using values_tuple = see below;
 using errors_variant = see below;
 using stop_callback = stop_callback_for_t<stop_token_of_t<env_of_t<Rcvr>>, on-stop-request>;

 struct state-type {
 void arrive(Rcvr& rcvr) noexcept { // exposition only
 if (0 == --count) {
 complete(rcvr);
 }
 }

 void complete(Rcvr& rcvr) noexcept; // exposition only

 atomic<size_t> count{sizeof...(sndrs)}; // exposition only
 inplace_stop_source stop_src{}; // exposition only
 atomic<disposition> disp{disposition::started}; // exposition only
 errors_variant errors{}; // exposition only
 values_tuple values{}; // exposition only
 optional<stop_callback> on_stop{nullptr}; // exposition only
 };

 return state-type{};
 }
};

```

<sup>12</sup> Let *copy-fail* be `exception_ptr` if decay-copying any of the child senders' result datums can potentially throw; otherwise, *none-such*, where *none-such* is an unspecified empty class type.

<sup>13</sup> The alias `values_tuple` denotes the type

```
tuple<value_types_of_t<Sndrs, FWD-ENV-T(env_of_t<Rcvr>), decayed-tuple, optional>...>
```

if that type is well-formed; otherwise, `tuple<>`.

<sup>14</sup> The alias `errors_variant` denotes the type `variant<none-such, copy-fail, Es...>` with duplicate types removed, where *Es* is the pack of the decayed types of all the child senders' possible error result datums.

<sup>15</sup> The member `void state-type::complete(Rcvr& rcvr) noexcept` behaves as follows:

(15.1) — If `disp` is equal to `disposition::started`, evaluates:

```

auto tie = []<class... T>(tuple<T...& t) noexcept { return tuple<T&...>(t); };
auto set = [&](auto&... t) noexcept { set_value(std::move(rcvr), std::move(t)...); };

on_stop.reset();
apply(
 [&](auto&... opts) noexcept {
 apply(set, tuple_cat(tie(*opts)...));
 },
 values);

```

(15.2) — Otherwise, if `disp` is equal to `disposition::error`, evaluates:

```
on_stop.reset();
```

```

visit(
 [&<class Error>(Error& error) noexcept {
 if constexpr (!same_as<Error, none-such>) {
 set_error(std::move(rcvr), std::move(error));
 }
 },
 errors);

```

(15.3) — Otherwise, evaluates:

```

if constexpr (sends-stopped) {
 on_stop.reset();
 set_stopped(std::move(rcvr));
}

```

where *sends-stopped* equals true if and only if there exists an element *S* of *Sndrs* such that *completion\_signatures\_of\_t*<*S*, *when-all-env*<*env\_of\_t*<*Rcvr*>>> contains *set\_stopped\_t*().

<sup>16</sup> The member *impls-for*<*when\_all\_t*>::*start* is initialized with a callable object equivalent to the following lambda expression:

```

[]<class State, class Rcvr, class... Ops>(
 State& state, Rcvr& rcvr, Ops&... ops) noexcept -> void {
 state.on_stop.emplace(
 get_stop_token(get_env(rcvr)),
 on-stop-request{state.stop_src});
 (start(ops), ...);
}

```

<sup>17</sup> The member *impls-for*<*when\_all\_t*>::*complete* is initialized with a callable object equivalent to the following lambda expression:

```

[]<class Index, class State, class Rcvr, class Set, class... Args>(
 this auto& complete, Index, State& state, Rcvr& rcvr, Set, Args&&... args) noexcept -> void {
 if constexpr (same_as<Set, set_error_t>) {
 if (disposition::error != state.disp.exchange(disposition::error)) {
 state.stop_src.request_stop();
 TRY-EMPLACE-ERROR(state.errors, std::forward<Args>(args)...);
 }
 } else if constexpr (same_as<Set, set_stopped_t>) {
 auto expected = disposition::started;
 if (state.disp.compare_exchange_strong(expected, disposition::stopped)) {
 state.stop_src.request_stop();
 }
 } else if constexpr (!same_as<decltype(State::values), tuple<>>) {
 if (state.disp == disposition::started) {
 auto& opt = get<Index::value>(state.values);
 TRY-EMPLACE-VALUE(complete, opt, std::forward<Args>(args)...);
 }
 }
 state.arrive(rcvr);
}

```

where *TRY-EMPLACE-ERROR* (*v*, *e*), for subexpressions *v* and *e*, is equivalent to:

```

try {
 v.template emplace<decltype(auto(e))>(e);
} catch (...) {
 v.template emplace<exception_ptr>(current_exception());
}

```

if the expression *decltype(auto(e))(e)* is potentially throwing; otherwise, *v.template emplace<decltype(auto(e))>(e)*; and where *TRY-EMPLACE-VALUE* (*c*, *o*, *as...*), for subexpressions *c*, *o*, and pack of subexpressions *as*, is equivalent to:

```

try {
 o.emplace(as...);
} catch (...) {
 c(Index(), state, rcvr, set_error, current_exception());
}

```

```
 return;
}
```

if the expression *decayed-tuple*<decltype(as)...>{as...} is potentially throwing; otherwise, `o.emplace(as...)`.

- 18 The expression `when_all_with_variant(sndrs...)` is expression-equivalent to *make-sender*(`when_all_with_variant, {}, sndrs...`).
- 19 Given subexpressions `sndr` and `env`, if *sender-for*<decltype((sndr)), `when_all_with_variant_t`> is `false`, then the expression `when_all_with_variant.transform_sender(set_value, sndr, env)` is ill-formed; otherwise, it is equivalent to:

```
 auto&& [_ , _ , ...child] = sndr;
 return when_all(into_variant(std::forward_like<decltype((sndr))>(child))...);
```

[Note 1: This causes the `when_all_with_variant(sndrs...)` sender to become `when_all(into_variant(sndrs...)` when it is connected with a receiver whose execution domain does not customize `when_all_with_variant`. — end note]

### 33.9.12.13 execution::into\_variant

[exec.into.variant]

- 1 `into_variant` adapts a sender with multiple value completion signatures into a sender with just one value completion signature consisting of a `variant` of tuples.
- 2 The name `into_variant` denotes a pipeable sender adaptor object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `Sndr` does not satisfy *sender*, `into_variant(sndr)` is ill-formed.
- 3 Otherwise, the expression `into_variant(sndr)` is expression-equivalent to *make-sender*(`into_variant, {}, sndr`).
- 4 The exposition-only class template *impls-for* (33.9.2) is specialized for `into_variant` as follows:

```
namespace std::execution {
 template<>
 struct impls_for<into_variant_t> : default_impls {
 static constexpr auto get_state = see below;
 static constexpr auto complete = see below;

 template<class Sndr, class... Env>
 static consteval void check_types() {
 auto cs = get_completion_signatures<child-type<Sndr>, FWD-ENV-T(Env)...>();
 decay-copyable-result-datums(cs); // see 33.9.2
 }
 };
}
```

- 5 The member *impls-for*<`into_variant_t`>::*get-state* is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept
-> type_identity<value_types_of_t<child-type<Sndr>, FWD-ENV-T(env_of_t<Rcvr>)>>> {
 return {};
}
```

- 6 The member *impls-for*<`into_variant_t`>::*complete* is initialized with a callable object equivalent to the following lambda:

```
[]<class State, class Rcvr, class Tag, class... Args>(
 auto, State, Rcvr& rcvr, Tag, Args&&... args) noexcept -> void {
 if constexpr (same_as<Tag, set_value_t>) {
 using variant_type = State::type;
 TRY-SET-VALUE(rcvr, variant_type(decayed-tuple<Args...>{std::forward<Args>(args)...}));
 } else {
 Tag()(std::move(rcvr), std::forward<Args>(args)...);
 }
}
```

### 33.9.12.14 execution::stopped\_as\_optional

[exec.stopped.opt]

- 1 `stopped_as_optional` maps a sender's stopped completion operation into a value completion operation as a disengaged optional. The sender's value completion operation is also converted into an `optional`. The

result is a sender that never completes with stopped, reporting cancellation by completing with a disengaged optional.

- <sup>2</sup> The name `stopped_as_optional` denotes a pipeable sender adaptor object. For a subexpression `snldr`, let `Sndr` be `decltype((snldr))`. The expression `stopped_as_optional(snldr)` is expression-equivalent to `make-sender(stopped_as_optional, {}, snldr)`.
- <sup>3</sup> The exposition-only class template *impls-for* (33.9.2) is specialized for `stopped_as_optional_t` as follows:

```
namespace std::execution {
 template<>
 struct impls-for<stopped_as_optional_t> : default-impls {
 template<class Sndr, class... Env>
 static constexpr void check-types() {
 default-impls::check-types<Sndr, Env...>();
 if constexpr (!requires {
 requires (!same_as<void, single-sender-value-type<child-type<Sndr>,
 FWD-ENV-T(Env)...>>); })
 throw unspecified-exception();
 }
 };
}
```

- <sup>4</sup> Let `snldr` and `env` be subexpressions such that `Sndr` is `decltype((snldr))` and `Env` is `decltype((env))`. If `sender-for<Sndr, stopped_as_optional_t>` is false then the expression `stopped_as_optional.transform_sender(set_value, snldr, env)` is ill-formed; otherwise, if `sender_in<child-type<Sndr>, FWD-ENV-T(Env)>` is false, the expression `stopped_as_optional.transform_sender(set_value, snldr, env)` is equivalent to `not-a-sender()`; otherwise, it is equivalent to:

```
auto&& [_, _, child] = snldr;
using V = single-sender-value-type<child-type<Sndr>, FWD-ENV-T(Env)>;
return let_stopped(
 then(std::forward_like<Sndr>(child),
 [<class... Ts>(Ts&&... ts) noexcept(is_nothrow_constructible_v<V, Ts...>) {
 return optional<V>(in_place, std::forward<Ts>(ts)...);
 })),
 [<>() noexcept { return just(optional<V>()); }]);
```

### 33.9.12.15 `execution::stopped_as_error`

[exec.stopped.err]

- <sup>1</sup> `stopped_as_error` maps an input sender's stopped completion operation into an error completion operation as a custom error type. The result is a sender that never completes with stopped, reporting cancellation by completing with an error.
- <sup>2</sup> The name `stopped_as_error` denotes a pipeable sender adaptor object. For some subexpressions `snldr` and `err`, let `Sndr` be `decltype((snldr))` and let `Err` be `decltype((err))`. If the type `Sndr` does not satisfy `sender` or if the type `Err` does not satisfy `movable-value`, `stopped_as_error(snldr, err)` is ill-formed. Otherwise, the expression `stopped_as_error(snldr, err)` is expression-equivalent to `make-sender(stopped_as_error, err, snldr)`.
- <sup>3</sup> Let `snldr` and `env` be subexpressions such that `Sndr` is `decltype((snldr))` and `Env` is `decltype((env))`. If `sender-for<Sndr, stopped_as_error_t>` is false, then the expression `stopped_as_error.transform_sender(set_value, snldr, env)` is ill-formed; otherwise, it is equivalent to:

```
auto&& [_, err, child] = snldr;
using E = decltype(auto(err));
return let_stopped(
 std::forward_like<Sndr>(child),
 [err = std::forward_like<Sndr>(err)]() mutable noexcept(is_nothrow_move_constructible_v<E>) {
 return just_error(std::move(err));
 });
```

### 33.9.12.16 `execution::associate`

[exec.associate]

- <sup>1</sup> `associate` tries to associate a sender with an async scope such that the scope can track the lifetime of any asynchronous operations created with the sender.
- <sup>2</sup> Let *associate-data* be the following exposition-only class template:

```

namespace std::execution {
 template<scope_token Token, sender Sender>
 struct associate_data { // exposition only
 using wrap_sender = // exposition only
 remove_cvref_t<decltype(declval<Token>().wrap(declval<Sender>()))>;
 using assoc_t = decltype(declval<Token>().try_associate()); // exposition only
 using sender_ref = // exposition only
 unique_ptr<wrap_sender, decltype([](auto* p) noexcept { destroy_at(p); })>;

 explicit associate_data(Token t, Sender&& s)
 : sndr(t.wrap(std::forward<Sender>(s))),
 assoc([&] {
 sender_ref guard{addressof(sndr)};
 auto assoc = t.try_associate();
 if (assoc) {
 guard.release();
 }
 return assoc;
 }) {}

 associate_data(const associate_data& other)
 noexcept(is_nothrow_copy_constructible_v<wrap_sender> &&
 noexcept(other.assoc.try_associate()));

 associate_data(associate_data&& other)
 noexcept(is_nothrow_move_constructible_v<wrap_sender>)
 : associate_data(std::move(other).release()) {}

 ~associate_data();

 pair<assoc_t, sender_ref> release() && noexcept;

 private:
 associate_data(pair<assoc_t, sender_ref> parts); // exposition only
 union { // exposition only
 wrap_sender sndr; // exposition only
 };
 assoc_t assoc; // exposition only
 };

 template<scope_token Token, sender Sender>
 associate_data(Token, Sender&&) -> associate_data<Token, Sender>;
}

```

- 3 For an *associate\_data* object *a*, `bool(a.assoc)` is true if and only if an association was successfully made and is owned by *a*.

```

associate_data(const associate_data& other)
 noexcept(is_nothrow_copy_constructible_v<wrap_sender> &&
 noexcept(other.assoc.try_associate()));

```

- 4 *Constraints:* *wrap\_sender* models `copy_constructible`.

- 5 *Effects:* Initializes *assoc* with `other.assoc.try_associate()`. If `bool(assoc)` is true, initializes *sndr* with `other.sndr`.

```

associate_data(pair<assoc_t, sender_ref> parts);

```

- 6 *Effects:* Initializes *assoc* with `std::move(parts.first)`. If `bool(assoc)` is true, initializes *sndr* with `std::move(*parts.second)`.

```

~associate_data();

```

- 7 *Effects:* If `bool(assoc)` is true, destroys *sndr*.

```
pair<assoc_t, sender_ref> release() && noexcept;
```

- 8 *Effects:* Constructs an object *u* of type *sender\_ref* that is initialized with `addressof(sndr)` if `bool(assoc)` is true and with `nullptr` otherwise, then returns `pair{std::move(assoc), std::move(u)}`.

9 The name `associate` denotes a pipeable sender adaptor object. For subexpressions `sndr` and `token`:

- (9.1) — If `decltype((sndr))` does not satisfy `sender`, or `remove_cvref_t<decltype((token))>` does not satisfy `scope_token`, then `associate(sndr, token)` is ill-formed.
- (9.2) — Otherwise, the expression `associate(sndr, token)` is expression-equivalent to `make_sender(associate, associate_data(token, sndr))`.

10 The exposition-only class template *impls-for* (33.9.2) is specialized for `associate_t` as follows:

```
namespace std::execution {
 template<>
 struct impls_for<associate_t> : default_impls {
 static constexpr auto get_state = see below; // exposition only
 static constexpr auto start = see below; // exposition only

 template<class Sndr, class... Env>
 static constexpr void check_types() { // exposition only
 using associate_data_t = remove_cvref_t<data_type<Sndr>>;
 using child_type_t = associate_data_t::wrap_sender;
 (void)get_completion_signatures<child_type_t, FWD-ENV-T(Env)...>();
 }
 };
}
```

11 The member `impls_for<associate_t>::get_state` is initialized with a callable object equivalent to the following lambda:

```
[]<class Sndr, class Rcvr>(Sndr&& sndr, Rcvr& rcvr) noexcept(see below) {
 auto&& [_ , data] = std::forward<Sndr>(sndr);

 using associate_data_t = remove_cvref_t<decltype(data)>;
 using assoc_t = associate_data_t::assoc_t;
 using sender_ref_t = associate_data_t::sender_ref;

 using op_t = connect_result_t<typename sender_ref_t::element_type, Rcvr>;

 struct op_state {
 assoc_t assoc; // exposition only
 union {
 Rcvr* rcvr; // exposition only
 op_t op; // exposition only
 };

 explicit op_state(pair<assoc_t, sender_ref_t> parts, Rcvr& r)
 : assoc(std::move(parts.first)) {
 if (assoc) {
 ::new (voidify(op)) op_t(connect(std::move(*parts.second), std::move(r)));
 } else {
 rcvr = addressof(r);
 }
 }

 explicit op_state(associate_data_t&& ad, Rcvr& r)
 : op_state(std::move(ad).release(), r) {}

 explicit op_state(const associate_data_t& ad, Rcvr& r)
 requires copy_constructible<associate_data_t>
 : op_state(associate_data_t(ad).release(), r) {}

 op_state(op_state&&) = delete;
 };
}
```

```

~op_state() {
 if (assoc) {
 op.~op_t();
 }
}

void run() noexcept { // exposition only
 if (assoc) {
 start(op);
 } else {
 set_stopped(std::move(*rcvr));
 }
}
};

return op_state{std::forward_like<Sndr>(data), rcvr};
}

```

- <sup>12</sup> The expression in the noexcept clause of *impls-for*<associate\_t>::*get-state* is

```

(is_same_v<Sndr, remove_cvref_t<Sndr>> ||
 is_nothrow_constructible_v<remove_cvref_t<Sndr>, Sndr>) &&
nothrow_callable<connect_t, wrap_sender, Rcvr>

```

where *wrap\_sender* is the type *remove\_cvref\_t*<*data-type*<Sndr>>::*wrap\_sender*.

- <sup>13</sup> The member *impls-for*<associate\_t>::*start* is initialized with a callable object equivalent to the following lambda:

```

[] (auto& state, auto&) noexcept -> void {
 state.run();
}

```

- <sup>14</sup> The evaluation of *associate*(sndr, token) may cause side effects observable via token's associated async scope object.

### 33.9.12.17 Exposition-only execution::stop-when [exec.stop.when]

- <sup>1</sup> *stop-when* fuses an additional stop token *t* into a sender so that, upon connecting to a receiver *r*, the resulting operation state receives stop requests from both *t* and the token returned from *get\_stop\_token*(*get\_env*(*r*)).
- <sup>2</sup> The name *stop-when* denotes an exposition-only sender adaptor. For subexpressions *sndr* and *token*:
- (2.1) — If *decltype*((*sndr*)) does not satisfy *sender*, or *remove\_cvref\_t*<*decltype*((*token*))> does not satisfy *stoppable\_token*, then *stop-when*(*sndr*, *token*) is ill-formed.
  - (2.2) — Otherwise, if *remove\_cvref\_t*<*decltype*((*token*))> models *unstoppable\_token* then *stop-when*(*sndr*, *token*) is expression-equivalent to (void)*token*, *sndr*, except that *token* and *sndr* are indeterminately sequenced.
  - (2.3) — Otherwise, *stop-when*(*sndr*, *token*) returns a sender *osndr*. If *osndr* is connected to a receiver *r*, let *rtoken* be the result of *get\_stop\_token*(*get\_env*(*r*)).
    - (2.3.1) — If the type of *rtoken* models *unstoppable\_token* then the effects of connecting *osndr* to *r* are equivalent to *connect*(*write\_env*(*sndr*, *prop*(*get\_stop\_token*, *token*)), *r*).
    - (2.3.2) — Otherwise, the effects of connecting *osndr* to *r* are equivalent to *connect*(*write\_env*(*sndr*, *prop*(*get\_stop\_token*, *token*)), *r*) where *token* is an object of an exposition-only type *token-t* such that:
      - (2.3.2.1) — *token-t* models *stoppable\_token*;
      - (2.3.2.2) — *token.stop\_requested*() returns *token.stop\_requested*() || *rtoken.stop\_requested*();
      - (2.3.2.3) — *token.stop\_possible*() returns *token.stop\_possible*() || *rtoken.stop\_possible*(); and
      - (2.3.2.4) — for types *Fn* and *Init* such that both *invocable*<*Fn*> and *constructible\_from*<*Fn*, *Init*> are modeled, *token-t*::*callback\_type*<*Fn*> models *stoppable\_callback\_for*<*Fn*, *token-t*, *Init*>.

[*Note 1:* For an object `fn` of type `Fn` constructed from a value, `init`, of type `Init`, registering `fn` using `token-t::callback_type<Fn>(token, init)` results in an invocation of `fn` when a callback registered with `token` or `rtoken` would be invoked. `fn` is invoked at most once. — *end note*]

### 33.9.12.18 `execution::spawn_future`

[`exec.spawn.future`]

- <sup>1</sup> `spawn_future` attempts to associate the given input sender with the given token's async scope and, on success, eagerly starts the input sender; the return value is a sender that, when connected and started, completes with either the result of the eagerly-started input sender or with `set_stopped` if the input sender was not started.

- <sup>2</sup> The name `spawn_future` denotes a customization point object. For subexpressions `sndr`, `token`, and `env`,

- (2.1) — let `Sndr` be `decltype((sndr))`,
- (2.2) — let `Token` be `remove_cvref_t<decltype((token))>`, and
- (2.3) — let `Env` be `remove_cvref_t<decltype((env))>`.

If any of `sender<Sndr>`, `scope_token<Token>`, or `queryable<Env>` are not satisfied, the expression `spawn_future(sndr, token, env)` is ill-formed.

- <sup>3</sup> Let `try-cancelable` be the exposition-only class:

```
namespace std::execution {
 struct try-cancelable { // exposition only
 virtual void try-cancel() noexcept = 0; // exposition only
 };
}
```

- <sup>4</sup> Let `spawn-future-state-base` be the exposition-only class template:

```
namespace std::execution {
 template<class Completions>
 struct spawn-future-state-base; // exposition only

 template<class... Sigs>
 struct spawn-future-state-base<completion_signatures<Sigs...>> // exposition only
 : try-cancelable {
 using variant-t = see below; // exposition only
 variant-t result; // exposition only
 virtual void complete() noexcept = 0; // exposition only
 };
}
```

- <sup>5</sup> Let `Sigs` be the pack of arguments to the `completion_signatures` specialization provided as a parameter to the `spawn-future-state-base` class template. Let `as-tuple` be an alias template that transforms a completion signature `Tag(Args...)` into the tuple specialization `decayed-tuple<Tag, Args...>`.

- (5.1) — If `is_nothrow_constructible_v<decay_t<Arg>, Arg>` is true for every type `Arg` in every parameter pack `Args` in every completion signature `Tag(Args...)` in `Sigs` then `variant-t` denotes the type `variant<monostate, tuple<set_stopped_t>, as-tuple<Sigs>...>`, except with duplicate types removed.
- (5.2) — Otherwise `variant-t` denotes the type `variant<monostate, tuple<set_stopped_t>, tuple<set_error_t, exception_ptr>, as-tuple<Sigs>...>`, except with duplicate types removed.

- <sup>6</sup> Let `spawn-future-receiver` be the exposition-only class template:

```
namespace std::execution {
 template<class Completions>
 struct spawn-future-receiver { // exposition only
 using receiver_concept = receiver_tag;

 spawn-future-state-base<Completions>* state; // exposition only

 template<class... T>
 void set_value(T&&... t) && noexcept {
 set-complete<set_value_t>(std::forward<T>(t)...);
 }
 };
}
```

```

template<class E>
void set_error(E&& e) && noexcept {
 set-complete<set_error_t>(std::forward<E>(e));
}

void set_stopped() && noexcept {
 set-complete<set_stopped_t>();
}

private:
template<class CPO, class... T>
void set-complete(T&&... t) noexcept { // exposition only
 constexpr bool nothrow = (is_nothrow_constructible_v<decay_t<T>, T> && ...);
 try {
 state->result.template emplace<decayed-tuple<CPO, T...>>(CPO{},
 std::forward<T>(t)...);
 }
 catch (...) {
 if constexpr (!nothrow) {
 using tuple_t = decayed-tuple<set_error_t, exception_ptr>;
 state->result.template emplace<tuple_t>(set_error_t{}, current_exception());
 }
 }
 state->complete();
}
};
}

```

- 7 Let *ssource-t* be an unspecified type that models *stoppable-source* and *default\_initializable*, such that a default-initialized object of type *ssource-t* has an associated stop state. Let *ssource* be an lvalue of type *ssource-t*. Let *token-t* be `decltype(ssource.get_token())`. Let *future-spawned-sender* be the alias template:

```

template<sender Sender, class Env>
using future-spawned-sender = // exposition only
 decltype(write_env(stop-when(declval<Sender>(), declval<token-t>()), declval<Env>())));

```

- 8 Let *spawn-future-state* be the exposition-only class template:

```

namespace std::execution {
template<class Alloc, scope_token Token, sender Sender, class Env>
struct spawn-future-state // exposition only
 : spawn-future-state-base<completion_signatures_of_t<future-spawned-sender<Sender, Env>,
 env<>>> {

 using sigs-t = // exposition only
 completion_signatures_of_t<future-spawned-sender<Sender, Env>, env<>>;
 using receiver-t = // exposition only
 spawn-future-receiver<sigs-t>;
 using op-t = // exposition only
 connect_result_t<future-spawned-sender<Sender, Env>, receiver-t>;

 spawn-future-state(Alloc alloc, Sender&& sndr, Token token, Env env) // exposition only
 : alloc(std::move(alloc)),
 op(connect(
 write_env(stop-when(std::forward<Sender>(sndr), ssource.get_token()), std::move(env)),
 receiver-t(this))),
 assoc(token.try_associate()) {
 if (assoc)
 start(op);
 else
 set_stopped(receiver-t(this));
 }

 void complete() noexcept override; // exposition only
 void consume(receiver auto& rcvr) noexcept; // exposition only
 void abandon() noexcept; // exposition only
}

```

```

void try-cancel() noexcept override { // exposition only
 ssource.request_stop();
 try-set-stopped();
}
void try-set-stopped() noexcept; // exposition only

private:
using assoc-t = // exposition only
 remove_cvref_t<decltype(declval<Token&>().try_associate())>;

Alloc alloc; // exposition only
ssource-t ssource; // exposition only
op-t op; // exposition only
assoc-t assoc; // exposition only

void destroy() noexcept; // exposition only
};

template<class Alloc, scope_token Token, sender Sender, class Env> // exposition only
 spawn-future-state(Alloc alloc, Sender&& sndr, Token token, Env env)
 -> spawn-future-state<Alloc, Token, Sender, Env>;
}

```

- <sup>9</sup> For purposes of determining the existence of a data race, *complete*, *consume*, *try-set-stopped*, and *abandon* behave as atomic operations (6.10.2). These operations on a single object of a type that is a specialization of *spawn-future-state* appear to occur in a single total order.

```
void complete() noexcept;
```

10 *Effects:*

- (10.1) — No effects if this invocation of *complete* happens before an invocation of *consume*, *try-set-stopped*, or *abandon* on *\*this*;
- (10.2) — otherwise, if an invocation of *consume* on *\*this* happens before this invocation of *complete* and no invocation of *try-set-stopped* on *\*this* happened before this invocation of *complete* then there is a receiver, *rcvr*, registered and that receiver is deregistered and completed as if by *consume(rcvr)*;
- (10.3) — otherwise, *destroy* is invoked.

```
void consume(receiver auto& rcvr) noexcept;
```

11 *Effects:*

- (11.1) — If this invocation of *consume* happens before an invocation of *complete* on *\*this* and no invocation of *try-set-stopped* on *\*this* happened before this invocation of *consume* then *rcvr* is registered to be completed when *complete* is subsequently invoked on *\*this*;
- (11.2) — otherwise, if this invocation of *consume* happens after an invocation of *try-set-stopped* on *\*this* and no invocation of *complete* on *\*this* happened before this invocation of *consume* then *rcvr* is completed as if by *set\_stopped(std::move(rcvr))*;
- (11.3) — otherwise, *rcvr* is completed as if by:

```

std::move(this->result).visit(
 [&rcvr](auto&& tuple) noexcept {
 if constexpr (!same_as<remove_reference_t<decltype(tuple)>, monostate>) {
 apply([&rcvr](auto cpo, auto&&... vals) {
 cpo(std::move(rcvr), std::move(vals)...);
 }, std::move(tuple));
 }
 });
destroy();

```

```
void try-set-stopped() noexcept;
```

12 *Effects:*

- (12.1) — If an invocation of *consume* on *\*this* happens before this invocation of *try-set-stopped* and no invocation of *complete* on *\*this* happened before this invocation of *try-set-stopped* then there is a receiver, *rcvr*, registered and that receiver is deregistered and completed as if by *set\_stopped(std::move(rcvr)), destroy()*;

- (12.2) — otherwise, no effects.

```
void abandon() noexcept;
```

13 *Effects:*

- (13.1) — If this invocation of *abandon* happens before an invocation of *complete* on *\*this* then equivalent to:

```
 ssource.request_stop();
```

- (13.2) — otherwise, *destroy* is invoked.

```
void destroy() noexcept;
```

14 *Effects:* Equivalent to:

```
 auto associated = std::move(this->associated);
 {
 using traits = allocator_traits<Alloc>::template rebind_traits<spawn-future-state>;
 typename traits::allocator_type alloc(std::move(this->alloc));
 traits::destroy(alloc, this);
 traits::deallocate(alloc, this, 1);
 }
```

- 15 Let *future-operation* be the exposition-only class template:

```
namespace std::execution {
 template<class StatePtr, class Rcvr>
 struct future-operation {
 struct callback {
 try-cancelable* state;
 // exposition only

 void operator()() noexcept {
 state->try-cancel();
 };
 };

 using stop-token-t =
 stop_token_of_t<env_of_t<Rcvr>>;
 // exposition only

 using stop-callback-t =
 stop_callback_for_t<stop-token-t, callback>;
 // exposition only

 struct rcvr-t {
 using receiver_concept = receiver_tag;
 future-operation* op;
 // exposition only

 template<class... T>
 void set_value(T&&... ts) && noexcept {
 op->set-complete<set_value_t>(std::forward<T>(ts)...);
 }

 template<class E>
 void set_error(E&& e) && noexcept {
 op->set-complete<set_error_t>(std::forward<E>(e));
 }

 void set_stopped() && noexcept {
 op->set-complete<set_stopped_t>();
 }

 env_of_t<Rcvr> get_env() const noexcept {
 return execution::get_env(op->rcvr);
 }
 };
 };
};
```

```

 }
};

Rcvr rcvr; // exposition only
StatePtr state; // exposition only
rcvr-t inner; // exposition only
optional<stop-callback-t> stopCallback; // exposition only

future-operation(StatePtr state, Rcvr rcvr) noexcept // exposition only
: rcvr(std::move(rcvr)), state(std::move(state)), inner(this)
{}

future-operation(future-operation&&) = delete;

void run() & noexcept { // exposition only
 constexpr bool nothrow =
 is_nothrow_constructible_v<stop-callback-t, stop-token-t, callback>;
 try {
 stopCallback.emplace(get_stop_token(rcvr), callback(state.get()));
 }
 catch (...) {
 if constexpr (!nothrow) {
 set_error(std::move(rcvr), current_exception());
 return;
 }
 }

 state.release()->consume(inner);
}

template<class CP0, class... T>
void set-complete(T&&... ts) noexcept { // exposition only
 stopCallback.reset();
 CP0{ }(std::move(rcvr), std::forward<T>(ts)...);
}
};
}

```

- 16 The exposition-only class template *impls-for* (33.9.2) is specialized for `spawn_future_t` as follows:

```

namespace std::execution {
 template<>
 struct impls-for<spawn_future_t> : default-impls {
 static constexpr auto start = see below; // exposition only
 static constexpr auto get-state = see below; // exposition only
 };
}

```

- 17 The member `impls-for<spawn_future_t>::start` is initialized with a callable object equivalent to the following lambda:

```

[](auto& state, auto&) noexcept -> void {
 state.run();
}

```

- 18 The member `impls-for<spawn_future_t>::get-state` is initialized with a callable object equivalent to the following lambda:

```

[]<class Sndr, class Rcvr>(Sndr sndr, Rcvr& rcvr) noexcept {
 auto& [_ , data] = sndr;
 using state_ptr = remove_cvref_t<decltype(data)>;
 return future-operation<state_ptr, Rcvr>(std::move(data), std::move(rcvr));
}

```

- 19 For the expression `spawn_future(sndr, token, env)` let `new_sender` be the expression `token.wrap(sndr)` and let `alloc` and `senv` be defined as follows:

- (19.1) — if the expression `get_allocator(env)` is well-formed, then `alloc` is the result of `get_allocator(env)` and `senv` is the expression `env`;
  - (19.2) — otherwise, if the expression `get_allocator(get_env(new_sender))` is well-formed, then `alloc` is the result of `get_allocator(get_env(new_sender))` and `senv` is the expression `JOIN-ENV(prop(get_allocator, alloc), env)`;
  - (19.3) — otherwise, `alloc` is `allocator<void>()` and `senv` is the expression `env`.
- 20 The expression `spawn_future(sndr, token, env)` has the following effects:
- (20.1) — Uses `alloc` to allocate and construct an object `s` of type `decltype(spawn-future-state(alloc, token.wrap(sndr), token, senv))` from `alloc`, `token.wrap(sndr)`, `token`, and `senv`. If an exception is thrown then any constructed objects are destroyed and any allocated memory is deallocated.
  - (20.2) — Constructs an object `u` of a type that is a specialization of `unique_ptr` such that:
    - (20.2.1) — `u.get()` is equal to the address of `s`, and
    - (20.2.2) — `u.get_deleter()(u.release())` is equivalent to `u.release()->abandon()`.
  - (20.3) — Returns `make-sender(spawn_future, std::move(u))`.
- 21 The expression `spawn_future(sndr, token)` is expression-equivalent to `spawn_future(sndr, token, execution::env<>())`.

### 33.9.13 Sender consumers

[exec.consumers]

#### 33.9.13.1 `this_thread::sync_wait`

[exec.sync.wait]

- 1 `this_thread::sync_wait` and `this_thread::sync_wait_with_variant` are used to block the current thread of execution until the specified sender completes and to return its async result. `sync_wait` mandates that the input sender has exactly one value completion signature.

- 2 Let *sync-wait-env* be the following exposition-only class type:

```
namespace std::this_thread {
 struct sync-wait-env {
 execution::run_loop* loop; // exposition only

 auto query(execution::get_scheduler_t) const noexcept {
 return loop->get_scheduler();
 }

 auto query(execution::get_start_scheduler_t) const noexcept {
 return loop->get_scheduler();
 }

 auto query(execution::get_delegation_scheduler_t) const noexcept {
 return loop->get_scheduler();
 }
 };
}
```

- 3 Let *sync-wait-result-type* and *sync-wait-with-variant-result-type* be exposition-only alias templates defined as follows:

```
namespace std::this_thread {
 template<execution::sender_in<sync-wait-env> Sndr>
 using sync-wait-result-type =
 optional<execution::value_types_of_t<Sndr, sync-wait-env, decayed-tuple,
 type_identity_t>>;

 template<execution::sender_in<sync-wait-env> Sndr>
 using sync-wait-with-variant-result-type =
 optional<execution::value_types_of_t<Sndr, sync-wait-env>>;
}
```

- 4 The name `this_thread::sync_wait` denotes a customization point object. For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. The expression `this_thread::sync_wait(sndr)` is equivalent to `apply_`

`sender(Domain(), sync_wait, sndr)`, where `Domain` is the type of `get_completion_domain<set_value_t>(get_env(sndr), sync_wait_env{})`.

5 *Mandates:*

- (5.1) — `sender_in<Sndr, sync_wait_env>` is true.
  - (5.2) — The type `sync_wait_result_type<Sndr>` is well-formed.
  - (5.3) — `same_as<decltype(e), sync_wait_result_type<Sndr>>` is true, where *e* is the `apply_sender` expression above.
- 6 Let `sync_wait_state` and `sync_wait_receiver` be the following exposition-only class templates:

```
namespace std::this_thread {
 template<class Sndr>
 struct sync_wait_state { // exposition only
 execution::run_loop loop; // exposition only
 exception_ptr error; // exposition only
 sync_wait_result_type<Sndr> result; // exposition only
 };

 template<class Sndr>
 struct sync_wait_receiver { // exposition only
 using receiver_concept = execution::receiver_tag;
 sync_wait_state<Sndr>* state; // exposition only

 template<class... Args>
 void set_value(Args&&... args) && noexcept;

 template<class Error>
 void set_error(Error&& err) && noexcept;

 void set_stopped() && noexcept;

 sync_wait_env get_env() const noexcept { return {&state->loop}; }
 };
}
```

```
template<class... Args>
void set_value(Args&&... args) && noexcept;
```

7 *Effects:* Equivalent to:

```
try {
 state->result.emplace(std::forward<Args>(args)...);
} catch (...) {
 state->error = current_exception();
}
state->loop.finish();
```

```
template<class Error>
void set_error(Error&& err) && noexcept;
```

8 *Effects:* Equivalent to:

```
state->error = AS-EXCEPT-PTR(std::forward<Error>(err)); // see 33.1
state->loop.finish();
```

```
void set_stopped() && noexcept;
```

9 *Effects:* Equivalent to `state->loop.finish()`.

10 For a subexpression `sndr`, let `Sndr` be `decltype((sndr))`. If `sender-to<Sndr, sync_wait_receiver<Sndr>>` is false, the expression `sync_wait.apply_sender(sndr)` is ill-formed; otherwise, it is equivalent to:

```
sync_wait_state<Sndr> state;
auto op = connect(sndr, sync_wait_receiver<Sndr>{&state});
start(op);
```

```

state.loop.run();
if (state.error) {
 rethrow_exception(std::move(state.error));
}
return std::move(state.result);

```

11 The behavior of `this_thread::sync_wait(sndr)` is undefined unless:

- (11.1) — It blocks the current thread of execution (3.6) with forward progress guarantee delegation (6.10.2.3) until the specified sender completes.  
*[Note 1: The default implementation of `sync_wait` achieves forward progress guarantee delegation by providing a `run_loop` scheduler via the `get_delegation_scheduler` query on the `sync-wait-receiver`'s environment. The `run_loop` is driven by the current thread of execution. — end note]*
- (11.2) — It returns the specified sender's async results as follows:
  - (11.2.1) — For a value completion, the result datums are returned in a `tuple` in an engaged `optional` object.
  - (11.2.2) — For an error completion, an exception is thrown.
  - (11.2.3) — For a stopped completion, a disengaged `optional` object is returned.

### 33.9.13.2 `this_thread::sync_wait_with_variant` [exec.sync.wait.var]

1 The name `this_thread::sync_wait_with_variant` denotes a customization point object. For a subexpression `sndr`, let `Sndr` be `decltype(into_variant(sndr))`. The expression `this_thread::sync_wait_with_variant(sndr)` is equivalent to `apply_sender(Domain(), sync_wait_with_variant, sndr)`, where `Domain` is the type of `get_completion_domain<set_value_t>(get_env(sndr), sync-wait-env{})`.

2 *Mandates:*

- (2.1) — `sender_in<Sndr, sync-wait-env>` is true.
- (2.2) — The type `sync-wait-with-variant-result-type<Sndr>` is well-formed.
- (2.3) — `same_as<decltype(e), sync-wait-with-variant-result-type<Sndr>>` is true, where `e` is the `apply_sender` expression above.

3 The expression `sync_wait_with_variant.apply_sender(sndr)` is equivalent to:

```

using result_type = sync-wait-with-variant-result-type<Sndr>;
if (auto opt_value = sync_wait(into_variant(sndr))) {
 return result_type(std::move(get<0>(*opt_value)));
}
return result_type(nullopt);

```

4 The behavior of `this_thread::sync_wait_with_variant(sndr)` is undefined unless:

- (4.1) — It blocks the current thread of execution (3.6) with forward progress guarantee delegation (6.10.2.3) until the specified sender completes.  
*[Note 1: The default implementation of `sync_wait_with_variant` achieves forward progress guarantee delegation by relying on the forward progress guarantee delegation provided by `sync_wait`. — end note]*
- (4.2) — It returns the specified sender's async results as follows:
  - (4.2.1) — For a value completion, the result datums are returned in an engaged `optional` object that contains a `variant` of `tuples`.
  - (4.2.2) — For an error completion, an exception is thrown.
  - (4.2.3) — For a stopped completion, a disengaged `optional` object is returned.

### 33.9.13.3 `execution::spawn` [exec.spawn]

1 `spawn` attempts to associate the given input sender with the given token's async scope and, on success, eagerly starts the input sender.

2 The name `spawn` denotes a customization point object. For subexpressions `sndr`, `token`, and `env`,

- (2.1) — let `Sndr` be `decltype((sndr))`,
- (2.2) — let `Token` be `remove_cvref_t<decltype((token))>`, and
- (2.3) — let `Env` be `remove_cvref_t<decltype((env))>`.

If any of `sender<Sndr>`, `scope_token<Token>`, or `queryable<Env>` are not satisfied, the expression `spawn(sndr, token, env)` is ill-formed.

