

WebConfig URL_Mask

- **Article Type:** General
 - **Product:** MetaLib
 - **Product Version:** 3
-

Description:

In some "WebConfig" resources, the URL_Mask changes the characters (i.e., the symbol +) and replaces them by hexadecimal characters. As a result of this, we are not able to configure the resource.

Can this problem be solved somehow? We are interested in keeping the symbol +.

Resolution:

The problem is that the plus sign is used to URL-encode spaces. If you change the plus signs to spaces in the configuration, it should work:

Hostname:port: http://www2.fao.org/BASIS/AGRIIS/web/Cat_ia/SDW?

URL Mask: W=(EN PH WORDS 'TERM1')

Additional Information

Configuration, WebConfig