- <sup>3</sup> Let *spawn-state-base* be the exposition-only class:

```
namespace std::execution {
 struct spawn-state-base { // exposition only
 virtual void complete() noexcept = 0; // exposition only
 };
}
```

- <sup>4</sup> Let *spawn-receiver* be the exposition-only class:

```
namespace std::execution {
 struct spawn-receiver { // exposition only
 using receiver_concept = receiver_tag;

 spawn-state-base* state; // exposition only
 void set_value() && noexcept { state->complete(); }
 void set_stopped() && noexcept { state->complete(); }
 };
}
```

- <sup>5</sup> Let *spawn-state* be the exposition-only class template:

```
namespace std::execution {
 template<class Alloc, scope_token Token, sender Sender>
 struct spawn-state : spawn-state-base { // exposition only
 using op-t = connect_result_t<Sender, spawn-receiver>; // exposition only

 spawn-state(Alloc alloc, Sender&& sndr, Token token); // exposition only
 void complete() noexcept override; // exposition only
 void run() noexcept; // exposition only

 private:
 using assoc-t = // exposition only
 remove_cvref_t<decltype(declval<Token&>().try_associate())>;

 Alloc alloc; // exposition only
 op-t op; // exposition only
 assoc-t assoc; // exposition only
 };
}
```

```
spawn-state(Alloc alloc, Sender&& sndr, Token token);
```

- <sup>6</sup> *Effects:* Initializes *alloc* with `std::move(alloc)`, *op* with `connect(std::move(sndr), spawn-receiver(this))`, and *assoc* with `token.try_associate()`.

```
void run() noexcept;
```

- <sup>7</sup> *Effects:* Equivalent to:

```
if (assoc)
 start(op);
else
 complete();
```

```
void complete() noexcept override;
```

- <sup>8</sup> *Effects:* Equivalent to:

```
auto assoc = std::move(this->assoc);
{
 using traits = allocator_traits<Alloc>::template rebind_traits<spawn-state>;
 typename traits::allocator_type alloc(this->alloc);
 traits::destroy(alloc, this);
 traits::deallocate(alloc, this, 1);
}
```

<sup>9</sup> For the expression `spawn(sndr, token, env)` let `new_sender` be the expression `token.wrap(sndr)` and let `alloc` and `senv` be defined as follows:

- (9.1) — if the expression `get_allocator(env)` is well-formed, then `alloc` is the result of `get_allocator(env)` and `senv` is the expression `env`,
- (9.2) — otherwise if the expression `get_allocator(get_env(new_sender))` is well-formed, then `alloc` is the result of `get_allocator(get_env(new_sender))` and `senv` is the expression `JOIN-ENV(prop(get_allocator, alloc), env)`,
- (9.3) — otherwise `alloc` is `allocator<void>()` and `senv` is the expression `env`.

<sup>10</sup> The expression `spawn(sndr, token, env)` is of type `void` and has the following effects:

- (10.1) — Uses `alloc` to allocate and construct an object `o` of type `decltype(spawn-state(alloc, write_env(token.wrap(sndr), senv), token))` from `alloc`, `write_env(token.wrap(sndr), senv)`, and `token` and then invokes `o.run()`. If an exception is thrown then any constructed objects are destroyed and any allocated memory is deallocated.
- <sup>11</sup> The expression `spawn(sndr, token)` is expression-equivalent to `spawn(sndr, token, execution::env<>())`.

### 33.10 Completion signatures

[exec.cmplsig]

<sup>1</sup> `completion_signatures` is a type that encodes a set of completion signatures (33.3).

<sup>2</sup> [Example 1:

```
struct my_sender {
 using sender_concept = sender_tag;
 using completion_signatures =
 execution::completion_signatures<
 set_value_t(),
 set_value_t(int, float),
 set_error_t(exception_ptr),
 set_error_t(error_code),
 set_stopped_t()>;
};
```

Declares `my_sender` to be a sender that can complete by calling one of the following for a receiver expression `rcvr`:

- (2.1) — `set_value(rcvr)`
  - (2.2) — `set_value(rcvr, int{...}, float{...})`
  - (2.3) — `set_error(rcvr, exception_ptr{...})`
  - (2.4) — `set_error(rcvr, error_code{...})`
  - (2.5) — `set_stopped(rcvr)`
- end example]

<sup>3</sup> This subclause makes use of the following exposition-only entities:

```
template<class Fn>
 concept completion_signature = see below;
```

<sup>4</sup> A type `Fn` satisfies *completion\_signature* if and only if it is a function type with one of the following forms:

- (4.1) — `set_value_t(Vs...)`, where `Vs` is a pack of object or reference types.
- (4.2) — `set_error_t(Err)`, where `Err` is an object or reference type.
- (4.3) — `set_stopped_t()`

```
5 template<bool>
 struct indirect-meta-apply {
 template<template<class...> class T, class... As>
 using meta-apply = T<As...>;
 // exposition only
 };
```

```
template<class...>
 concept always-true = true;
 // exposition only
```

```
template<class Tag,
 valid-completion-signatures Completions,
 template<class...> class Tuple,
 template<class...> class Variant>
using gather-signatures = see below;
```

- <sup>6</sup> Let `Fns` be a pack of the arguments of the `completion_signatures` specialization named by `Completions`, let `TagFns` be a pack of the function types in `Fns` whose return types are `Tag`, and let `Tsn` be a pack of the function argument types in the  $n$ -th type in `TagFns`. Then, given two variadic templates `Tuple` and `Variant`, the type `gather-signatures<Tag, Completions, Tuple, Variant>` names the type

```
META-APPLY(Variant, META-APPLY(Tuple, Ts0...),
 META-APPLY(Tuple, Ts1...),
 ...,
 META-APPLY(Tuple, Tsm-1...))
```

where  $m$  is the size of the pack `TagFns` and `META-APPLY(T, As...)` is equivalent to:

```
typename indirect-meta-apply<always-true<As...>>::template meta-apply<T, As...>
```

- <sup>7</sup> [Note 1: The purpose of `META-APPLY` is to make it valid to use non-variadic templates as `Variant` and `Tuple` arguments to `gather-signatures`. — end note]

```
8 namespace std::execution {
 template<completion-signature... Fns>
 struct completion_signatures {
 template<class Tag>
 static constexpr size_t count-of(Tag) { return see below; }

 template<class Fn>
 static constexpr void for-each(Fn&& fn) { // exposition only
 (fn(static_cast<Fns*>(nullptr)), ...);
 }
 };

 template<class Sndr, class Env = env<>,
 template<class...> class Tuple = decayed-tuple,
 template<class...> class Variant = variant-or-empty>
 requires sender_in<Sndr, Env>
 using value_types_of_t =
 gather-signatures<set_value_t, completion_signatures_of_t<Sndr, Env>, Tuple, Variant>;

 template<class Sndr, class Env = env<>,
 template<class...> class Variant = variant-or-empty>
 requires sender_in<Sndr, Env>
 using error_types_of_t =
 gather-signatures<set_error_t, completion_signatures_of_t<Sndr, Env>,
 type_identity_t, Variant>;

 template<class Sndr, class Env = env<>>
 requires sender_in<Sndr, Env>
 constexpr bool sends_stopped =
 !same_as<type-list<>,
 gather-signatures<set_stopped_t, completion_signatures_of_t<Sndr, Env>,
 type-list, type-list>>;
 }
```

- <sup>9</sup> For a subexpression `tag`, let `Tag` be the decayed type of `tag`. `completion_signatures<Fns...>::count-of(tag)` returns the count of function types in `Fns...` that are of the form `Tag(Ts...)` where `Ts` is a pack of types.

### 33.11 Queryable utilities

[exec.envs]

#### 33.11.1 Class template `prop`

[exec.prop]

```
namespace std::execution {
 template<class QueryTag, class ValueType>
 struct prop {
 QueryTag query_; // exposition only
 };
```

```

ValueType value_; // exposition only

constexpr const ValueType& query(QueryTag, auto&&...) const noexcept {
 return value_;
}
};

template<class QueryTag, class ValueType>
prop(QueryTag, ValueType) -> prop<QueryTag, unwrap_reference_t<ValueType>>;
}

```

- <sup>1</sup> Class template `prop` is for building a queryable object from a query object and a value.
- <sup>2</sup> *Mandates:* `callable<QueryTag, prop-like<ValueType>>` is modeled, where *prop-like* is the following exposition-only class template:

```

template<class ValueType>
struct prop-like { // exposition only
 const ValueType& query(auto) const noexcept;
};

```

- <sup>3</sup> [Example 1:

```

template<sender Sndr>
sender auto parameterize_work(Sndr sndr) {
 // Make an environment such that get_allocator(env) returns a reference to a copy of my_alloc{}.
 auto e = prop(get_allocator, my_alloc{});

 // Parameterize the input sender so that it will use our custom execution environment.
 return write_env(sndr, e);
}

```

— end example]

- <sup>4</sup> Specializations of `prop` are not assignable.

### 33.11.2 Class template `env`

[exec.env]

```

namespace std::execution {
 template<queryable... Envs>
 struct env {
 Envs0 envs0; // exposition only
 Envs1 envs1; // exposition only
 :
 Envsn-1 envsn-1; // exposition only

 template<class QueryTag, class... Args>
 constexpr decltype(auto) query(QueryTag q, Args&&... args) const noexcept(see below);
 };

 template<class... Envs>
 env(Envs...) -> env<unwrap_reference_t<Envs>...>;
}

```

- <sup>1</sup> The class template `env` is used to construct a queryable object from several queryable objects. Query invocations on the resulting object are resolved by attempting to query each subobject in lexical order.
- <sup>2</sup> Specializations of `env` are not assignable.
- <sup>3</sup> It is unspecified whether `env` supports initialization using a parenthesized *expression-list* (9.5), unless the *expression-list* consist of a single element of type (possibly `const`) `env`.
- <sup>4</sup> [Example 1:

```

template<sender Sndr>
sender auto parameterize_work(Sndr sndr) {
 // Make an environment such that:
 // get_allocator(env) returns a reference to a copy of my_alloc{}
 // get_scheduler(env) returns a reference to a copy of my_sched{}
 auto e = env{prop(get_allocator, my_alloc{}),

```

```

 prop(get_scheduler, my_sched{}));

 // Parameterize the input sender so that it will use our custom execution environment.
 return write_env(sndr, e);
}
—end example]

```

```

template<class QueryTag, class... Args>
constexpr decltype(auto) query(QueryTag q, Args&&... args) const noexcept(see below);

```

5 Let *has-query* be the following exposition-only concept:

```

 template<class Env, class QueryTag, class... Args>
 concept has-query = // exposition only
 requires (const Env& env, Args&&... args) {
 env.query(QueryTag(), std::forward<Args>(args)...);
 };

```

6 Let *fe* be the first element of *envs*<sub>0</sub>, *envs*<sub>1</sub>, ..., *envs*<sub>*n*−1</sub> such that the expression *fe*.query(*q*, std::forward<Args>(args)...) is well-formed.

7 *Constraints*: (*has-query*<Env, QueryTag, Args...> || ...) is true.

8 *Effects*: Equivalent to: return *fe*.query(*q*, std::forward<Args>(args)...) ;

9 *Remarks*: The expression in the noexcept clause is equivalent to noexcept(*fe*.query(*q*, std::forward<Args>(args)...) ).

### 33.12 Execution contexts

[exec.ctx]

#### 33.12.1 execution::run\_loop

[exec.run.loop]

##### 33.12.1.1 General

[exec.run.loop.general]

- 1 A *run\_loop* is an execution resource on which work can be scheduled. It maintains a thread-safe first-in-first-out queue of work. Its *run* member function removes elements from the queue and executes them in a loop on the thread of execution that calls *run*.
- 2 A *run\_loop* instance has an associated *count* that corresponds to the number of work items that are in its queue. Additionally, a *run\_loop* instance has an associated state that can be one of *starting*, *running*, *finishing*, or *finished*.
- 3 Concurrent invocations of the member functions of *run\_loop* other than *run* and its destructor do not introduce data races. The member functions *pop-front*, *push-back*, and *finish* execute atomically.
- 4 *Recommended practice*: Implementations should use an intrusive queue of operation states to hold the work units to make scheduling allocation-free.

```

namespace std::execution {
 class run_loop {
 // 33.12.1.2, associated types
 class run-loop-scheduler; // exposition only
 class run-loop-sender; // exposition only
 struct run-loop-opstate-base { // exposition only
 virtual void execute() noexcept = 0; // exposition only
 run_loop* loop; // exposition only
 run-loop-opstate-base* next; // exposition only
 };
 template<class Rcvr>
 using run-loop-opstate = unspecified; // exposition only

 // 33.12.1.4, member functions
 run-loop-opstate-base* pop-front() noexcept; // exposition only
 void push-back(run-loop-opstate-base*) noexcept; // exposition only

 public:
 // 33.12.1.3, constructor and destructor
 run_loop() noexcept;
 run_loop(run_loop&&) = delete;
 ~run_loop();
 };
}

```

```

// 33.12.1.4, member functions
run-loop-scheduler get_scheduler() noexcept;
void run() noexcept;
void finish() noexcept;
};
}

```

### 33.12.1.2 Associated types

[exec.run.loop.types]

```
class run-loop-scheduler;
```

<sup>1</sup> *run-loop-scheduler* is an unspecified type that models *scheduler*.

<sup>2</sup> Instances of *run-loop-scheduler* remain valid until the end of the lifetime of the *run\_loop* instance from which they were obtained.

<sup>3</sup> Two instances of *run-loop-scheduler* compare equal if and only if they were obtained from the same *run\_loop* instance.

<sup>4</sup> Let *sch* be an expression of type *run-loop-scheduler*. The expression *schedule(sch)* has type *run-loop-sender* and is not potentially-throwing if *sch* is not potentially-throwing.

<sup>5</sup> For type *set-tag* other than *set\_error\_t*, the expression *get\_completion\_scheduler<set-tag>(get\_env(schedule(sch))) == sch* evaluates to *true*.

```
class run-loop-sender;
```

<sup>6</sup> *run-loop-sender* is an exposition-only type that satisfies *sender*. Let *E* be the type of an environment. If *unstoppable\_token<stop\_token\_of\_t<E>>* is *true*, then *completion\_signatures\_of\_t<run-loop-sender, E>* is *completion\_signatures<set\_value\_t()>*. Otherwise, it is *completion\_signatures<set\_value\_t(), set\_stopped\_t()>*.

<sup>7</sup> An instance of *run-loop-sender* remains valid until the end of the lifetime of its associated *run\_loop* instance.

<sup>8</sup> Let *sndr* be an expression of type *run-loop-sender*, let *rcvr* be an expression such that *receiver-of<decltype((rcvr)), CS>* is *true* where *CS* is the *completion\_signatures* specialization above. Let *C* be either *set\_value\_t* or *set\_stopped\_t*. Then:

- (8.1) — The expression *connect(sndr, rcvr)* has type *run-loop-opstate<decay\_t<decltype((rcvr))>>* and is potentially-throwing if and only if *(void(sndr), auto(rcvr))* is potentially-throwing.
- (8.2) — The expression *get\_completion\_scheduler<C>(get\_env(sndr))* has type *run-loop-scheduler* and compares equal to the *run-loop-scheduler* instance from which *sndr* was obtained.

```
template<class Rcvr>
struct run-loop-opstate;
```

<sup>9</sup> *run-loop-opstate<Rcvr>* inherits privately and unambiguously from *run-loop-opstate-base*.

<sup>10</sup> Let *o* be a non-const lvalue of type *run-loop-opstate<Rcvr>*, and let *REC(o)* be a non-const lvalue reference to an instance of type *Rcvr* that was initialized with the expression *rcvr* passed to the invocation of *connect* that returned *o*. Then:

- (10.1) — The object to which *REC(o)* refers remains valid for the lifetime of the object to which *o* refers.
- (10.2) — The type *run-loop-opstate<Rcvr>* overrides *run-loop-opstate-base::execute()* such that *o.execute()* is equivalent to:

```

if (get_stop_token(REC(o)).stop_requested()) {
 set_stopped(std::move(REC(o)));
} else {
 set_value(std::move(REC(o)));
}

```

- (10.3) — The expression *start(o)* is equivalent to:

```
o.loop->push-back(addressof(o));
```

**33.12.1.3 Constructor and destructor**

[exec.run.loop.ctor]

`run_loop() noexcept;`

1 *Postconditions:* The `run_loop` instance's count is 0 and its state is starting.

`~run_loop();`

2 *Effects:* If the `run_loop` instance's count is not 0 or if its state is running, invokes `terminate` (14.6.2). Otherwise, has no effects.

**33.12.1.4 Member functions**

[exec.run.loop.members]

`run-loop-opstate-base* pop-front() noexcept;`

1 *Effects:* Blocks (3.6) until one of the following conditions is `true`:

- (1.1) — The `run_loop` instance's count is 0 and its state is finishing, in which case *pop-front* sets the state to finished and returns `nullptr`; or
- (1.2) — the `run_loop` instance's count is greater than 0, in which case an item is removed from the front of the queue, the count is decremented by 1, and the removed item is returned.

`void push-back(run-loop-opstate-base* item) noexcept;`

2 *Effects:* Adds `item` to the back of the queue and increments the `run_loop` instance's count by 1.

3 *Synchronization:* This operation synchronizes with the *pop-front* operation that obtains `item`.

`run-loop-scheduler get_scheduler() noexcept;`

4 *Returns:* An instance of *run-loop-scheduler* that can be used to schedule work onto this `run_loop` instance.

`void run() noexcept;`

5 *Preconditions:* The `run_loop` instance's state is either starting or finishing.

6 *Effects:* If the `run_loop` instance's state is starting, sets the state to running, otherwise leaves the state unchanged. Then, equivalent to:

```
while (auto* op = pop-front()) {
 op->execute();
}
```

7 *Remarks:* When the `run_loop` instance's state changes, it does so without introducing data races.

`void finish() noexcept;`

8 *Preconditions:* The `run_loop` instance's state is either starting or running.

9 *Effects:* Changes the `run_loop` instance's state to finishing.

10 *Synchronization:* `finish` synchronizes with the *pop-front* operation that returns `nullptr`.

**33.13 Coroutine utilities**

[exec.coro.util]

**33.13.1 execution::as\_awaitable**

[exec.as.awaitable]

1 `as_awaitable` transforms an object into one that is awaitable within a particular coroutine. Subclause 33.13 makes use of the following exposition-only entities:

```
namespace std::execution {
 template<class Sndr, class Promise>
 concept awaitable-sender =
 single-sender<Sndr, env_of_t<Promise>>> &&
 sender-to<Sndr,
 typename sender-awaitable<Sndr, Promise>::awaitable-receiver> && // see below
 requires (Promise& p) {
 { p.unhandled_stopped() } -> convertible_to<coroutine_handle<>>;
 };
}
```

```

template<class Sndr>
concept has-queryable-await-completion-adaptor = // exposition only
 sender<Sndr> &&
 requires(Sndr&& sender) {
 get_await_completion_adaptor(get_env(sender));
 };

template<class Sndr, class Promise>
class sender-awaitable; // exposition only
}

```

- <sup>2</sup> The type *sender-awaitable*<Sndr, Promise> is equivalent to:

```

namespace std::execution {
 template<class Sndr, class Promise>
 class sender-awaitable {
 struct unit {}; // exposition only
 using value-type = // exposition only
 single-sender-value-type<Sndr, env_of_t<Promise>>;
 using result-type = // exposition only
 conditional_t<is_void_v<value-type>, unit, value-type>;
 struct awaitable-receiver; // exposition only

 variant<monostate, result-type, exception_ptr> result{}; // exposition only
 connect_result_t<Sndr, awaitable-receiver> state; // exposition only

 public:
 sender-awaitable(Sndr&& sndr, Promise& p);
 static constexpr bool await_ready() noexcept { return false; }
 void await_suspend(coroutine_handle<Promise>) noexcept { start(state); }
 value-type await_resume();
 };
}

```

- <sup>3</sup> *awaitable-receiver* is equivalent to:

```

struct awaitable-receiver {
 using receiver_concept = receiver_tag;
 variant<monostate, result-type, exception_ptr>* result_ptr; // exposition only
 coroutine_handle<Promise> continuation; // exposition only
 // see below
};

```

- <sup>4</sup> Let *rcvr* be an rvalue expression of type *awaitable-receiver*, let *crcvr* be a const lvalue that refers to *rcvr*, let *vs* be a pack of subexpressions, and let *err* be an expression of type *Err*. Let *MAKE-NOEXCEPT*(*expr*) for some subexpression *expr* be expression-equivalent to *[&] noexcept -> decltype(auto) { return (expr); }()*. Then:

- (4.1) — The expression *set\_value(rcvr, vs...)* is equivalent to:

```

try {
 rcvr.result_ptr->template emplace<1>(vs...);
} catch(...) {
 rcvr.result_ptr->template emplace<2>(current_exception());
}
MAKE-NOEXCEPT(rcvr.continuation.resume());

```

*Mandates:* *constructible\_from<result-type, decltype((vs))...>* is satisfied.

- (4.2) — The expression *set\_error(rcvr, err)* is equivalent to:

```

try {
 rcvr.result_ptr->template emplace<2>(AS-EXCEPT-PTR(err)); // see 33.1
} catch(...) {
 rcvr.result_ptr->template emplace<2>(current_exception());
}
MAKE-NOEXCEPT(rcvr.continuation.resume());

```

- (4.3) — The expression *set\_stopped(rcvr)* is equivalent to:

- ```

MAKE-NOEXCEPT(
    static_cast<coroutine_handle<>>(
        rcvr.continuation.promise().unhandled_stopped()).resume());

```
- (4.4) — For any expression *tag* whose type satisfies *forwarding-query* and for any pack of subexpressions *as*, *get_env(crcvr).query(tag, as...)* is expression-equivalent to:
- ```

tag(get_env(as_const(MAKE-NOEXCEPT(crcvr.continuation.promise()))),
 as...)

```
- ```

sender-awaitable(Sndr&& sndr, Promise& p);

```
- 5 *Effects*: Initializes *state* with
- ```

connect(std::forward<Sndr>(sndr),
 awaitable-receiver{addressof(result), coroutine_handle<Promise>::from_promise(p)})

```
- ```

value-type await_resume();

```
- 6 *Effects*: Equivalent to:
- ```

if (result.index() == 2)
 rethrow_exception(get<2>(result));
if constexpr (!is_void_v<value-type>)
 return std::forward<value-type>(get<1>(result));

```
- 7 *as\_awaitable* is a customization point object. For subexpressions *expr* and *p*, where *Expr* names the type *decltype((expr))* and *Promise* names the type *decay\_t<decltype((p))>*, *as\_awaitable(expr, p)* is ill-formed if *p* is not an lvalue, otherwise *as\_awaitable(expr, p)* is expression-equivalent to the expression specified below, except that the evaluations of *expr* and *p* are indeterminately sequenced:
- (7.1) — *expr.as\_awaitable(p)* if that expression is well-formed.
- Mandates*: *is-awaitable*<*A*, *Promise*> is true, where *A* is the type of the expression above.
- (7.2) — Otherwise,
- ```

adapt-for-await-completion(transform_sender(expr, get_env(p))).as_awaitable(p)

```
- if this expression is well-formed, *sender_in*<*Expr*, *env_of_t*<*Promise*>> is true, and *single-sender-value-type*<*Expr*, *env_of_t*<*Promise*>> is well-formed, except that *p* is only evaluated once.
- (7.3) — Otherwise, *(void(p), expr)* if *decltype(GET-AWAITER(expr))* satisfies *is-awaiter*<*Promise*>.
- (7.4) — Otherwise,
- ```

sender-awaitable{adapt-for-await-completion(transform_sender(expr, get_env(p))), p}

```
- if *sender\_in*<*Expr*, *env\_of\_t*<*Promise*>> is true and *single-sender-value-type*<*Expr*, *env\_of\_t*<*Promise*>> is well-formed, except that *p* is only evaluated once.
- (7.5) — Otherwise, *(void(p), expr)*.
- 8 *adapt-for-await-completion(s)* is expression-equivalent to
- (8.1) — *get\_await\_completion\_adaptor(get\_env(s))(s)* if that is well-formed, except that *s* is evaluated only once,
- (8.2) — otherwise, *s*.

### 33.13.2 execution::with\_awaitable\_senders

[exec.with.awaitable.senders]

- 1 *with\_awaitable\_senders*, when used as the base class of a coroutine promise type, makes senders awaitable in that coroutine type.

In addition, it provides a default implementation of *unhandled\_stopped* such that if a sender completes by calling *set\_stopped*, it is treated as if an uncatchable "stopped" exception were thrown from the *await-expression*.

[Note 1: The coroutine is never resumed, and the *unhandled\_stopped* of the coroutine caller's promise type is called.  
— end note]

```

namespace std::execution {
 template<class-type Promise>
 struct with_awaitable_senders {
 template<class OtherPromise>

```

```

 requires (!same_as<OtherPromise, void>)
void set_continuation(coroutine_handle<OtherPromise> h) noexcept;

coroutine_handle<> continuation() const noexcept { return continuation; }

coroutine_handle<> unhandled_stopped() noexcept {
 return stopped-handler(continuation.address());
}

template<class Value>
see below await_transform(Value&& value);

private:
[[noreturn]] static coroutine_handle<>
 default-unhandled-stopped(void*) noexcept { // exposition only
 terminate();
 }
coroutine_handle<> continuation{}; // exposition only
coroutine_handle<> (*stopped-handler)(void*) noexcept = // exposition only
 &default-unhandled-stopped;
};

template<class OtherPromise>
 requires (!same_as<OtherPromise, void>)
void set_continuation(coroutine_handle<OtherPromise> h) noexcept;

```

2 *Effects*: Equivalent to:

```

 continuation = h;
if constexpr (requires(OtherPromise& other) { other.unhandled_stopped(); }) {
 stopped-handler = [](void* p) noexcept -> coroutine_handle<> {
 return coroutine_handle<OtherPromise>::from_address(p)
 .promise().unhandled_stopped();
 };
} else {
 stopped-handler = &default-unhandled-stopped;
}

```

```

template<class Value>
call-result-t<as_awaitable_t, Value, Promise&> await_transform(Value&& value);

```

3 *Effects*: Equivalent to:

```

 return as_awaitable(std::forward<Value>(value), static_cast<Promise&>(*this));

```

### 33.13.3 execution::affine

[exec.affine]

- 1 **affine** adapts a sender into one that completes on the receiver's scheduler. If the algorithm determines that the adapted sender already completes on the correct scheduler it can avoid any scheduling operation.
- 2 The name **affine** denotes a pipeable sender adaptor object. For a subexpression **sndr**, if `decltype((sndr))` does not satisfy **sender**, **affine(sndr)** is ill-formed.
- 3 Otherwise, the expression **affine(sndr)** is expression-equivalent to *make-sender*(**affine**, *env*<>(), **sndr**).
- 4 For a subexpression **sch** whose type models **scheduler**, let *UNSTOPPABLE-SCHEDULER*(**sch**) be an expression **e** whose type models **scheduler** such that:
  - (4.1) — *schedule*(**e**) is expression-equivalent to *unstoppable*(*schedule*(**sch**)).
  - (4.2) — For any query object **q** and pack of subexpressions **args...**, **e.query(q, args...)** is expression-equivalent to **sch.query(q, args...)**.
  - (4.3) — The expression **e == UNSTOPPABLE-SCHEDULER(other)** is expression-equivalent to **sch == other**.
- 5 Let **sndr** and **ev** be subexpressions such that **Sndr** is `decltype((sndr))`. If *sender-for*<**Sndr**, **affine\_t**> is **false**, then the expression **affine.transform\_sender(sndr, ev)** is ill-formed; otherwise, it is equal to:

```

auto& [_, _, child] = sndr;

```

```

if constexpr (requires { std::forward_like<Sndr>(child).affine(); }) {
 return std::forward_like<Sndr>(child).affine();
} else {
 return continues_on(std::forward_like<Sndr>(child),
 UNSTOPPABLE-SCHEDULER(get_start_scheduler(ev)));
}

```

- <sup>6</sup> *Recommended practice:* Implementations should provide `affine` member functions for senders that are known to resume on the scheduler where they were started. Example senders for which that is the case are `just`, `just_error`, `just_stopped`, `read_env`, and `write_env`.
- <sup>7</sup> Let `out_sndr` be a subexpression denoting a sender returned from `affine(sndr)` or one equal to such, and let `OutSndr` be the type `decltype((out_sndr))`. Let `out_rcvr` be a subexpression denoting a receiver that has an environment of type `Env`. If `get_start_scheduler(get_env(out_rcvr))` is ill-formed or does not satisfy *infallible-scheduler*<`Env`>, then evaluation of the expression `get_completion_signatures<OutSndr, Env>()` exits with an exception. Let `op` be an lvalue referring to the operation state that results from connecting `out_sndr` to `out_rcvr`. Calling `start(op)` will start `sndr` on the current execution agent and execute completion operations on `out_rcvr` on an execution agent of the execution resource associated with `sch`. If the current execution resource is the same as the execution resource associated with `sch`, the completion operation on `out_rcvr` may be called before `start(op)` completes.

### 33.13.4 `execution::inline_scheduler`

[exec.inline.scheduler]

```

namespace std::execution {
 class inline_scheduler {
 class inline-sender; // exposition only

 template<receiver R>
 class inline-state; // exposition only

 public:
 using scheduler_concept = scheduler_tag;

 constexpr inline-sender schedule() noexcept { return {}; }
 constexpr bool operator==(const inline_scheduler&) const noexcept = default;
 };
}

```

- <sup>1</sup> `inline_scheduler` is a class that models `scheduler` (33.6). All objects of type `inline_scheduler` are equal. For a subexpression `sch` of type `inline_scheduler`, a query object `q`, and a pack of subexpressions `args`, the expression `sch.query(q, args...)` is expression-equivalent to `inline-attrs<set_value_t>().query(q, args...)`.
- <sup>2</sup> `inline-sender` is an exposition-only type that satisfies `sender`. The type `completion_signatures_of_t<inline-sender>` is `completion_signatures<set_value_t>`.
- <sup>3</sup> Let `sndr` be an expression of type `inline-sender`, let `rcvr` be an expression such that *receiver-of*<`decltype((rcvr))`, `CS`> is true where `CS` is `completion_signatures<set_value_t>`, then the expression `connect(sndr, rcvr)` has type `inline-state<remove_cvref_t<decltype((rcvr))>>` and is potentially-throwing if and only if `((void)sndr, auto(rcvr))` is potentially-throwing.
- <sup>4</sup> Let `o` be a non-const lvalue of type `inline-state<Rcvr>`, and let `REC(o)` be a non-const lvalue reference to an object of type `Rcvr` that was initialized with the expression `rcvr` passed to an invocation of `connect` that returned `o`, then:
- (4.1) — the object to which `REC(o)` refers remains valid for the lifetime of the object to which `o` refers, and
- (4.2) — the expression `start(o)` is equivalent to `set_value(std::move(REC(o)))`.

### 33.13.5 `execution::task_scheduler`

[exec.task.scheduler]

```

namespace std::execution {
 class task_scheduler {
 class ts-domain; // exposition only

 template<scheduler Sch>
 class backend-for; // exposition only
 };
}

```

```

public:
 using scheduler_concept = scheduler_tag;

 template<class Sch, class Allocator = allocator<void>>
 requires (!same_as<task_scheduler, remove_cvref_t<Sch>>) && scheduler<Sch>
 explicit task_scheduler(Sch&& sch, Allocator alloc = {});

 task_scheduler(const task_scheduler&) = default;
 task_scheduler& operator=(const task_scheduler&) = default;

 see below schedule();

 friend bool operator==(const task_scheduler& lhs, const task_scheduler& rhs) noexcept;
 template<class Sch>
 requires (!same_as<task_scheduler, Sch>) && scheduler<Sch>
 friend bool operator==(const task_scheduler& lhs, const Sch& rhs) noexcept;

private:
 // see 33.16.4
 shared_ptr<parallel_scheduler_replacement::parallel_scheduler_backend> sch_; // exposition only
};

```

- 1 *task\_scheduler* is a class that models *scheduler* (33.6). Given an object *s* of type *task\_scheduler*, let *SCHED*(*s*) be the object pointed to by the pointer owned by *s.sch\_*. The expression *get\_forward\_progress\_guarantee*(*s*) is equivalent to *get\_forward\_progress\_guarantee*(*SCHED*(*s*)). The expression *get\_completion\_domain*<*set\_value\_t*>(s) is equivalent to *task\_scheduler::ts-domain*( ).

```

template<class Sch, class Allocator = allocator<void>>
 requires(!same_as<task_scheduler, remove_cvref_t<Sch>>) && scheduler<Sch>
explicit task_scheduler(Sch&& sch, Allocator alloc = {});

```

- 2 *Mandates*: *Sch* satisfies *infallible-scheduler*<*env*>>.

- 3 *Effects*: Initializes *sch\_* with:

```
allocate_shared<backend-for<remove_cvref_t<Sch>>>(alloc, std::forward<Sch>(sch))
```

- 4 *Recommended practice*: Implementations should avoid the use of dynamically allocated memory for small scheduler objects.

- 5 *Remarks*: Any allocations performed by calls on *\*this* are performed using a copy of *alloc*.

```
bool operator==(const task_scheduler& lhs, const task_scheduler& rhs) noexcept;
```

- 6 *Effects*: Equivalent to: *return lhs == SCHED*(*rhs*);

```

template<class Sch>
 requires (!same_as<task_scheduler, Sch>)
 && scheduler<Sch>
bool operator==(const task_scheduler& lhs, const Sch& rhs) noexcept;

```

- 7 *Returns*: *false* if the type of *SCHED*(*lhs*) is not *Sch*, otherwise *SCHED*(*lhs*) == *rhs*.

- 8 For an lvalue *r* of a type derived from *receiver\_proxy*, let *WRAP-RCVR*(*r*) be an object of a type that models *receiver* and whose completion handlers result in invoking the corresponding completion handlers of *r*.

```

namespace std::execution {
 template<scheduler Sch>
 class task_scheduler::backend-for
 : public parallel_scheduler_replacement::parallel_scheduler_backend { // exposition only
 public:
 explicit backend-for(Sch sch) : sched_(std::move(sch)) {}

 void schedule(receiver_proxy& r, span<byte> s) noexcept override;
 void schedule_bulk_chunked(size_t shape, bulk_item_receiver_proxy& r,
 span<byte> s) noexcept override;
 void schedule_bulk_unchunked(size_t shape, bulk_item_receiver_proxy& r,
 span<byte> s) noexcept override;

```

```

private:
 Sch sched_;
};
}

```

- <sup>9</sup> Let *env* be a pack of subexpressions, and let *just-sndr-like* be a sender whose only value completion signature is `set_value_t()` and for which the expression `get_completion_scheduler<set_value_t>(get_env(just-sndr-like), env...)` is expression-equivalent to `get_completion_scheduler<set_value_t>(sched_, env...)`.

```
void schedule(receiver_proxy& r, span<byte> s) noexcept override;
```

- <sup>10</sup> *Effects:* Constructs an operation state *os* with `connect(schedule(sched_), WRAP-RCVR(r))` and calls `start(os)`.

```
void schedule_bulk_chunked(size_t shape, bulk_item_receiver_proxy& r,
 span<byte> s) noexcept override;
```

- <sup>11</sup> *Effects:* Let *chunk\_size* be an integer less than or equal to *shape*, let *num\_chunks* be  $(\text{shape} + \text{chunk\_size} - 1) / \text{chunk\_size}$ , and let *fn* be a function object such that for an integer *i*, *fn*(*i*) calls `r.execute(i * chunk_size, m)`, where *m* is the lesser of  $(i + 1) * \text{chunk\_size}$  and *shape*. Constructs an operation state *os* as if with

```
connect(bulk(just-sndr-like, par, num_chunks, fn), WRAP-RCVR(r))
```

and calls `start(os)`.

```
void schedule_bulk_unchunked(size_t shape, bulk_item_receiver_proxy& r,
 span<byte> s) noexcept override;
```

- <sup>12</sup> *Effects:* Let *fn* be a function object such that for an integer *i*, *fn*(*i*) is equivalent to `r.execute(i, i + 1)`. Constructs an operation state *os* as if with

```
connect(bulk(just-sndr-like, par, shape, fn), WRAP-RCVR(r))
```

and calls `start(os)`.

see below `schedule()`;

- <sup>13</sup> *Returns:* A prvalue *ts-sndr* whose type models sender such that:

- (13.1) — `get_completion_scheduler<set_value_t>(get_env(ts-sndr))` is equal to `*this`.
- (13.2) — `get_completion_domain<set_value_t>(get_env(ts-sndr))` is expression-equivalent to `ts-domain()`.
- (13.3) — If a receiver *rcvr* is connected to *ts-sndr* and the resulting operation state is started, calls `sch->schedule(r, s)`, where
  - (13.3.1) — *r* is a proxy for *rcvr* with base `parallel_scheduler_replacement::receiver_proxy` (33.15) and
  - (13.3.2) — *s* is a preallocated backend storage for *r*.
- (13.4) — For any type *E*, `completion_signatures_of_t<decltype(ts-sndr), E>` denotes `completion_signatures<set_value_t>` if `unstoppable_token<stop_token_of_t<E>>` is true, and otherwise `completion_signatures<set_value_t(), set_stopped_t>`.

```

namespace std::execution {
 class task_scheduler::ts-domain : public default_domain { // exposition only
 public:
 template<class BulkSndr, class Env>
 static constexpr auto transform_sender(set_value_t, BulkSndr&& bulk_sndr, const Env& env)
 noexcept(see below);
 };
}

```

```

template<class BulkSndr, class Env>
 static constexpr auto transform_sender(BulkSndr&& bulk_sndr, const Env& env)
 noexcept(is_nothrow_constructible_v<decay_t<BulkSndr>, BulkSndr>);

```

- <sup>14</sup> *Constraints:*

- (14.1) — `sender_in<BulkSndr, Env>` is true,
  - (14.2) — `auto(std::forward<BulkSndr>(bulk_sndr))` is well-formed, and
  - (14.3) — either
  - (14.3.1) — `sender_for<BulkSndr, bulk_chunked_t>` or
  - (14.3.2) — `sender_for<BulkSndr, bulk_unchunked_t>`
- is true.

15 *Effects:* Equivalent to:

```
auto& [_, data, child] = bulk_sndr;
auto& [_, shape, fn] = data;
auto sch = call-with-default(get_completion_scheduler<set_value_t>,
 not-a-scheduler(), get_env(child), FWD-ENV(env));
return e;
```

where *e* is `not-a-sender()` if the type of `sch` is not `task_scheduler`; otherwise, it is a prvalue whose type models `sender` such that, if it is connected to a receiver `rcvr` and the resulting operation state is started, `child` is connected to an unspecified receiver `R` and started. The expression `get_env(R)` is expression-equivalent to `FWD-ENV(get_env(rcvr-copy))`, where `rcvr-copy` is an lvalue subexpression designating an object decay-copied from `rcvr`.

If `child` completes with an error or a stopped completion, the completion operation is forwarded unchanged to `rcvr`. Otherwise, let `args` be a pack of lvalue subexpressions designating objects decay-copied from the value result datums. Then:

- (15.1) — If `bulk_sndr` was the result of the evaluation of an expression equivalent to `bulk_chunked(child, policy, shape, fn)` or a copy of such, then `sch->schedule_bulk_chunked(shape, r, s)` is called where `r` is a bulk chunked proxy (33.15) for `rcvr` with callable `fn` and arguments `args`, and `s` is a preallocated backend storage for `r`.
- (15.2) — Otherwise, calls `sch->schedule_bulk_unchunked(shape, r, s)` where `r` is a bulk unchunked proxy for `rcvr` with callable `fn` and arguments `args`, and `s` is a preallocated backend storage for `r`.

### 33.13.6 execution::task

[exec.task]

#### 33.13.6.1 task overview

[task.overview]

- <sup>1</sup> The `task` class template represents a sender that can be used as the return type of coroutines. The first template parameter `T` defines the type of the value completion datum (33.3) if `T` is not `void`. Otherwise, there are no value completion datums. Inside coroutines returning `task<T, E>` the operand of `co_return` (if any) becomes the argument of `set_value`. The second template parameter `Environment` is used to customize the behavior of `task`.

#### 33.13.6.2 Class template task

[task.class]

```
namespace std::execution {
 template<class T = void, class Environment = env<>>
 class task {
 // 33.13.6.4
 template<receiver Rcvr>
 class state; // exposition only

 public:
 using sender_concept = sender_tag;
 using allocator_type = see below;
 using start_scheduler_type = see below;
 using stop_source_type = see below;
 using stop_token_type = decltype(declval<stop_source_type>().get_token());
 using error_types = see below;

 // 33.13.6.5
 class promise_type;
```

```

 task(task&&) noexcept;
 ~task();

 template<class Self, class... Env>
 static consteval auto get_completion_signatures();

 template<receiver Rcvr>
 state<Rcvr> connect(Rcvr&& rcvr) &&;

private:
 coroutine_handle<promise_type> handle; // exposition only
};
}

```

- 1 **task**<T, E> models **sender** (33.9) if T is void, a reference type, or a *cv*-unqualified non-array object type and E is a class type. Otherwise a program that instantiates the definition of **task**<T, E> is ill-formed.
- 2 The nested types of **task** template specializations are determined based on the **Environment** parameter:
  - (2.1) — **allocator\_type** is **Environment::allocator\_type** if that *qualified-id* is valid and denotes a type, **allocator<byte>** otherwise.
  - (2.2) — **start\_scheduler\_type** is **Environment::start\_scheduler\_type** if that *qualified-id* is valid and denotes a type, **task\_scheduler** otherwise.
  - (2.3) — **stop\_source\_type** is **Environment::stop\_source\_type** if that *qualified-id* is valid and denotes a type, **inplace\_stop\_source** otherwise.
  - (2.4) — **error\_types** is **Environment::error\_types** if that *qualified-id* is valid and denotes a type, **completion\_signatures<set\_error\_t(exception\_ptr)>** otherwise.
- 3 A program is ill-formed if **error\_types** is not a specialization of **execution::completion\_signatures** or if the template arguments of that specialization contain an element which is not of the form **set\_error\_t(E)** for some type E.
- 4 **allocator\_type** shall meet the *Cpp17Allocator* requirements, **scheduler\_type** shall model **scheduler**, and **stop\_source\_type** shall model **stoppable-source**.

### 33.13.6.3 task members

[task.members]

```
task(task&& other) noexcept;
```

- 1 *Effects:* Initializes *handle* with **exchange**(other.*handle*, {}).  

```
~task();
```

- 2 *Effects:* Equivalent to:

```
 if (handle)
 handle.destroy();
```

```

template<class Self, class... Env>
 static consteval auto get_completion_signatures();

```

- 3 Let the type C be a specialization of **execution::completion\_signatures** with the template arguments (in unspecified order):
  - (3.1) — **set\_value\_t()** if T is void, and **set\_value\_t(T)** otherwise;
  - (3.2) — template arguments of the specialization of **execution::completion\_signatures** denoted by **error\_types**; and
  - (3.3) — **set\_stopped\_t()**.
- 4 *Returns:* C().

```

template<receiver Rcvr>
 state<Rcvr> connect(Rcvr&& rcvr) &&;

```

- 5 *Mandates:* At least one of the expressions **allocator\_type**(**get\_allocator**(**get\_env**(rcvr))) and **allocator\_type**() is well-formed.
- 6 *Preconditions:* **bool**(*handle*) is true.

7 *Effects:* Equivalent to:

```
return state<Rcvr>(exchange(handle, {}), std::forward<Rcvr>(rcvr));
```

### 33.13.6.4 Class template `task::state`

[task.state]

```
namespace std::execution {
 template<class T, class Environment>
 template<receiver Rcvr>
 class task<T, Environment>::state { // exposition only
 public:
 using operation_state_concept = operation_state_tag;

 template<class R>
 state(coroutine_handle<promise_type> h, R&& rr);

 ~state();

 void start() & noexcept;

 stop_token_type get-stop-token(); // exposition only

 private:
 using own-env-t = see below; // exposition only
 coroutine_handle<promise_type> handle; // exposition only
 remove_cvref_t<Rcvr> rcvr; // exposition only
 optional<stop_source_type> source; // exposition only
 own-env-t own-env; // exposition only
 Environment environment; // exposition only
 optional<T> result; // exposition only; present only if is_void_v<T> is false
 exception_ptr error; // exposition only
 };
}
```

1 The type *own-env-t* is `Environment::template env_type<decltype(get_env(declval<Rcvr>()))>` if that *qualified-id* is valid and denotes a type, `env<>` otherwise.

```
template<class R>
 state(coroutine_handle<promise_type> h, R&& rr);
```

2 *Effects:* Initializes

- (2.1) — *handle* with `std::move(h)`;
- (2.2) — *rcvr* with `std::forward<R>(rr)`;
- (2.3) — *own-env* with *own-env-t* (`get_env(rcvr)`) if that expression is valid and *own-env-t* () otherwise. If neither of these expressions is valid, the program is ill-formed.
- (2.4) — *environment* with `Environment(own-env)` if that expression is valid, otherwise `Environment(get_env(rcvr))` if this expression is valid, otherwise `Environment()`. If neither of these expressions is valid, the program is ill-formed.

```
~state();
```

3 *Effects:* Equivalent to:

```
if (handle)
 handle.destroy();
```

```
void start() & noexcept;
```

4 *Effects:* Let *prom* be the object `handle.promise()`. Associates `STATE(prom)`, `RCVR(prom)`, and `SCHED(prom)` with `*this` as follows:

- (4.1) — `STATE(prom)` is `*this`.
- (4.2) — `RCVR(prom)` is *rcvr*.
- (4.3) — `SCHED(prom)` is the object initialized with `start_scheduler_type(get_start_scheduler(get_env(rcvr)))` if that expression is valid and `start_scheduler_type()` otherwise. If neither of these expressions is valid, the program is ill-formed.

Finally, invokes *handle.resume()*.

```
stop_token_type get-stop-token(); // exposition only
```

5 *Effects:* If `same_as<decltype(declval<stop_source_type>().get_token()), decltype(get_stop_token(get_env(rcvr)))>` is true, returns `get_stop_token(get_env(rcvr))`. Otherwise, if `source.has_value()` is false, initializes the contained value of *source* such that

(5.1) — `source->stop_requested()` returns `get_stop_token(get_env(rcvr))->stop_requested()`; and

(5.2) — `source->stop_possible()` returns `get_stop_token(get_env(rcvr))->stop_possible()`.

Finally, returns `source->get_token()`.

### 33.13.6.5 Class `task::promise_type`

[task.promise]

```
namespace std::execution {
 template<class T, class Environment>
 class task<T, Environment>::promise_type {
 public:
 task get_return_object() noexcept;

 static constexpr suspend_always initial_suspend() noexcept { return {}; }
 auto final_suspend() noexcept;

 void unhandled_exception();
 coroutine_handle<> unhandled_stopped() noexcept;

 void return_void(); // present only if is_void_v<T> is true
 template<class V = T>
 void return_value(V&& value); // present only if is_void_v<T> is false

 template<class E>
 unspecified yield_value(with_error<E> error);

 template<sender Sender>
 auto await_transform(Sender&& sndr);

 unspecified get_env() const noexcept;

 void* operator new(size_t size);
 template<class Alloc, class... Args>
 void* operator new(size_t size, allocator_arg_t, Alloc alloc, Args&&...);
 template<class This, class Alloc, class... Args>
 void* operator new(size_t size, const This&, allocator_arg_t, Alloc alloc, Args&&...);

 void operator delete(void* pointer, size_t size) noexcept;
 };
}
```

<sup>1</sup> Let *prom* be an object of `promise_type` and let *tsk* be the task object created by `prom.get_return_object()`. The description below refers to objects *STATE*(*prom*), *RCVR*(*prom*), and *SCHED*(*prom*) associated with *tsk* during evaluation of `task::state<Rcvr>::start` for some receiver *Rcvr*.

```
task get_return_object() noexcept;
```

2 *Returns:* A task object whose member *handle* is `coroutine_handle<promise_type>::from_promise(*this)`.

```
auto final_suspend() noexcept;
```

3 *Returns:* An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the completion of the asynchronous operation associated with *STATE*(*\*this*). Let *st* be a reference to *STATE*(*\*this*). The asynchronous completion first destroys the coroutine frame using `st.handle.destroy()` and then invokes:

(3.1) — `set_error(std::move(st.rcvr), std::move(st.error))` if `bool(st.error)` is true, otherwise

(3.2) — `set_value(std::move(st.rcvr))` if `is_void_v<T>` is true, and otherwise

(3.3) — `set_value(std::move(st.rcvr), *std::move(st.result))`.

```
template<class Err>
 auto yield_value(with_error<Err> err);
```

4 *Mandates:* `std::move(err.error)` is convertible to exactly one of the `set_error_t` argument types of `error_types`. Let *Cerr* be that type.

5 *Returns:* An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the calling coroutine to be suspended and then completes the asynchronous operation associated with `STATE(*this)`. Let *st* be a reference to `STATE(*this)`. Then the asynchronous operation completes by first destroying the coroutine frame using `st.handle.destroy()` and then invoking `set_error(std::move(st.rcvr), Cerr(std::move(err.error)))`.

```
template<sender Sender>
 auto await_transform(Sender&& sndr);
```

6 *Returns:* If `same_as<inline_scheduler, start_scheduler_type>` is true, returns `as_awaitable(std::forward<Sender>(sndr), *this)`; otherwise returns `as_awaitable(affine(std::forward<Sender>(sndr)), *this)`.

```
void unhandled_exception();
```

7 *Effects:* If the signature `set_error_t(exception_ptr)` is not an element of `error_types`, calls `terminate()` (14.6.2). Otherwise, stores `current_exception()` into `STATE(*this).error`.

```
coroutine_handle<> unhandled_stopped() noexcept;
```

8 *Effects:* Completes the asynchronous operation associated with `STATE(*this)`. Let *st* be a reference to `STATE(*this)`. The asynchronous operation is completed by first destroying the coroutine frame using `st.handle.destroy()` and then invoking `set_stopped(std::move(st.rcvr))`.

9 *Returns:* `noop_coroutine()`.

```
void return_void();
```

10 *Effects:* Does nothing.

```
template<class V>
 void return_value(V&& v);
```

11 *Effects:* Equivalent to `result.emplace(std::forward<V>(v))`.

```
unspecified get_env() const noexcept;
```

12 *Returns:* An object *env* such that queries are forwarded as follows:

(12.1) — `env.query(get_start_scheduler)` returns `start_scheduler_type(SCHED(*this))`.

(12.2) — `env.query(get_allocator)` returns `allocator_type(get_allocator(get_env(RCVR(*this)))` if this expression is well-formed and `allocator_type()` otherwise.

(12.3) — `env.query(get_stop_token)` returns `STATE(*this).get-stop-token()`.

(12.4) — For any other query *q* and arguments *a...* a call to `env.query(q, a...)` returns `STATE(*this).environment.query(q, a...)` if this expression is well-formed and `forwarding_query(q)` is well-formed and is true. Otherwise `env.query(q, a...)` is ill-formed.

```
void* operator new(size_t size);
```

13 *Effects:* Equivalent to: `return operator new(size, allocator_arg, allocator_type());`

```
template<class Alloc, class... Args>
 void* operator new(size_t size, allocator_arg_t, Alloc alloc, Args&&...);
template<class This, class Alloc, class... Args>
 void* operator new(size_t size, const This&, allocator_arg_t, Alloc alloc, Args&&...);
```

14 Let *PAlloc* be `allocator_traits<Alloc>::template rebind_alloc<U>`, where *U* is an unspecified type whose size and alignment are both `__STDCPP_DEFAULT_NEW_ALIGNMENT__`.

15 *Mandates:* `allocator_traits<PAlloc>::pointer` is a pointer type.

16 *Effects:* Initializes an allocator `palloc` of type `PAlloc` with `alloc`. Uses `palloc` to allocate storage for the smallest array of `U` sufficient to provide storage for a coroutine state of size `size`, and unspecified additional state necessary to ensure that `operator delete` can later deallocate this memory block with an allocator equal to `palloc`.

17 *Returns:* A pointer to the allocated storage.

```
void operator delete(void* pointer, size_t size) noexcept;
```

18 *Preconditions:* `pointer` was returned from an invocation of the above overload of `operator new` with a size argument equal to `size`.

19 *Effects:* Deallocates the storage pointed to by `pointer` using an allocator equal to that used to allocate it.

### 33.14 Execution scope utilities

[exec.scope]

#### 33.14.1 Execution scope concepts

[exec.scope.concepts]

- 1 The `scope_association` concept defines the requirements on a type `Assoc`. An object of type `Assoc` is *engaged* if and only if it owns an association with an async scope, referred to as its *associated scope*.

```
namespace std::execution {
 template<class Assoc>
 concept scope_association =
 movable<Assoc> &&
 is_nothrow_move_constructible_v<Assoc> &&
 is_nothrow_move_assignable_v<Assoc> &&
 default_initializable<Assoc> &&
 requires(const Assoc assoc) {
 { static_cast<bool>(assoc) } noexcept;
 { assoc.try_associate() } -> same_as<Assoc>;
 };
}
```

- 2 A type `Assoc` models `scope_association` only if:

- (2.1) — a default constructed object of type `Assoc` is not engaged;
- (2.2) — for an object `assoc` of type `Assoc`, `static_cast<bool>(assoc)` is `true` if and only if `assoc` is engaged;
- (2.3) — no two distinct objects of type `Assoc` own the same association;
- (2.4) — for an object `assoc` of type `Assoc`, destroying `assoc` releases the association owned by `assoc`, if any;
- (2.5) — for an object `assoc` of type `Assoc`, after it is used as the source operand of a move constructor, the `assoc` is not engaged;
- (2.6) — for distinct objects `assoc1` and `assoc2` of type `Assoc`, after evaluating `assoc1 = std::move(assoc2)`, the association owned by `assoc1`, if any, is released and `assoc2` is not engaged;
- (2.7) — for an object `assoc` of type `Assoc` that is engaged, `assoc.try_associate()` either returns an object that is not engaged or acquires a new association with `assoc`'s associated scope and returns an engaged object that owns that association;
- (2.8) — for an object `assoc` of type `Assoc` that is not engaged, `assoc.try_associate()` returns an object that is not engaged.

- 3 The `scope_token` concept defines the requirements on a type `Token` that can be used to create associations between senders and an async scope. Every object of type `Token` is associated with an async scope that is referred to as its *associated scope*.

- 4 Let `test-sender` and `test-env` be unspecified types such that `sender_in<test-sender, test-env>` is modeled.

```
namespace std::execution {
 template<class Token>
 concept scope_token =
 copyable<Token> &&
 requires(const Token token) {
 { token.try_associate() } -> scope_association;
 { token.wrap(declval<test-sender>()) } -> sender_in<test-env>;
 };
}
```

```
 };
}
```

<sup>5</sup> A type `Token` models `scope_token` only if:

- (5.1) — no exceptions are thrown from copy construction, move construction, copy assignment, or move assignment of objects of type `Token`;
- (5.2) — for an object `token` of type `Token`, `token.try_associate()` either returns an object that is not engaged or acquires a new association with `token`'s associated scope and returns an engaged object that owns that association; and
- (5.3) — given an lvalue `token` of type (possibly `const`) `Token`, for all expressions `sndr` such that `decltype((sndr))` models `sender`:
  - (5.3.1) — `token.wrap(sndr)` is a valid expression,
  - (5.3.2) — `decltype(token.wrap(sndr))` models `sender`, and
  - (5.3.3) — `completion_signatures_of_t<decltype(token.wrap(sndr)), E>` contains the same completion signatures as `completion_signatures_of_t<decltype((sndr)), E>` for all types `E` such that `sender_in<decltype((sndr)), E>` is modeled.

### 33.14.2 Counting Scopes

[exec.counting.scopes]

#### 33.14.2.1 General

[exec.counting.scopes.general]

<sup>1</sup> Scopes of type `simple_counting_scope` and `counting_scope` maintain counts of associations. Let:

- (1.1) — `Scope` be either `simple_counting_scope` or `counting_scope`,
- (1.2) — `scope` be an object of type `Scope`,
- (1.3) — `tkn` be an object of type `Scope::token` obtained from `scope.get_token()`,
- (1.4) — `jsndr` be a sender obtained from `scope.join()`, and
- (1.5) — `op` be an operation state obtained from connecting `jsndr` to a receiver.

During its lifetime `scope` goes through different states which govern what operations are allowed and the result of these operations:

- (1.6) — *unused*: a newly constructed object starts in the *unused* state.
- (1.7) — *open*: when `tkn.try_associate()` is called while `scope` is in the *unused* state, `scope` moves to the *open* state.
- (1.8) — *open-and-joining*: when the operation state `op` is started while `scope` is in the *unused* or *open* state, `scope` moves to the *open-and-joining* state.
- (1.9) — *closed*: when `scope.close()` is called while `scope` is in the *open* state, `scope` moves to the *closed* state.
- (1.10) — *unused-and-closed*: when `scope.close()` is called while `scope` is in the *unused* state, `scope` moves to the *unused-and-closed* state.
- (1.11) — *closed-and-joining*: when `scope.close()` is called while `scope` is in the *open-and-joining* state or the operation state `op` is started while `scope` is in the *closed* or *unused-and-closed* state, `scope` moves to the *closed-and-joining* state.
- (1.12) — *joined*: when the count of associations drops to zero while `scope` is in the *open-and-joining* or *closed-and-joining* state, `scope` moves to the *joined* state.

<sup>2</sup> *Recommended practice*: For `simple_counting_scope` and `counting_scope`, implementations should store the state and the count of associations in a single member of type `size_t`.

<sup>3</sup> Subclause 33.14.2 makes use of the following exposition-only entities:

```
struct scope-join-t {}; // exposition only

enum scope-state-type { // exposition only
 unused, // exposition only
 open, // exposition only
 closed, // exposition only
 open-and-joining, // exposition only
 closed-and-joining, // exposition only
};
```

```

 unused-and-closed, // exposition only
 joined, // exposition only
};

```

```

template<class Scope>
 struct association-t; // exposition only

```

- 4 The exposition-only class template *impls-for* (33.9.2) is specialized for *scope-join-t* as follows:

```

namespace std::execution {
 template<>
 struct impls-for<scope-join-t> : default-impls {
 template<class Scope, class Rcvr>
 struct state { // exposition only
 struct rcvr-t { // exposition only
 using receiver_concept = receiver_tag;

 Rcvr& rcvr; // exposition only

 void set_value() && noexcept {
 execution::set_value(std::move(rcvr));
 }

 template<class E>
 void set_error(E&& e) && noexcept {
 execution::set_error(std::move(rcvr), std::forward<E>(e));
 }

 void set_stopped() && noexcept {
 execution::set_stopped(std::move(rcvr));
 }

 decltype(auto) get_env() const noexcept {
 return execution::get_env(rcvr);
 }
 };

 using sched-sender = // exposition only
 decltype(schedule(get_start_scheduler(get_env(declval<Rcvr&>()))));
 using op-t = // exposition only
 connect_result_t<sched-sender, rcvr-t>;

 Scope* scope; // exposition only
 Rcvr& receiver; // exposition only
 op-t op; // exposition only

 state(Scope* scope, Rcvr& rcvr) // exposition only
 noexcept(nothrow_callable<connect_t, sched-sender, rcvr-t>)
 : scope(scope),
 receiver(rcvr),
 op(connect(schedule(get_start_scheduler(get_env(rcvr))), rcvr-t(rcvr))) {}

 void complete() noexcept { // exposition only
 start(op);
 }

 void complete-inline() noexcept { // exposition only
 set_value(std::move(receiver));
 }
 };
 };

 static constexpr auto get-state = // exposition only
 [<class Rcvr>(auto&& sender, Rcvr& receiver)
 noexcept(is_nothrow_constructible_v<state<Rcvr>, data-type<decltype(sender)>, Rcvr&>) {
 auto[, self] = sender;

```

```

 return state(self, receiver);
};

static constexpr auto start = // exposition only
[] (auto& s, auto&) noexcept {
 if (s.scope->start-join-sender(s))
 s.complete-inline();
};
};
}

```

<sup>5</sup> *association-t* is a class template, specializations of which model *scope\_association* and contain an exposition-only member *scope* of type *Scope\**. For a class type *Scope* and an object *assoc* of type *association-t*<*Scope*>:

- (5.1) — *assoc.scope* points to its associated scope,
- (5.2) — *assoc* is engaged when *assoc.scope* != *nullptr* is true,
- (5.3) — if *assoc* is engaged, then *assoc.try\_associate()* is equivalent to *assoc.scope->try-associate()*, and
- (5.4) — the association owned by *assoc* is released by invoking *assoc.scope->disassociate()*.

### 33.14.2.2 Simple Counting Scope

[exec.scope.simple.counting]

#### 33.14.2.2.1 General

[exec.scope.simple.counting.general]

```

namespace std::execution {
 class simple_counting_scope {
 public:
 // 33.14.2.2.4, token
 struct token;

 using assoc-t = association-t<simple_counting_scope>; // exposition only

 static constexpr size_t max_associations = implementation-defined;

 // 33.14.2.2.2, constructor and destructor
 simple_counting_scope() noexcept;
 simple_counting_scope(simple_counting_scope&&) = delete;
 ~simple_counting_scope();

 // 33.14.2.2.3, members
 token get_token() noexcept;
 void close() noexcept;
 sender auto join() noexcept;

 private:
 size_t count; // exposition only
 scope-state-type state; // exposition only

 assoc-t try_associate() noexcept; // exposition only
 void disassociate() noexcept; // exposition only
 template<class State>
 bool start-join-sender(State& state) noexcept; // exposition only
 };
}

```

<sup>1</sup> For purposes of determining the existence of a data race, *get\_token*, *close*, *join*, *try-associate*, *disassociate*, and *start-join-sender* behave as atomic operations (6.10.2). These operations on a single object of type *simple\_counting\_scope* appear to occur in a single total order.

#### 33.14.2.2.2 Constructor and Destructor

[exec.simple.counting.ctor]

```
simple_counting_scope() noexcept;
```

<sup>1</sup> *Postconditions:* *count* is 0 and *state* is *unused*.

```
~simple_counting_scope();
```

- 2 *Effects:* If *state* is not one of *joined*, *unused*, or *unused-and-closed*, invokes `terminate` (14.6.2). Otherwise, has no effects.

### 33.14.2.2.3 Members

[exec.simple.counting.mem]

```
token get_token() noexcept;
```

- 1 *Returns:* An object *t* of type `simple_counting_scope::token` such that `t.scope == this` is true.

```
void close() noexcept;
```

- 2 *Effects:* If *state* is

- (2.1) — *unused*, then changes *state* to *unused-and-closed*;
- (2.2) — *open*, then changes *state* to *closed*;
- (2.3) — *open-and-joining*, then changes *state* to *closed-and-joining*;
- (2.4) — otherwise, no effects.

- 3 *Postconditions:* Any subsequent call to `try-associate()` on *\*this* returns false.

```
sender auto join() noexcept;
```

- 4 *Returns:* `make-sender(scope-join-t(), this)`.

```
assoc-t try-associate() noexcept;
```

- 5 *Effects:* If *count* is equal to `max_associations`, then no effects. Otherwise, if *state* is

- (5.1) — *unused*, then increments *count* and changes *state* to *open*;
- (5.2) — *open* or *open-and-joining*, then increments *count*;
- (5.3) — otherwise, no effects.

- 6 *Returns:* If *count* was incremented, an object of type `assoc-t` that is engaged and associated with *\*this*, and `assoc-t()` otherwise.

```
void disassociate() noexcept;
```

- 7 *Preconditions:* *count* is greater than zero.

- 8 *Effects:* Decrements *count*. If *count* is zero after decrementing and *state* is *open-and-joining* or *closed-and-joining*, changes *state* to *joined* and calls `complete()` on all objects registered with *\*this*.

[Note 1: Calling `complete()` on any registered object can cause *\*this* to be destroyed. — end note]

```
template<class State>
```

```
bool start-join-sender(State& st) noexcept;
```

- 9 *Effects:* If *count* is zero, then changes *state* to *joined* and returns true. Otherwise, if *state* is

- (9.1) — *open* or *open-and-joining*, then changes *state* to *open-and-joining*, registers *st* with *\*this* and returns false;
- (9.2) — *closed* or *closed-and-joining*, then changes *state* to *closed-and-joining*, registers *st* with *\*this* and returns false.

### 33.14.2.2.4 Token

[exec.simple.counting.token]

```
namespace std::execution {
 struct simple_counting_scope::token {
 template<sender Sender>
 Sender&& wrap(Sender&& snd) const noexcept;
 assoc-t try_associate() const noexcept;

 private:
 simple_counting_scope* scope; // exposition only
 };
}
```

```
template<sender Sender>
 Sender&& wrap(Sender&& snd) const noexcept;
```

1     *Returns:* `std::forward<Sender>(snd)`.

```
assoc-t try_associate() const noexcept;
```

2     *Effects:* Equivalent to: `return scope->try_associate();`

### 33.14.2.3 Counting Scope

[exec.scope.counting]

```
namespace std::execution {
 class counting_scope {
 public:
 using assoc-t = association-t<counting_scope>; // exposition only

 struct token {
 template<sender Sender>
 sender auto wrap(Sender&& snd) const noexcept(see below);
 assoc-t try_associate() const noexcept;

 private:
 counting_scope* scope; // exposition only
 };

 static constexpr size_t max_associations = implementation-defined;

 counting_scope() noexcept;
 counting_scope(counting_scope&&) = delete;
 ~counting_scope();

 token get_token() noexcept;
 void close() noexcept;
 sender auto join() noexcept;
 void request_stop() noexcept;

 private:
 size_t count; // exposition only
 scope-state-type state; // exposition only
 inplace_stop_source s_source; // exposition only

 assoc-t try_associate() noexcept; // exposition only
 void disassociate() noexcept; // exposition only

 template<class State>
 bool start-join-sender(State& state) noexcept; // exposition only
 };
}
```

1     `counting_scope` differs from `simple_counting_scope` by adding support for cancellation. Unless specified below, the semantics of members of `counting_scope` are the same as the corresponding members of `simple_counting_scope`.

```
token get_token() noexcept;
```

2     *Returns:* An object `t` of type `counting_scope::token` such that `t.scope == this` is true.

```
void request_stop() noexcept;
```

3     *Effects:* Equivalent to `s_source.request_stop()`.

4     *Remarks:* Calls to `request_stop` do not introduce data races.

```
assoc-t try_associate() noexcept;
```

5     *Effects:* If `count` is equal to `max_associations`, then no effects. Otherwise, if `state` is

(5.1)     — *unused*, then increments `count` and changes `state` to *open*;

(5.2)     — *open* or *open-and-joining*, then increments `count`;

(5.3) — otherwise, no effects.

6 *Returns:* If *count* was incremented, an object of type *assoc-t* that is engaged and associated with *\*this*, and *assoc-t* () otherwise.

```
template<sender Sender>
 sender auto counting_scope::token::wrap(Sender&& snd) const
 noexcept(is_nothrow_constructible_v<remove_cvref_t<Sender>, Sender>);

7 Effects: Equivalent to:
 return stop-when(std::forward<Sender>(snd), scope->s_source.get_token());

 assoc-t counting_scope::token::try_associate() const noexcept;

8 Effects: Equivalent to: return scope->try-associate();
```

### 33.15 Parallel scheduler

[exec.par.scheduler]

```
namespace std::execution {
 class parallel_scheduler {
 unspecified
 };
}
```

1 *parallel\_scheduler* models *scheduler*.

2 Let *sch* be an object of type *parallel\_scheduler*, and let *BACKEND-OF*(*sch*) be *\*ptr*, where *sch* is associated with *ptr*.

3 The expression *get\_forward\_progress\_guarantee*(*sch*) has the value *forward\_progress\_guarantee::parallel*.

4 Let *sch2* be an object of type *parallel\_scheduler*. Two objects *sch* and *sch2* compare equal if and only if *BACKEND-OF*(*sch*) and *BACKEND-OF*(*sch2*) refer to the same object.

5 Let *rcvr* be a receiver. A *proxy for rcvr with base B* is an lvalue *r* of type *B* such that:

(5.1) — *r.set\_value*() has effects equivalent to *set\_value*(std::move(*rcvr*)).

(5.2) — *r.set\_error*(*e*), where *e* is an *exception\_ptr* object, has effects equivalent to *set\_error*(std::move(*rcvr*), std::move(*e*)).

(5.3) — *r.set\_stopped*() has effects equivalent to *set\_stopped*(std::move(*rcvr*)).

6 A *preallocated backend storage for a proxy r* is an object *s* of type *span<byte>* such that the range *s* remains valid and may be overwritten until one of *set\_value*, *set\_error*, or *set\_stopped* is called on *r*.

[Note 1: The storage referenced by *s* can be used as temporary storage for operations launched via calls to *parallel\_scheduler\_backend*. — end note]

7 Let *b* be *BACKEND-OF*(*sch*), let *sndr* be the object returned by *schedule*(*sch*), and let *rcvr* be a receiver. If *rcvr* is connected to *sndr* and the resulting operation state is started, then:

(7.1) — If *sndr* completes successfully, then *b.schedule*(*r*, *s*) is called, where

(7.1.1) — *r* is a proxy for *rcvr* with base *parallel\_scheduler\_replacement::receiver\_proxy* and

(7.1.2) — *s* is a preallocated backend storage for *r*.

(7.2) — All other completion operations are forwarded unchanged.

8 The expression *get\_domain*(*sch*) returns an expression of exposition-only type *parallel-scheduler-domain*, that is equivalent with:

```
struct parallel_scheduler_domain {
 template<sender-for<bulk_chunked_t> Sndr, queryable Env>
 static constexpr decltype(auto)
 transform_sender(set_value_t, Sndr&& sndr, const Env& env) const noexcept {
 return see below;
 }
 template<sender-for<bulk_unchunked_t> Sndr, queryable Env>
 static constexpr decltype(auto)
 transform_sender(set_value_t, Sndr&& sndr, const Env& env) const noexcept {
 return see below;
 }
}
```

```
 }
};
```

- 9 For argument `sndr` of the above `transform_sender`, let `child`, `pol`, `shape` and `f` be defined by the following declarations:

```
 auto& [_ , data, child] = sndr;
 auto& [pol, shape, f] = data;
```

10 Let `p` be

- (10.1) — `true`, if the type of the expression `pol` is `cv parallel_policy` or `cv parallel_unsequenced_policy`;
- (10.2) — implementation-defined, if `pol` is an implementation-defined execution policy;
- (10.3) — `false`, otherwise.

11 The `transform_sender` overload that accepts senders with tag `bulk_chunked_t` returns a sender such that if it is connected to a receiver `rcvr` and the resulting operation state is started, then:

- (11.1) — If `child` completes with values `vals`, let `args` be a pack of lvalue subexpressions designating `vals`, then `b.schedule_bulk_chunked(p ? shape : 1, r, s)` is called, where
  - (11.1.1) — `r` is a proxy for `rcvr` with base `parallel_scheduler_replacement::bulk_item_receiver_proxy` such that `r.execute(i, j)` for indices `i` and `j` has effects equivalent to `f(i, j, args...)` if `p` is true and `f(0, shape, args...)` otherwise; and
  - (11.1.2) — `s` is a preallocated backend storage for `r`.
- (11.2) — All other completion operations are forwarded unchanged.

12 The `transform_sender` overload that accepts senders with tag `bulk_unchunked_t` returns a sender such that if it is connected to a receiver `rcvr` and the resulting operation state is started, then:

- (12.1) — If `child` completes with values `vals`, let `args` be a pack of lvalue subexpressions designating `vals`, then `b.schedule_bulk_unchunked(p ? shape : 1, r, s)` is called, where
  - (12.1.1) — `r` is a proxy for `rcvr` with base `parallel_scheduler_replacement::bulk_item_receiver_proxy` such that `r.execute(i, i + 1)` for index `i` has effects equivalent to `f(i, args...)` if `p` is true and
 

```
for (decltype(shape) i = 0; i < shape; i++) { f(i, args...); }
```

 otherwise; and
  - (12.1.2) — `s` is a preallocated backend storage for `r`.
- (12.2) — All other completion operations are forwarded unchanged.

```
parallel_scheduler get_parallel_scheduler();
```

- 13 *Effects:* Let `eb` be the result of `parallel_scheduler_replacement::query_parallel_scheduler_backend()`. If `eb == nullptr` is true, calls `terminate` (14.6.2). Otherwise, returns a `parallel_scheduler` object associated with `eb`.

### 33.16 Namespace `parallel_scheduler_replacement`

[exec.parschedrepl]

#### 33.16.1 General

[exec.parschedrepl.general]

- 1 Facilities in the `parallel_scheduler_replacement` namespace allow users to replace the default implementation of `parallel_scheduler`.

#### 33.16.2 Receiver proxies

[exec.parschedrepl.recvproxy]

```
namespace std::execution::parallel_scheduler_replacement {
 struct receiver_proxy {
 protected:
 virtual bool query_env(unspecified) noexcept = 0; // exposition only

 public:
 virtual void set_value() noexcept = 0;
 virtual void set_error(exception_ptr) noexcept = 0;
 virtual void set_stopped() noexcept = 0;
```

```

 template<class P, class-type Query>
 optional<P> try_query(Query q) const noexcept;
};

struct bulk_item_receiver_proxy : receiver_proxy {
 virtual void execute(size_t, size_t) noexcept = 0;
};
}

```

- <sup>1</sup> **receiver\_proxy** represents a receiver that will be notified by the implementations of **parallel\_scheduler\_backend** to trigger the completion operations. **bulk\_item\_receiver\_proxy** is derived from **receiver\_proxy** and is used for **bulk\_chunked** and **bulk\_unchunked** customizations that will also receive notifications from implementations of **parallel\_scheduler\_backend** corresponding to different iterations.

```

template<class P, class-type Query>
 optional<P> try_query(Query q) const noexcept;

```

- <sup>2</sup> *Mandates:* P is a cv-unqualified non-array object type.

- <sup>3</sup> *Returns:* Let **env** be the environment of the receiver represented by **\*this**. If

- (3.1) — **Query** is not a member of an implementation-defined set of supported queries; or
- (3.2) — P is not a member of an implementation-defined set of supported result types for **Query**; or
- (3.3) — the expression **q(env)** is not well-formed,

then returns **nullopt**. Otherwise, if **q(env)** has type *cv* P, then returns **q(env)**. Otherwise, returns an implementation-defined value of type **optional<P>**.

- <sup>4</sup> *Remarks:* **get\_stop\_token\_t** is in the implementation-defined set of supported queries, and **inplace\_stop\_token** is a member of the implementation-defined set of supported result types for **get\_stop\_token\_t**.

- <sup>5</sup> *Recommended practice:* If P is **inplace\_stop\_token** and T is a type other than **inplace\_stop\_token** that models **stoppable\_token**, **try\_query** should return an object of type **inplace\_stop\_token** such that until one of **set\_value**, **set\_error** or **set\_stopped** is called on **\*this**, all calls to **try\_query** return equivalent **inplace\_stop\_token** objects.

### 33.16.3 query\_parallel\_scheduler\_backend

[exec.parschedrepl.query]

```
shared_ptr<parallel_scheduler_backend> query_parallel_scheduler_backend();
```

- <sup>1</sup> **query\_parallel\_scheduler\_backend()** returns the implementation object for a parallel scheduler.

- <sup>2</sup> *Returns:* An object **p**, such that **p.get()** points to a **parallel\_scheduler\_backend** object that is a base-class subobject of some most derived object **o** within its lifetime. The lifetime of **o** does not end as long as there exists a **shared\_ptr** object **q** within its lifetime such that **q.owner\_equal(p)** is true.

- <sup>3</sup> *Remarks:* This function is replaceable (9.6.5).

### 33.16.4 Class parallel\_scheduler\_backend

[exec.parschedrepl.psb]

```

namespace std::execution::parallel_scheduler_replacement {
 struct parallel_scheduler_backend {
 virtual ~parallel_scheduler_backend() = default;

 virtual void schedule(receiver_proxy&, span<byte>) noexcept = 0;
 virtual void schedule_bulk_chunked(size_t, bulk_item_receiver_proxy&,
 span<byte>) noexcept = 0;
 virtual void schedule_bulk_unchunked(size_t, bulk_item_receiver_proxy&,
 span<byte>) noexcept = 0;
 };
}

```

```
virtual void schedule(receiver_proxy& r, span<byte> s) noexcept = 0;
```

- <sup>1</sup> *Preconditions:* The ends of the lifetime of **\*this**, of the lifetime of the object referred to by **r**, and of the duration of any storage referenced by **s** all happen after the beginning of the evaluation of the call to **set\_value**, **set\_error**, or **set\_stopped** on **r** (see below).

2 *Effects:* A derived class shall implement this function such that:

(2.1) — One of the following expressions is evaluated:

(2.1.1) — `r.set_value()`, if no error occurs, and the work is successful;

(2.1.2) — `r.set_error(eptr)`, if an error occurs, where `eptr` is an object of type `exception_ptr`;

(2.1.3) — `r.set_stopped()`, if the work is canceled.

(2.2) — Any call to `r.set_value()` happens on an execution agent of the execution context represented by `*this`.

3 *Remarks:* The storage referenced by `s` may be used by `*this` as temporary storage for the duration of the operation launched by this call.

```
virtual void schedule_bulk_chunked(size_t n, bulk_item_receiver_proxy& r,
 span<byte> s) noexcept = 0;
```

4 *Preconditions:* The ends of the lifetime of `*this`, of the lifetime of the object referred to by `r`, and of the duration of any storage referenced by `s` all happen after the beginning of the evaluation of the call to `set_value`, `set_error`, or `set_stopped` on `r` (see below).

5 *Effects:* A derived class shall implement this function such that:

(5.1) — Eventually, one of the following expressions is evaluated:

(5.1.1) — `r.set_value()`, if no error occurs, and the work is successful;

(5.1.2) — `r.set_error(eptr)`, if an error occurs, where `eptr` is an object of type `exception_ptr`;

(5.1.3) — `r.set_stopped()`, if the work is canceled.

(5.2) — If `r.execute(b, e)` is called, then `b` and `e` are in the range  $[0, n]$  and  $b < e$ .

(5.3) — For each  $i$  in  $[0, n]$ , there is at most one call to `r.execute(b, e)` such that  $i$  is in the range  $[b, e)$ .

(5.4) — If `r.set_value()` is called, then for each  $i$  in  $[0, n]$ , there is exactly one call to `r.execute(b, e)` such that  $i$  is in the range  $[b, e)$ .

(5.5) — All calls to `execute` on `r` happen before the call to either `set_value`, `set_error`, or `set_stopped` on `r`.

(5.6) — All calls to `execute` and `set_value` on `r` are made on execution agents of the execution context represented by `*this`.

6 *Remarks:* The storage referenced by `s` may be used by `*this` as temporary storage for the duration of the operation launched by this call.

```
virtual void schedule_bulk_unchunked(size_t n, bulk_item_receiver_proxy& r,
 span<byte> s) noexcept = 0;
```

7 *Preconditions:* The ends of the lifetime of `*this`, of the lifetime of the object referred to by `r`, and of the duration of any storage referenced by `s` all happen after the beginning of the evaluation of the call to `set_value`, `set_error`, or `set_stopped` on `r` (see below).

8 *Effects:* A derived class shall implement this function such that:

(8.1) — Eventually, one of the following expressions is evaluated:

(8.1.1) — `r.set_value()`, if no error occurs, and the work is successful;

(8.1.2) — `r.set_error(eptr)`, if an error occurs, where `eptr` is an object of type `exception_ptr`;

(8.1.3) — `r.set_stopped()`, if the work is canceled.

(8.2) — If `r.execute(b, e)` is called, then `b` is in the range  $[0, n)$  and `e` is equal to `b + 1`. For each  $i$  in  $[0, n)$ , there is at most one call to `r.execute(i, i + 1)`.

(8.3) — If `r.set_value()` is called, then for each  $i$  in  $[0, n)$ , there is exactly one call to `r.execute(i, i + 1)`.

(8.4) — All calls to `execute` on `r` happen before the call to either `set_value`, `set_error`, or `set_stopped` on `r`.

(8.5) — All calls to `execute` and `set_value` on `r` are made on execution agents of the execution context represented by `*this`.

- <sup>9</sup> *Remarks:* The storage referenced by **s** may be used by **\*this** as temporary storage for the duration of the operation launched by this call.

# Annex A

## (informative)

### Grammar summary

[gram]

#### A.1 General

[gram.general]

- <sup>1</sup> This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.11, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

#### A.2 Keywords

[gram.key]

- <sup>1</sup> New context-dependent keywords are introduced into a program by `typedef` (9.2.4), `namespace` (9.9.2), `class` (Clause 11), `enumeration` (9.8.1), and `template` (Clause 13) declarations.

*typedef-name:*  
*identifier*  
*simple-template-id*

*namespace-name:*  
*identifier*  
*namespace-alias*

*namespace-alias:*  
*identifier*

*class-name:*  
*identifier*  
*simple-template-id*

*enum-name:*

*line-directive*:

- `# line pp-tokens new-line`

# Annex B

## (informative)

### Implementation quantities [implimits]

<sup>1</sup> Implementations can exhibit limitations for various quantities; some possibilities are presented in the following list. The bracketed number following each quantity is a potential minimum value for that quantity.

- (1.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
- (1.2) — Nesting levels of conditional inclusion (15.2) [256].
- (1.3) — Pointer (9.3.4.2), pointer-to-member (9.3.4.4), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a type in a declaration [256].
- (1.4) — Nesting levels of parenthesized expressions (7.5.4) within a full-expression [256].
- (1.5) — Number of characters in an internal identifier (5.11) or macro name (15.7) [1 024].
- (1.6) — Number of characters in an external identifier (5.11, 6.7) [1 024].
- (1.7) — External identifiers (6.7) in one translation unit [65 536].
- (1.8) — Identifiers with block scope declared in one block (6.4.3) [1 024].
- (1.9) — Structured bindings (9.7) introduced in one declaration [256].
- (1.10) — Macro identifiers (15.7) simultaneously defined in one translation unit [65 536].
- (1.11) — Parameters in one function definition (9.6.1) [256].
- (1.12) — Arguments in one function call (7.6.1.3) [256].
- (1.13) — Parameters in one macro definition (15.7) [256].
- (1.14) — Arguments in one macro invocation (15.7) [256].
- (1.15) — Characters in one logical source line (5.2) [65 536].
- (1.16) — Characters in a *string-literal* (5.13.5) (after concatenation (5.2)) [65 536].
- (1.17) — Size of an object (6.8.2) [262 144].
- (1.18) — Nesting levels for `#include` files (15.3) [256].
- (1.19) — Case labels for a `switch` statement (8.5.3) (excluding those for any nested `switch` statements) [16 384].
- (1.20) — Non-static data members (including inherited ones) in a single class (11.4) [16 384].
- (1.21) — Lambda-captures in one *lambda-expression* (7.5.6.3) [256].
- (1.22) — Enumeration constants in a single enumeration (9.8.1) [4 096].
- (1.23) — Levels of nested class definitions (11.4.12) in a single *member-specification* [256].
- (1.24) — Functions registered by `atexit()` (17.5) [32].
- (1.25) — Functions registered by `at_quick_exit()` (17.5) [32].
- (1.26) — Direct and indirect base classes (11.7) [16 384].
- (1.27) — Direct base classes for a single class (11.7) [1 024].
- (1.28) — Class members declared in a single *member-specification* (including member functions) (11.4) [4 096].
- (1.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16 384].
- (1.30) — Direct and indirect virtual bases of a class (11.7.2) [1 024].
- (1.31) — Static data members of a class (11.4.9.3) [1 024].

- (1.32) — Friend declarations in a class (11.8.4) [4 096].
- (1.33) — Access control declarations in a class (11.8.2) [4 096].
- (1.34) — Member initializers in a constructor definition (11.9.3) [6 144].
- (1.35) — *initializer-clauses* in one *braced-init-list* (9.5) [16 384].
- (1.36) — Scope qualifications of one identifier (7.5.5.3) [256].
- (1.37) — Nested *linkage-specifications* (9.12) [1 024].
- (1.38) — Recursive constexpr function invocations (9.2.6) [512].
- (1.39) — Full-expressions evaluated within a core constant expression (7.7.2) [1 048 576].
- (1.40) — Template parameters in a template declaration (13.2) [1 024].
- (1.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1 024].
- (1.42) — Handlers per try block (14.4) [256].
- (1.43) — Number of placeholders (22.10.15.5) [10].
- (1.44) — Number of hazard-protectable possibly-reclaimable objects (32.11.3.1) [256].

# Annex C

## (informative)

## Compatibility

[diff]

### C.1 C++ and ISO C++ 2026

[diff.cpp26]

#### C.1.1 General

[diff.cpp26.general]

- <sup>1</sup> Subclause C.1 lists the differences between C++ and ISO C++ 2026, by the chapters of this document.

#### C.1.2 Clause 6: basics

[diff.cpp26.basic]

- <sup>1</sup> **Affected subclause:** 6.8.6.5.3

**Change:** Potentially throwing exception specifications on deallocation functions are ill-formed.

**Rationale:** Removes potential undefined behavior.

**Effect on original feature:** Valid C++ 2026 code that declares a deallocation function with a potentially throwing exception specification becomes ill-formed.

[Example 1:

```
struct T {
 void operator delete(void *) noexcept(false); // ill-formed; previously well-formed
};
```

— end example]

#### C.1.3 Clause 9: declarations

[diff.cpp26.dcl]

- <sup>1</sup> **Affected subclause:** 9.5

**Change:** Support for designated initialization of base classes of aggregates.

**Rationale:** New functionality.

**Effect on original feature:** Some valid C++ 2026 code may fail to compile.

[Example 1:

```
struct A { int a; };
struct B : A { int b; };

void f(A); // #1
void f(B); // #2

void g() {
 f({.a=1}); // ambiguous between #1 and #2; previously called #1
}
```

— end example]

- <sup>2</sup> **Affected subclause:** 9.6.2

**Change:** It is no longer valid for explicitly defaulted assignment operators to have a *cv-qualifier-seq* or *&& ref-qualifier*, or for an explicitly defaulted move assignment operator to have a parameter of type “reference to T” where T is cv-qualified.

**Rationale:** Removal of rarely-used and confusing feature.

**Effect on original feature:** A valid C++ 2026 program which uses these features on an explicitly defaulted assignment operator is ill-formed.

[Example 2:

```
struct S {
 S& operator=(const S&) && = default; // ill-formed; previously well-formed
};
```

```

struct T {
 T& operator=(const T&) const = default; // ill-formed; previously well-formed but deleted
};
struct U {
 U& operator=(const U&&) = default; // ill-formed; previously well-formed but deleted
};
— end example]

```

## C.2 C++ and ISO C++ 2023

[diff.cpp23]

### C.2.1 General

[diff.cpp23.general]

- <sup>1</sup> Subclause C.2 lists the differences between C++ and ISO C++ 2023, by the chapters of this document.

### C.2.2 Clause 5: lexical conventions

[diff.cpp23.lex]

- <sup>1</sup> **Affected subclause:** 5.8

**Change:** New operator `^^`.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2023 code that contains two consecutive `^` tokens can be ill-formed in this revision of C++.

[Example 1:

```

struct C { int operator^(int); };
int operator^(int (C::*p)(int), C);
int i = &C::operator^^C{}; // ill-formed; previously well-formed
— end example]

```

- <sup>2</sup> **Affected subclause:** 5.12

**Change:** New keywords.

**Rationale:** Required for new features.

- (2.1) — The `contract_assert` keyword is added to introduce a contract assertion through an *assertion-statement* (8.9).

**Effect on original feature:** Valid C++ 2023 code using `contract_assert` as an identifier is not valid in this revision of C++.

### C.2.3 Clause 7: expressions

[diff.cpp23.expr]

- <sup>1</sup> **Affected subclause:** 7.4

**Change:** Operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type are no longer valid.

**Rationale:** Reinforcing type safety.

**Effect on original feature:** A valid C++ 2023 program that performs operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type is ill-formed.

[Example 1:

```

enum E1 { e };
enum E2 { f };
bool b = e <= 3.7; // ill-formed; previously well-formed
int k = f - e; // ill-formed; previously well-formed
auto x = true ? e : f; // ill-formed; previously well-formed
— end example]

```

- <sup>2</sup> **Affected subclauses:** 7.6.9 and 7.6.10

**Change:** Comparing two objects of array type is no longer valid.

**Rationale:** The old behavior was confusing since it compared not the contents of the two arrays, but their addresses.

**Effect on original feature:** A valid C++ 2023 program directly comparing two array objects is rejected as ill-formed in this document.

[Example 2:

```

int arr1[5];
int arr2[5];
bool same = arr1 == arr2; // ill-formed; previously well-formed

```

```

 bool idem = arr1 == +arr2; // compare addresses
 bool less = arr1 < +arr2; // compare addresses, unspecified result
— end example]

```

### 3 Affected subclause: 7.6.2.9

**Change:** Calling `delete` on a pointer to an incomplete class is ill-formed.

**Rationale:** Reduce undefined behavior.

**Effect on original feature:** A valid C++ 2023 program that calls `delete` on an incomplete class type is ill-formed.

[Example 3:

```

 struct S;

 void f(S *p) {
 delete p; // ill-formed; previously well-formed
 }

 struct S {};
— end example]

```

## C.2.4 Clause 9: declarations

[diff.cpp23.dcl.dcl]

### 1 Affected subclause: 9.5.5

**Change:** Pointer comparisons between `initializer_list` objects' backing arrays are unspecified.

**Rationale:** Permit the implementation to store backing arrays in static read-only memory.

**Effect on original feature:** Valid C++ 2023 code that relies on the result of pointer comparison between backing arrays may change behavior.

[Example 1:

```

 bool ne(std::initializer_list<int> a, std::initializer_list<int> b) {
 return a.begin() != b.begin() + 1;
 }
 bool b = ne({2,3}, {1,2,3}); // unspecified result; previously false
— end example]

```

### 2 Affected subclause: 9.3.4.5

**Change:** Previously, `T... [n]` would declare a pack of function parameters. `T... [n]` is now a *pack-index-specifier*.

**Rationale:** Improve the handling of packs.

**Effect on original feature:** Valid C++ 2023 code that declares a pack of parameters without specifying a *declarator-id* becomes ill-formed.

[Example 2:

```

 template <typename... T>
 void f(T... [1]);
 template <typename... T>
 void g(T... ptr[1]);
 int main() {
 f<int, double>(nullptr, nullptr); // ill-formed,
 // previously void f<int, double>(int [1], double [1])
 g<int, double>(nullptr, nullptr); // ok
 }
— end example]

```

### 3 Affected subclause: 9.13.1

**Change:** New token `:]`.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2023 code that contained an *attribute-specifier* with an *attribute-using-prefix* but no attributes and no whitespace is ill-formed in this revision of C++.

[Example 3:

```

 struct [[using CC:]] C; // ill-formed; previously well-formed
 struct [[using DD:]] D; // OK

```

— end example]

## C.2.5 Clause 13: templates

[diff.cpp23.temp]

### <sup>1</sup> Affected subclause: 13.5

**Change:** Some atomic constraints become fold expanded constraints.

**Rationale:** Permit the subsumption of fold expressions.

**Effect on original feature:** Valid C++ 2023 code may become ill-formed.

[Example 1:

```
template <typename ...V> struct A;
struct S {
 static constexpr int compare(const S&) { return 1; }
};

template <typename ...T, typename ...U>
void f(A<T ...> *, A<U ...> *)
requires (T::compare(U{}) && ...); // was well-formed (atomic constraint of type bool),
 // now ill-formed (results in an atomic constraint of type int)

void g(A<S, S> *ap) {
 f(ap, ap);
}
```

— end example]

### <sup>2</sup> Affected subclause: 13.10.3.2

**Change:** Template argument deduction from overload sets succeeds in more cases.

**Rationale:** Allow consideration of constraints to disambiguate overload sets used as parameters in function calls.

**Effect on original feature:** Valid C++ 2023 code may become ill-formed.

[Example 2:

```
template <typename T>
void f(T &&, void (*)(T &&));

void g(int &); // #1
inline namespace A {
 void g(short &&); // #2
}
inline namespace B {
 void g(short &&); // #3
}

void q() {
 int x;
 f(x, g); // ill-formed; previously well-formed, deducing T = int&
}
```

There is no change to the applicable deduction rules for the individual `g` candidates: Type deduction from #1 does not succeed; type deductions from #2 and #3 both succeed. — end example]

## C.2.6 Clause 15: preprocessing directives

[diff.cpp23.cpp]

### <sup>1</sup> Affected subclause: 15.7.1

**Change:** Additional restrictions on macro names.

**Rationale:** Avoid hard to diagnose or non-portable constructs.

**Effect on original feature:** Keywords, names of identifiers with special meaning (5.11), and (unless otherwise specified) *attribute-tokens* specified in 9.13 may not be used as macro names. For example, valid C++ 2023 code that defines `post` or `pre` as macros is invalid in this revision of C++.

## C.2.7 Clause 16: library introduction

[diff.cpp23.library]

### <sup>1</sup> Affected subclause: 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<contracts>` (17.10), `<debugging>`

(19.7.2), `<hazard_pointer>` (32.11.3.2), `<hive>` (23.3.8), `<inplace_vector>` (23.3.15), `<linalg>` (29.9.2), `<meta>` (21.4.1), `<rcu>` (32.11.2.2), `<simd>` (29.10.3), `<stdbit.h>` (22.12), `<stdckdint.h>` (29.11.1), and `<text_encoding>` (28.4.1). Valid C++ 2023 code that `#includes` headers with these names may be invalid in this revision of C++.

## C.2.8 Clause 20: memory management library [diff.cpp23.mem]

### <sup>1</sup> Affected subclause: 20.2.12

**Change:** Calling `realloc` with a non-null pointer and zero size has erroneous behavior.

**Rationale:** The C standard library does not define this behavior.

**Effect on original feature:** Valid C++ 2023 code that calls `realloc` with a non-null pointer and a size of zero is erroneous and may change behavior.

## C.2.9 Clause 27: strings library [diff.cpp23.strings]

### <sup>1</sup> Affected subclause: 27.4.5

**Change:** Output of floating-point overloads of `to_string` and `to_wstring`.

**Rationale:** Prevent loss of information and improve consistency with other formatting facilities.

**Effect on original feature:** `to_string` and `to_wstring` function calls that take floating-point arguments may produce a different output.

[Example 1:

```
auto s = std::to_string(1e-7); // "1e-07"
 // previously "0.000000" with '.' possibly
 // changed according to the global C locale
```

— end example]

## C.2.10 Clause 31: input/output library [diff.cpp23.io]

### <sup>1</sup> Affected subclause: 31.7.5.4

**Change:** Overloaded `std::basic_istream<char, traits>::ignore`.

**Rationale:** Allow `char` values to be used as delimiters.

**Effect on original feature:** Calls to `istream::ignore` with a second argument of `char` type can change behavior. Calls to `istream::ignore` with a second argument that is neither `int` nor `char` type can become ill-formed.

[Example 1:

```
std::istringstream in("\xF0\x9F\xA4\xA1 Clown Face");
in.ignore(100, '\xA1'); // ignore up to '\xA1' delimiter,
 // previously might have ignored to EOF
in.ignore(100, -1L); // ambiguous overload,
 // previously equivalent to (int)-1L
```

— end example]

## C.2.11 Annex D: compatibility features [diff.cpp23.depr]

### <sup>1</sup> Change: Remove the type alias `allocator<T>::is_always_equal`.

**Rationale:** Non-empty allocator classes derived from `allocator` needed to explicitly define an `is_always_equal` member type so that `allocator_traits` would not use the one from the allocator base class.

**Effect on original feature:** It is simpler to correctly define an allocator class with an allocator base class.

[Example 1:

```
template <class T>
struct MyAlloc : allocator<T> {
 int tag;
};

static_assert(!allocator_traits<MyAlloc<int>>::is_always_equal); // Error in C++ 2023,
 // OK in C++ 2026
```

— end example]

### <sup>2</sup> Change: Removal of atomic access API for `shared_ptr` objects.

**Rationale:** The old behavior was brittle. `shared_ptr` objects using the old API were not protected by the type system, and certain interactions with code not using this API would, in some cases, silently produce

undefined behavior. A complete type-safe replacement is provided in the form of `atomic<shared_ptr<T>>`.

**Effect on original feature:** A valid C++ 2023 program that relies on the presence of the removed functions may fail to compile.

- 3 **Change:** Remove the `basic_string::reserve()` overload with no parameters.

**Rationale:** The overload of `reserve` with no parameters is redundant. The `shrink_to_fit` member function can be used instead.

**Effect on original feature:** A valid C++ 2023 program that calls `reserve()` on a `basic_string` object may fail to compile. The old functionality can be achieved by calling `shrink_to_fit()` instead, or the function call can be safely eliminated with no side effects.

- 4 **Change:** Remove header `<codecvt>` and all its contents.

**Rationale:** The header has been deprecated for the previous three editions of this document and no longer implements the current Unicode standard, supporting only the obsolete UCS-2 encoding. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.

**Effect on original feature:** A valid C++ 2023 program `#include`-ing the header or importing the header unit may fail to compile. Code that uses any of the following names by importing the standard library modules may fail to compile:

- (4.1) — `codecvt_mode`,
- (4.2) — `codecvt_utf16`,
- (4.3) — `codecvt_utf8`,
- (4.4) — `codecvt_utf8_utf16`,
- (4.5) — `consume_header`,
- (4.6) — `generate_header`, and
- (4.7) — `little_endian`.

- 5 **Change:** Remove header `<strstream>` and all its contents.

**Rationale:** The header has been deprecated since the original C++ standard; the `<spanstream>` header provides an updated, safer facility. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.

**Effect on original feature:** A valid C++ 2023 program `#include`-ing the header or importing the header unit may become ill-formed. Code that uses any of the following classes by importing one of the standard library modules may become ill-formed:

- (5.1) — `istrstream`
- (5.2) — `ostrstream`
- (5.3) — `strstream`
- (5.4) — `strstreambuf`

- 6 **Change:** Remove convenience interfaces `wstring_convert` and `wbuffer_convert`.

**Rationale:** These features were underspecified with no clear error reporting mechanism and were deprecated for the last three editions of this document. Ongoing support is at implementer's discretion, exercising freedoms granted by 16.4.5.3.2.

**Effect on original feature:** A valid C++ 2023 program using these interfaces may become ill-formed.

### C.3 C++ and ISO C++ 2020

[diff.cpp20]

#### C.3.1 General

[diff.cpp20.general]

- 1 Subclause C.3 lists the differences between C++ and ISO C++ 2020, in addition to those listed above, by the chapters of this document.

#### C.3.2 Clause 5: lexical conventions

[diff.cpp20.lex]

- 1 **Affected subclause:** 5.11

**Change:** Previously valid identifiers containing characters not present in UAX #44 properties `XID_Start` or `XID_Continue`, or not in Normalization Form C, are now rejected.

**Rationale:** Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.

**Effect on original feature:** Some identifiers are no longer well-formed.

<sup>2</sup> **Affected subclause:** 5.13.5

**Change:** Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

**Rationale:** Removal of unimplemented conditionally-supported feature.

**Effect on original feature:** Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed.

[Example 1:

```
 auto c = L"a" U"b"; // was conditionally-supported; now ill-formed
— end example]
```

### C.3.3 Clause 7: expressions

[diff.cpp20.expr]

<sup>1</sup> **Affected subclause:** 7.5.5.2

**Change:** Change move-eligible *id-expressions* from lvalues to xvalues.

**Rationale:** Simplify the rules for implicit move.

**Effect on original feature:** Valid C++ 2020 code that relies on a returned *id-expression*'s being an lvalue may change behavior or fail to compile.

[Example 1:

```
 decltype(auto) f(int&& x) { return (x); } // returns int&&; previously returned int&
 int& g(int&& x) { return x; } // ill-formed; previously well-formed
— end example]
```

<sup>2</sup> **Affected subclause:** 7.6.1.2

**Change:** Change the meaning of comma in subscript expressions.

**Rationale:** Enable repurposing a deprecated syntax to support multidimensional indexing.

**Effect on original feature:** Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile.

[Example 2:

```
 arr[1, 2] // was equivalent to arr[(1, 2)],
 // now equivalent to arr.operator[](1, 2) or ill-formed
— end example]
```

### C.3.4 Clause 8: statements

[diff.cpp20.stmt]

<sup>1</sup> **Affected subclause:** 8.6.5

**Change:** The lifetime of temporary objects in the *for-range-initializer* is extended until the end of the loop (6.8.7).

**Rationale:** Improve usability of the range-based *for* statement.

**Effect on original feature:** Destructors of some temporary objects are invoked later.

[Example 1:

```
 void f() {
 std::vector<int> v = { 42, 17, 13 };
 std::mutex m;

 for (int x :
 static_cast<void>(std::lock_guard<std::mutex>(m)), v) { // lock released in C++ 2020
 std::lock_guard<std::mutex> guard(m); // OK in C++ 2020, now deadlocks
 }
 }
— end example]
```

### C.3.5 Clause 9: declarations

[diff.cpp20.dcl]

<sup>1</sup> **Affected subclause:** 9.5.3

**Change:** UTF-8 string literals may initialize arrays of `char` or `unsigned char`.

**Rationale:** Compatibility with previously written code that conformed to previous versions of this document.

**Effect on original feature:** Arrays of `char` or `unsigned char` may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates.

[Example 1:

```
struct A {
 char8_t s[10];
};
struct B {
 char s[10];
};

void f(A);
void f(B);

int main() {
 f({u8""}); // ambiguous
}
```

— end example]

### C.3.6 Clause 12: overloading

[diff.cpp20.over]

#### <sup>1</sup> Affected subclause: 12.2.2.9

**Change:** Deducing class template arguments from inherited constructors.

**Rationale:** Making class template argument deduction consistent with construction.

**Effect on original feature:** Valid ISO C++ 2020 code may become ill-formed or change meaning in this revision of C++.

[Example 1:

```
template<typename T>
struct B {
 B(T);
};

template<typename T>
struct D : B<T *> {
 D(T);
 using B<T *>::B;
 T m = "a"; // #1
};

D d(""); // ill-formed at #1 (T deduced as const char);
 // previously well-formed (T deduced as const char*)
```

— end example]

### C.3.7 Clause 13: templates

[diff.cpp20.temp]

#### <sup>1</sup> Affected subclause: 13.10.3.6

**Change:** Deducing template arguments from exception specifications.

**Rationale:** Facilitate generic handling of throwing and non-throwing functions.

**Effect on original feature:** Valid ISO C++ 2020 code may be ill-formed in this revision of C++.

[Example 1:

```
template<bool> struct A { };
template<bool B> void f(void (*) (A) noexcept(B));
void g(A<false>) noexcept;
void h() {
 f(g); // ill-formed; previously well-formed
}
```

— end example]

### C.3.8 Clause 16: library introduction

[diff.cpp20.library]

#### <sup>1</sup> Affected subclause: 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<expected>` (22.8.2), `<flat_map>` (23.6.7),

<flat\_set> (23.6.10), <generator> (25.8.2), <mdspan> (23.7.3.2), <print> (31.7.4), <spanstream> (31.9.2), <stacktrace> (19.6.2), <stdatomic.h> (32.5.12), and <stdfloat> (17.4.2). Valid C++ 2020 code that #includes headers with these names may be invalid in this revision of C++.

### C.3.9 Clause 18: concepts library

[diff.cpp20.concepts]

<sup>1</sup> **Affected subclauses:** 17.12.4, 18.5.4, and 18.5.5

**Change:** Replace `common_reference_with` in `three_way_comparable_with`, `equality_comparable_with`, and `totally_ordered_with` with an exposition-only concept.

**Rationale:** Allow uncopyable, but movable, types to model these concepts.

**Effect on original feature:** Valid C++ 2020 code relying on subsumption with `common_reference_with` may fail to compile in this revision of C++.

[Example 1:

```
template<class T, class U>
 requires equality_comparable_with<T, U>
bool attempted_equals(const T& t, const U& u); // previously selected overload

template<class T, class U>
 requires common_reference_with<const remove_reference_t<T>&, const remove_reference_t<U>&>
bool attempted_equals(const T& t, const U& u); // ambiguous overload; previously
 // rejected by partial ordering

bool test(shared_ptr<int> p) {
 return attempted_equals(p, nullptr); // ill-formed; previously well-formed
}
```

— end example]

### C.3.10 Clause 20: memory management library

[diff.cpp20.memory]

<sup>1</sup> **Affected subclause:** 20.2.9.1

**Change:** Forbid partial and explicit program-defined specializations of `allocator_traits`.

**Rationale:** Allow addition of `allocate_at_least` to `allocator_traits`, and potentially other members in the future.

**Effect on original feature:** Valid C++ 2020 code that partially or explicitly specializes `allocator_traits` is ill-formed with no diagnostic required in this revision of C++.

### C.3.11 Clause 22: general utilities library

[diff.cpp20.utilities]

<sup>1</sup> **Affected subclause:** 28.5

**Change:** Signature changes: `format`, `format_to`, `vformat_to`, `format_to_n`, `formatted_size`. Removal of `format_args_t`.

**Rationale:** Improve safety via compile-time format string checks, avoid unnecessary template instantiations.

**Effect on original feature:** Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or `format_args_t` may become ill-formed.

[Example 1:

```
auto s = std::format("{:d}", "I am not a number"); // ill-formed,
 // previously threw format_error
```

— end example]

<sup>2</sup> **Affected subclause:** 28.5

**Change:** Signature changes: `format`, `format_to`, `format_to_n`, `formatted_size`.

**Rationale:** Enable formatting of views that do not support iteration when const-qualified and that are not copyable.

**Effect on original feature:** Valid C++ 2020 code that passes bit-fields to formatting functions may become ill-formed.

[Example 2:

```
struct tiny {
 int bit: 1;
};
```

```

 auto t = tiny();
 std::format("{:}", t.bit); // ill-formed, previously returned "0"
— end example]

```

### 3 Affected subclause: 28.5.2.2

**Change:** Restrict types of formatting arguments used as *width* or *precision* in a *std-format-spec*.

**Rationale:** Disallow types that do not have useful or portable semantics as a formatting width or precision.

**Effect on original feature:** Valid C++ 2020 code that passes a boolean or character type as *arg-id* becomes invalid.

[Example 3:

```

 std::format("{:.*^{}}", "", true); // ill-formed, previously returned "*"
 std::format("{:.*^{}}", "", '1'); // ill-formed, previously returned an
 // implementation-defined number of '*' characters
— end example]

```

### 4 Affected subclause: 28.5.6.4

**Change:** Removed the `formatter` specialization:

```

template<size_t N> struct formatter<const charT[N], charT>;

```

**Rationale:** The specialization is inconsistent with the design of `formatter`, which is intended to be instantiated only with cv-unqualified object types.

**Effect on original feature:** Valid C++ 2020 code that instantiated the removed specialization can become ill-formed.

## C.3.12 Clause 27: strings library

[diff.cpp20.strings]

### 1 Affected subclause: 27.4

**Change:** Additional rvalue overload for the `substr` member function and the corresponding constructor.

**Rationale:** Improve efficiency of operations on rvalues.

**Effect on original feature:** Valid C++ 2020 code that created a substring by calling `substr` (or the corresponding constructor) on an xvalue expression with type `S` that is a specialization of `basic_string` may change meaning in this revision of C++.

[Example 1:

```

 std::string s1 = "some long string that forces allocation", s2 = s1;
 std::move(s1).substr(10, 5);
 assert(s1 == s2); // unspecified, previously guaranteed to be true
 std::string s3(std::move(s2), 10, 5);
 assert(s1 == s2); // unspecified, previously guaranteed to be true
— end example]

```

## C.3.13 Clause 23: containers library

[diff.cpp20.containers]

### 1 Affected subclauses: 23.2.7 and 23.2.8

**Change:** Heterogeneous `extract` and `erase` overloads for associative containers.

**Rationale:** Improve efficiency of erasing elements from associative containers.

**Effect on original feature:** Valid C++ 2020 code may fail to compile in this revision of C++.

[Example 1:

```

 struct B {
 auto operator<=>(const B&) const = default;
 };

 struct D : private B {
 void f(std::set<B, std::less<>>& s) {
 s.erase(*this); // ill-formed; previously well-formed
 }
 };
— end example]

```

**C.3.14 Clause 32: concurrency support library****[diff.cpp20.thread]**<sup>1</sup> **Affected subclause:** [32.9.3](#)

**Change:** In this revision of C++, it is implementation-defined whether a barrier's phase completion step runs if no thread calls `wait`. Previously the phase completion step was guaranteed to run on the last thread that calls `arrive` or `arrive_and_drop` during the phase. In this revision of C++, it can run on any of the threads that arrived or waited at the barrier during the phase.

**Rationale:** Correct contradictory wording and improve implementation flexibility for performance.

**Effect on original feature:** Valid C++ 2020 code using a barrier might have different semantics in this revision of C++ if it depends on a completion function's side effects occurring exactly once, on a specific thread running the phase completion step, or on a completion function's side effects occurring without `wait` having been called.

[Example 1:

```
auto b0 = std::barrier(1);
b0.arrive();
b0.arrive(); // implementation-defined; previously well-defined

int data = 0;
auto b1 = std::barrier(1, [&] { data++; });
b1.arrive();
assert(data == 1); // implementation-defined; previously well-defined
b1.arrive(); // implementation-defined; previously well-defined
```

— end example]

**C.4 C++ and ISO C++ 2017****[diff.cpp17]****C.4.1 General****[diff.cpp17.general]**

- <sup>1</sup> Subclause [C.4](#) lists the differences between C++ and ISO C++ 2017, in addition to those listed above, by the chapters of this document.

**C.4.2 Clause 5: lexical conventions****[diff.cpp17.lex]**<sup>1</sup> **Affected subclauses:** [5.5](#), [10.1](#), [10.3](#), [15.1](#), [15.5](#), and [15.6](#)

**Change:** New identifiers with special meaning.

**Rationale:** Required for new features.

**Effect on original feature:** Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++.

[Example 1:

```
class module {};
module m1; // was variable declaration; now module-declaration
module *m2; // variable declaration

class import {};
import j1; // was variable declaration; now module-import-declaration
::import j2; // variable declaration
```

— end example]

<sup>2</sup> **Affected subclause:** [5.6](#)

**Change:** *header-name* tokens are formed in more contexts.

**Rationale:** Required for new features.

**Effect on original feature:** When the identifier `import` is followed by a `<` character, a *header-name* token may be formed.

[Example 2:

```
template<typename> class import {};
import<int> f(); // ill-formed; previously well-formed
::import<int> g(); // OK
```

— end example]

<sup>3</sup> **Affected subclause:** [5.12](#)

**Change:** New keywords.

**Rationale:** Required for new features.

- (3.1) — The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- (3.2) — The `concept` keyword is added to enable the definition of concepts (13.7.9).
- (3.3) — The `constexpr` keyword is added to declare immediate functions (9.2.6).
- (3.4) — The `constinit` keyword is added to prevent unintended dynamic initialization (9.2.7).
- (3.5) — The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.6.4).
- (3.6) — The `requires` keyword is added to introduce constraints through a *requires-clause* (13.1) or a *requires-expression* (7.5.8).

**Effect on original feature:** Valid C++ 2017 code using `char8_t`, `concept`, `constexpr`, `constinit`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

#### 4 Affected subclause: 5.8

**Change:** New operator `<=>`.

**Rationale:** Necessary for new functionality.

**Effect on original feature:** Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++.

[Example 3:

```
namespace N {
 struct X {};
 bool operator<=(X, X);
 template<bool(X, X)> struct Y {};
 Y<operator<=> y; // ill-formed; previously well-formed
}
```

— end example]

#### 5 Affected subclause: 5.13

**Change:** Type of UTF-8 string and character literals.

**Rationale:** Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

**Effect on original feature:** Valid C++ 2017 code that depends on UTF-8 string literals having type “array of `const char`” and UTF-8 character literals having type “`char`” is not valid in this revision of C++.

[Example 4:

```
const auto *u8s = u8"text"; // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s; // ill-formed; previously well-formed

auto u8c = u8'c'; // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c; // ill-formed; previously well-formed

std::string s = u8"text"; // ill-formed; previously well-formed

void f(const char *s);
f(u8"text"); // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
 using type = char;
};
ct<decltype(u8'c')>::type x; // ill-formed; previously well-formed.
```

— end example]

### C.4.3 Clause 6: basics

[diff.cpp17.basic]

#### 1 Affected subclause: 6.8.4

**Change:** A pseudo-destructor call ends the lifetime of the object to which it is applied.

**Rationale:** Increase consistency of the language model.

**Effect on original feature:** Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++.

[Example 1:

```
int f() {
 int a = 123;
 using T = int;
 a.~T();
 return a; // undefined behavior; previously returned 123
}
```

— end example]

## <sup>2</sup> Affected subclause: 6.10.2.2

**Change:** Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.

**Rationale:** Removal of rarely used and confusing feature.

**Effect on original feature:** If a `memory_order_release` atomic store is followed by a `memory_order_relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

### C.4.4 Clause 7: expressions

[diff.cpp17.expr]

## <sup>1</sup> Affected subclause: 7.5.6.3

**Change:** Implicit lambda capture may capture additional entities.

**Rationale:** Rule simplification, necessary to resolve interactions with `constexpr` if.

**Effect on original feature:** Lambdas with a *capture-default* may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

### C.4.5 Clause 9: declarations

[diff.cpp17.dcl.dcl]

## <sup>1</sup> Affected subclause: 9.2.4

**Change:** Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.

**Rationale:** Necessary for implementability.

**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++.

[Example 1:

```
typedef struct {
 void f() {} // ill-formed; previously well-formed
} S;
```

— end example]

## <sup>2</sup> Affected subclause: 9.3.4.7

**Change:** A function cannot have different default arguments in different translation units.

**Rationale:** Required for modules support.

**Effect on original feature:** Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required.

[Example 2:

```
// Translation unit 1
int f(int a = 42);
int g() { return f(); }

// Translation unit 2
int f(int a = 76) { return a; } // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); } // used to return 42
```

— end example]

## <sup>3</sup> Affected subclause: 9.5.2

**Change:** A class that has user-declared constructors is never an aggregate.

**Rationale:** Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.

**Effect on original feature:** Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++.

[Example 3:

```

struct A { // not an aggregate; previously an aggregate
 A() = delete;
};

struct B { // not an aggregate; previously an aggregate
 B() = default;
 int i = 0;
};

struct C { // not an aggregate; previously an aggregate
 C(C&&) = default;
 int a, b;
};

A a{}; // ill-formed; previously well-formed
B b = {1}; // ill-formed; previously well-formed
auto* c = new C{2, 3}; // ill-formed; previously well-formed

struct Y;

struct X {
 operator Y();
};

struct Y { // not an aggregate; previously an aggregate
 Y(const Y&) = default;
 X x;
};

Y y{X{}}; // copy constructor call; previously aggregate-initialization
— end example]
```

#### 4 Affected subclause: 9.5.5

**Change:** Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 4:

```

bool y[] = { "bc" }; // ill-formed; previously well-formed
— end example]
```

### C.4.6 Clause 11: classes

[diff.cpp17.class]

#### 1 Affected subclauses: 11.4.5 and 11.4.8.3

**Change:** The class name can no longer be used parenthesized immediately after an `explicit decl-specifier` in a constructor declaration. The *conversion-function-id* can no longer be used parenthesized immediately after an `explicit decl-specifier` in a conversion function declaration.

**Rationale:** Necessary for new functionality.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 1:

```

struct S {
 explicit (S)(const S&); // ill-formed; previously well-formed
 explicit (operator int)(); // ill-formed; previously well-formed
 explicit(true) (S)(int); // OK
};
— end example]
```

#### 2 Affected subclauses: 11.4.5 and 11.4.7

**Change:** A *simple-template-id* is no longer valid as the *declarator-id* of a constructor or destructor.

**Rationale:** Remove potentially error-prone option for redundancy.

**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 2:

```
template<class T>
struct A {
 A<T>(); // error: simple-template-id not allowed for constructor
 A(int); // OK, injected-class-name used
 ~A<T>(); // error: simple-template-id not allowed for destructor
};
```

— end example]

### <sup>3</sup> Affected subclause: 11.9.6

**Change:** A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

**Rationale:** Side effect of making it easier to write more efficient code that takes advantage of moves.

**Effect on original feature:** Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++.

[Example 3:

```
struct base {
 base();
 base(base const &);
private:
 base(base &&);
};

struct derived : base {};

base f(base b) {
 throw b; // error: base(base &&) is private
 derived d;
 return d; // error: base(base &&) is private
}

struct S {
 S(const char *s) : m(s) { }
 S(const S&) = default;
 S(S&& other) : m(other.m) { other.m = nullptr; }
 const char * m;
};

S consume(S&& s) { return s; }

void g() {
 S s("text");
 consume(static_cast<S&&>(s));
 char c = *s.m; // undefined behavior; previously ok
}
```

— end example]

## C.4.7 Clause 12: overloading

[diff.cpp17.over]

### <sup>1</sup> Affected subclause: 12.2.2.3

**Change:** Equality and inequality expressions can now find reversed and rewritten candidates.

**Rationale:** Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.

**Effect on original feature:** For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous.

[Example 1:

```

struct A {
 operator int() const;
};

bool operator==(A, int); // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
 return (x == y) + // ill-formed; previously well-formed
 (10 == x) + // calls #1, previously selected #2
 (10 != x); // calls #1, previously selected #3
}

```

— end example]

## <sup>2</sup> Affected subclause: 12.2.2.3

**Change:** Overload resolution may change for equality operators (7.6.10).

**Rationale:** Support calling `operator==` with reversed order of arguments.

**Effect on original feature:** Valid C++ 2017 code that uses equality operators with conversion functions may be ill-formed or have different semantics in this revision of C++.

[Example 2:

```

struct A {
 operator int() const { return 10; }
};

bool operator==(A, int); // #1
// #2 is built-in candidate: bool operator==(int, int);
bool b = 10 == A(); // calls #1 with reversed order of arguments; previously selected #2

struct B {
 bool operator==(const B&); // member function with no cv-qualifier
};
B b1;
bool eq = (b1 == b1); // ambiguous; previously well-formed

```

— end example]

## C.4.8 Clause 13: templates

[diff.cpp17.temp]

### <sup>1</sup> Affected subclause: 13.3

**Change:** An *unqualified-id* that is followed by a `<` and for which name lookup finds nothing or finds a function will be treated as a *template-name* in order to potentially cause argument-dependent lookup to be performed.

**Rationale:** It was problematic to call a function template with an explicit template argument list via argument-dependent lookup because of the need to have a template with the same name visible via normal lookup.

**Effect on original feature:** Previously valid code that uses a function name as the left operand of a `<` operator would become ill-formed.

[Example 1:

```

struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
 A a;
 f < a; // ill-formed; previously well-formed
 (f) < a; // still well-formed
}

```

— end example]

## C.4.9 Clause 14: exception handling

[diff.cpp17.except]

### <sup>1</sup> Affected subclause: 14.5

**Change:** Remove `throw()` exception specification.

**Rationale:** Removal of obsolete feature that has been replaced by `noexcept`.

**Effect on original feature:** A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses `throw()` for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017.

[*Note 1:* There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — *end note*]

#### C.4.10 Clause 16: library introduction

[diff.cpp17.library]

##### <sup>1</sup> Affected subclause: 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: `<barrier>` (32.9.3.2), `<bit>` (22.11.2), `<charconv>` (28.2.1), `<compare>` (17.12.1), `<concepts>` (18.3), `<coroutine>` (17.13.2), `<format>` (28.5.1), `<latch>` (32.9.2.2), `<numbers>` (29.8.1), `<ranges>` (25.2), `<semaphore>` (32.8.2), `<source_location>` (17.8.1), `<span>` (23.7.2.1), `<stop_token>` (32.3.2), `<syncstream>` (31.11.1), and `<version>` (17.3.1). Valid C++ 2017 code that `#includes` headers with these names may be invalid in this revision of C++.

##### <sup>2</sup> Affected subclause: 16.4.2.3

**Change:** Remove vacuous C++ header files.

**Rationale:** The empty headers implied a false requirement to achieve C compatibility with the C++ headers.

**Effect on original feature:** A valid C++ 2017 program that `#includes` any of the following headers may fail to compile: `<ccomplex>`, `<ciso646>`, `<cstdalign>`, `<cstdbool>`, and `<ctgmath>`. To retain the same behavior:

- (2.1) — a `#include` of `<ccomplex>` can be replaced by a `#include` of `<complex>` (29.4.2),
- (2.2) — a `#include` of `<ctgmath>` can be replaced by a `#include` of `<cmath>` (29.7.1) and a `#include` of `<complex>`, and
- (2.3) — a `#include` of `<ciso646>`, `<cstdalign>`, or `<cstdbool>` can simply be removed.

#### C.4.11 Clause 23: containers library

[diff.cpp17.containers]

##### <sup>1</sup> Affected subclauses: 23.3.7 and 23.3.11

**Change:** Return types of `remove`, `remove_if`, and `unique` changed from `void` to `container::size_type`.

**Rationale:** Improve efficiency and convenience of finding number of removed elements.

**Effect on original feature:** Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

#### C.4.12 Clause 24: iterators library

[diff.cpp17.iterators]

##### <sup>1</sup> Affected subclause: 24.3.2.3

**Change:** The specialization of `iterator_traits` for `void*` and for function pointer types no longer contains any nested typedefs.

**Rationale:** Corrects an issue misidentifying pointer types that are not incrementable as iterator types.

**Effect on original feature:** A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

#### C.4.13 Clause 26: algorithms library

[diff.cpp17.alg.reqs]

##### <sup>1</sup> Affected subclause: 26.2

**Change:** The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.

**Rationale:** Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.

**Effect on original feature:** A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

## C.4.14 Clause 31: input/output library

[diff.cpp17.input.output]

## 1 Affected subclause: 31.7.5.3.3

**Change:** Character array extraction only takes array types.**Rationale:** Increase safety via preventing buffer overflow at compile time.**Effect on original feature:** Valid C++ 2017 code may fail to compile in this revision of C++.

[Example 1:

```

auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p; // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q; // OK

```

— end example]

## 2 Affected subclause: 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with UTF-8 literals.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` or `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

[Example 2:

```

std::cout << u8"text"; // previously called operator<<(const char*) and printed a string;
 // now ill-formed
std::cout << u8'X'; // previously called operator<<(char) and printed a character;
 // now ill-formed

```

— end example]

## 3 Affected subclause: 31.7.6.3.4

**Change:** Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.**Rationale:** Removal of surprising behavior.**Effect on original feature:** Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed.

[Example 3:

```

std::cout << u"text"; // previously formatted the string as a pointer value;
 // now ill-formed
std::cout << u'X'; // previously formatted the character as an integer value;
 // now ill-formed

```

— end example]

## 4 Affected subclause: 31.12.6

**Change:** Return type of filesystem path format observer member functions.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++.

[Example 4:

```

std::filesystem::path p;
std::string s1 = p.u8string(); // ill-formed; previously well-formed
std::string s2 = p.generic_u8string(); // ill-formed; previously well-formed

```

— end example]

## C.4.15 Annex D: compatibility features

[diff.cpp17.depr]

1 **Change:** Remove `uncaught_exception`.**Rationale:** The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.**Effect on original feature:** A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It can be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.2 **Change:** Remove support for adaptable function API.**Rationale:** The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`,

and by the `std::bind` and `std::not_fn` function templates.

**Effect on original feature:** A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

- <sup>3</sup> **Change:** Remove redundant members from `std::allocator`.

**Rationale:** `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.

**Effect on original feature:** A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

- <sup>4</sup> **Change:** Remove `raw_storage_iterator`.

**Rationale:** The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.

**Effect on original feature:** A valid C++ 2017 program that uses this iterator class may fail to compile.

- <sup>5</sup> **Change:** Remove temporary buffers API.

**Rationale:** The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.

**Effect on original feature:** A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

- <sup>6</sup> **Change:** Remove `shared_ptr::unique`.

**Rationale:** The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well-defined use in single-threaded cases.

**Effect on original feature:** A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

- <sup>7</sup> **Affected subclause:** [D.13](#)

**Change:** Remove deprecated type traits.

**Rationale:** The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that did not directly support function types. It has been superseded by the `invoke_result` trait.

**Effect on original feature:** A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

## C.5 C++ and ISO C++ 2014

[diff.cpp14]

### C.5.1 General

[diff.cpp14.general]

- <sup>1</sup> Subclause [C.5](#) lists the differences between C++ and ISO C++ 2014, in addition to those listed above, by the chapters of this document.

### C.5.2 Clause 5: lexical conventions

[diff.cpp14.lex]

- <sup>1</sup> **Affected subclause:** [5.2](#)

**Change:** Removal of trigraph support as a required feature.

**Rationale:** Prevents accidental uses of trigraphs in non-raw string literals and comments.

**Effect on original feature:** Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.

- <sup>2</sup> **Affected subclause:** [5.7](#)

**Change:** *pp-number* can contain *p sign* and *P sign*.

**Rationale:** Necessary to enable *hexadecimal-floating-point-literals*.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++.

[Example 1:

```
#define F(a) b ## a
int b0p = F(0p+0); // ill-formed; equivalent to “int b0p = b0p + 0;” in C++ 2014
— end example]
```

### C.5.3 Clause 7: expressions

[diff.cpp14.expr]

#### <sup>1</sup> Affected subclauses: 7.6.1.6 and 7.6.2.3

**Change:** Remove increment operator with `bool` operand.

**Rationale:** Obsolete feature with occasionally surprising semantics.

**Effect on original feature:** A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this revision of C++.

#### <sup>2</sup> Affected subclauses: 7.6.2.8 and 7.6.2.9

**Change:** Dynamic allocation mechanism for over-aligned types.

**Rationale:** Simplify use of over-aligned types.

**Effect on original feature:** In C++ 2014 code that uses a *new-expression* to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this revision of C++, `::operator new(std::size_t, std::align_val_t)` is used instead.

### C.5.4 Clause 9: declarations

[diff.cpp14.dcl.dcl]

#### <sup>1</sup> Affected subclause: 9.2.2

**Change:** Removal of *register storage-class-specifier*.

**Rationale:** Enable repurposing of deprecated keyword in future revisions of C++.

**Effect on original feature:** A valid C++ 2014 declaration utilizing the *register storage-class-specifier* is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

#### <sup>2</sup> Affected subclause: 9.2.9.7

**Change:** auto deduction from *braced-init-list*.

**Rationale:** More intuitive deduction behavior.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++.

[Example 1:

```
auto x1{1}; // was std::initializer_list<int>, now int
auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
— end example]
```

#### <sup>3</sup> Affected subclause: 9.3.4.6

**Change:** Make exception specifications be part of the type system.

**Rationale:** Improve type-safety.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or change meaning in this revision of C++.

[Example 2:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2); // ill-formed; previously well-formed
— end example]
```

#### <sup>4</sup> Affected subclause: 9.5.2

**Change:** Definition of an aggregate is extended to apply to user-defined types with base classes.

**Rationale:** To increase convenience of aggregate initialization.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types.

[Example 3:

```
struct derived;
struct base {
 friend struct derived;
```

```
private:
 base();
};
struct derived : base {};

derived d1{}; // error; the code was well-formed in C++ 2014
derived d2; // still OK
— end example]
```

### C.5.5 Clause 11: classes

[diff.cpp14.class]

#### <sup>1</sup> Affected subclause: 11.9.4

**Change:** Inheriting a constructor no longer injects a constructor into the derived class.

**Rationale:** Better interaction with other language features.

**Effect on original feature:** Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A *using-declaration* that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

[Example 1:

```
struct A {
 template<typename T> A(T, typename T::type = 0);
 A(int);
};
struct B : A {
 using A::A;
 B(int);
};
B b(42L); // now calls B(int), used to call B<long>(long),
 // which called A(int) due to substitution failure
 // in A<long>(long).
```

— end example]

### C.5.6 Clause 13: templates

[diff.cpp14.temp]

#### <sup>1</sup> Affected subclause: 13.10.3.6

**Change:** Allowance to deduce from the type of a constant template argument.

**Rationale:** In combination with the ability to declare constant template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the constant template argument.

**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this revision of C++.

[Example 1:

```
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
 foo(p); // ill-formed; previously well-formed
}
```

— end example]

### C.5.7 Clause 14: exception handling

[diff.cpp14.except]

#### <sup>1</sup> Affected subclause: 14.5

**Change:** Remove dynamic exception specifications.

**Rationale:** Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.

**Effect on original feature:** A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls `terminate` rather than `unexpected`, and it is unspecified whether stack unwinding is performed prior to such a call.

**C.5.8 Clause 16: library introduction****[diff.cpp14.library]**<sup>1</sup> **Affected subclause:** 16.4.2.3**Change:** New headers.**Rationale:** New functionality.**Effect on original feature:** The following C++ headers are new: `<any>` (22.7.2), `<charconv>` (28.2.1), `<execution>` (33.4), `<filesystem>` (31.12.4), `<memory_resource>` (20.6.1), `<optional>` (22.5.2), `<string_view>` (27.3.2), and `<variant>` (22.6.2). Valid C++ 2014 code that `#includes` headers with these names may be invalid in this revision of C++.<sup>2</sup> **Affected subclause:** 16.4.5.2.3**Change:** New reserved namespaces.**Rationale:** Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.**Effect on original feature:** The global namespaces `std` followed by an arbitrary sequence of *digits* (5.11) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.**C.5.9 Clause 22: general utilities library****[diff.cpp14.utilities]**<sup>1</sup> **Affected subclause:** 22.10.17**Change:** Constructors taking allocators removed.**Rationale:** No implementation consensus.**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.<sup>2</sup> **Affected subclause:** 20.4.2.2**Change:** Different constraint on conversions from `unique_ptr`.**Rationale:** Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++.*[Example 1:*

```
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

*— end example]***C.5.10 Clause 27: strings library****[diff.cpp14.string]**<sup>1</sup> **Affected subclause:** 27.4.3**Change:** Non-const `.data()` member added.**Rationale:** The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.**Effect on original feature:** Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string's `.data()` member in this revision of C++.*[Example 1:*

```
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

*— end example]***C.5.11 Clause 23: containers library****[diff.cpp14.containers]**<sup>1</sup> **Affected subclause:** 23.2.7**Change:** Requirements change:**Rationale:** Increase portability, clarification of associative container requirements.**Effect on original feature:** Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++.

[Example 1:

```
#include <set>

struct compare
{
 bool operator()(int a, int b)
 {
 return a < b;
 }
};

int main() {
 const std::set<int, compare> s;
 s.find(0);
}
```

— end example]

### C.5.12 Annex D: compatibility features [diff.cpp14.depr]

- <sup>1</sup> **Change:** The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.

**Rationale:** Superseded by new features.

**Effect on original feature:** Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

- <sup>2</sup> **Change:** Remove old iostreams members [depr.ios.members].

**Rationale:** Redundant feature for compatibility with pre-standard code has served its time.

**Effect on original feature:** A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

## C.6 C++ and ISO C++ 2011 [diff.cpp11]

### C.6.1 General [diff.cpp11.general]

- <sup>1</sup> Subclause C.6 lists the differences between C++ and ISO C++ 2011, in addition to those listed above, by the chapters of this document.

### C.6.2 Clause 5: lexical conventions [diff.cpp11.lex]

- <sup>1</sup> **Affected subclause:** 5.7

**Change:** *pp-number* can contain one or more single quotes.

**Rationale:** Necessary to enable single quotes as digit separators.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a *character-literal* in C++ 2011, whereas they are digit separators in this revision of C++.

[Example 1:

```
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4, 5) };
// int x[2] = { 5 }; — C++ 2011
// int x[2] = { 3'4, 5 }; — this revision of C++
```

— end example]

### C.6.3 Clause 6: basics [diff.cpp11.basic]

- <sup>1</sup> **Affected subclause:** 6.8.6.5.3

**Change:** New usual (non-placement) deallocator.

**Rationale:** Required for sized deallocation.

**Effect on original feature:** Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (6.8.6.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

#### C.6.4 Clause 7: expressions

[diff.cpp11.expr]

##### <sup>1</sup> Affected subclause: 7.6.16

**Change:** A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.

**Rationale:** Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.

**Effect on original feature:** Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++.

[Example 1:

```
struct S {
 int x = 1;
 void mf() { x = 2; }
};
int f(bool cond) {
 S s;
 (cond ? s : throw 0).mf();
 return s.x;
}
```

In C++ 2011, `f(true)` returns 1. In this revision of C++, it returns 2.

```
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`. — end example]

#### C.6.5 Clause 9: declarations

[diff.cpp11.dcl.dcl]

##### <sup>1</sup> Affected subclause: 9.2.6

**Change:** `constexpr` non-static member functions are not implicitly `const` member functions.

**Rationale:** Necessary to allow `constexpr` member functions to mutate the object.

**Effect on original feature:** Valid C++ 2011 code may fail to compile in this revision of C++.

[Example 1:

```
struct S {
 constexpr const int &f();
 int &f();
};
```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types. — end example]

##### <sup>2</sup> Affected subclause: 9.5.2

**Change:** Classes with default member initializers can be aggregates.

**Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++.

[Example 2:

```
struct S { // Aggregate in C++ 2014 onwards.
 int m = 1;
};
struct X {
 operator int();
 operator S();
};
X a{};
S b{a}; // uses copy constructor in C++ 2011,
 // performs aggregate initialization in this revision of C++
```

— end example]

**C.6.6 Clause 16: library introduction****[diff.cpp11.library]**<sup>1</sup> **Affected subclause:** [16.4.2.3](#)**Change:** New header.**Rationale:** New functionality.**Effect on original feature:** The C++ header `<shared_mutex>` ([32.6.3](#)) is new. Valid C++ 2011 code that `#includes` a header with that name may be invalid in this revision of C++.**C.6.7 Clause 31: input/output library****[diff.cpp11.input.output]**<sup>1</sup> **Affected subclause:** [31.13](#)**Change:** `gets` is not defined.**Rationale:** Use of `gets` is considered dangerous.**Effect on original feature:** Valid C++ 2011 code that uses the `gets` function may fail to compile in this revision of C++.**C.7 C++ and ISO C++ 2003****[diff.cpp03]****C.7.1 General****[diff.cpp03.general]**

- <sup>1</sup>
- Subclause
- [C.7](#)
- lists the differences between C++ and ISO C++ 2003, in addition to those listed above, by the chapters of this document.

**C.7.2 Clause 5: lexical conventions****[diff.cpp03.lex]**<sup>1</sup> **Affected subclause:** [5.5](#)**Change:** New kinds of *string-literals*.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named `R`, `u8`, `u8R`, `u`, `uR`, `U`, `UR`, or `LR` will not be expanded when adjacent to a *string-literal* but will be interpreted as part of the *string-literal*.*[Example 1:*

```
#define u8 "abc"
const char* s = u8"def"; // Previously "abcdef", now "def"
```

*— end example]*<sup>2</sup> **Affected subclause:** [5.5](#)**Change:** User-defined literal string support.**Rationale:** Required for new features.**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.*[Example 2:*

```
#define _x "there"
"hello"_x // #1
```

*Previously, #1 would have consisted of two separate preprocessing tokens and the macro `_x` would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded. — end example]*<sup>3</sup> **Affected subclause:** [5.12](#)**Change:** New keywords.**Rationale:** Required for new features.**Effect on original feature:** Added to [Table 5](#), the following identifiers are new keywords: `alignas`, `alignof`, `char16_t`, `char32_t`, `constexpr`, `decltype`, `noexcept`, `nullptr`, `static_assert`, and `thread_local`. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.<sup>4</sup> **Affected subclause:** [5.13.2](#)**Change:** Type of integer literals.**Rationale:** C99 compatibility.**Effect on original feature:** Certain integer literals larger than can be represented by `long` could change from an unsigned integer type to `signed long long`.**C.7.3 Clause 7: expressions****[diff.cpp03.expr]**<sup>1</sup> **Affected subclause:** [7.3.12](#)**Change:** Only literals are integer null pointer constants.

**Rationale:** Removing surprising interactions with templates and constant expressions.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[Example 1:

```
void f(void *); // #1
void f(...); // #2
template<int N> void g() {
 f(0*N); // calls #2; used to call #1
}
```

— end example]

## 2 Affected subclause: 7.6.1.8

**Change:** Evaluation of operands in `typeid`.

**Rationale:** Introduce additional expression value categories.

**Effect on original feature:** Valid C++ 2003 code that uses xvalues as operands for `typeid` may change behavior in this revision of C++.

[Example 2:

```
void f() {
 struct B {
 B() {}
 virtual ~B() { }
 };

 struct C { B b; };
 typeid(C().b); // unevaluated in C++ 2003, evaluated in C++ 2011
}
```

— end example]

## 3 Affected subclause: 7.6.5

**Change:** Specify rounding for results of integer `/` and `%`.

**Rationale:** Increase portability, C99 compatibility.

**Effect on original feature:** Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

## 4 Affected subclause: 7.6.14

**Change:** `&&` is valid in a *type-name*.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this revision of C++.

[Example 3:

```
bool b1 = new int && false; // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false; // previously false, now ill-formed
```

— end example]

## 5 Affected subclause: 7.6.16

**Change:** Fewer copies in the conditional operator.

**Rationale:** Introduce additional expression value categories.

**Effect on original feature:** Valid C++ 2003 code that uses xvalues as operands for the conditional operator may change behavior in this revision of C++.

[Example 4:

```
void f() {
 struct B {
 B() {}
 B(const B&) { }
 };
 struct D : B {};

 struct BB { B b; };
 struct DD { D d; };
```

```

 true ? BB().b : DD().d; // additional copy in C++ 2003, no copy or move in C++ 2011
}
— end example]

```

#### C.7.4 Clause 9: declarations

[diff.cpp03.dcl.dcl]

##### <sup>1</sup> Affected subclause: 9.2

**Change:** Remove `auto` as a storage class specifier.

**Rationale:** New feature.

**Effect on original feature:** Valid C++ 2003 code that uses the keyword `auto` as a storage class specifier may be invalid in this revision of C++. In this revision of C++, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

##### <sup>2</sup> Affected subclause: 9.5.5

**Change:** Narrowing restrictions in aggregate initializers.

**Rationale:** Catches bugs.

**Effect on original feature:** Valid C++ 2003 code may fail to compile in this revision of C++.

[Example 1:

```
int x[] = { 2.0 };
```

This code is valid in C++ 2003 but invalid in this revision of C++ because `double` to `int` is a narrowing conversion.  
— end example]

##### <sup>3</sup> Affected subclause: 9.12

**Change:** Names declared in an unnamed namespace changed from external linkage to internal linkage; language linkage applies to names with external linkage only.

**Rationale:** Alignment with user expectations.

**Effect on original feature:** Valid C++ 2003 code may violate the one-definition rule (6.3) in this revision of C++.

[Example 2:

```

namespace { extern "C" { extern int x; } } // #1, previously external linkage and C language linkage,
 // now internal linkage and C++ language linkage
namespace A { extern "C" int x = 42; } // #2, external linkage and C language linkage
int main(void) { return x; }

```

This code is valid in C++ 2003, but #2 is not a definition for #1 in this revision of C++, violating the one-definition rule. — end example]

#### C.7.5 Clause 11: classes

[diff.cpp03.class]

##### <sup>1</sup> Affected subclauses: 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6

**Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.

**Rationale:** Improves template argument deduction failure.

**Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

##### <sup>2</sup> Affected subclause: 11.4.7

**Change:** User-declared destructors have an implicit exception specification.

**Rationale:** Clarification of destructor requirements.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

#### C.7.6 Clause 13: templates

[diff.cpp03.temp]

##### <sup>1</sup> Affected subclause: 13.2

**Change:** Repurpose `export` for modules (Clause 10, 15.5, 15.6).

**Rationale:** No implementation consensus for the C++ 2003 meaning of `export`.

**Effect on original feature:** A valid C++ 2003 program containing `export` is ill-formed in this revision of C++.

2 **Affected subclause:** 13.4

**Change:** Remove whitespace requirement for nested closing template right angle brackets.

**Rationale:** Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.

**Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates.

[Example 1:

```
template <class T> struct X { };
template <int N> struct Y { };
X< Y< 1 >> 2 > > x;
```

This code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>” closes two templates. — end example]

3 **Affected subclause:** 13.8.4.2

**Change:** Allow dependent calls of functions with internal linkage.

**Rationale:** Overly constrained, simplify overload resolution rules.

**Effect on original feature:** A valid C++ 2003 program can get a different result in this revision of C++.

## C.7.7 Clause 16: library introduction

[diff.cpp03.library]

1 **Affected:** Clause 16 – Clause 33

**Change:** New reserved identifiers.

**Rationale:** Required by new features.

**Effect on original feature:** Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

2 **Affected subclause:** 16.4.2.3

**Change:** New headers.

**Rationale:** New functionality.

**Effect on original feature:** The following C++ headers are new: <array> (23.3.2), <atomic> (32.5.2), <chrono> (30.2), <condition\_variable> (32.7.2), <forward\_list> (23.3.6), <future> (32.10.2), <initializer\_list> (17.11.2), <mutex> (32.6.2), <random> (29.5.2), <ratio> (21.5.2), <regex> (28.6.3), <scoped\_allocator> (20.7.1), <system\_error> (19.5.2), <thread> (32.4.2), <tuple> (22.4.2), <typeindex> (17.7.6), <type\_traits> (21.3.3), <unordered\_map> (23.5.2), and <unordered\_set> (23.5.5). In addition the following C compatibility headers are new: <cfenv> (29.3.1), <cinttypes> (31.13.2), <cstdint> (17.4.1), and <cuchar> (28.7.4). Valid C++ 2003 code that #includes headers with these names may be invalid in this revision of C++.

3 **Affected subclause:** 16.4.4.3

**Change:** Function swap moved to a different header.

**Rationale:** Remove dependency on <algorithm> (26.4) for swap.

**Effect on original feature:** Valid C++ 2003 code that has been compiled expecting swap to be in <algorithm> (26.4) may have to instead include <utility> (22.2.1).

4 **Affected subclause:** 16.4.5.2.2

**Change:** New reserved namespace.

**Rationale:** New functionality.

**Effect on original feature:** The global namespace posix is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace posix may be invalid in this revision of C++.

5 **Affected subclause:** 16.4.5.3.3

**Change:** Additional restrictions on macro names.

**Rationale:** Avoid hard to diagnose or non-portable constructs.

**Effect on original feature:** Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines override, final, or noreturn as macros is invalid in this revision of C++.

## C.7.8 Clause 17: language support library

[diff.cpp03.language.support]

1 **Affected subclause:** 17.6.3.2

**Change:** operator new may throw exceptions other than std::bad\_alloc.

**Rationale:** Consistent application of `noexcept`.

**Effect on original feature:** Valid C++ 2003 code that assumes that global operator `new` only throws `std::bad_alloc` may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator `new` is ill-formed in this revision of C++, because the exception specification of `throw(std::bad_alloc)` was removed.

### C.7.9 Clause 19: diagnostics library

[diff.cpp03.diagnostics]

<sup>1</sup> **Affected subclause:** 19.4

**Change:** Thread-local error numbers.

**Rationale:** Support for new thread facilities.

**Effect on original feature:** Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this revision of C++.

### C.7.10 Clause 22: general utilities library

[diff.cpp03.utilities]

<sup>1</sup> **Affected subclauses:** 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11

**Change:** Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.

**Rationale:** Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

**Effect on original feature:** Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

### C.7.11 Clause 27: strings library

[diff.cpp03.strings]

<sup>1</sup> **Affected subclause:** 27.4

**Change:** `basic_string` requirements no longer allow reference-counted strings.

**Rationale:** Invalidation is subtly different with reference-counted strings. This change regularizes behavior.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++.

<sup>2</sup> **Affected subclause:** 27.4.3.2

**Change:** Loosen `basic_string` invalidation rules.

**Rationale:** Allow small-string optimization.

**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. Some `const` member functions, such as `data` and `c_str`, no longer invalidate iterators.

### C.7.12 Clause 23: containers library

[diff.cpp03.containers]

<sup>1</sup> **Affected subclause:** 23.2

**Change:** Complexity of `size()` member functions now constant.

**Rationale:** Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.

**Effect on original feature:** Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

<sup>2</sup> **Affected subclause:** 23.2

**Change:** Requirements change: relaxation.

**Rationale:** Clarification.

**Effect on original feature:** Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

- (2.1) — not all containers provide `size()`; use `empty()` instead of `size() == 0`;
- (2.2) — not all containers are empty after construction (`array`);
- (2.3) — not all containers have constant complexity for `swap()` (`array`).

<sup>3</sup> **Affected subclause:** 23.2

**Change:** Requirements change: default constructible.

**Rationale:** Clarification of container requirements.

**Effect on original feature:** Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

<sup>4</sup> **Affected subclauses:** 23.2.4 and 23.2.7

**Change:** Signature changes: from `void` return types.

**Rationale:** Old signature threw away useful information that may be expensive to recalculate.

**Effect on original feature:** The following member functions have changed:

- (4.1) — `erase(iterator)` for `set`, `multiset`, `map`, `multimap`
- (4.2) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (4.3) — `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
- (4.4) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

<sup>5</sup> **Affected subclauses:** [23.2.4](#) and [23.2.7](#)

**Change:** Signature changes: from `iterator` to `const_iterator` parameters.

**Rationale:** Overspecification.

**Effect on original feature:** The signatures of the following member functions changed from taking an `iterator` to taking a `const_iterator`:

- (5.1) — `insert(iterator, val)` for `vector`, `deque`, `list`, `set`, `multiset`, `map`, `multimap`
- (5.2) — `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`
- (5.3) — `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
- (5.4) — all forms of `list::splice`
- (5.5) — all forms of `list::merge`

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

<sup>6</sup> **Affected subclauses:** [23.2.4](#) and [23.2.7](#)

**Change:** Signature changes: `resize`.

**Rationale:** Performance, compatibility with move semantics.

**Effect on original feature:** For `vector`, `deque`, and `list` the fill value passed to `resize` is now passed by reference instead of by value, and an additional overload of `resize` has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

### C.7.13 Clause 26: algorithms library

[diff.cpp03.algorithms]

<sup>1</sup> **Affected subclause:** [26.1](#)

**Change:** Result state of inputs after application of some algorithms.

**Rationale:** Required by new feature.

**Effect on original feature:** A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, `std::remove` and `std::remove_if` may leave the tail of the input sequence with a different set of values than previously.

### C.7.14 Clause 29: numerics library

[diff.cpp03.numerics]

<sup>1</sup> **Affected subclause:** [29.4](#)

**Change:** Specified representation of complex numbers.

**Rationale:** Compatibility with C99.

**Effect on original feature:** Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of `std::complex` may not be compatible with this revision of C++.

### C.7.15 28.3: localization library

[diff.cpp03.locale]

<sup>1</sup> **Affected subclause:** [28.3.4.3.2.3](#)

**Change:** The `num_get` facet recognizes hexadecimal floating-point values.

**Rationale:** Required by new feature.

**Effect on original feature:** Valid C++ 2003 code may have different behavior in this revision of C++.

### C.7.16 Clause 31: input/output library

[diff.cpp03.input.output]

<sup>1</sup> **Affected subclauses:** [31.7.5.2.4](#), [31.7.6.2.4](#), and [31.5.4.4](#)

**Change:** Specify use of `explicit` in existing boolean conversion functions.

**Rationale:** Clarify intentions, avoid workarounds.

**Effect on original feature:** Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

- (1.1) — passing a value to a function that takes an argument of type `bool`;
- (1.2) — using `operator==` to compare to `false` or `true`;
- (1.3) — returning a value from a function with a return type of `bool`;
- (1.4) — initializing members of type `bool` via aggregate initialization;
- (1.5) — initializing a `const bool&` which would bind to a temporary object.

<sup>2</sup> **Affected subclause:** 31.5.2.2.1

**Change:** Change base class of `std::ios_base::failure`.

**Rationale:** More detailed error messages.

**Effect on original feature:** `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.

<sup>3</sup> **Affected subclause:** 31.5.2

**Change:** Flag types in `std::ios_base` are now bitmasks with values defined as constexpr static members.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this revision of C++.

[Example 1:

```
#include <iostream>

int main() {
 int flag = std::ios_base::hex;
 std::cout.setf(flag); // error: setf does not take argument of type int
}
```

— end example]

## C.8 C++ and C

[diff.iso]

### C.8.1 General

[diff.iso.general]

- <sup>1</sup> Subclause C.8 lists the differences between C++ and C, in addition to those listed above, by the chapters of this document.

### C.8.2 Clause 5: lexical conventions

[diff.lex]

<sup>1</sup> **Affected subclause:** 5.12

**Change:** New keywords.

New keywords are added to C++; see 5.12.

**Rationale:** These keywords were added in order to implement the new semantics of C++.

**Effect on original feature:** Change to semantics of well-defined feature. Any C programs that used any of these keywords as identifiers are not valid C++ programs.

**Difficulty of converting:** Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.

**How widely used:** Common.

<sup>2</sup> **Affected subclause:** 5.13.3

**Change:** Type of *character-literal* is changed from `int` to `char`.

**Rationale:** This is needed for improved overloaded function argument type matching.

[Example 1:

```
int function(int i);
int function(char c);

function('x');
```

It is preferable that this call match the second version of function rather than the first. — end example]

**Effect on original feature:** Change to semantics of well-defined feature. C programs which depend on `sizeof('x') == sizeof(int)`

will not work the same as C++ programs.

**Difficulty of converting:** Simple.

**How widely used:** Programs which depend upon `sizeof('x')` are probably rare.

<sup>3</sup> **Affected subclause:** 5.13.5

**Change:** Concatenated *string-literals* can no longer have conflicting *encoding-prefixes*.

**Rationale:** Removal of non-portable feature.

**Effect on original feature:** Concatenation of *string-literals* with different *encoding-prefixes* is now ill-formed.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** 5.13.5

**Change:** String literals made `const`.

The type of a *string-literal* is changed from “array of `char`” to “array of `const char`”. The type of a UTF-8 string literal is changed from “array of `char`” to “array of `const char8_t`”. The type of a UTF-16 string literal is changed from “array of *some-integer-type*” to “array of `const char16_t`”. The type of a UTF-32 string literal is changed from “array of *some-integer-type*” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.

**Rationale:** This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Syntactic transformation. The fix is to add a cast:

```
char* p = "abc"; // valid in C, invalid in C++
void f(char*) {
 char* p = (char*)"abc"; // OK, cast added
 f(p);
 f((char*)"def"); // OK, cast added
}
```

**How widely used:** Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

### C.8.3 Clause 6: basics

[diff.basic]

<sup>1</sup> **Affected subclause:** 6.2

**Change:** C++ does not have “tentative definitions” as in C.

[Example 1: At file scope,

```
int i;
int i;
```

is valid in C, invalid in C++. — end example]

This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C.

[Example 2:

```
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

— end example]

**Rationale:** This avoids having different initialization rules for fundamental types and user-defined types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 6.4

**Change:** A `struct` is a scope in C++, not in C.

[Example 3:

```
struct X {
 struct Y { int a; } b;
};
struct Y c;
```

is valid in C but not in C++, which would require `X::Y c;`. — end example]

**Rationale:** Class scope is crucial to C++, and a struct is a class.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

<sup>3</sup> **Affected subclause:** 6.7 [also 9.2.9]

**Change:** A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

**Rationale:** Because `const` objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each `const` object. This feature allows the user to put `const` objects in source files that are included in more than one translation unit.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** 6.10.3.1

**Change:** The `main` function cannot be called recursively and cannot have its address taken.

**Rationale:** The `main` function may require special actions.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Trivial: create an intermediary function such as `mymain(argc, argv)`.

**How widely used:** Seldom.

<sup>5</sup> **Affected subclause:** 6.9

**Change:** C allows mixing between “compatible types” in several places where C++ does not.

For example, enumerated types are “compatible” with their underlying types in C but, in C++, enumerations are types distinct from their underlying types.

**Rationale:** Stricter type checking is essential for C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, such problems. Some cases are allowed by C++ according to the “layout compatibility rules” of this document.

**How widely used:** Common.

## C.8.4 Clause 7: expressions

[diff.expr]

<sup>1</sup> **Affected subclause:** 7.3.12

**Change:** Converting a prvalue of type “pointer to *cv* void” to a pointer-to-object type requires casting.

[Example 1:

```
char a[10];
void* b=a;
void foo() {
 char* c=b;
}
```

C accepts this usage of “pointer to void” being assigned to a pointer to object type. C++ does not. — end example]

**Rationale:** C++ tries harder than C to enforce compile-time type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast.

[Example 2:

```
char* c = (char*) b;
```

— end example]

**How widely used:** Common.

<sup>2</sup> **Affected subclause:** 7.4

**Change:** Operations mixing a value of an enumeration type and a value of a different enumeration type or of a floating-point type are not valid.

[Example 3:

```
enum E1 { e };
enum E2 { f };
int b = e <= 3.7; // valid in C; ill-formed in C++
int k = f - e; // valid in C; ill-formed in C++
int x = 1 ? e : f; // valid in C; ill-formed in C++
```

— end example]

**Rationale:** Reinforcing type safety in C++.

**Effect on original feature:** Well-formed C code will not compile with this International Standard.

**Difficulty of converting:** Violations will be diagnosed by the C++ translator. The original behavior can be restored with a cast or integral promotion.

[Example 4:

```
enum E1 { e };
enum E2 { f };
int b = (int)e <= 3.7;
int k = +f - e;
```

— end example]

**How widely used:** Uncommon.

<sup>3</sup> **Affected subclause:** 7.4

**Change:** The usual arithmetic conversions differ, between C and C++, in the treatment of enumeration types with no fixed underlying type. In C++, values of such types are not specified as converting to the underlying type of the enumeration as part of the usual arithmetic conversions. Instead, integral promotions (7.3.7) based on the values of the enumeration (9.8.1) are applied.

**Rationale:** Avoids the difference that can arise in C when replacing an enumeration constant in an expression with a cast of the same enumeration constant to the enumeration type. Allows C++ to treat an enumerator with behavior like that of `int` even while giving the enumerator the type of its enumeration.

**Effect on original feature:** Changes to semantics of well-defined feature. Some C expressions that have a dependence upon the implementation-defined underlying type of affected enumeration types will yield different results (as they would if a different underlying type is chosen by the C implementation).

[Example 5:

```
typedef enum { E0 } E; // the underlying type of E can be unsigned int
static_assert(((E)E0 - 1 < 0) == (E0 - 1 < 0), "Must pass for C++");
```

The `static_assert` may fail in C. — end example]

**Difficulty of converting:** Programs must add explicit casts to the underlying type.

**How widely used:** Rare.

<sup>4</sup> **Affected subclauses:** 7.6.1.6 and 7.6.2.3

**Change:** Decrement operator is not allowed with `bool` operand.

**Rationale:** Feature with surprising semantics.

**Effect on original feature:** A valid C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C typedef in `<stdbool.h>` (17.15.5)) is ill-formed in C++.

<sup>5</sup> **Affected subclause:** 7.6.2.2

**Change:** In certain contexts, taking the address of a dereferenced null or past-the-end pointer value is well-defined in C (and yields the original pointer value), but results in undefined behavior in C++.

[Example 6:

```
void f() {
 char *p = nullptr;
 char *p2 = &*p; // well-defined in C, undefined behavior in C++
 char *p3 = &p[0]; // well-defined in C, undefined behavior in C++
 int a[5];
```

```
 int *q = &a[5]; // well-defined in C, undefined behavior in C++
}
```

— end example]

**Rationale:** Consistent treatment of lvalues in C++.

**Effect on original feature:** Well-formed and well-defined C code exhibits undefined behavior in C++.

**Difficulty of converting:** Syntactic transformation to pointer arithmetic and possible addition of a check for null pointer values.

**How widely used:** Occasionally.

<sup>6</sup> **Affected subclauses:** 7.6.2.5 and 7.6.3

**Change:** In C++, types can only be defined in declarations, not in expressions.

In C, a `sizeof` expression or cast expression may define a new type.

[Example 7:

```
p = (void*)(struct x {int i;} *)0;
```

defines a new type, `struct x`. — end example]

**Rationale:** This prohibition helps to clarify the location of definitions in the source code.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>7</sup> **Affected subclauses:** 7.6.9 and 7.6.10

**Change:** C allows directly comparing two objects of array type; C++ does not.

**Rationale:** The behavior is confusing because it compares not the contents of the two arrays, but their addresses.

**Effect on original feature:** Deletion of semantically well-defined feature that had unspecified behavior in common use cases.

**Difficulty of converting:** Violations will be diagnosed by the C++ translator. The original behavior can be replicated by explicitly casting either array to a pointer, such as by using a unary `+`.

[Example 8:

```
int arr1[5];
int arr2[5];
int same = arr1 == arr2; // valid C, ill-formed C++
int idem = arr1 == +arr2; // valid C++, constraint violation in C
```

— end example]

**How widely used:** Rare.

<sup>8</sup> **Affected subclauses:** 7.6.16, 7.6.19, and 7.6.20

**Change:** The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

**Rationale:** C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

**Effect on original feature:** Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results.

[Example 9:

```
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C. — end example]

**Difficulty of converting:** Programs must add explicit casts to the appropriate rvalue.

**How widely used:** Rare.

## C.8.5 Clause 8: statements

[diff.stat]

<sup>1</sup> **Affected subclauses:** 8.5.3 and 8.8.6

**Change:** It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

**Rationale:** Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this

simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 8.8.4

**Change:** It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

**Rationale:** The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with `void` and `int` return types.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Add an appropriate return value to the source code, such as zero.

**How widely used:** Seldom. For several years, many existing C implementations have produced warnings in this case.

## C.8.6 Clause 9: declarations

[diff.dcl]

<sup>1</sup> **Affected subclause:** 9.1

**Change:** In C++, no declaration of a variable can have *cv* `void` type. In C, this is allowed, unless the declaration is a definition.

[Example 1:

```
extern void x; // valid C, invalid in C++
— end example]
```

**Rationale:** Stricter type checking in C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 9.2.2

**Change:** In C++, the `static` or `extern` specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

[Example 2:

```
static struct S { // valid C, invalid in C++
 int i;
};
— end example]
```

**Rationale:** Storage class specifiers don't have any meaning when associated with a type. In C++, class members can be declared with the `static` storage class specifier. Storage class specifiers on type declarations can be confusing for users.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>3</sup> **Affected subclause:** 9.2.2

**Change:** In C++, `register` is not a storage class specifier.

**Rationale:** The storage class specifier had no effect in C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common.

<sup>4</sup> **Affected subclause:** 9.2.4

**Change:** A C++ *typedef-name* must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a *typedef-name* and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

[Example 3:

```
typedef struct name1 { /* ... */ } name1; // valid C and C++
struct name { /* ... */ };
typedef int name; // valid C, invalid C++
```

— end example]

**Rationale:** For ease of use, C++ doesn't require that a type name be prefixed with the keywords `class`, `struct` or `union` when used in object declarations or type casts.

[Example 4:

```
class name { /* ... */ };
name i; // i has type class name
```

— end example]

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. One of the 2 types has to be renamed.

**How widely used:** Seldom.

<sup>5</sup> **Affected subclause:** 9.2.9 [see also 6.7]

**Change:** Const objects must be initialized in C++ but can be left uninitialized in C.

**Rationale:** A const object cannot be assigned to so it must be initialized to hold a useful value.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>6</sup> **Affected subclause:** 9.2.9.7

**Change:** The keyword `auto` cannot be used as a storage class specifier.

[Example 5:

```
void f() {
 auto int x; // valid C, invalid C++
}
```

— end example]

**Rationale:** Allowing the use of `auto` to deduce the type of a variable from its initializer results in undesired interpretations of `auto` as a storage class specifier in certain contexts.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Rare.

<sup>7</sup> **Affected subclause:** 9.3.4.6

**Change:** In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

[Example 6:

```
int f(); // means int f(void) in C++
 // int f(unknown) in C
```

— end example]

**Rationale:** This is to avoid function calls with the wrong number or type of arguments.

**Effect on original feature:** Change to semantics of well-defined feature. This feature was marked as “obsolescent” in C.

**Difficulty of converting:** Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.

**How widely used:** Common.

<sup>8</sup> **Affected subclause:** 9.3.4.6 [see 7.6.2.5]

**Change:** In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

[Example 7:

```
void f(struct S { int a; } arg) {} // valid C, invalid C++
enum E { A, B, C } f() {} // valid C, invalid C++
```

— end example]

**Rationale:** When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The type definitions must be moved to file scope, or in header files.

**How widely used:** Seldom. This style of type definition is seen as poor coding style.

9 **Affected subclause:** 9.6

**Change:** In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

**Rationale:** Prototypes are essential to type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common in old programs, but already known to be obsolescent.

10 **Affected subclause:** 9.5.2

**Change:** In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

[Example 8:

```
struct A { int x, y; };
struct B { struct A a; };
struct A a = { .y = 1, .x = 2 }; // valid C, invalid C++
int arr[3] = { [1] = 5 }; // valid C, invalid C++
struct B b = { .a.x = 0 }; // valid C, invalid C++
struct A c = { .x = 1, 2 }; // valid C, invalid C++
```

— end example]

**Rationale:** In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so member initializers must be specified in order. Array designators conflict with *lambda-expression* syntax. Nested designators are seldom used.

**Effect on original feature:** Deletion of feature that is incompatible with C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Out-of-order initializers are common. The other features are seldom used.

11 **Affected subclause:** 9.5.3

**Change:** In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating ‘\0’) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating ‘\0’.

[Example 9:

```
char array[4] = "abcd"; // valid C, invalid C++
```

— end example]

**Rationale:** When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. The arrays must be declared one element bigger to contain the string terminating ‘\0’.

**How widely used:** Seldom. This style of array initialization is seen as poor coding style.

12 **Affected subclause:** 9.8.1

**Change:** C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

[Example 10:

```
enum color { red, blue, green };
enum color c = 1; // valid C, invalid C++
```

— end example]

**Rationale:** The type-safe nature of C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

**How widely used:** Common.

<sup>13</sup> **Affected subclause:** 9.8.1

**Change:** In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is an integer type.

[Example 11:

```
enum e { A };
void f() {
 auto x = A;
 int *p = &x; // valid C, invalid C++
}
```

— end example]

**Rationale:** In C++, an enumeration is a distinct type.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

<sup>14</sup> **Affected subclause:** 9.13.2

**Change:** In C++, an *alignment-specifier* is an *attribute-specifier*. In C, an *alignment-specifier* is a *declaration-specifier*.

[Example 12:

```
#include <stdalign.h>
unsigned alignas(8) int x; // valid C, invalid C++
unsigned int y alignas(8); // valid C++, invalid C
```

— end example]

**Rationale:** C++ requires unambiguous placement of the *alignment-specifier*.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

## C.8.7 Clause 11: classes

[diff.class]

<sup>1</sup> **Affected subclause:** 11.3 [see also 9.2.4]

**Change:** In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

[Example 1:

```
int x[99];
void f() {
 struct x { int a; };
 sizeof(x); /* size of the array in C */
 /* size of the struct in C++ */
}
```

— end example]

**Rationale:** This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords **class**, **struct**, **union** or **enum** be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. If the hidden name that needs to be accessed is at global scope, the `::` C++ operator can be used. If the hidden name is at block scope, either the type or the

struct tag has to be renamed.

**How widely used:** Seldom.

<sup>2</sup> **Affected subclause:** 11.4.5.3

**Change:** Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue.

[*Example 2:* The following is valid in C:

```
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1; // invalid C++
struct X x3;
x3 = x1; // also invalid C++
```

— end example]

**Rationale:** Several alternatives were debated at length. Changing the parameter to `volatile const X&` would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit `const_cast` can be used.

**How widely used:** Seldom.

<sup>3</sup> **Affected subclause:** 11.4.10

**Change:** Bit-fields of type plain `int` are signed.

**Rationale:** The signedness needs to be consistent among template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

**Effect on original feature:** The choice is implementation-defined in C, but not so in C++.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

<sup>4</sup> **Affected subclause:** 11.4.12

**Change:** In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

[*Example 3:*

```
struct X {
 struct Y { /* ... */ } y;
};
struct Y yy; // valid C, invalid C++
```

— end example]

**Rationale:** C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing struct is defined.

[*Example 4:*

```
struct Y; // struct Y and struct X are at the same scope
struct X {
 struct Y { /* ... */ } y;
};
```

— end example]

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 6.4.

**How widely used:** Seldom.

5 **Affected subclause:** 6.5.2

**Change:** In C++, a *typedef-name* may not be redeclared in a class definition after being used in that definition.

[Example 5:

```
typedef int I;
struct S {
 I i;
 int I; // valid C, invalid C++
};
```

— end example]

**Rationale:** When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of I really is.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Either the type or the struct member has to be renamed.

**How widely used:** Seldom.

## C.8.8 Clause 15: preprocessing directives

[diff.cpp]

1 **Affected subclause:** 15.12

**Change:** Whether `__STDC__` is defined and if so, what its value is, are implementation-defined.

**Rationale:** C++ is not identical to C. Mandating that `__STDC__` be defined would require that translators make an incorrect claim.

**Effect on original feature:** Change to semantics of well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Programs and headers that reference `__STDC__` are quite common.

## C.9 C standard library

[diff.library]

### C.9.1 General

[diff.library.general]

- 1 Subclause C.9 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

### C.9.2 Modifications to headers

[diff.mods.to.headers]

- 1 For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in 17.15.
- 2 There are no C++ headers for the C standard library's headers `<stdnoreturn.h>` and `<threads.h>`, nor are these headers from the C standard library headers themselves part of C++.
- 3 The C headers `<complex.h>` and `<tgmath.h>` do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

### C.9.3 Modifications to definitions

[diff.mods.to.definitions]

#### C.9.3.1 Types `char8_t`, `char16_t`, and `char32_t`

[diff.char16]

- 1 The types `char8_t`, `char16_t`, and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char8_t`, `char16_t`, and `char32_t` are keywords in C++ (5.12). They do not appear as macro or type names defined in `<cuchar>` (28.7.4).

#### C.9.3.2 Type `wchar_t`

[diff.wchar.t]

- 1 The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in C++ (5.12). It does not appear as a macro or type name defined in any of `<cstddef>` (17.2.1), `<cstdlib>` (17.2.2), or `<wchar>` (28.7.3).

**C.9.3.3 Header <iso646.h>**

[diff.header.iso646.h]

- <sup>1</sup> The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not`, `not_eq`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in C++ (5.12), and are not introduced as macros by <iso646.h> (17.15.3).

**C.9.3.4 Macro NULL**

[diff.null]

- <sup>1</sup> The macro `NULL`, defined in any of <locale> (28.3.5.1), <cstddef> (17.2.1), <cstdio> (31.13.1), <cstdlib> (17.2.2), <cstring> (27.5.1), <ctime> (30.15), or <wchar> (28.7.3), is an implementation-defined null pointer constant in C++ (17.2).

**C.9.4 Modifications to declarations**

[diff.mods.to.declarations]

- <sup>1</sup> Header <cstring> (27.5.1): The following functions have different declarations:

- (1.1) — `strchr`
- (1.2) — `strpbrk`
- (1.3) — `strrchr`
- (1.4) — `strstr`
- (1.5) — `memchr`

Subclause 27.5.1 describes the changes.

- <sup>2</sup> Header <wchar> (28.7.3): The following functions have different declarations:

- (2.1) — `wcschr`
- (2.2) — `wcspbrk`
- (2.3) — `wcsrchr`
- (2.4) — `wcsstr`
- (2.5) — `wmemchr`

Subclause 28.7.3 describes the changes.

- <sup>3</sup> Header <cstddef> (17.2.1) declares the names `nullptr_t`, `byte`, and `to_integer`, and the operators and operator templates in 17.2.5, in addition to the names declared in <stddef.h> (17.15) in the C standard library.

**C.9.5 Modifications to behavior**

[diff.mods.to.behavior]

**C.9.5.1 General**

[diff.mods.to.behavior.general]

- <sup>1</sup> Header <cstdlib> (17.2.2): The following functions have different behavior:

- (1.1) — `atexit`
- (1.2) — `exit`
- (1.3) — `abort`

Subclause 17.5 describes the changes.

- <sup>2</sup> Header <csetjmp> (17.14.3): The following functions have different behavior:

- (2.1) — `longjmp`

Subclause 17.14.3 describes the changes.

**C.9.5.2 Macro `offsetof`(*type*, *member-designator*)**

[diff.offsetof]

- <sup>1</sup> The macro `offsetof`, defined in <cstddef> (17.2.1), accepts a restricted set of *type* arguments in C++. Subclause 17.2.4 describes the change.

**C.9.5.3 Memory allocation functions**

[diff.malloc]

- <sup>1</sup> The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.

# Annex D

## (normative)

## Compatibility features

[depr]

### D.1 General

[depr.general]

- <sup>1</sup> This Annex describes features of this document that are specified for compatibility with existing implementations.
- <sup>2</sup> These are deprecated features, where *deprecated* is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the `deprecated` attribute (9.13.4).

### D.2 Non-local use of TU-local entities

[depr.local]

- <sup>1</sup> A declaration of a non-TU-local entity that is an exposure (6.7) is deprecated.

[Note 1: Such a declaration in an importable module unit is ill-formed. — end note]

[Example 1:

```
namespace {
 struct A {
 void f() {}
 };
}
A h();
inline void g() {A().f();}
```

// deprecated: not internal linkage

// deprecated: inline and not internal linkage

— end example]

### D.3 Implicit capture of `*this` by reference

[depr.capture.this]

- <sup>1</sup> For compatibility with prior revisions of C++, a *lambda-expression* with *capture-default* = (7.5.6.3) may implicitly capture `*this` by reference.

[Example 1:

```
struct X {
 int x;
 void foo(int n) {
 auto f = [=]() { x = n; };
 auto g = [=, this]() { x = n; };
 }
};
```

// deprecated: x means this->x, not a copy thereof

// recommended replacement

— end example]

### D.4 Deprecated volatile types

[depr.volatile.type]

- <sup>1</sup> Postfix `++` and `--` expressions (7.6.1.6) and prefix `++` and `--` expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[Example 1:

```
volatile int velociraptor;
++velociraptor;
```

// deprecated

— end example]

- <sup>2</sup> Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2:

```
int neck, tail;
volatile int brachiosaur;
brachiosaur = neck; // OK
tail = brachiosaur; // OK
tail = brachiosaur = neck; // deprecated
brachiosaur += neck; // OK
```

— end example]

- <sup>3</sup> A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3:

```
volatile struct amber jurassic(); // deprecated
void trex(volatile short left_arm, volatile short right_arm); // deprecated
void fly(volatile struct pterosaur* pteranodon); // OK
```

— end example]

- <sup>4</sup> A structured binding (9.7) of a volatile-qualified type is deprecated.

[Example 4:

```
struct linhenykus { short forelimb; };
void park(linhenykus alvarezsauroid) {
 volatile auto [what_is_this] = alvarezsauroid; // deprecated
 // ...
}
```

— end example]

## D.5 Non-comma-separated ellipsis parameters

[depr.ellipsis.comma]

A *parameter-declaration-clause* of the form *parameter-declaration-list* ... is deprecated (9.3.4.6).

[Example 1:

```
void f(int...); // deprecated
void g(auto...); // OK, declares a function parameter pack
void h(auto.....); // deprecated
```

— end example]

## D.6 Implicit declaration of copy functions

[depr.impldec]

- <sup>1</sup> The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.6.3).

## D.7 Redeclaration of static constexpr data members

[depr.static constexpr]

- <sup>1</sup> For compatibility with prior revisions of C++, a `constexpr` static data member may be redundantly redeclared outside the class with no initializer (6.2, 11.4.9.3). This usage is deprecated.

[Example 1:

```
struct A {
 static constexpr int n = 5; // definition (declaration in C++ 2014)
};

constexpr int A::n; // redundant declaration (definition in C++ 2014)
```

— end example]

## D.8 Literal operator function declarations using an identifier

[depr.lit]

- <sup>1</sup> A *literal-operator-id* (12.6) of the form

```
operator unevaluated-string identifier
```

is deprecated.

**D.9 template keyword before qualified names**

[depr.template.template]

- <sup>1</sup> The use of the keyword `template` before the qualified name of a class or alias template without a template argument list is deprecated (13.3).

**D.10 has\_denorm members in numeric\_limits**

[depr.numeric.limits.has.denorm]

- <sup>1</sup> The following type is defined in addition to those specified in <limits> (17.3.3):

```
namespace std {
 enum float_denorm_style {
 denorm_indeterminate = -1,
 denorm_absent = 0,
 denorm_present = 1
 };
}
```

- <sup>2</sup> The following members are defined in addition to those specified in 17.3.5.1:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

- <sup>3</sup> The values of `has_denorm` and `has_denorm_loss` of specializations of `numeric_limits` are unspecified.

- <sup>4</sup> The following members of the specialization `numeric_limits<bool>` are defined in addition to those specified in 17.3.5.3:

```
static constexpr float_denorm_style has_denorm = denorm_absent;
static constexpr bool has_denorm_loss = false;
```

**D.11 Deprecated C macros**

[depr.c.macros]

- <sup>1</sup> The header <cfloat> (17.3.7) has the following macros:

```
#define FLT_HAS_SUBNORM see below
#define DBL_HAS_SUBNORM see below
#define LDBL_HAS_SUBNORM see below
#define DECIMAL_DIG see below
```

The header defines these macros the same as the C standard library header <float.h>.

SEE ALSO: ISO/IEC 9899:2024, 5.3.5.3.3, 7.33.6

- <sup>2</sup> In addition to being available via inclusion of the <cfloat> header, the macros `INFINITY` and `NAN` are available when <cmath> (29.7.1) is included.

SEE ALSO: ISO/IEC 9899:2024, 7.12

- <sup>3</sup> The header <stdbool.h> (17.15.5) has the following macro:

```
#define __bool_true_false_are_defined 1
```

SEE ALSO: ISO/IEC 9899:2024, 7.19

**D.12 Deprecated error numbers**

[depr.cerrno]

- <sup>1</sup> The header <cerrno> (19.4.2) has the following additional macros:

```
#define ENODATA see below
#define ENOSR see below
#define ENOSTR see below
#define ETIME see below
```

- <sup>2</sup> The meaning of these macros is defined by the POSIX standard.

- <sup>3</sup> The following `enum errc` enumerators are defined in addition to those specified in 19.5.2:

```
no_message_available, // ENODATA
no_stream_resources, // ENOSR
not_a_stream, // ENOSTR
stream_timeout, // ETIME
```

- <sup>4</sup> The value of each `enum errc` enumerator above is the same as the value of the <cerrno> macro shown in the above synopsis.

## D.13 Deprecated type traits

[depr.meta.types]

- 1 The header `<type_traits>` (21.3.3) has the following addition:

```
namespace std {
 template<class T> struct is_trivial;
 template<class T> constexpr bool is_trivial_v = is_trivial<T>::value;
 template<class T> struct is_pod;
 template<class T> constexpr bool is_pod_v = is_pod<T>::value;
 template<size_t Len, size_t Align = default-alignment> // see below
 struct aligned_storage;
 template<size_t Len, size_t Align = default-alignment> // see below
 using aligned_storage_t = aligned_storage<Len, Align>::type;
 template<size_t Len, class... Types>
 struct aligned_union;
 template<size_t Len, class... Types>
 using aligned_union_t = aligned_union<Len, Types...>::type;
}
```

- 2 The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

- 3 A *trivial class* is a class that is trivially copyable and has one or more eligible default constructors, all of which are trivial.

[Note 1: In particular, a trivial class does not have virtual functions or virtual base classes. — end note]

A *trivial type* is a scalar type, a trivial class, an array of such a type, or a cv-qualified version of one of these types.

- 4 A *POD class* is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A *POD type* is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

```
template<class T> struct is_trivial;
```

- 5 *Preconditions:* `remove_all_extents_t<T>` shall be a complete type or *cv void*.

- 6 *Remarks:* `is_trivial<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` is a trivial type, and `false_type` otherwise.

- 7 [Note 2: It is unspecified whether a closure type (7.5.6.2) is a trivial type. — end note]

```
template<class T> struct is_pod;
```

- 8 *Preconditions:* `remove_all_extents_t<T>` shall be a complete type or *cv void*.

- 9 *Remarks:* `is_pod<T>` is a *Cpp17UnaryTypeTrait* (21.3.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise.

- 10 [Note 3: It is unspecified whether a closure type (7.5.6.2) is a POD type. — end note]

```
template<size_t Len, size_t Align = default-alignment>
 struct aligned_storage;
```

- 11 The value of *default-alignment* is the most stringent alignment requirement for any object type whose size is no greater than `Len` (6.9).

- 12 *Mandates:* `Len` is not zero. `Align` is equal to `alignof(T)` for some type `T` or to *default-alignment*.

- 13 The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`.

- 14 [Note 4: Uses of `aligned_storage<Len, Align>::type` can be replaced by an array `std::byte[Len]` declared with `alignas(Align)`. — end note]

- 15 [Note 5: A typical implementation would define `aligned_storage` as:

```
template<size_t Len, size_t Alignment>
struct aligned_storage {
 typedef struct {
 alignas(Alignment) unsigned char __data[Len];
 } type;
};
```

— end note]

```
template<size_t Len, class... Types>
struct aligned_union;
```

16 *Mandates:* At least one type is provided. Each type in the template parameter pack **Types** is a complete object type.

17 The member typedef **type** denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in **Types**; its size shall be at least **Len**. The static member **alignment\_value** is an integral constant of type **size\_t** whose value is the strictest alignment of all types listed in **Types**.

## D.14 Relational operators

[depr.relops]

1 The header <utility> (22.2.1) has the following additions:

```
namespace std::rel_ops {
 template<class T> bool operator!=(const T&, const T&);
 template<class T> bool operator> (const T&, const T&);
 template<class T> bool operator<=(const T&, const T&);
 template<class T> bool operator>=(const T&, const T&);
}
```

2 To avoid redundant definitions of **operator!=** out of **operator==** and operators **>**, **<=**, and **>=** out of **operator<**, the library provides the following:

```
template<class T> bool operator!=(const T& x, const T& y);
```

3 *Preconditions:* T meets the *Cpp17EqualityComparable* requirements (Table 28).

4 *Returns:* !(x == y).

```
template<class T> bool operator>(const T& x, const T& y);
```

5 *Preconditions:* T meets the *Cpp17LessThanComparable* requirements (Table 29).

6 *Returns:* y < x.

```
template<class T> bool operator<=(const T& x, const T& y);
```

7 *Preconditions:* T meets the *Cpp17LessThanComparable* requirements (Table 29).

8 *Returns:* !(y < x).

```
template<class T> bool operator>=(const T& x, const T& y);
```

9 *Preconditions:* T meets the *Cpp17LessThanComparable* requirements (Table 29).

10 *Returns:* !(x < y).

## D.15 Tuple

[depr.tuple]

1 The header <tuple> (22.4.2) has the following additions:

```
namespace std {
 template<class T> struct tuple_size<volatile T>;
 template<class T> struct tuple_size<const volatile T>;

 template<size_t I, class T> struct tuple_element<I, volatile T>;
 template<size_t I, class T> struct tuple_element<I, const volatile T>;
}
```

```
template<class T> struct tuple_size<volatile T>;
```

```
template<class T> struct tuple_size<const volatile T>;
```

2 Let TS denote **tuple\_size<T>** of the cv-unqualified type T. If the expression **TS::value** is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a base characteristic of **integral\_constant<size\_t, TS::value>**. Otherwise, they have no member **value**.

3 Access checking is performed as if in a context unrelated to TS and T. Only the validity of the immediate context of the expression is considered.

- 4 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, volatile T>;
template<size_t I, class T> struct tuple_element<I, const volatile T>;
```

- 5 Let TE denote `tuple_element_t<I, T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef `type` that names the following type:

- (5.1) — for the first specialization, `volatile TE`, and  
 (5.2) — for the second specialization, `const volatile TE`.

- 6 In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (23.3.2), `<ranges>` (25.2), or `<utility>` (22.2.1) are included.

## D.16 Variant

[depr.variant]

- 1 The header `<variant>` (22.6.2) has the following additions:

```
namespace std {
 template<class T> struct variant_size<volatile T>;
 template<class T> struct variant_size<const volatile T>;

 template<size_t I, class T> struct variant_alternative<I, volatile T>;
 template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}
```

```
template<class T> struct variant_size<volatile T>;
template<class T> struct variant_size<const volatile T>;
```

- 2 Let VS denote `variant_size<T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17UnaryTypeTrait* requirements with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
```

- 3 Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T. Then specializations of each of the two templates meet the *Cpp17TransformationTrait* requirements with a member typedef `type` that names the following type:

- (3.1) — for the first specialization, `volatile VA::type`, and  
 (3.2) — for the second specialization, `const volatile VA::type`.

## D.17 Deprecated `vector<bool, Allocator>` swap

[depr.vector.bool.swap]

- 1 The following member is declared in addition to those members specified in 23.3.14:

```
namespace std {
 template<class Allocator> class vector<bool, Allocator> {
 public:
 static constexpr void swap(reference x, reference y) noexcept;
 };
}
```

```
static constexpr void swap(reference x, reference y) noexcept;
```

- 2 *Effects:* Exchanges the values denoted by x and y as if by:

```
bool b = x;
x = y;
y = b;
```

## D.18 Deprecated iterator class template

[depr.iterator]

- 1 The header `<iterator>` (24.2) has the following addition:

```

namespace std {
 template<class Category, class T, class Distance = ptrdiff_t,
 class Pointer = T*, class Reference = T&>
 struct iterator {
 using iterator_category = Category;
 using value_type = T;
 using difference_type = Distance;
 using pointer = Pointer;
 using reference = Reference;
 };
}

```

- <sup>2</sup> The `iterator` template may be used as a base class to ease the definition of required types for new iterators.
- <sup>3</sup> [Note 1: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]
- <sup>4</sup> [Example 1: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:

```

class MyIterator :
 public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
 // code implementing ++, etc.
};
— end example]

```

## D.19 Deprecated `move_iterator` access

[depr.move.iter.elem]

- <sup>1</sup> The following member is declared in addition to those members specified in 24.5.4.6:

```

namespace std {
 template<class Iterator>
 class move_iterator {
 public:
 constexpr pointer operator->() const;
 };
}

constexpr pointer operator->() const;

```

- <sup>2</sup> Returns: current.

## D.20 Deprecated locale category facets

[depr.locale.category]

- <sup>1</sup> The `ctype` locale category includes the following facets as if they were specified in Table 91 of 28.3.3.1.2.1.

```

codecvt<char16_t, char, mbstate_t>
codecvt<char32_t, char, mbstate_t>
codecvt<char16_t, char8_t, mbstate_t>
codecvt<char32_t, char8_t, mbstate_t>

```

- <sup>2</sup> The `ctype` locale category includes the following facets as if they were specified in Table 92 of 28.3.3.1.2.1.

```

codecvt_byname<char16_t, char, mbstate_t>
codecvt_byname<char32_t, char, mbstate_t>
codecvt_byname<char16_t, char8_t, mbstate_t>
codecvt_byname<char32_t, char8_t, mbstate_t>

```

- <sup>3</sup> The following class template specializations are required in addition to those specified in 28.3.4.2.5. The specializations `codecvt<char16_t, char, mbstate_t>` and `codecvt<char16_t, char8_t, mbstate_t>` convert between the UTF-16 and UTF-8 encoding forms, and the specializations `codecvt<char32_t, char, mbstate_t>` and `codecvt<char32_t, char8_t, mbstate_t>` convert between the UTF-32 and UTF-8 encoding forms.

## D.21 Deprecated formatting

[depr.format]

### D.21.1 Header `<format>` synopsis

[depr.format.syn]

- <sup>1</sup> The header `<format>` (28.5.1) has the following additions:

```
namespace std {
 template<class Visitor, class Context>
 decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
}
```

### D.21.2 Formatting arguments

[depr.format.arg]

```
template<class Visitor, class Context>
 decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
```

- <sup>1</sup> *Effects:* Equivalent to: `return visit(std::forward<Visitor>(vis), arg.value_);`

### D.22 Deprecated time formatting

[depr.ctime]

- <sup>1</sup> The header `<ctime>` (30.15) has the following additions:

```
char* asctime(const tm* timeptr);
char* ctime(const time_t* timer);
```

- <sup>2</sup> The functions `asctime` and `ctime` are not required to avoid data races (16.4.6.10).

SEE ALSO: ISO/IEC 9899:2024, 7.29

### D.23 Deprecated file systems

[depr.filesystems]

#### D.23.1 Deprecated filesystem path factory functions

[depr.fs.path.factory]

- <sup>1</sup> The header `<filesystem>` (31.12.4) has the following additions:

```
template<class Source>
 path u8path(const Source& source);
template<class InputIterator>
 path u8path(InputIterator first, InputIterator last);
```

- <sup>2</sup> *Mandates:* The value type of `Source` and `InputIterator` is `char` or `char8_t`.

- <sup>3</sup> *Preconditions:* The `source` and `[first,last)` sequences are UTF-8 encoded. `Source` meets the requirements specified in 31.12.6.4.

- <sup>4</sup> *Returns:*

- (4.1) — If `path::value_type` is `char` and the current native narrow encoding (31.12.6.3.2) is UTF-8, return `path(source)` or `path(first, last)`; otherwise,
- (4.2) — if `path::value_type` is `wchar_t` and the native wide encoding is UTF-16, or if `path::value_type` is `char16_t` or `char32_t`, convert `source` or `[first,last)` to a temporary, `tmp`, of type `path::string_type` and return `path(tmp)`; otherwise,
- (4.3) — convert `source` or `[first,last)` to a temporary, `tmp`, of type `u32string` and return `path(tmp)`.

- <sup>5</sup> *Remarks:* Argument format conversion (31.12.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

- <sup>6</sup> [*Example 1:* A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

```
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));
```

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs. — *end example*]

[*Note 1:* The example above is representative of a historical use of `filesystem::u8path`. To indicate a UTF-8 encoding, passing a `std::u8string` to `path`'s constructor is preferred as it is consistent with `path`'s handling of other encodings. — *end note*]

**D.23.2 Deprecated filesystem path format observers****[depr.fs.path.obs]**

- <sup>1</sup> The following members are declared in addition to those members specified in [31.12.6.5](#):

```
namespace std::filesystem {
 class path {
 public:
 std::string string() const;
 std::string generic_string() const;
 };
}
```

```
std::string string() const;
```

- <sup>2</sup> *Returns:* native\_encoded\_string().

```
std::string generic_string() const;
```

- <sup>3</sup> *Returns:* generic\_native\_encoded\_string().

**D.24 Deprecated atomic operations****[depr.atomics]****D.24.1 General****[depr.atomics.general]**

- <sup>1</sup> The header <atomic> ([32.5.2](#)) has the following additions.

```
namespace std {
 template<class T>
 void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
 template<class T>
 void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;
 template<class T>
 constexpr T kill_dependency(T y) noexcept; // freestanding
 inline constexpr memory_order memory_order_consume = memory_order::consume; // freestanding

 #define ATOMIC_VAR_INIT(value) see below
}
```

**D.24.2 Volatile access****[depr.atomics.volatile]**

- <sup>1</sup> If an atomic ([32.5.8](#)) specialization has one of the following overloads, then that overload participates in overload resolution even if `atomic<T>::is_always_lock_free` is false:

```
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
 memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
value_type operator++(int) volatile noexcept;
value_type operator--(int) volatile noexcept;
value_type operator++() volatile noexcept;
value_type operator--() volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void notify_one() volatile noexcept;
void notify_all() volatile noexcept;
```

**D.24.3 Non-member functions**

[depr.atomics.nonmembers]

```
template<class T>
 void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
 void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

<sup>1</sup> *Effects:* Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed);`

**D.24.4 Operations on atomic types**

[depr.atomics.types.operations]

```
#define ATOMIC_VAR_INIT(value) see below
```

<sup>1</sup> The macro expands to a token sequence suitable for constant initialization of an atomic variable with static storage duration of a type that is initialization-compatible with `value`.

[*Note 1:* This operation possibly needs to initialize locks. — *end note*]

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[*Example 1:*

```
 atomic<int> v = ATOMIC_VAR_INIT(5);
```

— *end example*]

**D.24.5 `memory_order::consume`**

[depr.atomics.order]

<sup>1</sup> The `memory_order` enumeration contains an additional enumerator:

```
 consume = 1
```

The `memory_order::consume` enumerator is allowed wherever `memory_order::acquire` is allowed, and it has the same meaning.

```
template<class T> constexpr T kill_dependency(T y) noexcept;
```

<sup>2</sup> *Returns:* `y`.

**D.25 Deprecated signed char and unsigned char extraction** [depr.istream.extractors]

<sup>1</sup> The header `<istream>` (31.7.1) has the following additions:

```
template<class traits>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);
```

<sup>2</sup> *Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. A character is extracted from `in`, if one is available, and stored in `c`. Otherwise, `ios_base::failbit` is set in the input function's local error state before `setstate` is called.

<sup>3</sup> *Returns:* `in`.

```
4 template<class traits, size_t N>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
 basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);
```

<sup>5</sup> *Effects:* Behaves like a formatted input member (as described in 31.7.5.3.1) of `in`. After a sentry object is constructed, `operator>>` extracts characters and stores them into `s`. If `width()` is greater than zero, `n` is `min(size_t(width()), N)`. Otherwise `n` is `N`. `n` is the maximum number of characters stored.

<sup>6</sup> Characters are extracted and stored until any of the following occurs:

- (6.1) — `n - 1` characters are stored;
- (6.2) — end of file occurs on the input sequence;
- (6.3) — letting `ct` be `use_facet<ctype<charT>>(in.getloc())`, `ct.is(ct.space, s)` is true.

- 7 `operator>>` then stores a null byte (`charT()`) in the next position, which may be the first position if no characters were extracted. `operator>>` then calls `width(0)`.
- 8 If the function extracted no characters, `ios_bit::failbit` is set in the input function's local error state before `setstate` is called.
- 9 *Returns:* `in`.

## D.26 Deprecated signed char and unsigned char insertion [depr ostream.inserters]

- 1 The header `<ostream>` (31.7.2) has the following additions:
- 2 `template<class traits>`  
     `basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);`  
`template<class traits>`  
     `basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, unsigned char c);`
- 3 *Effects:* Equivalent to: `return out << static_cast<char>(c);`
- 4 `template<class traits>`  
     `basic_ostream<char, traits>&`  
         `operator<<(basic_ostream<char, traits>& out, const signed char* s);`  
`template<class traits>`  
     `basic_ostream<char, traits>&`  
         `operator<<(basic_ostream<char, traits>& out, const unsigned char* s);`
- 5 *Effects:* Equivalent to: `return out << reinterpret_cast<const char*>(s);`

# Annex E

## (informative)

### Conformance with UAX #31

[uaxid]

#### E.1 General

[uaxid.general]

- <sup>1</sup> This Annex describes the choices made in application of UAX #31 (“Unicode Identifier and Pattern Syntax”) to C++ in terms of the requirements from UAX #31 and how they do or do not apply to this document. In terms of UAX #31, this document conforms by meeting the requirements R1 “Default Identifiers” and R4 “Equivalent Normalized Identifiers” from UAX #31. The other requirements from UAX #31, also listed below, are either alternatives not taken or do not apply to this document.

#### E.2 R1 Default identifiers

[uaxid.def]

##### E.2.1 General

[uaxid.def.general]

- <sup>1</sup> UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

```
<Identifier> := <Start> <Continue>* (<Medial> <Continue>+)*
```

where <Start> has the `XID_Start` property, <Continue> has the `XID_Continue` property, and <Medial> is a list of characters permitted between continue characters. UAX #31 also specifies some standard profiles, including the Mathematical Compatibility Notation profile. For C++ we apply the Mathematical Compatibility Notation profile, and we add the character `U+005F LOW LINE`, or `_`, to the set of permitted <Start> characters. The <Medial> set is empty. In the grammar used in UAX #31, this is

```
<Identifier> := <Start> <Continue>*
<Start> := XID_Start + ID_Compat_Math_Start + U+005F
<Continue> := <Start> + XID_Continue + ID_Compat_Math_Continue
```

- <sup>2</sup> This is described in the C++ grammar in 5.11, where *identifier* is formed from *identifier-start* or *identifier* followed by *identifier-continue*.

##### E.2.2 R1b Stable identifiers

[uaxid.def.stable]

- <sup>1</sup> An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.
- <sup>2</sup> C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the `XID_Start` and `XID_Continue` properties.

#### E.3 R2 Immutable identifiers

[uaxid.immutable]

- <sup>1</sup> An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.
- <sup>2</sup> C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

#### E.4 R3 Pattern\_White\_Space and Pattern\_Syntax characters

[uaxid.pattern]

- <sup>1</sup> UAX #31 describes how formal languages such as computer languages should describe and implement their use of whitespace and syntactically significant characters during the processes of lexing and parsing.
- <sup>2</sup> This document does not claim conformance with this requirement from UAX #31.

**E.5 R4 Equivalent normalized identifiers** [uaxid.eqn]

- <sup>1</sup> UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.
- <sup>2</sup> This document requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.11.

**E.6 R5 Equivalent case-insensitive identifiers** [uaxid.eqci]

- <sup>1</sup> This document considers case to be significant in identifier comparison, and does not do any case folding. This requirement from UAX #31 does not apply to this document.

**E.7 R6 Filtered normalized identifiers** [uaxid.filter]

- <sup>1</sup> If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.
- <sup>2</sup> This document does not make any such exclusions.

**E.8 R7 Filtered case-insensitive identifiers** [uaxid.filterci]

- <sup>1</sup> C++ identifiers are case sensitive, and therefore this requirement from UAX #31 does not apply.

**E.9 R8 Hashtag identifiers** [uaxid.hashtag]

- <sup>1</sup> There are no hashtags in C++, so this requirement from UAX #31 does not apply.

# Annex F

## (informative)

### Core undefined behavior

[ub]

#### F.1 General

[ub.general]

- <sup>1</sup> This Annex documents undefined behavior explicitly called out in [Clause 4](#) through [Clause 15](#) using the following phrases:

- (1.1) — is undefined
- (1.2) — the behavior is undefined
- (1.3) — the behavior of the program is undefined
- (1.4) — has undefined behavior
- (1.5) — have undefined behavior
- (1.6) — result has undefined behavior
- (1.7) — results in undefined behavior

Undefined behavior that is implicit is not covered by this annex. Each entry contains a title, a cross-reference, a summary of the circumstances, and code examples. The code examples are not intended to exhaustively cover all possible ways of invoking that case.

#### F.2 Clause 6: Basics

[ub.basic]

##### F.2.1

[ub:intro.object.implicit.create]

Specified in: [6.8.2](#)

- <sup>1</sup> For each operation that is specified as implicitly creating objects, that operation implicitly creates and starts the lifetime of zero or more objects of implicit-lifetime types ([6.9](#)) in its specified region of storage if doing so would result in the program having defined behavior. If no such set of objects would give the program defined behavior, the behavior of the program is undefined.

- <sup>2</sup> [Example 1:

```
void f()
{
 void *p = malloc(sizeof(int) + sizeof(float));
 reinterpret_cast<int>(p) = 0;
 reinterpret_cast<float>(p) = 0.0f; // undefined behavior, cannot create
 // both int and float in same place
}
```

— end example]

##### F.2.2

[ub:intro.object.implicit.pointer]

Specified in: [6.8.2](#)

- <sup>1</sup> After implicitly creating objects within a specified region of storage, some operations are described as producing a pointer to a suitable created object ([6.9](#)). These operations select one of the implicitly-created objects whose address is the address of the start of the region of storage, and produce a pointer value that points to that object, if that value would result in the program having defined behavior. If no such pointer value would give the program defined behavior, the behavior of the program is undefined.

- <sup>2</sup> [Example 1:

```

#include <cstdlib>
struct X {
 int a, b;
 ~X() = delete; // deleted destructor makes X a non-implicit-lifetime class
};

X* make_x() {
 X* p = (X*)std::malloc(sizeof(struct X)); // Cannot implicitly create an object because X
 // is not an implicit-lifetime class.
 p->a = 1; // undefined behavior, no set of objects give us defined behavior
 return p;
}
— end example]

```

[Example 2:

```

#include <cstdlib>

struct X {
 int a;
};

struct Y {
 int x;
};

Y* make_y() {
 X* p1 = (X*)std::malloc(sizeof(struct X)); // object #1
 p1->a = 1;
 Y* p2 = (Y*)p1;
 p2->x = 2; // undefined behavior, p2 points to an in-lifetime object of type X,
 // which is not similar to Y (7.6.1.5)
 return p2;
}
— end example]

```

### F.2.3

[ub:basic.align.object.alignment]

Specified in: 6.8.3

<sup>1</sup> All instances of a type must be created in storage that meets the alignment requirement of that type.

<sup>2</sup> [Example 1:

```

struct alignas(4) S {};

void make_misaligned()
{
 alignas(S) char s[sizeof(S) + 1];
 new (&s+1) S(); // undefined behavior, &s+1 will yield a pointer to
 // a char which is 1 byte away from an address with
 // an alignment of 4 and so cannot have an alignment of 4
}
— end example]

```

### F.2.4

[ub:lifetime.outside.pointer.delete]

Specified in: 6.8.4

<sup>1</sup> For a pointer pointing to an object outside of its lifetime, behavior is undefined if the object will be or was of a class type with a non-trivial destructor and the pointer is used as the operand of a *delete-expression*.

<sup>2</sup> [Example 1:

```

struct S {
 float f = 0;
 ~S() {}
};

```

```

void f() {
 S* p = new S;
 p->~S();
 delete p; // undefined behavior, operand of delete, lifetime has ended and S
 // has a non-trivial destructor
}

```

— end example]

## F.2.5

[ub:lifetime.outside.pointer.member]

Specified in: 6.8.4

- <sup>1</sup> For a pointer pointing to an object outside of its lifetime, behavior is undefined if the pointer is used to access a non-static data member or call a non-static member function of the object.

<sup>2</sup> [Example 1:

```

struct S {
 float f = 0;
};

float f() {
 S s;
 S* p = &s;
 s.~S();
 return p->f; // undefined behavior, accessing non-static data member after end of lifetime
}

```

— end example]

## F.2.6

[ub:lifetime.outside.pointer.virtual]

Specified in: 6.8.4

- <sup>1</sup> For a pointer pointing to an object outside of its lifetime, behavior is undefined if the pointer is implicitly converted (7.3.12) to a pointer to a virtual base class (or base class of a virtual base class).

<sup>2</sup> [Example 1:

```

struct B {};
struct D : virtual B {};
void f() {
 D d;
 D* p = &d;
 d.~D();
 B* b = p; // undefined behavior
}

```

— end example]

## F.2.7

[ub:lifetime.outside.pointer.dynamic.cast]

Specified in: 6.8.4

- <sup>1</sup> For a pointer pointing to an object outside of its lifetime, behavior is undefined if the pointer is used as the operand of a `dynamic_cast` (7.6.1.7).

<sup>2</sup> [Example 1:

```

struct B { virtual ~B() = default; };
struct D : B {};
void f()
{
 D d;
 B* bp = &d;
 d.~D();
 D* dp = dynamic_cast<D*>(bp); // undefined behavior
}

```

— end example]

**F.2.8****[ub:lifetime.outside.glvalue.access]****Specified in:** 6.8.4

- <sup>1</sup> Behavior is undefined if a glvalue referring to an object outside of its lifetime is used to access the object.

<sup>2</sup> [Example 1:

```
void f() {
 int x = int{10};
 using T = int;
 x.~T();
 int y = x; // undefined behavior, glvalue used to access the
 // object after the lifetime has ended
}
```

— end example]

**F.2.9****[ub:lifetime.outside.glvalue.member]****Specified in:** 6.8.4

- <sup>1</sup> Behavior is undefined if a glvalue referring to an object outside of its lifetime is used to call a non-static member function of the object.

<sup>2</sup> [Example 1:

```
struct A {
 void f() {}
};

void f() {
 A a;
 a.~A();
 a.f(); // undefined behavior, glvalue used to access a non-static member
 // function after the lifetime has ended
}
```

— end example]

**F.2.10****[ub:lifetime.outside.glvalue.virtual]****Specified in:** 6.8.4

- <sup>1</sup> Behavior is undefined if a glvalue referring to an object outside of its lifetime is bound to a reference to a virtual base class.

<sup>2</sup> [Example 1:

```
struct B {};
struct D : virtual B {
};

void f() {
 D d;
 d.~D();
 B& b = d; // undefined behavior
}
```

— end example]

**F.2.11****[ub:lifetime.outside.glvalue.dynamic.cast]****Specified in:** 6.8.4

- <sup>1</sup> Behavior is undefined if a glvalue referring to an object outside of its lifetime is used as the operand of a `dynamic_cast` or as the operand of `typeid`.

<sup>2</sup> [Example 1:

```
struct B { virtual ~B(); };
struct D : virtual B {};
```

```

void f() {
 D d;
 B& br = d;
 d.~D();
 D& dr = dynamic_cast<D&>(br); // undefined behavior
}

```

— end example]

### F.2.12

[ub:original.type.implicit.destructor]

Specified in: 6.8.4

- <sup>1</sup> The behavior is undefined if a non-trivial implicit destructor call occurs when the type of the object inhabiting the associated storage is not the original type associated with that storage.

- <sup>2</sup> [Example 1:

```

class T {};

struct B {
 ~B();
};

void h() {
 B b;
 new (&b) T;
} // undefined behavior at block exit

```

— end example]

### F.2.13

[ub:creating.within.const.complete.obj]

Specified in: 6.8.4

- <sup>1</sup> Creating a new object within the storage that a const complete object with static, thread, or automatic storage duration occupies, or within the storage that such a const object used to occupy before its lifetime ended, results in undefined behavior.

- <sup>2</sup> [Example 1:

```

struct B {
 B();
 ~B();
};

const B b;

void h() {
 b.~B();
 new (const_cast<B*>(&b)) const B; // undefined behavior
}

```

— end example]

### F.2.14

[ub:basic.indet.value]

Specified in: 6.8.5

- <sup>1</sup> When the result of an evaluation is an indeterminate value (but not just an erroneous value) the behavior is undefined.

- <sup>2</sup> [Example 1:

```

void g() {
 int x [[indeterminate]];
 int y = x; // undefined behavior
}

```

— end example]

**F.2.15****[ub:basic.stc.alloc.dealloc.constraint]****Specified in:** 6.8.6.5.1

- <sup>1</sup> If the behavior of an allocation or deallocation function does not satisfy the semantic constraints specified in 6.8.6.5.2 and 6.8.6.5.3, the behavior is undefined.

<sup>2</sup> [Example 1:

```
#include <new>
void* operator new(std::size_t sz) {
 if (sz == 0)
 return nullptr; // undefined behavior, should return non-null pointer

 return std::malloc(1); // undefined behavior, if successful should return allocation with
 // length in bytes is at least as large as the requested size
}
void operator delete(void* ptr) noexcept {
 throw 0; // undefined behavior, terminates by throwing an exception
}
```

— end example]

**F.2.16****[ub:basic.stc.alloc.zero.dereference]****Specified in:** 6.8.6.5.2

- <sup>1</sup> The pointer returned when invoking an allocation function with a size of zero cannot be dereferenced.

<sup>2</sup> [Example 1:

```
void test()
{
 char* c = static_cast<char*>(operator new(0z));
 c[0] = 'X'; // undefined behavior
}
```

— end example]

**F.2.17****[ub:basic.compound.invalid.pointer]****Specified in:** 6.9.5

- <sup>1</sup> Indirection or the invocation of a deallocation function with a pointer value referencing storage that has been freed has undefined behavior. (Most other uses of such a pointer have implementation-defined behavior.)

<sup>2</sup> [Example 1:

```
void f()
{
 int *x = new int{5};
 delete x;
 int y = *x; // undefined behavior
 delete x; // undefined behavior
}
```

— end example]

**F.2.18****[ub:intro.execution.unsequenced.modification]****Specified in:** 6.10.1

- <sup>1</sup> If a side effect on a memory location (6.8.1) is unsequenced relative to either another side effect on the same memory location or a value computation using the value of any object in the same memory location, and they are not potentially concurrent (6.10.2), the behavior is undefined.

<sup>2</sup> [Example 1:

```
void g(int i) {
 i = 7, i++, i++; // i becomes 9

 i = i++ + 1; // the value of i is incremented
 i = i++ + i; // undefined behavior
 i = i + 1; // the value of i is incremented
}
```

— end example]

### F.2.19

[ub:intro.races.data]

Specified in: 6.10.2.2

- <sup>1</sup> The execution of a program contains a data race if it contains two potentially concurrent conflicting actions, at least one of which is not atomic, and neither happens before the other, except for the special case for signal handlers described in 6.10.2.2. Any such data race results in undefined behavior.

<sup>2</sup> [Example 1:

```
int count = 0;
auto f = [&] { count++; };
std::thread t1{f}, t2{f}, t3{f};
// undefined behavior t1, t2 and t3 have a data race on access of variable count
```

— end example]

### F.2.20

[ub:intro.progress.stops]

Specified in: 6.10.2.3

- <sup>1</sup> The behavior is undefined if a thread of execution that has not terminated stops making execution steps.

<sup>2</sup> [Example 1:

```
bool stop() { return false; }

void busy_wait_thread() {
 while (!stop()); // undefined behavior, thread makes no progress but the loop
} // is not trivial because stop() is not a constant expression

int main() {
 std::thread t(busy_wait_thread);
 t.join();
}
```

— end example]

### F.2.21

[ub:basic.start.main.exit.during.destruction]

Specified in: 6.10.3.1

- <sup>1</sup> If `std::exit` is called to end a program during the destruction of an object with static or thread storage duration, the program has undefined behavior.

<sup>2</sup> [Example 1:

```
#include <cstdlib>

struct Exiter {
 ~Exiter() { std::exit(0); }
};

Exiter ex;

int main() {}
// undefined behavior when destructor of static variable ex is called it will call std::exit
```

— end example]

### F.2.22

[ub:basic.start.term.use.after.destruction]

Specified in: 6.10.3.4

- <sup>1</sup> If a function contains a block-scope object of static or thread storage duration that has been destroyed and the function is called during the destruction of an object with static or thread storage duration, the program has undefined behavior if the flow of control passes through the definition of the previously destroyed block-scope object. Likewise, the behavior is undefined if the block-scope object is used indirectly (i.e., through a pointer) after its destruction.

<sup>2</sup> [Example 1:

```

struct A {};
void f() {
 static A a;
}

struct B {
 B() { f(); }
};
struct C {
 ~C() { f(); }
};

C c;
B b; // call to f() in constructor begins lifetime of a

int main() {}
// undefined behavior, static objects are destructed in reverse order, in this case a then b and
// finally c. When the destructor of c is called, it calls f() which passes through the definition of
// previously destroyed block-scope object
— end example]
```

### F.3 Clause 7: Expressions

[ub.expr]

#### F.3.1

[ub.expr.expr.eval]

Specified in: 7.1

- <sup>1</sup> If during the evaluation of an expression, the result is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

<sup>2</sup> [Example 1:

```

#include <limits>
int main() {
 // Assuming 32-bit int, the range of values is: -2,147,483,648 to 2,147,483,647.
 int x1 = std::numeric_limits<int>::max() + 1;
 // undefined behavior, 2,147,483,647 + 1 is not representable as an int
 int x2 = std::numeric_limits<int>::min() / -1;
 // undefined behavior, -2,147,483,648 / -1 is not representable as an int
}
— end example]
```

#### F.3.2

[ub.expr.basic.lvalue.strict.aliasing.violation]

Specified in: 7.2.1

- <sup>1</sup> If a program attempts to access (3.1) the stored value of an object whose dynamic type is  $T$  through a glvalue whose type is not similar (7.3.6) to  $T$  (or its corresponding signed or unsigned types) the behavior is undefined.

<sup>2</sup> [Example 1:

```

int foo(float* f, int* i) {
 *i = 1;
 *f = 0.f; // undefined behavior, glvalue is not similar to int

 return *i;
}

int main() {
 int x = 0;

 x = foo(reinterpret_cast<float*>(&x), &x);
}
— end example]
```

**F.3.3****[ub:expr.basic.lvalue.union.initialization]****Specified in:** 7.2.1

- <sup>1</sup> If a program invokes a defaulted copy/move constructor or defaulted copy/move assignment operator of a union with an argument that is not an object of a similar type within its lifetime, the behavior is undefined.

<sup>2</sup> [Example 1:

```
union U { int x; };
void f()
{
 char u[sizeof(U)];
 U o = reinterpret_cast<U&>(u); // undefined behavior
}
— end example]
```

**F.3.4****[ub:expr.type.reference.lifetime]****Specified in:** 7.2.2

- <sup>1</sup> Evaluating a reference when an equivalent use of a pointer denoting the same object would be invalid has undefined behavior.

<sup>2</sup> [Example 1:

```
void g()
{
 int* ip = new int(5);
 int& i = *ip;
 delete ip;
 i; // undefined behavior
}
— end example]
```

**F.3.5****[ub:conv.lval.valid.representation]****Specified in:** 7.3.2

- <sup>1</sup> Performing an lvalue-to-rvalue conversion on an object whose value representation is not valid for its type has undefined behavior.

<sup>2</sup> [Example 1:

```
bool f() {
 bool b = true;
 char c = 42;
 memcpy(&b, &c, 1);
 return b; // undefined behavior if 42 is not a valid value representation for bool
}
— end example]
```

**F.3.6****[ub:conv.double.out.of.range]****Specified in:** 7.3.10

- <sup>1</sup> Converting a floating-point value to a type that cannot represent the value has undefined behavior.

<sup>2</sup> [Example 1:

```
#include <limits>

int main() {
 // Assuming 32-bit int, 32-bit float and 64-bit double.
 double d2 = std::numeric_limits<double>::max();
 float f = d2; // undefined behavior on systems where the range of representable values
 // of float is [-max,+max]; on systems where the range of representable
 // values is [-inf,+inf] this would not be undefined behavior
 int i = d2; // undefined behavior, the max value of double is not representable as int
}
— end example]
```

**F.3.7****[ub:conv.fpint.float.not.represented]****Specified in:** 7.3.11

- <sup>1</sup> When converting a floating-point value to an integer type, if the value is not representable in the destination type, the behavior is undefined.

<sup>2</sup> [Example 1:

```
#include <limits>

int main() {
 // Assuming 32-bit int, the range of values is: -2,147,483,648 to
 // 2,147,483,647. Assuming 32-bit float and 64-bit double.
 double d = (double)std::numeric_limits<int>::max() + 1;
 int x1 = d; // undefined behavior, 2,147,483,647 + 1 is not representable as int
}
```

— end example]

**F.3.8****[ub:conv.fpint.int.not.represented]****Specified in:** 7.3.11

- <sup>1</sup> When converting a value of integer or unscoped enumeration type to a floating-point type, if the value is not representable in the destination type the behavior is undefined.

<sup>2</sup> [Example 1:

```
int main() {
 unsigned long long x2 = -1;
 float f = x2; // undefined behavior on systems where f does not include
 // a representation for infinity and the maximum value for float
 // is smaller than the maximum value for unsigned long long
}
```

— end example]

**F.3.9****[ub:conv.ptr.virtual.base]****Specified in:** 7.3.12

- <sup>1</sup> Converting a pointer to a derived class D to a pointer to a virtual base class B that does not point to a valid object within its lifetime has undefined behavior.

<sup>2</sup> [Example 1:

```
struct B {};
struct D : virtual B {};
void f()
{
 D ds[1];
 B* b = &ds[1]; // undefined behavior
}
```

— end example]

**F.3.10****[ub:conv.member.missing.member]****Specified in:** 7.3.13

- <sup>1</sup> The conversion of a pointer to a member of a base class to a pointer to member of a derived class that could not contain that member has undefined behavior.

<sup>2</sup> [Example 1:

```
struct B {};
struct D1 : B { int d1; };
struct D2 : B {};
void f()
{
 int (D1::*pd1) = &D1::d1;
 int (B::*pb) = static_cast<int (B::*)>(pd1);
 int (D2::*pd2) = pb; // undefined behavior
}
```

— end example]

### F.3.11

[ub:expr.call.different.type]

Specified in: 7.6.1.3

- <sup>1</sup> Calling a function through an expression whose function type is not call-compatible with the function type of the called function's definition results in undefined behavior.

<sup>2</sup> [Example 1:

```
using f_float = int (*)(float);
using f_int = int (*)(int);

int f1(float) { return 10; }

int f2(int) { return 20; }

int main() {
 return reinterpret_cast<f_int>(f1)(20); // undefined behavior, the function type of the expression
 // is different from the called function's definition
}
```

— end example]

### F.3.12

[ub:expr.ref.member.not.similar]

Specified in: 7.6.1.5

- <sup>1</sup> In a class member access E1.E2, where E2 is a non-static member, the behavior is undefined if E1 refers to an object whose type is not similar to the type of the expression E1.

<sup>2</sup> [Example 1:

```
struct A { int i; };
struct B { int j; };
A a;
int x = reinterpret_cast<B&>(a).j; // undefined behavior
```

— end example]

### F.3.13

[ub:expr.dynamic.cast.pointer.lifetime]

Specified in: 7.6.1.7

- <sup>1</sup> Evaluating a `dynamic_cast` on a non-null pointer that points to an object (of polymorphic type) of the wrong type or to an object not within its lifetime has undefined behavior.

<sup>2</sup> [Example 1:

```
struct B { virtual ~B(); };
void f() {
 B bs[1];
 B* dp = dynamic_cast<B*>(bs+1); // undefined behavior
}
```

— end example]

### F.3.14

[ub:expr.dynamic.cast.glvalue.lifetime]

Specified in: 7.6.1.7

- <sup>1</sup> Evaluating a `dynamic_cast` on a reference that denotes an object (of polymorphic type) of a type that is not similar to the referenced type or an object not within its lifetime has undefined behavior.

<sup>2</sup> [Example 1:

```
struct B { virtual ~B(); };
void f() {
 B bs[1];
 B& dr = dynamic_cast<B&>(bs[1]); // undefined behavior
}
```

— end example]

**F.3.15****[ub:expr.static.cast.base.class]****Specified in:** 7.6.1.9

- <sup>1</sup> A glvalue of type B can be cast to the type “reference to D” if B is a base class of D, otherwise the behavior is undefined.

<sup>2</sup> [Example 1:

```
struct B {};
struct D1 : B {};
struct D2 : B {};

void f() {
 D1 d;
 B &b = d;
 static_cast<D2 &>(b); // undefined behavior, base class object of type D1 not D2
}
```

— end example]

**F.3.16****[ub:expr.static.cast.enum.outside.range]****Specified in:** 7.6.1.9

- <sup>1</sup> If the enumeration type does not have a fixed underlying type, the value is unchanged if the original value is within the range of the enumeration values (9.8.1), and otherwise, the behavior is undefined.

<sup>2</sup> [Example 1:

```
enum A { e1 = 1, e2 };

void f() {
 enum A a = static_cast<A>(4); // undefined behavior, 4 is not within the range of enumeration values
}
```

— end example]

**F.3.17****[ub:expr.static.cast.fp.outside.range]****Specified in:** 7.6.1.9

- <sup>1</sup> An explicit conversion of a floating-point value that is outside the range of the target type has undefined behavior.

<sup>2</sup> [Example 1: If float does not adhere to ISO/IEC 60559 and cannot represent positive infinity, a sufficiently large double value will be outside the (finite) range of float.

```
void f() {
 double d = FLT_MAX;
 d *= 16;
 float f = static_cast<float>(d); // undefined behavior
}
```

— end example]

**F.3.18****[ub:expr.static.cast.downcast.wrong.derived.type]****Specified in:** 7.6.1.9

- <sup>1</sup> Casting from a pointer to a base class to a pointer to a derived class when there is no enclosing object of that derived class at the specified location has undefined behavior.

<sup>2</sup> [Example 1:

```
struct B {};
struct D1 : B {};
struct D2 : B {};

void f() {
 B *bp = new D1;
 static_cast<D2 *>(bp); // undefined behavior, base class object of type D1 not D2
}
```

— end example]

**F.3.19****[ub:expr.static.cast.does.not.contain.original.member]****Specified in:** 7.6.1.9

- <sup>1</sup> A pointer to member of derived class D can be cast to a pointer to member of base class B (with certain restrictions on *cv* qualifiers) as long as B contains the original member, or is a base or derived class of the class containing the original member; otherwise the behavior is undefined.

<sup>2</sup> [Example 1:

```

struct A {
 char c;
};

struct B {
 int i;
};

struct D : A, B {};

int main() {
 char D::*p1 = &D::c;
 char B::*p2 = static_cast<char B::*>(p1); // undefined behavior, B does not contain the
 // original member c
}

```

— end example]

**F.3.20****[ub:expr.unary.dereference]****Specified in:** 7.6.2.2

- <sup>1</sup> Dereferencing a pointer that does not point to an object or function has undefined behavior.

<sup>2</sup> [Example 1:

```

int f()
{
 int *p = nullptr;
 return *p; // undefined behavior
}

```

— end example]

**F.3.21****[ub:expr.new.non.allocating.null]****Specified in:** 7.6.2.8

- <sup>1</sup> If the allocation function is a non-allocating form (17.6.3.4) that returns null, the behavior is undefined.

<sup>2</sup> [Example 1:

```

#include <new>
[[nodiscard]] void* operator new(std::size_t size, void* ptr) noexcept {
 return nullptr; // undefined behavior, should return non-null pointer
}

```

— end example]

[Example 2:

```

#include <new>

struct A {
 int x;
};

int main() {
 char *p = nullptr;
 A *a = new (p) A; // undefined behavior, non-allocating new returning nullptr
}

```

— end example]

**F.3.22****[ub:expr.delete.mismatch]****Specified in:** 7.6.2.9

- <sup>1</sup> Using array delete on the result of a single object new expression has undefined behavior.

<sup>2</sup> [Example 1:

```
int* x = new int;
delete[] x; // undefined behavior, allocated using single object new expression
— end example]
```

**F.3.23****[ub:expr.delete.array.mismatch]****Specified in:** 7.6.2.9

- <sup>1</sup> Using single object delete on the result of an array new expression has undefined behavior.

<sup>2</sup> [Example 1:

```
int* x = new int[10];
delete x; // undefined behavior, allocated using array new expression
— end example]
```

**F.3.24****[ub:expr.delete.dynamic.type.differ]****Specified in:** 7.6.2.9

- <sup>1</sup> If the static type of the object to be deleted is different from its dynamic type and the selected deallocation function is not a destroying operator delete, the static type shall be a base class of the dynamic type of the object to be deleted and the static type shall have a virtual destructor or the behavior is undefined.

<sup>2</sup> [Example 1:

```
struct B {
 int a;
};

struct D : public B {
 int b;
};

void f() {
 B* b = new D;
 delete b; // undefined behavior, no virtual destructor
}
— end example]
```

**F.3.25****[ub:expr.delete.dynamic.array.dynamic.type.differ]****Specified in:** 7.6.2.9

- <sup>1</sup> In an array delete expression, if the dynamic type of the object to be deleted differs from its static type, the behavior is undefined.

<sup>2</sup> [Example 1:

```
struct B {
 virtual ~B();
 void operator delete[](void*, std::size_t);
};

struct D : B {
 void operator delete[](void*, std::size_t);
};

void f(int i) {
 D* dp = new D[i];
 delete[] dp; // uses D::operator delete[](void*, std::size_t)
 B* bp = new D[i];
 delete[] bp; // undefined behavior
}
```

— end example]

### F.3.26

[ub:expr.mptr.oper.not.contain.member]

Specified in: 7.6.4

- <sup>1</sup> Abbreviating *pm-expression*.*\*cast-expression* as *E1.\*E2*, *E1* is called the object expression. If the dynamic type of *E1* does not contain the member to which *E2* refers, the behavior is undefined.

- <sup>2</sup> [Example 1:

```
struct B {};
struct D : B {
 int x;
};

void f() {
 B *b = new B;
 D *d = static_cast<D *>(b);
 int D::*p = &D::x;
 (*d).*p = 1; // undefined behavior, dynamic type B does not contain x
}
```

— end example]

### F.3.27

[ub:expr.mptr.oper.member.func.null]

Specified in: 7.6.4

- <sup>1</sup> If the second operand in a *.\** expression is the null member pointer value (7.3.13), the behavior is undefined.

- <sup>2</sup> [Example 1:

```
struct S {
 int f();
};

void f() {
 S cs;
 int (S::*pm)() = nullptr;
 (cs.*pm)(); // undefined behavior, the second operand is null
}
```

— end example]

### F.3.28

[ub:expr.mul.div.by.zero]

Specified in: 7.6.5

- <sup>1</sup> Division by zero has undefined behavior.

- <sup>2</sup> [Example 1:

```
int main() {
 int x = 1 / 0; // undefined behavior, division by zero
 double d = 1.0 / 0.0; // undefined behavior on systems where the range of
 // representable values of double is [-max,+max], on systems where
 // representable values is [-inf,+inf] this would not be undefined behavior
}
```

— end example]

### F.3.29

[ub:expr.mul.representable.type.result]

Specified in: 7.6.5

- <sup>1</sup> If the quotient *a/b* is representable in the type of the result, (*a/b*)\**b* + *a*%*b* is equal to *a*; otherwise, the behavior of both *a/b* and *a*%*b* is undefined.

- <sup>2</sup> [Example 1:

```
#include <limits>
```

```
int main() {
 int x = std::numeric_limits<int>::min() / -1;
 // Assuming LP64 -2,147,483,648 which when divided by -1
 // gives us 2,147,483,648 which is not representable by int.
}
—end example]
```

**F.3.30****[ub:expr.add.out.of.bounds]****Specified in:** 7.6.6<sup>1</sup> Creating an out of bounds pointer has undefined behavior.<sup>2</sup> [Example 1:

```
static const int arrs[10]{};

int main() {
 const int *y = arrs + 11; // undefined behavior, creating an out of bounds pointer
}
—end example]
```

[Example 2:

```
static const int arrs[10][10]{};

int main() {
 const int(*y)[10] = arrs + 11; // undefined behavior, creating an out of bounds pointer
}
—end example]
```

**F.3.31****[ub:expr.add.sub.diff.pointers]****Specified in:** 7.6.6<sup>1</sup> Subtracting pointers that are not part of the same array has undefined behavior.<sup>2</sup> [Example 1:

```
#include <cstddef>
void f() {
 int x[2];
 int y[2];
 int* p1 = x;
 int* p2 = y;
 std::ptrdiff_t off = p1 - p2; // undefined behavior, p1 and p2 point to different arrays
}
—end example]
```

**F.3.32****[ub:expr.add.not.similar]****Specified in:** 7.6.6<sup>1</sup> For addition or subtraction of two expressions  $P$  and  $Q$ , if  $P$  or  $Q$  have type “pointer to  $cv$   $T$ ”, where  $T$  and the array element type are not similar (7.3.5), the behavior is undefined.<sup>2</sup> [Example 1:

```
struct S { int i; };
struct T : S { double d; };

void f(const S* s, std::size_t count) {
 for (const S* end = s + count; s != end; ++s) {
 // undefined behavior, T is not similar to S but s points to a T[]
 /* ... */
 }
}
```

```
int main() {
 T test[5];
 f(test, 5);
}
```

— end example]

### F.3.33

[ub:expr.shift.neg.and.width]

Specified in: 7.6.7

- <sup>1</sup> Shifting by a negative amount or equal or greater than the bit-width of a type has undefined behavior.

- <sup>2</sup> [Example 1:

```
int y = 1 << -1; // undefined behavior, shift is negative

static_assert(sizeof(int) == 4 && CHAR_BIT == 8);
int y1 = 1 << 32; // undefined behavior, shift is equal to the bit width of int
int y2 = 1 >> 32; // undefined behavior, shift is equal to the bit width of int
```

— end example]

### F.3.34

[ub:expr.assign.overlap]

Specified in: 7.6.19

- <sup>1</sup> Overlap in the storage between the source and destination can result in undefined behavior.

- <sup>2</sup> [Example 1:

```
int x = 1;
char* c = reinterpret_cast<char*>(&x);
x = *c; // undefined behavior, source overlaps storage of destination
```

— end example]

## F.4 Clause 8: Statements

[ub.stmt]

### F.4.1

[ub:stmt.return.flow.off]

Specified in: 8.8.4

- <sup>1</sup> Flowing off the end of a function other than `main` or a coroutine results in undefined behavior if the return type is not *cv void*.

- <sup>2</sup> [Example 1:

```
int f(int x) {
 if (x)
 return 1;
 // undefined behavior if x is 0
}

void b() {
 int x = f(0); // undefined behavior, using 0 as an argument will cause f(...) to flow
 // off the end without a return statement
}
```

— end example]

### F.4.2

[ub:stmt.return.coroutine.flow.off]

Specified in: 8.8.5

- <sup>1</sup> Flowing off the end of a coroutine function body that does not return `void` has undefined behavior.

- <sup>2</sup> [Example 1:

```
#include <cassert>
#include <coroutine>
#include <iostream>
#include <vector>
```

```

class resumable {
public:
 struct promise_type;
 using coro_handle = std::coroutine_handle<promise_type>;
 resumable(coro_handle handle) : handle_(handle) { assert(handle); }
 resumable(resumable&) = delete;
 resumable(resumable&&) = delete;
 bool resume() {
 if (not handle_.done())
 handle_.resume();
 return not handle_.done();
 }
 ~resumable() { handle_.destroy(); }
 const char* return_val();

private:
 coro_handle handle_;
};

struct resumable::promise_type {
 using coro_handle = std::coroutine_handle<promise_type>;
 const char* string_;
 auto get_return_object() { return coro_handle::from_promise(*this); }
 auto initial_suspend() { return std::suspend_always(); }
 auto final_suspend() noexcept { return std::suspend_always(); }
 void unhandled_exception() { std::terminate(); }
 void return_value(const char* string) { string_ = string; }
};

const char* resumable::return_val() {
 return handle_.promise().string_;
}

resumable foo() {
 std::cout << "Hello" << std::endl;
 co_await std::suspend_always();
 // undefined behavior, falling off the end of coroutine that does not return void
}

int main() {
 resumable res = foo();
 while (res.resume())
 ;
 std::cout << res.return_val() << std::endl;
}

```

— end example]

### F.4.3

[ub:stmt.dcl.local.static.init.recursive]

Specified in: 8.10

<sup>1</sup> If control re-enters the declaration recursively while the variable is being initialized, the behavior is undefined.

<sup>2</sup> [Example 1:

```

int foo(int i) {
 static int s = foo(2 * i); // undefined behavior, recursive call
 return i + 1;
}

```

— end example]

## F.5 Clause 9: Declarations

[ub:dcl]

### F.5.1

[ub:dcl.type.cv.modify.const.obj]

Specified in: 9.2.9.2

<sup>1</sup> Any attempt to modify a const object during its lifetime results in undefined behavior.

<sup>2</sup> [Example 1:

```
const int* ciq = new const int(3); // initialized as required
int* iq = const_cast<int*>(ciq); // cast required
*iq = 4; // undefined behavior, modifies a const object
```

— end example]

## F.5.2

[ub:dcl.type.cv.access.volatile]

Specified in: 9.2.9.2

<sup>1</sup> If an attempt is made to access an object defined with a volatile-qualified type through the use of a non-volatile glvalue, the behavior is undefined.

<sup>2</sup> [Example 1:

```
volatile int x = 0;
int& y = const_cast<int&>(x);
std::cout << y; // undefined behavior, accessing volatile through non-volatile glvalue
```

— end example]

## F.5.3

[ub:dcl.ref.incompatible.function]

Specified in: 9.3.4.3

<sup>1</sup> Initializing a reference to a function with a value that is a function that is not call-compatible (7.6.1.3) with the type of the reference has undefined behavior.

<sup>2</sup> [Example 1:

```
void f(float x);
void (&g)(int) = reinterpret_cast<void (&)(int)>(f); // undefined behavior
```

— end example]

## F.5.4

[ub:dcl.ref.incompatible.type]

Specified in: 9.3.4.3

<sup>1</sup> Initializing a reference to an object with a value that is not type-accessible (7.2.1) through the type of the reference has undefined behavior.

<sup>2</sup> [Example 1:

```
float g;
int& i = reinterpret_cast<int&>(g); // undefined behavior
```

— end example]

## F.5.5

[ub:dcl.ref.uninitialized.reference]

Specified in: 9.3.4.3

<sup>1</sup> Evaluating a reference prior to initializing that reference has undefined behavior.

<sup>2</sup> [Example 1:

```
extern int &ir1;
int i2 = ir1; // undefined behavior, ir1 not yet initialized
int i3 = 17;
int &ir1 = i3;
```

— end example]

## F.5.6

[ub:dcl.fct.def.coroutine.resume.not.suspended]

Specified in: 9.6.4

<sup>1</sup> Invoking a resumption member function for a coroutine that is not suspended results in undefined behavior.

<sup>2</sup> [Example 1:

```
#include <coroutine>
```

```

struct minig {
 struct promise_type {
 int val;
 minig get_return_object() { return { *this }; }
 constexpr suspend_always initial_suspend() noexcept { return {}; }
 constexpr suspend_always final_suspend() noexcept { return {}; }
 constexpr void return_void() noexcept {}
 [[noreturn]] void unhandled_exception() noexcept { throw; }
 suspend_always yield_value(int v) noexcept {
 val = v;
 return {};
 }
 };
 using HDL = coroutine_handle<promise_type>;
 HDL coro;
 minig(promise_type& p) : coro(HDL::from_promise(p)) {}
 ~minig() { coro.destroy(); }
 bool move_next() {
 coro.resume();
 return !coro.done();
 }
 int current_value() { return coro.promise().val; }
};

static minig f(int n) {
 for (int i = 0; i < n; ++i)
 co_yield i;
}

int main() {
 auto g = f(10);
 int sum = 0;
 while (g.move_next())
 sum += g.current_value();

 g.move_next(); // undefined behavior, will call coro.resume() but final_suspend
 // has already returned, even though it returned suspend_always

 return sum;
}
— end example]

```

**F.5.7**

[ub:dcl.fct.def.coroutine.destroy.not.suspended]

Specified in: 9.6.4

<sup>1</sup> Invoking `destroy()` on a coroutine that is not suspended has undefined behavior.<sup>2</sup> [Example 1:

```

#include <coroutine>

struct minig {
 struct promise_type {
 int val;
 minig get_return_object() { return { *this }; }
 constexpr suspend_always initial_suspend() noexcept { return {}; }
 constexpr suspend_always final_suspend() noexcept { return {}; }
 constexpr void return_void() noexcept {}
 [[noreturn]] void unhandled_exception() { throw; }
 suspend_always yield_value(int v) noexcept {
 val = v;
 return {};
 }
 };
};
using HDL = coroutine_handle<promise_type>;

```

```

HDL coro;
minig(promise_type& p) : coro(HDL::from_promise(p)) {}
~minig() { coro.destroy(); }
bool move_next() {
 coro.resume();
 return !coro.done();
}
int current_value() {
 // this coroutine is not suspended therefore a call to destroy has undefined behavior
 coro.destroy();
 return coro.promise().val;
}
};

static minig f(int n) {
 for (int i = 0; i < n; ++i)
 co_yield i;
}

int main() {
 auto g = f(10);
 int sum = 0;
 while (g.move_next())
 sum += g.current_value();

 return sum;
}
— end example]

```

**F.5.8**

[ub:dcl.attr.assume.false]

**Specified in:** 9.13.3

- <sup>1</sup> If an assumption expression would not evaluate to true at the point where it appears the behavior is undefined.
- <sup>2</sup> [Example 1:

```

int g(int x) {
 [[assume(x >= 0)]];
 return x/32;
}

int f() {
 return g(-10); // undefined behavior, assumption in g is false
}
— end example]

```

**F.5.9**

[ub:dcl.attr.noreturn.eventually.returns]

**Specified in:** 9.13.10

- <sup>1</sup> If a function **f** is called where **f** was previously declared with the **noreturn** attribute and **f** eventually returns, the behavior is undefined.
- <sup>2</sup> [Example 1:

```

[[noreturn]] void f(int i) {
 if (i > 0)
 throw "positive";
}

int main() {
 f(0); // undefined behavior, returns from a [[noreturn]] function
}
— end example]

```

**F.6 Clause 11: Classes**

[ub.class]

**F.6.1**

[ub:class.dtor.no.longer.exists]

Specified in: 11.4.7

- <sup>1</sup> Once a destructor is invoked for an object, the object's lifetime has ended; the behavior is undefined if the destructor is invoked for an object whose lifetime has ended.

<sup>2</sup> [Example 1:

```

 struct A {
 ~A() {}
 };

 int main() {
 A a;
 a.~A();
 } // undefined behavior, lifetime of a already ended before implicit destructor
— end example]
```

**F.6.2**

[ub:class.abstract.pure.virtual]

Specified in: 11.7.4

- <sup>1</sup> Calling a pure virtual function from a constructor or destructor in an abstract class has undefined behavior.

<sup>2</sup> [Example 1:

```

 struct B {
 virtual void f() = 0;
 B() {
 f(); // undefined behavior, f is pure virtual and is being called from the constructor
 }
 };

 struct D : B {
 void f() override;
 };
— end example]
```

**F.6.3**

[ub:class.base.init.mem.fun]

Specified in: 11.9.3

- <sup>1</sup> Calling a member function before all the *mem-initializers* for base classes have completed has undefined behavior.

<sup>2</sup> [Example 1:

```

 class A {
 public:
 A(int);
 };

 class B : public A {
 int j;

 public:
 int f();
 B()
 : A(f()), // undefined behavior, calls member function but base A not yet initialized
 j(f()) {} // defined, bases are all initialized
 };

 class C {
 public:
 C(int);
 };

```

```

class D : public B, C {
 int i;

public:
 D()
 : C(f()), // undefined behavior, calls member function but base C not yet initialized
 i(f()) {} // defined, bases are all initialized
};
— end example]

```

**F.6.4****[ub:class.ctor.before.ctor]****Specified in:** 11.9.5

- <sup>1</sup> For an object with a non-trivial constructor, referring to any non-static member or base class of the object before the constructor begins execution results in undefined behavior.

- <sup>2</sup> [Example 1:

```

struct W {
 int j;
};
struct X : public virtual W {};
struct Y {
 int *p;
 X x;
 Y() : p(&x.j) { // undefined behavior, x is not yet constructed
 }
};
— end example]

```

**F.6.5****[ub:class.ctor.after.dtor]****Specified in:** 11.9.5

- <sup>1</sup> For an object with a non-trivial destructor, referring to any non-static member or base class of the object after the destructor finishes execution has undefined behavior.

- <sup>2</sup> [Example 1:

```

struct X {
 int i;
 ~X(); // non-trivial
};
X& g()
{
 static X x;
 return x;
}
void f()
{
 X* px = &g();
 px->~X();
 int j = px->i; // undefined behavior
}
— end example]

```

**F.6.6****[ub:class.ctor.convert.pointer]****Specified in:** 11.9.5

- <sup>1</sup> Converting a pointer to a base class of an object, when construction of that object has not started or destruction of that object has finished, has undefined behavior.

- <sup>2</sup> [Example 1:

```

struct A { };
struct B : virtual A { };
struct C : B { };

```

```

struct D : virtual A { D(A*); };
struct X { X(A*); };

struct E : C, D, X {
 E() : D(this), // undefined behavior, upcast from E* to A* might use path E* → D* → A*
 // but D is not constructed

 // “D((C*)this)” would be defined, E* → C* is defined because E() has started,
 // and C* → A* is defined because C is fully constructed

 X(this) {} // defined, upon construction of X, C/B/D/A sublattice is fully constructed
};
— end example]

```

**F.6.7****[ub:class.cdtor.form.pointer]****Specified in:** 11.9.5

- <sup>1</sup> When forming a pointer to a direct non-static member of a class, construction must have started and destruction must not have finished otherwise the behavior is undefined.

<sup>2</sup> [Example 1:

```

struct A {
 int i = 0;
};
struct B {
 int *p;
 A a;
 B() : p(&a.i) {} // undefined behavior
};
— end example]

```

**F.6.8****[ub:class.cdtor.virtual.not.x]****Specified in:** 11.9.5

- <sup>1</sup> When a virtual function is called directly or indirectly from a constructor or from a destructor, including during the construction or destruction of the class's non-static data members, and the object to which the call applies is the object (call it **x**) under construction or destruction, the function called is the final overrider in the constructor's or destructor's class and not one overriding it in a more-derived class. If the virtual function call uses an explicit class member access (7.6.1.5) and the object expression refers to the complete object of **x** or one of that object's base class subobjects but not **x** or one of its base class subobjects, the behavior is undefined.

<sup>2</sup> [Example 1:

```

struct V {
 virtual void f();
 virtual void g();
};

struct A : virtual V {
 virtual void f();
};

struct B : virtual V {
 virtual void g();
 B(V *, A *);
};

struct D : A, B {
 virtual void f();
 virtual void g();
 D() : B((A *)this, this) {}
};

```

```

B::B(V *v, A *a) {
 f(); // calls V::f, not A::f
 g(); // calls B::g, not D::g
 v->g(); // v is base of B, the call is defined, calls B::g
 a->f(); // undefined behavior, a's type not a base of B
}

```

— end example]

### F.6.9

[ub:class.ctor.typeid]

Specified in: 11.9.5

- <sup>1</sup> If the operand of `typeid` refers to the object under construction or destruction and the static type of the operand is neither the constructor or destructor's class nor one of its bases, the behavior is undefined.
- <sup>2</sup> [Example 1:

```

struct V {
 virtual void f();
};

struct A : virtual V {};
struct B : virtual V {
 B(V *, A *);
};

struct D : A, B {
 D() : B((A *)this, this) {}
};

B::B(V *v, A *a) {
 typeid(*this); // std::type_info for B
 typeid(*v); // defined, *v has type V, a base of B yields std::type_info for B
 typeid(*a); // undefined behavior, type A not a base of B
}

```

— end example]

### F.6.10

[ub:class.ctor.dynamic.cast]

Specified in: 11.9.5

- <sup>1</sup> If the operand of the `dynamic_cast` refers to the object under construction or destruction and the static type of the operand is not a pointer to or object of the constructor or destructor's own class or one of its bases, the `dynamic_cast` results in undefined behavior.
- <sup>2</sup> [Example 1:

```

struct V {
 virtual void f();
};

struct A : virtual V {};
struct B : virtual V {
 B(V *, A *);
};

struct D : A, B {
 D() : B((A *)this, this) {}
};

B::B(V *v, A *a) {
 dynamic_cast<B *>(v); // defined, v of type V*, V base of B results in B*
 dynamic_cast<B *>(a); // undefined behavior, a has type A*, A not a base of B
}

```

— end example]

**F.7 Clause 13: Templates****[ub.temp]****F.7.1****[ub:temp.inst.inf.recursion]****Specified in:** 13.9.2<sup>1</sup> The result of an infinite recursion in template instantiation is undefined.<sup>2</sup> [Example 1:

```

template <class T>
class X {
 X<T> *p; // OK
 X<T *> a; // implicit instantiation of X<T> requires
 // the implicit instantiation of X<T*> which requires
 // the implicit instantiation of X<T**> which ...
};

int main() {
 X<int> x; // undefined behavior, instantiation will lead to infinite recursion
}

```

— end example]

**F.8 Clause 14: Exception handling****[ub.except]****F.8.1****[ub:except.handle.handler.ctor.dtor]****Specified in:** 14.4<sup>1</sup> Referring to any non-static member or base class of an object in the handler for a *function-try-block* of a constructor or destructor for that object results in undefined behavior.<sup>2</sup> [Example 1:

```

#include <iostream>

struct A {
 A() try : x(0 ? 1 : throw 1) {
 } catch (int) {
 std::cout << "y: " << y << std::endl; // undefined behavior, referring to non-static member y in
 // the handler of function-try-block
 }
 int x;
 int y = 42;
};

```

— end example]

# Annex G

## (informative)

### Ill-formed, no diagnostic required [ifndr]

#### G.1 General [ifndr.general]

- <sup>1</sup> This Annex documents rules for which no diagnostic is required, called out in [Clause 4](#) through [Clause 15](#) using the following phrases:

- (1.1) — no diagnostic is required
- (1.2) — no diagnostic required
- (1.3) — a diagnostic is required only if

Each entry contains a title, a cross-reference, a summary of the circumstances, and code examples. The code examples are not intended to exhaustively cover all possible ways of invoking that case.

#### G.2 Clause 5: Lexical conventions [ifndr.lex]

##### G.2.1 [ifndr:lex.name.reserved]

Specified in: [5.11](#)

- <sup>1</sup> Using an identifier reserved for use by C++ is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

```
int _z; // IFNDR, _z is reserved because it starts with _ at global scope

int main() {
 int __x; // IFNDR, __x is reserved because it starts with __
 int _Y; // IFNDR, _Y is reserved because it starts with _ followed by a capital letter
 int x__y; // IFNDR, x__y is reserved because it contains __
}
```

— end example]

#### G.3 Clause 6: Basics [ifndr.basic]

##### G.3.1 [ifndr:basic.link.consistent.types]

Specified in: [6.7](#)

- <sup>1</sup> Having multiple declarations of the same entity with different kinds when those declarations are not reachable from one another is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

Module interface of M:

```
void g(); // #1
void h(); // #2
template <typename T> int j; // #3
```

Module interface of N:

```
int g(); // same entity as #1, different type
namespace h {} // same entity as #2, not both namespaces
template <int X> int j; // same entity as #3, non-equivalent template heads
```

Other translation unit:

```
import M;
import N;
// IFNDR due to the mismatched pairs above
```

— end example]

### G.3.2

[ifndr:basic.def.odr.minimum.one.def]

Specified in: 6.3

- <sup>1</sup> Not having a definition for a function or variable that is odr-used from a non-discarded statement (8.5.2) is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

```
auto f() {
 struct A {};
 return A{};
}
decltype(f()) g();
auto x = g(); // IFNDR, function g is used but not defined in this translation unit, and cannot
 // be defined in any other translation unit because its type does not have linkage
```

— end example]

### G.3.3

[ifndr:basic.def.odr.injected.match]

Specified in: 6.3

- <sup>1</sup> Defining a definable item D with an injected declaration (7.7.6) in one translation unit and a definition in a different translation unit when D is not attached to a named module or neither definition is reachable from the other is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

Translation unit #1:

```
struct S;
constexpr { std::meta::define_aggregate(~~S, {}); } // #1
```

Translation unit #2:

```
struct S {}; // IFNDR, definition here, injected declaration at #1
```

— end example]

### G.3.4

[ifndr:basic.def.odr.maximum.one.def]

Specified in: 6.3

- <sup>1</sup> If there are definitions in different translation units of a non-inline non-templated function or variable that are not attached to a named module or are not reachable from one another, the program is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

Translation unit #1:

```
export module M:A; // module partition
void f() {} // #1
void g() {} // #2
```

Translation unit #2:

```
export module M:B; // module partition
void f() {} // IFNDR, #1 not reachable
```

Translation unit #3:

```
export module M; // primary module interface unit
export import :A;
void g(); // error: #2 is reachable
```

— end example]

### G.3.5

[ifndr:basic.def.odr.definition.matches]

Specified in: 6.3

- <sup>1</sup> If there are definitions in different translation units of a definable item D where

- (1.1) — D is not defined by an injected declaration (7.7.6),
  - (1.2) — D is not an inline or templated function or variable, and
  - (1.3) — D is not attached to a named module or the declarations are not reachable from one another,
- that do not satisfy the matching rules described in 6.3, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
inline void f() {} // #1
inline void g() {} // #2
inline void h() {[]{}();} // #3
namespace { int i = 0; }
inline void j() {++i;} // #4
```

Translation unit #2:

```
inline void f() {} // OK, same as #1
inline void g() {}; // IFNDR, different sequence of tokens than #2
inline void h() {[]{}();} // IFNDR, closure has different type than #3
namespace { int i = 0; }
inline void j() {++i;} // IFNDR, i refers to different entity than in #4
```

— end example]

### G.3.6

[ifndr:basic.def.odr.unnamed.enum.same.type]

Specified in: 6.3

- <sup>1</sup> Having multiple unnamed enumeration definitions in the same scope that have the same first enumerator name and do not have typedef names for linkage purposes (9.8.1) that are not the same enumeration is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Source file "a.h":

```
enum { a };
```

Source file "b.h":

```
enum { a, b };
```

Source file "main.cpp":

```
import "a.h";
import "b.h";
auto n = decltype(a)::b; // IFNDR, more than one unnamed enum definition reachable at
 // this point but their types are not the same
```

— end example]

### G.3.7

[ifndr:basic.contract.vastart.contract.predicate]

Specified in: 6.11.1

- <sup>1</sup> The use of `va_start` (17.14.2) within the predicate of a contract assertion is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
void f(...)
{
 va_list args;
 contract_assert((va_start(const_cast<decltype(args)>(args)), true)) // IFNDR
}
```

— end example]

### G.3.8

[ifndr:basic.contract.handler.replacing.nonreplaceable]

Specified in: 6.11.3

- <sup>1</sup> On platforms where the contract-violation handler is not replaceable (9.6.5) a function declaration which could be such a replacement function is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
#include <contracts>
void handle_contract_violation(const std::contracts::contract_violation& violation);
 // IFNDR, if contract-violation handler is not replaceable
— end example]
```

### G.3.9

[ifndr:class.member.lookup.name.refers.diff.decl]

Specified in: 6.5.2

<sup>1</sup> A name *N* used in a class *S* referring to a different declaration when resolved in its context than when re-evaluated in the completed scope of *S* is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
struct foo {};

struct bar {
 foo *m_foo;

 foo *foo() {
 return m_foo;
 } // IFNDR, foo now refers to member function foo() while previously referred to struct foo
};
— end example]
```

[Example 2:

```
struct B {
 static int f();
};

struct D : public B {
 using B::f;
 int g(decltype(f()) x) {
 return 0;
 } // IFNDR, decltype(f()) will refer to B::f() here but if
 // moved to the end of D it would refer to D::f()
 static float f();
};

int main() {
 D d;

 return d.g(0);
}
— end example]
```

## G.4 Clause 7: Expressions

[ifndr.expr]

### G.4.1

[ifndr:expr.prim.req.always.sub.fail]

Specified in: 7.5.8.1

<sup>1</sup> If the substitution of template arguments into a *requirement* would always result in a substitution failure, the program is ill-formed; no diagnostic required.

<sup>2</sup> [Example 1:

```
template <typename T> concept C = requires {
 new int[-(int)sizeof(T)]; // IFNDR, the size of the allocation is required to be greater
 // than zero but can never be
};
— end example]
```

**G.5 Clause 8: Statements****[ifndr.stmt]****G.5.1****[ifndr:stmt.ambig.bound.diff.parse]****Specified in: 8.11**

- <sup>1</sup> If, during parsing, a name in a template parameter is bound differently than it would be bound during a trial parse, the program is ill-formed. No diagnostic is required.

<sup>2</sup> [Example 1:

```
template <int N> struct A { const static int a = 20; };

template <> struct A<100> { using a = char; };

const int x = 10;

int main() {
 using T = const int;
 T(x)
 (100), (y)(A<x>::a); // IFNDR, during trial parse the template parameter x is bound to
 // the global x later during parsing the template parameter x
 // is bound to the local x declared on the same line
}
```

— end example]

**G.6 Clause 9: Declarations****[ifndr.dcl]****G.6.1****[ifndr:dcl.constinit.specifier.not.reachable]****Specified in: 9.2.7**

- <sup>1</sup> If the initializing declaration of a variable without the `constinit` specifier has the `constinit` specifier applied to declarations that are not reachable from that initializing declaration, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
int x = 5; // initializing declaration of x
```

Translation unit #2:

```
extern constinit int x; // IFNDR, not reachable from initializing declaration of x
```

— end example]

**G.6.2****[ifndr:dcl.inline.missing.on.definition]****Specified in: 9.2.8**

- <sup>1</sup> If a function or variable with external or module linkage is declared inline but there is no inline declaration reachable from the end of some definition domain the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
inline int f();
```

Translation unit #2:

```
int f() { return 17; }
// IFNDR, end of definition domain but no inline declaration of f is reachable
```

— end example]

**G.6.3****[ifndr:dcl.fct.default.inline.same.defaults]****Specified in: 9.3.4.7**

- <sup>1</sup> If the accumulated set of default arguments for a given inline function with definitions in multiple translation units is different at the end of different translation units, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
inline int f(int x, int y = 2);
inline int f(int x = 1, int y);
// IFNDR, default arguments of f are 1 and 2
```

Translation unit #2:

```
inline int f(int x = 3, int y = 4);
// IFNDR, default arguments of f are 3 and 4
— end example]
```

## G.6.4

[ifndr:dcl.contract.func.mismatched.contract.specifiers]

Specified in: 9.4.1

- <sup>1</sup> If two different first declarations of a function (which must therefore not be reachable from one another) do not have equivalent function contract specifiers the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
int f(int x) pre(x >= 0); // IFNDR, pre present, not present in the other first declaration of f
int g(int x) pre(x == 0); // IFNDR, pre differs from the other first declaration of g
int h(int x) pre(x <= 0); // OK, pre equivalent to pre on the other first declaration of h
```

Translation unit #2:

```
int f(int x); // IFNDR, pre not present, present in the other first declaration of f
int g(int x) pre(x != 0); // IFNDR, pre differs from the other first declaration of g
int h(int y) pre(y <= 0); // OK, pre equivalent to pre on the other first declaration of h
— end example]
```

## G.6.5

[ifndr:dcl.fct.def.replace.bad.replacement]

Specified in: 9.6.5

- <sup>1</sup> A declaration of a replaceable function that is inline, not attached to the global module, does not have C++ language linkage, does not have the required return type, or is not a valid redeclaration of the corresponding declaration in a standard library header (if there is one) then the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
extern "C" // IFNDR, wrong language linkage
inline // IFNDR, inline
int // IFNDR, wrong return type
handle_contract_violation(const std::contracts::contract_violation&) {}

void* operator new(decltype(sizeof(0))) noexcept; // IFNDR, mismatched exception specification to
 // declaration in <new>
```

— end example]

## G.6.6

[ifndr:dcl.link.mismatched.language.linkage]

Specified in: 9.12

- <sup>1</sup> If two declarations of an entity do not have the same language linkage and neither is reachable from the other the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
extern "C" { void f(); }
```

Translation unit #2:

```
extern "C++" { void f(); } // IFNDR, different language linkage
— end example]
```

**G.6.7****[ifndr:dcl.align.diff.translation.units]****Specified in:** 9.13.2

- <sup>1</sup> No diagnostic is required if declarations of an entity have different *alignment-specifiers* in different translation units.

<sup>2</sup> [Example 1:

Translation unit #1:

```
struct S { int x; } s, *p = &s;
```

Translation unit #2:

```
struct alignas(16) S; // IFNDR, definition of S lacks alignment
extern S* p;
```

— end example]

**G.6.8****[ifndr:dcl.attr.indet.mismatched.declarations]****Specified in:** 9.13.6

- <sup>1</sup> If two first declarations of a function declare a function parameter with mismatched uses of the *indeterminate* attribute, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
int h(int x [[indeterminate]]); // IFNDR, mismatched [[indeterminate]] to other first declaration of h
```

Translation unit #2:

```
int h(int x); // IFNDR, mismatched [[indeterminate]] to other first declaration of h
```

— end example]

**G.6.9****[ifndr:dcl.attr.noreturn.trans.unit.mismatch]****Specified in:** 9.13.10

- <sup>1</sup> No diagnostic is required if a function is declared in one translation unit with the *noreturn* attribute but has declarations in other translation units without the attribute.

<sup>2</sup> [Example 1:

Translation unit #1:

```
[[noreturn]] void f() {}
```

Translation unit #2:

```
void f(); // IFNDR, declared without noreturn
```

— end example]

**G.7 Clause 10: Modules****[ifndr.module]****G.7.1****[ifndr:module.unit.reserved.identifiers]****Specified in:** 10.1

- <sup>1</sup> Specifying a *module-name* beginning with an identifier consisting of *std* followed by zero or more digits, or containing a reserved identifier (5.10) in a *module-declaration* is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
module std; // IFNDR, std is not allowed at the beginning
module module; // IFNDR, module is a reserved identifier
module std0; // IFNDR, std followed by digits is not allowed at the beginning
export module _Test; // IFNDR, _Test is a reserved identifier
export module te__st; // IFNDR, te__st is a reserved identifier
```

— end example]

**G.7.2****[ifndr:module.unit.named.module.no.partition]****Specified in: 10.1**

<sup>1</sup> Having multiple primary module interface units for a named module is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
module A;
export import :Internals; // IFNDR, module partition not allowed
— end example]
```

**G.7.3****[ifndr:module.unit.unexported.module.partition]****Specified in: 10.1**

<sup>1</sup> If a module partition of a module that is a module interface unit but is not directly or indirectly exported by the primary module interface unit (10.3), the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
export module M; // primary module interface unit
export import :A;
```

Translation unit #2:

```
export module M:A; // OK, directly exported by M
export import :B;
```

Translation unit #3:

```
export module M:B; // OK, indirectly exported by M
```

Translation unit #4:

```
export module M:C; // IFNDR, not directly or indirectly exported by M
— end example]
```

**G.7.4****[ifndr:module.private.frag.other.module.units]****Specified in: 10.5**

<sup>1</sup> If a module has a private module fragment and there is another module unit of that module, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Translation unit #1:

```
export module M;
module :private; // private module fragment
```

Translation unit #2:

```
module M:A; // IFNDR, partition of M with private module fragment
— end example]
```

**G.8 Clause 11: Classes****[ifndr.class]****G.8.1****[ifndr:class.base.init.delegate.itself]****Specified in: 11.9.3**

<sup>1</sup> If a constructor delegates to itself directly or indirectly, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
struct C {
 C(int) { } // #1: non-delegating constructor
 C(): C(42) { } // #2: delegates to #1
 C(char c) : C(42.0) { } // #3: IFNDR due to recursion with #4
 C(double d) : C('a') { } // #4: IFNDR due to recursion with #3
};
— end example]
```

**G.8.2****[ifndr:class.virtual.pure.or.defined]****Specified in:** 11.7.3

- <sup>1</sup> If a virtual function that is not pure has no definition, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
class A {
 virtual void f();
};

int main() {
 A a; // IFNDR, virtual function that is not pure but has no definition
}
```

— end example]

**G.9 Clause 12: Overloading****[ifndr.over]****G.9.1****[ifndr:over.literal.reserved]****Specified in:** 12.6

- <sup>1</sup> Some literal suffix identifiers are reserved for future standardization. A declaration whose *literal-operator-id* uses such a literal suffix identifier is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
float operator "E(const char*); // IFNDR, reserved literal suffix
double operator " _Bq(long double); // IFNDR, uses the reserved identifier _Bq
```

— end example]

**G.10 Clause 13: Templates****[ifndr.temp]****G.10.1****[ifndr:temp.pre.reach.def]****Specified in:** 13.1

- <sup>1</sup> A definition of a function template, member function of a class template, variable template, or static data member of a class template that is not reachable from the end of every definition domain (6.3) in which it is implicitly instantiated (13.9.2) and whose corresponding specialization is not explicitly instantiated (13.9.3) in some translation unit is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Source file "a.h":

```
template <typename T>
void f();
```

Source file "a.cpp":

```
#include "a.h"
int main() {
 f<int>(); // IFNDR, function template implicitly instantiated but not reachable definition
}
```

— end example]

**G.10.2****[ifndr:temp.arg.template.sat.constraints]****Specified in:** 13.4.4

- <sup>1</sup> Any partial specializations (13.7.6) associated with the primary template are considered when a specialization based on the template template-parameter is instantiated. If a specialization is not reachable from the point of instantiation, and it would have been selected had it been reachable, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
template<class T> struct A {
 int x;
};
```

```

template<template<class U> class V> struct C {
 V<int> y;
 V<int*> z;
};

C<A> c;

// IFNDR, specialization is not reachable from point of instantiation above and it would have
// been selected if it had
template<class T> struct A<T*> {
 long x;
};
— end example]

```

**G.10.3****[ifndr:temp.constr.atomic.equiv.but.not.equiv]****Specified in:** 13.5.2.3

- <sup>1</sup> If the validity or meaning of the program depends on whether two atomic constraints are equivalent, and they are functionally equivalent but not equivalent, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```

template <int N> concept Add1 = true;
template <unsigned N> void f2()
requires Add1<2 * N>;
template <unsigned N> int f2()
requires Add1<N * 2> && true;
void h2() {
 f2<0>(); // IFNDR, requires determination of subsumption between atomic constraints
 // that are functionally equivalent but not equivalent
}

```

— end example]

**G.10.4****[ifndr:temp.constr.atomic.sat.result.diff]****Specified in:** 13.5.2.3

- <sup>1</sup> If, at different points in the program, the satisfaction result is different for identical atomic constraints and template arguments, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```

template<class T>
concept Complete = sizeof(T) == sizeof(T);

struct A;
static_assert(!Complete<A>); // #1
struct A {};
static_assert(Complete<A>); // IFNDR, satisfaction result differs from point #1

```

— end example]

**G.10.5****[ifndr:temp.constr.normal.invalid]****Specified in:** 13.5.4

- <sup>1</sup> If during constraint normalization any such substitution results in an invalid type or expression, the program is ill-formed, no diagnostic is required.

<sup>2</sup> [Example 1:

```

template<typename T> concept A = T::value || true;
template<typename U> concept B = A<U*>;
template<typename V> concept C = B<V&>; // IFNDR, it would form the invalid type V&*
 // in the parameter mapping

```

— end example]

**G.10.6****[ifndr:temp.spec.partial.general.partial.reachable]****Specified in:** 13.7.6.1

- <sup>1</sup> If a partial specialization is not reachable from a use of a template specialization that would make use of that partial specialization as the result of an implicit or explicit instantiation, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
template<typename T> class X{
public:
 void foo(){};
};
```

```
template class X<void*>; // IFNDR, explicit instantiation and partial specialization is not reachable
```

```
template<typename T> class X<T*>{
public:
 void baz();
};
```

— end example]

**G.10.7****[ifndr:temp.over.link.equiv.not.equiv]****Specified in:** 13.7.7.2

- <sup>1</sup> If the validity or meaning of the program depends on whether two constructs are equivalent, and they are functionally equivalent but not equivalent, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
template <int I>
struct A{};
```

*// IFNDR, the following declarations are functionally equivalent but not equivalent*

```
template <int I> void f(A<I>, A<I+10>);
template <int I> void f(A<I>, A<I+1+2+3+4>);
```

— end example]

**G.10.8****[ifndr:temp.res.general.default.but.not.found]****Specified in:** 13.8.1

- <sup>1</sup> If the validity or meaning of the program would be changed by considering a default argument or default template argument introduced in a declaration that is reachable from the point of instantiation of a specialization (13.8.4.1) but is not found by lookup for the specialization, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
void f(long); // #1
void f(int, int); // #2
template<typename T> void g(T t) { f(t); }
void f(int, int = 0); // #3
void h() { g(0); } // IFNDR, selects #3 here but selects #1 using lookup for g<int>
```

— end example]

**G.10.9****[ifndr:temp.point.diff.pt.diff.meaning]****Specified in:** 13.8.4.1

- <sup>1</sup> A specialization for a class template has at most one point of instantiation within a translation unit. A specialization for any template may have points of instantiation in multiple translation units. If two different points of instantiation give a template specialization different meanings according to the one-definition rule (6.3), the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Source file "a.h":

```
#include <type_traits>
```

```

template <typename T, typename Enabler = void>
struct is_complete : std::false_type {};

template <typename T>
struct is_complete<T, std::void_t<decltype(sizeof(T) != 0)>> : std::true_type {};

```

Source file "a.cpp":

```

#include "a.h"
struct X;
static_assert(!is_complete<X>::value); // IFNDR, different specialization selected in "b.cpp"

```

Source file "b.cpp":

```

#include "a.h"
struct X { };
static_assert(is_complete<X>::value); // IFNDR, different specialization selected in "a.cpp"

```

— end example]

## G.10.10

[ifndr:temp.dep.candidate.different.lookup.different]

Specified in: 13.8.4.2

- <sup>1</sup> If considering all function declarations with external linkage in the associated namespaces in all translations would make a dependent call (13.8.3) ill-formed or find a better match, the program is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

Translation unit #1:

```

namespace A {
 struct S {};
 void f(S&, long x, int y); // #3
 void g(S&, int x); // #4
}

```

Translation unit #2:

```

namespace A {
 struct S {};
 void f(S&, int x, long y); // #5
 void g(S&, long x); // #6
}
template <typename T>
void h(T& t)
{
 f(t, 1, 1); // Selects #5 in h<A::S>, would be ambiguous call if all declarations were considered.
 g(t, 1); // Selects #6 in h<A::S>, would select #4 if all declarations were considered.
}

```

— end example]

## G.10.11

[ifndr:temp.explicit.decl.implicit.inst]

Specified in: 13.9.3

- <sup>1</sup> If an entity that is the subject of an explicit instantiation declaration and that is also used in a way that would otherwise cause an implicit instantiation (13.9.2) in the translation unit is not the subject of an explicit instantiation definition somewhere in the program the program is ill-formed, no diagnostic required.

- <sup>2</sup> [Example 1:

```

extern template class std::vector<int>; // explicit instantiation declaration

int main() {
 std::cout << std::vector<int>().size(); // IFNDR, implicit instantiation but no explicit
 // instantiation definition
}

```

— end example]

**G.10.12****[ifndr:temp.expl.spec.unreachable.declaration]****Specified in:** 13.9.4

- <sup>1</sup> If an implicit instantiation of a template would occur and there is an unreachable explicit specialization that would have matched, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

Source file "a.h":

```
template <typename T> struct S {};
```

Translation unit #2:

```
#include "a.h"
template <> struct S<int> { int oops; }; // #1
```

Translation unit #3:

```
#include "a.h"
S<int> s; // IFNDR, #1 is not reachable but would have matched
```

— end example]

**G.10.13****[ifndr:temp.expl.spec.missing.definition]****Specified in:** 13.9.4

- <sup>1</sup> If an explicit specialization of a template is declared but there is no definition provided for that specialization, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
template <typename T> int f(T&&) { return 0; }
template <> int f<int>(int&&);
int j = f(1); // IFNDR, odr-use of f<int> with no definition
```

— end example]

**G.10.14****[ifndr:temp.deduct.general.diff.order]****Specified in:** 13.10.3.1

- <sup>1</sup> If substitution into different declarations of the same function template would cause template instantiations to occur in a different order or not at all, the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
template <class T> struct A { using X = typename T::X; };
template <class T> typename T::X h(typename A<T>::X); // #1
template <class T> auto h(typename A<T>::X) -> typename T::X; // redeclaration #2
template <class T> void h(...) { }
```

```
void x() {
 h<int>(0); // Substituting into #1 forms an invalid type from T::X and does
 // not attempt to instantiate A.
 // Substituting into #2 instantiates A<T>, which is ill-formed.
}
```

— end example]

**G.11 Clause 15: Preprocessing directives****[ifndr.cpp]****G.11.1****[ifndr:cpp.cond.defined.after.macro]****Specified in:** 15.2

- <sup>1</sup> If the expansion of a macro produces the preprocessing token **defined** the program is ill-formed, no diagnostic required.

<sup>2</sup> [Example 1:

```
#define A defined
#if A // IFNDR, defined is generated by macro replacement in controlling expression
#endif
```

— end example]

**G.11.2****[ifndr:cpp.cond.defined.malformed]****Specified in:** [15.2](#)

- <sup>1</sup> If the **defined** unary operator is used when it does not match one of the specified grammatical forms, the program is ill-formed, no diagnostic required.

- <sup>2</sup> [*Example 1:*

```
#define A
#define B A)
#if defined (B // IFNDR, unary operator defined did not match valid form before replacement
#endif
```

— *end example*]

**G.11.3****[ifndr:cpp.include.malformed.headername]****Specified in:** [15.3](#)

- <sup>1</sup> If the *header-name-tokens* after an **include** directive cannot be formed into a *header-name* (with implementation-defined treatment of whitespace), the program is ill-formed, no diagnostic required.

- <sup>2</sup> [*Example 1:*

```
#include `` // IFNDR, does not match one of the two allowable forms
```

— *end example*]

 1835

*yield-expression*, 174, 2395

## Z

zero

division by undefined, 105

remainder undefined, 105

undefined division by, 167

zero-initialization, 249

zeta functions  $\zeta$ , 1834

# Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary ([Annex A](#)). Other page numbers refer to pages where the grammar production is mentioned in the general text.

- abstract-declarator*, 227, **229**, 230, 239, 242, 243, **2400**
- abstract-pack-declarator*, **230**, **2400**
- access-specifier*, **344**, 344, 353, 354, **2405**
- additive-expression*, **168**, **2394**
- alias-declaration*, 33, 43, **206**, 212, 213, 230, 240, 308, 319, 416, 441, 461, **2397**
- alignment-specifier*, 68, 69, **292**, 293, 294, 322, 447, 449, 813, **2403**, 2450, 2499
- and-expression*, **172**, **2394**
- annotation*, **292**, 293, 300, 447, **2403**
- annotation-list*, **292**, 447, **2403**
- asm-declaration*, 180, 207, **290**, 290, **2402**
- assertion-statement*, 102, 104, 126, **203**, 203, 617, **2396**, 2413
- assignment-expression*, 140, **175**, 208, 225, 254, 274, 337, 362, 385, 475, 653, **2395**
- assignment-operator*, **176**, **2395**
- attribute*, **292**, 293, 294, 447, **2403**
- attribute-argument-clause*, **293**, 293–299, **2403**
- attribute-declaration*, 34, **207**, 209, **2397**
- attribute-list*, **292**, 293, 447, **2403**
- attribute-namespace*, **293**, 293, 294, **2403**
- attribute-scoped-token*, **293**, 293, 294, **2403**
- attribute-specifier*, **292**, 293, 294, **2403**, 2414, 2450
- attribute-specifier-seq*, 45, 123, 125, 156, 192–194, 203, 207, 209, 212, 216, 220, 231, 233, 234, 236–238, 246, 248, 268, 274, 276, 277, 281, 282, 290, **292**, 293, 297, 302, 306, 314, 321, 324, 331, 335, 337, 344, 462, 486, 514, **2402**
- attribute-token*, 21, 32, **293**, 293–299, 526, 537, **2403**, 2415
- attribute-using-prefix*, **292**, 293, **2403**, 2414
- attributed-identifier*, **248**, 248, **2400**
- await-expression*, 93, **153**, 153, 154, 179, 271, 272, 632, 2320, 2364, **2393**
- balanced-token*, **293**, **2403**
- balanced-token-seq*, 290, **293**, 293, 294, **2403**
- base-clause*, 315, **344**, 481, **2405**
- base-specifier*, 48, 56, 300, **344**, 344, 345, 353, 357, 447, 807, **2405**
- base-specifier-list*, 330, **344**, 344, 353, 365, 367, 375, 388, 447, 449, 805, **2405**
- basic-c-char*, **23**, 25, **2388**
- basic-s-char*, **27**, 29, **2389**
- binary-digit*, **22**, **23**, **2387**
- binary-exponent-part*, **26**, 27, **2389**
- binary-literal*, **22**, **23**, **2387**
- block-declaration*, 32, **206**, **2397**
- boolean-literal*, **29**, **2390**
- brace-or-equal-initializer*, 90, 208, 225, **249**, 249, 250, 254, 319, 320, 325, 337, 473, **2401**
- braced-init-list*, 3, 77, 78, 90, 143, 157, 176, 190, 202, 225, **249**, 251, 252, 254, 256, 257, 262, 263, 265, 362, 364, 366, 387, 428, 469, 474, 475, **2401**, 2411, 2431
- c-char*, **23**, 25, **2388**
- c-char-sequence*, 13, 17, **23**, 25, **2388**
- capture*, **129**, 130, 447, **2391**
- capture-default*, 37, **129**, 129, 130, 132, **2391**, 2424, 2454
- capture-list*, **129**, 447, **2391**
- cast-expression*, 134, 153, **165**, 165, 167, 190, 339, 408, 448, 449, 475, **2394**, 2481
- character-literal*, 15, 17, **23**, 25, 527, 537, 540, 1646, **2388**, 2434, 2442

# Index of library concepts

The bold page number for each entry is the page where the concept is defined. Other page numbers refer to pages where the concept is mentioned in the general text. Concepts whose name appears in *italics* are for exposition only.

*weakly\_incrementable*, 1192, 1201, **1207**, 1207–1209, 1218, 1220, 1240, 1249, 1261, 1286–1288, 1291, 1292, 1447–1451, 1457, 1459–1461, 1470, 1472, 1474–1477, 1508, 1509, 1511, 1513, 1514, 1521, 1522, 1524, 1526–1529, 1543, 1545, 1548, 1550, 1551, 1553, 1568, 1577

# Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

`#pragma`, 543

additional execution policies supported by parallel algorithms, 1430, 1431

additional `file_type` enumerators for file systems supporting additional types of file, 2151

additional formats for `time_get::do_get_date`, 1666

additional supported forms of preprocessing directive, 525

algorithms for producing the standard random number distributions, 1783

alignment, 68

alignment additional values, 69

alignment of bit-fields within a class object, 338

allocation of bit-fields within a class object, 338

argument values to construct

`ios_base::failure`, 2049

assignability of placeholder objects, 936

barrier phrase completion without `wait`, 2272

behavior of any function in `std::meta` for implementation-specific constructs, 786

behavior of iostream classes when `traits::pos_type` is not `streampos` or when `traits::off_type` is not `streamoff`, 2032

behavior of non-standard attributes, 293

bits in a byte, 64

character encoding scheme of the environment, 1678

choice of larger or smaller value of *floating-point-literal*, 27

code unit sequence for *conditional-escape-sequence*, 29

column value of `source_location::current`, 611

conversions between pointers and integers, 149

conversions of `basic_mask` from/to implementation-specific vector types, 1936

conversions of `basic_vec` from/to implementation-specific vector types, 1911

converting function pointer to object pointer and vice versa, 150

default ABI tag for `basic_vec` and `basic_mask`, 1892

default configuration of a pool, 744

default `next_buffer_size` for a `monotonic_buffer_resource`, 745

default number of buckets in `unordered_map`, 1069

default number of buckets in `unordered_multimap`, 1076, 1077

default number of buckets in `unordered_multiset`, 1088

default number of buckets in `unordered_set`, 1083

default semantics of `is_debugger_present`, 671

default value for `least_max_value` template parameter of `counting_semaphore`, 2268

defining `main` in freestanding environment, 98

definition and meaning of `__STDC__`, 546, 2452

definition and meaning of `__STDC_VERSION__`, 546

definition of `NULL`, 582, 2453

derived type for `typeid`, 146

determination of kind of input file, 13

determination of places and identification of headers during header search, 528

determination of places and identification of resources during bracket resource search, 530

diagnostic message, 4

dynamic initialization of static inline variables before `main`, 100

dynamic initialization of static variables before `main`, 100

dynamic initialization of thread-local variables before entry, 100

effect of calling associated Laguerre polynomials with `n`  $\geq$  128 or `m`  $\geq$  128, 1831

effect of calling associated Legendre polynomials with `l`  $\geq$  128, 1831

effect of calling `basic_filebuf::setbuf` with nonzero arguments, 2116

effect of calling `basic_filebuf::sync` when a get area exists, 2117

effect of calling `basic_streambuf::setbuf` with nonzero arguments, 2094

effect of calling cylindrical Bessel functions of the first kind with `nu`  $\geq$  128, 1832

effect of calling cylindrical Neumann functions with `nu`  $\geq$  128, 1833

effect of calling Hermite polynomials with `n`  $\geq$  128, 1834

- effect of calling `ios_base::sync_with_stdio` after any input or output operation on standard streams, 2043
- effect of calling irregular modified cylindrical Bessel functions with `nu >= 128`, 1832
- effect of calling Laguerre polynomials with `n >= 128`, 1834
- effect of calling Legendre polynomials with `l >= 128`, 1834
- effect of calling regular modified cylindrical Bessel functions with `nu >= 128`, 1832
- effect of calling spherical associated Legendre functions with `l >= 128`, 1835
- effect of calling spherical Bessel functions with `n >= 128`, 1835
- effect of calling spherical Neumann functions with `n >= 128`, 1835
- effect of *conditional-escape-sequence* on encoding state, 29
- effect of `filesystem::copy`, 2164
- effect on C locale of calling `locale::global`, 1642
- effects of invalid `hive` limits, 1012
- encoding assumption for `format` width computation, 1690
- encoding of an error message during formatting, 661
- `error_category` for errors originating outside the operating system, 578
- evaluation semantic used for the evaluation of a contract assertion, 102
- exception type when `random_device` constructor fails, 1780
- exception type when `random_device::operator()` fails, 1780
- exception type when `shared_ptr` constructor fails, 709
- exceptions thrown by standard library functions that have a potentially-throwing exception specification, 578
- exit status, 600
- extended signed integer types, 82
- file type of the file argument of `filesystem::status`, 2174
- floating-point conversion subrank, 90
- format of diagnostic created by `assert` macro's expression, 653
- formatted character sequence generated by `time_put::do_put` in C locale, 1668
- forward progress guarantees for implicit threads of parallel algorithms (if not defined for thread), 1429
- growth factor for `monotonic_buffer_resource`, 745
- growth factor of `hive` active block capacities, 1012
- headers for freestanding implementation, 559
- how `random_device::operator()` generates values, 1780
- how `text_encoding` objects are determined to be representative of a character encoding scheme, 1677
- how the set of importable headers is determined, 306
- interactive device, 12
- interpretation of the path character sequence with format `path::auto_format`, 2151
- invalid pointer value in the context of an evaluation, 88
- largest supported value to configure the largest allocation satisfied directly by a pool, 743
- largest supported value to configure the maximum number of blocks to replenish a pool, 743
- last enumerator of `launch`, 2274
- linkage of entities between C++ and other languages, 292
- linkage of `main`, 98
- linkage of names from C standard library, 561
- locale names, 1641
- locales with Unicode support for chrono types, 2022
- mapping from name to catalog when calling `messages::do_open`, 1675
- mapping header name to header or external source file, 19
- mapping input file characters to translation character set, 13, 2430
- mapping of pointer to integer, 149
- mapping to message when calling `messages::do_get`, 1675
- maximum depth of recursive template instantiations, 485
- maximum number of repeated evaluations of a contract assertion, 104
- maximum size of an allocated object, 157, 605
- maximum width for `vec` and `mask`, 1892
- meaning of `'`, `\`, `/*`, or `//` in a *q-char-sequence* or an *h-char-sequence*, 19
- meaning of `asm` declaration, 290
- meaning of attribute declaration, 209
- meaning of dot-dot in *root-directory*, 2137
- method by which contract termination occurs, 103
- nesting limit for `#include` directives, 529
- NTCTS in `basic_ostream<charT, traits>& operator<<(nullptr_t)`, 2079
- number of placeholders for bind expressions, 919, 936
- number of threads in a program under a freestanding implementation, 94
- operating system on which implementation depends, 2129

- `operator<<` for large extended floating-point types, 2078
- `operator>>` for large extended floating-point types, 2066
- ordinary and wide literal encodings, 15
- parallelism flag for an implementation-defined execution policy, 2381
- parameters to `main`, 98
- passing argument of class type through ellipsis, 142
- presence and meaning of `native_handle_type` and `native_handle`, 2179
- presence and value of `__STDC_ISO_10646__`, 546
- rank of extended signed integer type, 90
- replaceability of the contract-violation handler, 104
- representation of floating-point types, 84
- required alignment for `atomic_ref` type's operations, 2209, 2212, 2214, 2217
- resource limits on a message catalog, 1675
- result of evaluating `hash<indirect<T, Allocator>>()(i)` if `i` is valueless, 732
- result of `filesystem::file_size`, 2168
- result of inexact floating-point conversion, 113, 148
- resuming a coroutine on a different execution agent, 630
- return type of `cartesian_product_view::size`, 1409
- return types for `<stdbit.h>` functions, 959
- return value of `bad_alloc::what`, 605
- return value of `bad_any_cast::what`, 884
- return value of `bad_array_new_length::what`, 605
- return value of `bad_cast::what`, 608
- return value of `bad_exception::what`, 613
- return value of `bad_expected_access<E>::what`, 891
- return value of
  - `bad_expected_access<void>::what`, 891
- return value of `bad_function_call::what`, 937
- return value of `bad_optional_access::what`, 868
- return value of `bad_typeid::what`, 608
- return value of `bad_variant_access::what`, 883
- return value of `bad_weak_ptr::what`, 707
- return value of `char_traits<char16_t>::eof`, 1592
- return value of `char_traits<char32_t>::eof`, 1592
- return value of `char_traits<char8_t>::eof`, 1591
- return value of `exception::what`, 613
- return value of `receiver_proxy::try_query`, 2382
- return value of `source_location::current`, 610
- return value of `type_info::name()`, 608
- search for resources during quote resource search, 530
- search for source files during source file search, 528
- semantics of an access through a volatile glvalue, 218
- semantics of `breakpoint`, 670
- semantics of linkage specifiers, 290
- semantics of parallel algorithms invoked with implementation-defined execution policies, 1430
- semantics of
  - `stacktrace_entry::native_handle`, 665
- semantics of `token` parameter and default token value used by `random_device` constructors, 1780
- sequence of places searched for a header, 530
- set of additional thread-attributes, 2192
- set of aliases of a known registered character encoding, 1677
- set of character container types that iostreams templates can be instantiated for, 1639, 2032
- set of enabled `basic_mask<Bytes, Abi>` specializations, 1935
- set of enabled `basic_vec<T, Abi>` specializations, 1910
- set of integer-class types, 1207
- signedness of `char`, 220
- size in bits of a resource, 530
- `sizeof` applied to fundamental types other than `char`, `signed char`, and `unsigned char`, 154
- stack unwinding before invocation of
  - `std::terminate`, 519, 522
- `stacktrace_entry::native_handle_type`, 665
- startup and termination in freestanding environment, 98
- strict total order over pointer values, 5
- string resulting from `__func__`, 268
- subset of extended floating-point types that can be used as `RealType` template arguments, 1762
- subset of integer types that can be used as `IntType` template arguments, 1762
- subset of unsigned integer types that can be used as `UIntType` template arguments, 1762
- subset of values of a trivially copyable type to which a value representation corresponds, 82
- support for extended alignments, 69
- support for *module-import-declarations* with non-C++ language linkage, 290
- supported forms of `#embed` prefix parameters, 525
- supported input files, 13

supported multibyte character encoding rules, 1591

supported *root-names* in addition to any operating system dependent *root-names*, 2136, 2137

text of `__DATE__` when date of translation is not available, 543

text of `__TIME__` when time of translation is not available, 544

the contents provided in the `comment` field of `contract_violation`, 617

the contents provided in the `location` field of `contract_violation`, 618

the result of `display_string_of` and `u8display_string_of`, 791

the result of `std::meta::has_parent` for entities with neither C nor C++ language linkage, 797

the value returned by `std::meta::source_location_of`, 792

threads and program points at which deferred dynamic initialization is performed, 100

total ordering of all types, 627

transcoding of a formatted path when `charT` and `path::value_type` differ, 2149

treatment of whitespace when processing a `#embed` directive, 531

treatment of whitespace when processing a `#include` directive, 529

type of a directory-like file, 2158, 2160

type of `array::const_iterator`, 997

type of `array::iterator`, 997

type of `basic_stacktrace::const_iterator`, 666

type of `basic_stacktrace::difference_type`, 666

type of `basic_stacktrace::size_type`, 666

type of `basic_string::const_iterator`, 1607

type of `basic_string::iterator`, 1607

type of `basic_string_view::const_iterator`, 1594, 1597

type of `default_random_engine`, 1779

type of `deque::const_iterator`, 1000

type of `deque::difference_type`, 1000

type of `deque::iterator`, 1000

type of `deque::size_type`, 1000

type of `flat_map::const_iterator`, 1103

type of `flat_map::iterator`, 1102

type of `flat_multimap::const_iterator`, 1115

type of `flat_multimap::iterator`, 1115

type of `flat_multiset::const_iterator`, 1130

type of `flat_multiset::iterator`, 1130

type of `flat_set::const_iterator`, 1123

type of `flat_set::iterator`, 1122

type of `forward_list::const_iterator`, 1005

type of `forward_list::difference_type`, 1005

type of `forward_list::iterator`, 1005

type of `forward_list::size_type`, 1005

type of `inplace_vector::const_iterator`, 1037

type of `inplace_vector::iterator`, 1037

type of `list::const_iterator`, 1021

type of `list::difference_type`, 1021

type of `list::iterator`, 1021

type of `list::size_type`, 1021

type of `map::const_iterator`, 1044

type of `map::difference_type`, 1044

type of `map::iterator`, 1044

type of `map::size_type`, 1044

type of `match_results::const_iterator`, 1730

type of `multimap::const_iterator`, 1050

type of `multimap::difference_type`, 1050

type of `multimap::iterator`, 1050

type of `multimap::size_type`, 1050

type of `multiset::const_iterator`, 1059

type of `multiset::difference_type`, 1059

type of `multiset::iterator`, 1059

type of `multiset::size_type`, 1059

type of `native_handle_type`, 2112

type of `ptrdiff_t`, 582

type of `ranges::cartesian_product_view::iterator::difference_type`, 1410

type of `regex_constants::error_type`, 1720

type of `regex_constants::match_flag_type`, 1719

type of `set::const_iterator`, 1055

type of `set::difference_type`, 1055

type of `set::iterator`, 1055

type of `set::size_type`, 1055

type of `size_t`, 582

type of `span::iterator`, 1138, 1143

type of `std::bfloat16_t`, 599

type of `std::float128_t`, 599

type of `std::float16_t`, 599

type of `std::float32_t`, 599

type of `std::float64_t`, 599

type of `streamoff`, 2032

type of `syntax_option_type`, 1718

type of `text_encoding::aliases_view::begin()`, 1679

type of `text_encoding::aliases_view::end()`, 1679

type of `unordered_map::const_iterator`, 1064

type of `unordered_map::const_local_iterator`, 1064

type of `unordered_map::difference_type`, 1064

type of `unordered_map::iterator`, 1064

type of `unordered_map::local_iterator`, 1064

type of `unordered_map::size_type`, 1064

type of `unordered_multimap::const_iterator`, 1073

type of `unordered_multimap::const_local_iterator`, 1073

type of `unordered_multimap::difference_type`, 1073

type of `unordered_multimap::iterator`, 1073

type of `unordered_multimap::local_iterator`, 1073

- type of `unordered_multimap::size_type`, 1073
- type of `unordered_multiset::const_iterator`, 1084
- type of `unordered_multiset::const_local_iterator`, 1084
- type of `unordered_multiset::difference_type`, 1084
- type of `unordered_multiset::iterator`, 1084
- type of `unordered_multiset::local_iterator`, 1084
- type of `unordered_multiset::size_type`, 1084
- type of `unordered_set::const_iterator`, 1079
- type of `unordered_set::const_local_iterator`, 1079
- type of `unordered_set::difference_type`, 1079
- type of `unordered_set::iterator`, 1079
- type of `unordered_set::local_iterator`, 1079
- type of `unordered_set::size_type`, 1079
- type of `vector::const_iterator`, 1028
- type of `vector::difference_type`, 1028
- type of `vector::iterator`, 1028
- type of `vector::size_type`, 1028
- type of `vector<bool>::const_iterator`, 1033
- type of `vector<bool>::const_pointer`, 1033
- type of `vector<bool>::difference_type`, 1033
- type of `vector<bool>::iterator`, 1033
- type of `vector<bool>::pointer`, 1033
- type of `vector<bool>::size_type`, 1033
- underlying type for enumeration, 277
- underlying type of `bool`, 83
- underlying type of `char`, 83
- underlying type of `wchar_t`, 83
- unit suffix when `Period::type` is `micro`, 1962
- value of bit-field that cannot represent assigned value, 176
- initializer, 252
- value of *conditional-escape-sequence*, 25
- value of `ctype<char>::table_size`, 1647
- value of `future_errc::broken_promise`, 2273
- value of `future_errc::future_already_retrieved`, 2273
- value of `future_errc::no_state`, 2273
- value of `future_errc::promise_already_satisfied`, 2273
- value of *has-attribute-expression* for non-standard attributes, 526
- value of *has-attribute-expression* for standard attributes, 526
- value of `max_pointer_bits_available`, 694
- value of non-encodable character literal or multicharacter literal, 25
- value of `pow(0,0)`, 1757
- value of result of inexact integer to floating-point conversion, 113
- value of `simd::uninit_element`, 1894
- value of `simd::zero_element`, 1894
- value of `std::execution::counting_scope::max_associations`, 2379
- value of `std::execution::simple_counting_scope::max_associations`, 2377
- value representation of pointer types, 88
- value returned by `pointer_bits_available`, 694
- values of a trivially copyable type, 82
- values of various `ATOMIC_..._LOCK_FREE` macros, 2208
- whether `<cfenv>` functions can be used to manage floating-point status, 1751
- whether a freestanding deleted function is a deleted function, 555
- whether a given `atomic` type's operations are always lock free, 2219, 2220, 2224, 2227, 2230, 2234, 2236
- whether a given `atomic_ref` type's operations are always lock free, 2209, 2212, 2214, 2217
- whether a parameter is destroyed when the function exits or at the end of the enclosing full-expression, 141
- whether an expression is a core constant expression, 180
- whether `basic_spanbuf`'s move source is empty after a move, 2105
- whether `contract_violation` has a virtual destructor, 617
- whether declarations of some members of a closure type *Q* are *Q*-members-of-eligible, 804
- whether freestanding default replaceable global allocation functions satisfy required behavior, 601
- whether freestanding implementations replace the *statement* of a trivial infinite loop with a call to the function `std::this_thread::yield`, 197
- whether functions from Annex K of the C standard library are declared when C++ headers are included, 558
- whether locale object is global or per-thread, 1639
- whether `pragma FENV_ACCESS` is supported, 1751
- whether `rand` may introduce a data race, 1804
- whether runtime-undefined behavior results in the expression being deemed non-constant, 7
- whether sequence pointers are copied by `basic_filebuf` move constructor, 2113
- whether sequence pointers are copied by `basic_stringbuf` move constructor, 2091
- whether sequence pointers are initialized to null pointers, 2090
- whether source file inclusion of importable header is replaced with `import` directive, 529
- whether stack is unwound before invoking the function `std::terminate` when a `noexcept` specification is violated, 522
- whether the implementation is a hardened implementation, 11

whether the implementation is hosted or freestanding, [559](#)

whether the sources for module units and header units on which the current translation unit has an interface dependency are required to be available during translation, [14](#)

whether the thread that executes `main` and the threads created by `std::thread` or `std::jthread` provide concurrent forward progress guarantees, [97](#)

whether `time_get::do_get_year` accepts two-digit year numbers, [1666](#)

whether values are rounded or truncated to the required precision when converting between `time_t` values and `time_point` objects, [1967](#)

which functions in the C++ standard library may be recursively reentered, [577](#)

which non-standard-layout objects containing no data are considered empty, [66](#)

which scalar types have unique object representations, [768](#)

width of integral type, [83](#)
